HORTUS

This book is an annotated inventory of the species of plants and their main botanical varieties now in cultivation in the United States and Canada outside botanic gardens, experiment stations, government test grounds, special fancier's collections, and introduction gardens, together with brief indications of uses and methods of cultivation.

* * * * *

To be aware of all the plants that may be in cultivation within the country is manifestly impossible inasmuch as there is no recording agency of them. The present accounting is founded on the catalogues of plant and seed dealers, entries in books and current literature of North American origin, lists available for exchange and distribution, correspondence, together with observations and botanical collecting in many gardens and plantations in widely separated regions; it aims to cover the species now in regular cultivation somewhere within the vast region north of the Rio Grande or potentially available for general distribution or that are charged with public interest as cultivated subjects. Special care has been taken to discover the cultivated herbaceous plants inasmuch as they do not receive equal attention with trees and shrubs and their identities are not so well established since they are readily distributed by seeds and are likely to be fugitive. The inventory does not include plants that the Editors think ought to be in cultivation, nor does the inclusion of a plant imply any recommendation of it.

Although the annotations must be exceedingly brief under each entry, it is hoped that the volume will be useful as a handbook of ready reference providing an aid to current nomenclature and to the spelling of the names, a present help in labeling, a body of suggestions on the main requirements in cultivation, and a compact register of contemporaneous resources in plant materials. Persons desiring fuller descriptions of the species and more information are referred to the current manuals and floras of native plants, to the Standard Cyclopedia of Horticulture, to Bailey's Manual of Cultivated Plants, and to Rehder's Manual of Cultivated Trees and Shrubs; and more details on cultivation are to be found in the periodicals and in various gardening books and bulletins. The book is intended to supply sufficient information under each genus and species to meet the main requirements of the planter; in certain groups of special difficulty for which recent manuals or monographs are not available, regular brief description is provided to guide the consultant in identification. The consultant must naturally use all information on his own responsibility.

Named horticultural varieties, whether of apples, roses, irises, dahlias, tomatoes, strawberries, or other domesticated groups, are naturally not treated or catalogued in this work although a few of them may be mentioned in the cultural articles. Accounts of these varieties are to be found in special books and bulletins and in the publications of societies. Current varieties in all the groups are listed in Standardized Plant Names, compiled and published by the American Joint Committee on Horticultural Nomenclature, together with scientific and common names of plants in North American commerce approved for purposes of practical convenience in the horticultural trades.

Not all the plants entered in this book may be in cultivation in the country at any moment, and the Editors do not undertake to advise where seeds or roots of them may be obtained. In recent time very many species are introduced as seeds, and the kinds may not find permanent favor or be adapted to the country. The population of gardens undergoes change and shift. The book is a summary, as complete within its scope as the Editors are now able to make it but nevertheless reflecting the imperfections of our knowledge of the North American cultivated flora. Real records of cultivated plants, as of wild ones, are the plants themselves competently preserved in herbaria, but such records sufficient for conclusive study as a whole do not exist.

In a compilation of this kind it is obvious that precision and completeness are unattainable. One cannot be certain of the identity of all the botanical names in lists and periodicals. In many cases the plants themselves are not available and the only recourse is to describe the species so named; whether the plant grown under the name was correctly determined will be discovered in due time when specimens of it are procurable for study. Frequently the name has no botanical standing; it is then entered as a listed or trade name and its identity must await future effort.

* * * * *

The nomenclature follows the system of the International Rules of 1905 and 1910. The Editors have not undertaken to harmonize the names of plants coming from all parts of the world but have adopted the usage of standard works and other studies. In many genera the species from different countries may be here placed in juxtaposition for the first time, and as the nomenclature and judgments on species follow different authors so may the names not represent comparable treatment; but it is clearly not the office of this volume to make arbitrary changes. Likewise the brief annotations must often follow authentic descriptions without plain contrast of one species with another. The harmonizing of diagnoses and the unification of nomenclature must be the result of monographic studies of special investigators as the years pass.

The Editors do not necessarily approve either segregation or amalgamation of genera because of the entry of them in this book: they adopt what seems to them to be the most feasible present policy in doubtful cases, reserving full right of action for other occasions or in the event of critical study of the groups. For example, because new generic names may be here reduced to the rank of synonyms, it does not follow that the Editors definitely discard such names but only that for horticultural purposes a more conservative course may be advisable until such time as the common opinion of botanists passes judgment; and on the other hand when old genera or groups are broken up into several or many, it is not to be understood that thereby the Editors pronounce on the botanical validity of the segregations. Division of a widespread genus that is split only as to the species of one country, as of North America, cannot be adopted in this book if the species of other countries are to be entered, for those species may not have been transferred.

It is incumbent on a book of this kind to follow an accepted system of botanical nomenclature. The Latin names of plants have arisen from more than two centuries of trial and practice. They represent a technical language controlled by carefully constituted rules formulated as the result of the work of masters and the agreements of discussion in conference. The subject is technical and complex. It involves problems of history, usage, and biology. Regularly constituted international scientific agencies provide direction and sit as courts of decision.

The primary interest in nomenclature is not stability or invariability but representation of the facts and the making of printed records. In recent time the changes in names have been extensive because of the necessity to expand the rules to represent the enlarging studies of plants. The formal alterations may be expected to become fewer, but other changes must always follow new conclusions in biological study. Much of the confusion in names of cultivated plants arises from the frequent practice of growers and cataloguers in using varietal and specific names interchangeably or in failing to distinguish the two categories, and also in applying Latin names to incidental or horticultural variations; until these habits or practices are corrected there is little hope of attaining clarity in horticultural systematic nomenclature. The aim of nomenclature is to present the state of knowledge accurately and to eliminate confusion in conceptions of genera, species and varieties.

* * * * *

A statement is required on the orthography of generic names. It is to be understood that by the common consent of mankind, the botanical names of plants are to be Latin or Latinized. This is the only language adaptable to such formal usage, and it is common to botanists throughout the world. All rules and practices of technical botanical nomenclature issue from this premise.

The Rules require that names in botanical nomenclature retain their original spelling but that terminal syllables of species-names are to be modified to correspond with the gender of the generic name to which they are attached: thus the Latin *albus* (white) retains its masculine ending when associated with a masculine generic name, as *Lupinus albus*, but becomes feminine in *Brassica alba* and neuter in *Sedum album*.

It is not allowable, however, to modify the structure of either generic or specific names, after they are once published, to make them correct in etymology. We have seen that many of the names are very old and they have become imbedded in the language of nomenclature. If an effort were made to change them to satisfy exact rules of philological construction it would lead to great and unnecessary confusion. The rules of nomenclature are clear on this point. The International Rules assert that generic names "may be taken from any source whatever and may even be composed in an absolutely arbitrary manner"; and again, "the original spelling of a name must be retained, except in case of a typographic or orthographic error." The American Code states that "the original orthography of names is to be maintained," except that "manifest typographical errors may be corrected." Thus the palm *Serenoa* was first printed as *Serenæa* but the name was corrected by the author in the addendum of the same volume and the corrected spelling is to hold. Had Hooker intended to Latinize it as Serenæa, the name would have to stand in that form even though made for Sereno Watson. The author has the choice and the right to his own orthography, and it is not permissible to change it; he does not commit an error in exercising this privilege. Another illustration is *Dion.* The name was so published by Lindley in 1843, the Greek derivation being given; the name was repeated by him in his great work, "The Vegetable Kingdom," 1846. Subsequent authors "corrected" the name to Dioon, to correspond with the Greek elements (two-egged); this makes a word of three vowel syllables, and it was probably to avoid this difficulty that Lindley took pains to limit the vowels to two: he did not make a mistake and the name was not a misprint. The current edition of Webster's New International Dictionary adopts the original short spelling.

Although a generic name is based on a Latin or Greek root or suggested by such a root, or on a personal, geographic or other word more or less Latinized, the author of it is not obliged to follow the orthography of the original word or name on which he founded it. A name is a name quite independently of its etymology or origin and answers all the purposes of nomenclature, the more acceptable the more nearly it conforms to Latin usage. No one objects to *Arabis* because it does not follow exactly the name of Arabia which suggested it, and everyone is happy that *Triosteum* is a condensation of *Triosteospermum* and that *Tecoma* is separated from the full Mexican word *Tecomaxochitl.* It does not matter that *Agrimonia* is a corruption of *Argemone*, that *Asimina* is constructed from the French *Asiminier*, *Specularia* from *Speculum Veneris*, *Verbesina* said to be metamorphosed from *Verbena*, and that *Solidago* has only irregular relation with the Latin *solidare.*

The same attitude holds for generic words made from personal names. Botanical names are not primarily commemorative, and an author is under no greater obligation to adopt the exact orthography of a personal name than of a Latin, Greek, geographic or barbaric word. Nuttall had the privilege to write *Wisteria* although named, as he says "in memory of Caspar Wistar" (a family name, however, sometimes written Wister); he perhaps thought the word to be more euphonius Latin when spelled with an *e.* It is equally a compliment to the man. Similarly, Gaudichaud had the right to coin the name *Pernettia* although made for Pernetty, inasmuch as there is no original *y* in Latin; Pernetty himself would not have written his name with *y* if he had used it in a Latin dissertation. We understand why Robert Brown made the genus *Mathiola* in honor of Matthioli, apparently to avoid the undesirable *tt;* we have evidence that this spelling was intentional. There is, to be sure, another generic name spelled *Matthiola* which is not in use; if this other name is validated, Brown's may have to disappear; but as long as Mathiola holds for a cruciferous genus it should be spelled as Brown intended. Another case is Brown's *Malcomia*, named for Malcolm, but the second *l* is silent and was not transferred to the Latin nomen. We cannot regret *Plumeria* named for Plumier, *Gleditsia* for Gleditsch, *Mahonia* for M'Mahon, *Fontanesia* for Desfontaines, *Hamelia* for Duhamel, *Stranvæsia* for Fox-Strangways, and any number more.

A case in point is *Buginvillæa*. The name was published in this spelling by Jussieu in 1789. He adds that the plant was named for De Bougainville, and it is accredited to Commerson, these men having been associated in a circumnavigating expedition. In the list of errata at the end of the book there is no correction of the word. It is clear that the spelling *Buginvillæa* was intentional. The reason for this orthography is apparent: the authors chose to make a Latin word of it, and the elements *ou* and *ai* are unfamiliar in that language. We have no reason to object to the name as Commerson and Jussieu wrote it, when DeBougainville was still living, and we have no authority to change it to correspond to the form in French and thence in English. Ten spellings of this generic name by standard botanical authors are in the cited literature, among them being *Buginvillea*, *Buginvillæa*, *Buginvillia*, *Bugenvillea*, *Buguinvillea*, *Bougainvillæa:* the only satisfactory course is to go back to the original orthography, particularly as the word was properly constructed at that time.

* * * * *

A volume of this kind has been in prospect for twenty-five years or more. Ever since the completion of the Cyclopedia of American Horticulture in 1902 the hope has been entertained that a one-volume cyclopedia would some day be possible. The problem of keeping account of the species of plants newly introduced and of presenting the results of new systematic studies so far as they are expressed in the limits of genera, definitions of species and in nomenclature, has been an ever-present responsibility. This was acknowledged in the preface to the first Cyclopedia, written January 11, 1902: "It is hoped that subsequent progress may be recorded in annual supplemental volumes. It is planned to issue each year a supplement of say 75 to 100 pages, in the same size of page as the present book, with cumulative index, in paper covers: every five years these supplements may be completed into a volume." The effort began in a small way even earlier than this, in the five volumes of the Annals of Horticulture, covering the years 1889 to 1893. The supplements did not appear. Subsequently the Standard Cyclopedia of Horticulture was prepared as an enlargement of the subject, and was published in six volumes in the years 1914 to 1917, and later on thin paper in three volumes.

This volume is not assembled from the Standard Cyclopedia of Horticulture in the sense of being merely an epitome or abridgement of that work. It is a new undertaking, compiled as far as possible from fresh and original sources, to express the status of American horticulture at this period as reflected in the species of plants at the command of the cultivator. It has been in preparation about five years. The Standard Cyclopedia remains the basis, and the present book is a supplement to it, carrying out the hope that was expressed on the completion of the first work in 1902 and which has been under discussion between publisher and editor for many years. It is one more stage in the effort to represent American plant-growing as a living changing subject, and to stress the importance of clear identification of plants without which the highest type of horticulture is unattainable.

Hope is not abandoned that a way will be found whereby a recognized continuing effort may be developed to keep account of the cultivated flora, for the plants that men and women gather about them are a primary source of enjoyment and wealth and are more than ever needed as the material assets of life multiply. At stated intervals a new inventory should be published together with a review of the progress in plant knowledge in the intervening years. The Editors feel that a clear responsibility rests on plant lovers and horticulturists to communicate records of plants in cultivation in their respective regions; there is no other way by which the territory and the subject can be satisfactorily covered.

* * * * *

It is a peculiar pleasure to bring to North America the word Hortus as the name of a book. In such usage it has long and illustrious history. Latin for "a garden," the word is also employed for a book about the plants that grow in the garden and sometimes for a work about the kinds of plants in general. It is needless to trace the history of the usage, but a few citations will serve as illustrations. For our purposes we may well begin with the great Hortus Eystettensis of Besler in 1613, most ponderous of horticultural books when bound in its single volume; it describes and illustrates the plants that grew in the Eystadt garden in Bavaria, seat of a German prince-archbishop. Contemporaneous with the Besler, on or about the year 1614, the illustrious Hortus Floridus was published in Utrecht, by Crispin vande Pass; part of this famous book has been reproduced recently in England. Long before these dates, however, the anonymous Ortus Sanitatis, or "Garden of Health," had appeared. Different manuscripts of it exist, and various printed editions that comprise an important part of the early examples of the printer's art. The Hortus Malabaricus of Rheede, published in Amsterdam, 1686–1703, runs to twelve folio volumes; it is Hortus indicus malabaricus, describing plants of the western or Malabar coast of British India, and is one of the noted early works but not horticultural. Hortus Elthamensis was published in London in 1732, prepared by Dillenius, professor in Oxford, who once lived at Eltham and who made etchings of plants in the Sherard garden; it has become a famous reference. Two hortuses by Linnæus are of commanding importance because of their bearing on the identification of the species described in his subsequent works: one is Hortus Cliffortianus, 1737, covering the plants grown in the garden of George Clifford in Holland; the other is Hortus Upsaliensis, 1748, giving an account of the plants in his garden at Upsala. Subsequent hortuses became of great consequence in the establishing of the science of systematic botany, of which a few may be mentioned: Jacquin, Hortus Botanicus Vindobonensis, three folio volumes, 1770–1776, describing plants in the botanic garden in the city known in Latin as Vindobona and in English as Vienna; Aiton, Hortus Kewensis, 1789, a catalogue of the plants cultivated in the Royal Botanic Garden at Kew, England, in three volumes, with a second edition of five volumes in 1810–1813; Willdenow, Hortus Berolinensis, published in folio parts beginning 1806, at Berlin; Roxburgh, Hortus Bengalensis, a catalogue of the plants growing in the botanic garden in Calcutta, 1814. Mention should be made of Titford, "Sketches towards a Hortus botanicus americanus" that appeared in London in 1811, although it is not a hortus in the present sense; it deals mostly with Jamaican plants; and Lunan published his Hortus jamaicensis in Jamaica in 1814. Hortuses of a more distinctly horticultural character began to appear early in the past century, as: Robert Sweet, Hortus Suburbanus Londinensis, a catalogue of plants cultivated near London, 1818, followed in 1826–27 by his well-known Hortus Britannicus accounting for the plants cultivated in the gardens of Great Britain; Stephen Clarke, Hortus Anglicus, 1832, or the "modern English garden"; John Claudius Loudon, Hortus Britannicus, 1830 and subsequent editions, still a useful work of reference for gardeners. In later years the word Hortus has been less employed in book titles, although Hortus Vilmorinianus, a catalogue of all the plants in the collections of Philippe L. de Vilmorin and of Vilmorin-Andrieux et Cie, France, dates from 1906, and Hortus Mortolensis, compiled by Alwin Berger of the plants in the Hanbury gardens, La Mortola, in Italy, was published in 1912. In the western hemisphere, Hortus Fluminensis by Barbosa Rodrigues was published in 1894 or 1895, containing accounts of the plants cultivated in the Botanic Garden at Rio de Janeiro.

These various titles sufficiently testify to the significance of the word Hortus and indicate the character of its usage. There is no other available word that quite so well covers the attempt to compile a descriptive document of the plants in cultivation in a given time or place or region. The present work is a Hortus Americanus.

L. H. BAILEY.

Ithaca, N. Y.
Jan. 1, 1930.

Approximate statistics of Hortus are as follows:

1. Captions.	Main separate articles (in **LARGE CAPITALS**)	2,881	
	Secondary entries (in **SMALL CAPITALS**), including definitions, vernacular names, cross-references (but not all the cross-references in paragraphs)	2,409	
			5,290
2. Genera.	Captions that are technical generic names (in **LARGE CAPITALS**): genera accounted for		2,519
3. Species.	Number of species and independent species-names, aside from synonyms, regularly entered in **black small type**		12,659
4. Synonyms.	Species-names regularly entered as determined synonyms in **black small type**		3,987
5. Varieties.	Latin varietal names (vars.) in **black small type** (not vernacular names)		3,102
	Total Latin binomials and trinomials (in **black small type**) formally accounted for, aside from many secondary and subordinate accountings		19,748

Abbreviations and elisions are necessary to the great condensation required in a work of this character. Aside from the usual abbreviations for countries, states and provinces, those employed in this volume are as follows:

ann	annual
bien	biennial
caps	capsule
cent	central
cult	cultivated, cultivation
diam	diameter
E	East, eastern: E. U. S., Eastern United States; N. E. U. S., Northeastern United States.
fl	flower
fld	flowered
fls	flowers
fr	fruit
frs	fruits
ft	foot, feet
hort	horticulture, horticultural
in	inch, inches
infl	inflorescence
intro	introduced
isl., isls	island, islands
lf	leaf
lft	leaflet
lfts	leaflets
lvs	leaves
mts	mountains
N	North, northern: N. N. Amer., Northern North America; N. S. Amer., Northern South America; N. Eu., Northern Europe
nat	naturalized
per	perennial
S	South, Southern: S. S. Amer., Southern South America; S. Calif., Southern California; S. W. U. S., Southwestern United States
segm., segms	segment, segments
st., sts	stem, stems
subtrop	subtropical
temp	temperate (zone or region)
trop	tropical
var	variety (of a species)
W	West

Dimensions of stature, as well as of flowers and leaves, are stated for the information of the planter in choosing his material, not as botanical measurements. General outside normal sizes are commonly given for greatest brevity and also as most significant to the horticulturist: "to 8 in." means that the plant attains to that height under the usual conditions of its growth in the wild and in favorable circumstances, although it may not always actually reach it; "to 3 in. long" implies that the principal leaves or parts commonly attain to that length. Dimensions of leaves apply to the leaf-blade and do not include the petiole unless so stated; in grasses and similar plants they do not cover the leaf-sheath. Naturally, all these figures can be only approximate and are subject to variation. In the main horticultural species, there may be marked stature-forms, as dwarfs, talls, and giants.

Pronunciation of botanical names is indicated in all cases in the Standard Cyclopedia of Horticulture, of all genera in regular sequence in the Manual of Cultivated Plants and of species-names on pages 21-36 of that work, of both genera and species in Rehder's Manual of Cultivated Trees and Shrubs, and similarly in the manuals and floras of native plants. It is not necessary to repeat these technicalities in this plain book. Experience shows, however, that a few cautions and suggestions are necessary. The consultor is reminded that every vowel or vowel-element indicates a syllable to be separately pronounced, as

Rì-bes, Hè-be: two elements or syllables.

Nerì-ne, Helxì-ne, Agà-ve, Sém-ele, Silè-ne: three syllables.

Cardám-ine, Lirì-ope, Cordylì-ne: four syllables.

Hydrocót-yle: five syllables.

edù-le, acaù-le, commù-ne, vulgà-re, lóng-ipes, vír-ide, bivál-ve: three syllables.

canadén-se, barbinò-de, capillà-re: four syllables.

officinà-le, catawbién-se, occidentà-le: five syllables.

Ligatured letters, as æ, œ, are one element or sound, pronounced usually as e; when not ligatured these elements constitute two letters or syllables:

Æs-culus: three syllables.
Aer-ides: four syllables, as in *aeroplane.*
Œnothe-ra: four syllables.

Acknowledgment is due to many persons in many places who have aided by counsel and suggestions in the preparation of this Hortus, and whose names are so many that they cannot be listed here and particularly as the articles are printed on the responsibility of the Editors. The manuscripts of many genera have been examined carefully by specialists in the groups, and all the ferns, grasses, figworts, orchids, iris, mesembryanthemums, many of the orpines, and other associations have been in the hands of recognized authorities. Many practical and cultural directions have been supplied by experienced persons. This hearty cooperation has been one of the best satisfactions in the long and close labor of authorship and compilation, and the Editors extend their gratitude.

HORTUS

A CONCISE DICTIONARY OF GARDENING AND GENERAL HORTICULTURE

A

ABACÁ: *Musa textilis.*

ABELE: *Populus alba.*

ABELIA. *Caprifoliaceæ.* Attractive shrubs with persistent or deciduous simple opposite lvs. and numerous small white or pink tubular fls. in axillary or terminal cymes with persistent large purplish sepals, blooming in summer; native in Asia and Mex.

Abelias thrive in a well-drained soil, enriched with leaf-mold, and in a sunny preferably protected situation. *A. floribunda* is sometimes grown in the greenhouse. Propagated by greenwood cuttings rooted under glass in the summer, or by cuttings of ripe wood in autumn; seed is rarely employed. *A. grandiflora* and *A. Engleriana* are hardy North, and other species less hardy.

chinensis (*A. rupestris*). Deciduous shrub to 6 ft.: lvs. ovate, to 1½ in. long: fls. in dense terminal panicles, white, funnelform, ½ in. long, fragrant; sepals 5. China.—Plants grown under this name may be *A. grandiflora.*

Engleriana. Deciduous shrub to 6 ft.: lvs. ovate to oval-lanceolate, to 1½ in. long: fls. in few-fld. axillary clusters, rosy-purple or rosy-pink, funnelform, ¾ in. long; sepals 2. China.

floribunda. Mexican A. Evergreen shrub to 6 ft.: lvs. ovate, to 1½ in. long: fls. pendulous, solitary or in 2–3-fld. clusters, carmine-purple, tubular, 1½ in. long; sepals 5. Mex.

Graebneriana. Deciduous shrub to 10 ft.: lvs. ovate or narrowly so, to 2½ in. long, acuminate: fls. solitary or few on short side branchlets or axillary, pink, yellow inside. China.

grandiflora. Glossy A. Hybrid between *A. chinensis* and *A. uniflora:* half-evergreen shrub to 6 ft.: lvs. ovate, to 1½ in. long, shining: fls. in loose terminal panicles, white flushed pink, bell-shaped, ¾ in. long; sepals 2–5.—The common kind in cult.; often grown as *A. chinensis.*

rupestris: *A. chinensis,* but the plant in the trade is usually *A. grandiflora.*

Schumannii. Deciduous slender shrub to 5 ft. or more: lvs. ovate to elliptic, to about 1 in. long, mucronate but otherwise nearly obtuse: fls. several on short side growths, pink, corolla slender at base. China.

triflora. Deciduous shrub to 12 ft.: lvs. lanceolate or ovate-lanceolate, to 3 in. long: fls. in terminal clusters 2 in. across, rosy-white, salverform, ½ in. long; sepals 5. Himalayas.

uniflora. Interesting as one of the parents of *A. grandiflora:* evergreen, to 6 ft.: lvs. ovate, acuminate, shining above, to 1 in. long: fls. pinkish-white, orange in throat, 1 in. long; sepals 2. China.

ABELMOSCHUS: *Hibiscus.*

ABERIA: *Dovyalis.*

ABIES. Fir. *Pinaceæ.* Large evergreen trees 50 ft. and more in height and of pyramidal habit and continuous axis or trunk, having flat linear lvs. which are usually shiny above and with 2 white bands below, and erect cones with deciduous scales; native in the north temp. zone and hardy in cult. from the central regions north. Distinguished from the spruces (Picea) by the flat lvs. whitish beneath, erect cones with shedding scales. Although distinct to those who know them, the firs are difficult to separate by brief descriptions. For cult. see *Conifers.*

ajanensis: *Picea jezoensis.*

alba (*A. pectinata. A. Picea*). Silver F. Lvs. to 1¼ in. long, rounded and notched at apex: cones cylindric, to 5½ in. long, green turning reddish-brown. Cent. and S. Eu.; hardy in northeastern states, but likely to lose its lower branches there and to become thin. Var. **columnaris,** head columnar; var. **compacta,** dwarf and compact; var. **equi-trojani,** lvs. more pointed, cones oblong-cylindric; var. **pendula,** branches drooping; var. **pyramidalis,** head columnar.

amabilis. Cascade F. Lvs. about 1 in. long, notched or truncate at apex: cones oblong, to 6 in. long, purple. B. C. to Ore.; hardy in S. New England.

arizonica: *A. lasiocarpa* var.

baborensis: a synonym of *A. numidica.*

balsamea. Balsam F. Lvs. to 1 in. long, rounded or slightly notched at apex: cones oblong, to 2½ in. long, violet-purple. Lab. to W. Va. and Ia. Var. **hudsonia,** a dwarf form; var. **macrocarpa,** lvs. and cones longer; var. **phanerolepis,** bracts of cone exserted.

Beissneriana. Lvs. about 1 in. long: cones peduncled. W. China; probably hardy in north central states.

Borisii regis. Lvs. about 1 in. long, acute or sometimes notched at apex: cones cylindric, to 6 in. long. Balkan Peninsula.

Bornmuelleriana. Lvs. 1¼ in. long, rounded or notched at apex: cones cylindric, to 5 in. long. Asia Minor.

brachyphylla: *A. homolepis.*

canadensis: *Tsuga canadensis.*

caroliniana: *Tsuga caroliniana.*

cephalonica (*A. Reginæ-Amaliæ*). Greek F. Lvs. to 1 in. long, sharp-pointed: cones cylindric, to 7 in. long, brownish. Greece; hardy in S. New England. Var. **Apollinis** has thicker and broader less pointed lvs.

chensiensis. Lvs. to 1½ in. long, usually rounded and notched at apex: cones ovoid-oblong, to 4 in. long, green turning red-brown. Cent. China; can be grown in S. New England.

cilicica. Lvs. about 1 in. long, slightly notched at apex: cones cylindric, to 9 in. long, reddish-brown. Asia Minor, Syria; hardy in climates like S. New England and N. Y.

concolor. White F. Lvs. to 2 in. long, rounded or acute at apex: cones cylindric, to 5 in. long, greenish or purplish. Colo. to Mex.; hardy N. Var. **argentea,** lvs. silvery-white; var. **aurea,** lvs. golden-yellow when young; var. **brevifolia,** lvs. short and thick; var. **globosa,** habit globose; var. **Lowiana,** lvs. longer, notched at apex, Ore. to Calif.; var. **violacea,** lvs. bluish-white; var. **Wattezii,** lvs. pale yellowish becoming silvery-white.

Delavayi. Lvs. to 1 in. long, notched at apex, margins revolute: cones cylindric to oblong, to 3 in. long, violet-black. W. China; hardy in such climates as S. New England.

Fargesii. Lvs. to 1 in. long, notched at apex: cones ovoid-oblong, to 3 in. long, purple or red-brown. Cent. China; hardy S. New England but suffers in severe winters.

Faxoniana. Lvs. to 1 in. long, rounded or notched at apex, margins slightly revolute: cones ovoid-oblong, to 3 in. long, violet-purple. W. China; probably hardy in N. Y. and S. New England.

firma. Momi F. Lvs. to 1½ in. long, rounded and notched at apex, bands beneath inconspicuous: cones cylindric, to 5 in. long, yellowish-green. Japan; hardy in north central states and S. New England.

Forrestii. Lvs. to 1½ in. long, rounded or notched at apex: cones cylindric, to 4 in. long, violet-purple. W. China; somewhat tender N. E.

Fraseri (*Picea hudsonia*). Southern Balsam F. Lvs. to 1 in. long, rounded and notched at apex: cones oblong or ovoid, to 2¼ in. long, purple. Alleghany Mts.; hardy N.

Gordoniana: *A. grandis.*

grandis (*A. Gordoniana*). Giant F. Lvs. to 2¼ in. long, rounded and notched at apex: cones cylindric, to 4 in. long, bright green. Vancouver Isl. to Calif. and Mont.; to be grown in central states; in S. New England remains small.

holophylla. Needle F. Lvs. to 1½ in. long, rounded or acute at apex, spiny when young, bands beneath inconspicuous: cones cylindric, to 6 in. long, green becoming light brown. Manchuria, Korea; hardy N. Y. and New England.

homolepis (*A. brachyphylla*). Nikko F. Lvs. about 1 in. long, rounded and slightly notched at apex: cones cylindric, 4 in. long, purple. Japan; hardy in northern states. Var. **Tomomi**, less branched, lvs. shorter; var. **umbellata**, young cones green.

insignis. Hybrid between *A. Pinsapo* and *A. Nordmanniana.* Named vars. are **Beissneriana, Kentiana, Mastersiana,** and **speciosa.**

koreana. Lvs. to ¾ in. long, rounded and notched at apex, pointed when young, margins revolute: cones cylindric, to 3 in. long, violet-purple. Korea; hardy N. Y. and New England.

lasiocarpa (*Picea bifolia*). Alpine F. Lvs. to 1½ in. long, rounded or acute at apex, pale bluish-green: cones oblong-cylindric, to 4 in. long, purple. Alaska to New Mex. Var. **arizonica** (*A. arizonica*), Cork F., bark thick and corky; var. **compacta,** dwarf and compact.

magnifica. Red F. Lvs. 4-sided, to 1½ in. long, rounded at apex: cones cylindric-oblong, to 9 in. long, purplish-violet. Ore. to Calif.; hardy in parts of E. but needs shelter N. Var. **argentea,** lvs. bluish-white; var. **glauca,** Azure F., lvs. glaucous; var. **shastensis,** bracts of cone exserted.

Mariesii. Lvs. to ¾ in. long, rounded or notched at apex: cones ovoid to oblong, to 3½ in. long, dark purple. Japan; hardy N. Y. and New England.

nephrolepis. Very similar to *A. sibirica* but with shorter lvs. and smaller cones. Siberia, China; hardy in sheltered positions N. E.

nobilis. Noble F. Lvs. to 1½ in. long, rounded at apex, entire or slightly notched: cones cylindric-oblong, to 10 in. long, green becoming purplish-brown. Wash. to N. Calif.; not hardy throughout S. New England, and grows slowly. Var. **glauca** has glaucous lvs.; hardy.

Nordmanniana. Lvs. to 1½ in. long, rounded and notched at apex: cones cylindric, to 6 in. long, reddish-brown. Caucasus, Asia Minor, Greece; hardy and useful in northern states. Var. **aurea,** lvs. yellow; var. **tortifolia,** some of lvs. twisted.

numidica. Algerian F. Lvs. to ¾ in. long, rounded and slightly notched at apex: cones cylindric, to 7 in. long, purple. N. Afr.; grows in S. New England in sheltered places.

obovata: *Picea obovata.*

Omorika: *Picea Omorika.*

pectinata: *A. alba.*

Picea: *A. alba.*

Pindrow. Lvs. to 2⅓ in. long, acute and notched at apex, bands beneath inconspicuous: cones cylindric, to 5½ in. long, deep purple. Himalayas; hardy in central states.

Pinsapo. Spanish F. Lvs. to ¾ in. long, acute, thick and stiff, bands beneath inconspicuous: cones cylindric, to 5 in. long, purplish-brown. Spain; hardy in central states, also S. New England in sheltered positions. Var. **argentea,** lvs. silvery-white; var. **glauca,** lvs. glaucous; var. **pendula,** branches drooping.

recurvata. Lvs. to 1½ in. long, acute or sharp-pointed, bands beneath inconspicuous: cones oblong-ovoid, to 4 in. long, violet-purple becoming brownish. W. China; hardy in S. New England.

Reginæ-Amaliæ: *A. cephalonica.*

religiosa. Lvs. to 1¼ in. long, acute at apex: cones cylindric-oblong, to 6 in. long, violet-blue. Mex.

rubra: *Picea rubra.*

sachalinensis. Saghalin F. Lvs. to 1½ in. long, entire or slightly notched and rounded at apex: cones cylindric, to 3 in. long, greenish-purple. N. Japan, Saghalin; very hardy. Var. **nemorensis** has smaller cones.

sibirica. Lvs. to 1¼ in. long, rounded at apex, entire or notched: cones cylindric, to 3 in. long, bluish. N. Russia to Turkestan and Manchuria.—Sometimes suffers in hot dry summers.

spectabilis (*A. Webbiana*). Himalayan F. Lvs. to 2⅓ in. long, rounded or notched at apex: cones cylindric, to 7 in. long, violet-purple. Himalayas; hardy in central-southern regions. Var. **brevifolia** has shorter lvs.

squamata. Flaky F. Bark flaky: lvs. to 1 in. long, obtuse: cones oblong-ovoid, to 2½ in. long, violet. W. China.

sutchuenensis. Similar to *A. Fargesii* but differing in the shorter lvs. with yellow petioles. W. China.

taxifolia: *Pseudotsuga taxifolia.*

Veitchii. Lvs. to 1 in. long, notched at apex: cones cylindric, to 2½ in. long, bluish-purple. Japan; very hardy. Var. **nikkoensis,** cones smaller; var. **olivacea,** young cones green.

venusta. Bristlecone F. Lvs. to 2½ in. long, stiff, spiny-pointed: cones ovoid, bristly, to 4 in. long, purplish-brown. Calif.

Vilmorinii. Hybrid between *A. cephalonica* and *A. Pinsapo.*

Webbiana: *A. spectabilis.*

ABOBRA. *Cucurbitaceæ.* One extra trop. S. American tuberous-rooted diœcious vine infrequently grown under glass as an ornamental, particularly for the many showy little frs.: fls. small, greenish, solitary in the axils or the staminate racemose, fragrant. Grown mostly from seeds.

tenuifolia (*A. viridiflora*). Cranberry Gourd. St. herbaceous, to 20 ft. or more, from a carrot-like root: lvs. palmately 5-lobed and the older ones dissected: fr. cylindrical, about ⅓ in. long, scarlet.

viridiflora: *A. tenuifolia.*

ABRONIA. Sand-Verbena. *Nyctaginaceæ.* Trailing or low annuals or perennials, with fragrant red, yellow, or white verbena-like fls. borne in a peduncled showy head subtended by bracts; native in W. N. Amer., a few of minor importance for borders and flower-gardens in sunny exposures.

Abronias are treated as annuals. For early summer bloom seeds may be started indoors, but they are usually sown directly in the open ground; in mild climates seeds may be sown in the fall. Remove the husk before planting; the seeds are often slow in germinating.

arenaria: *A. latifolia.*

latifolia (*A. arenaria*). Yellow S. Per., prostrate: fls. lemon-yellow. Sea-coast Calif. to B. C.

umbellata. Pink S. The commonly cult. species: per., prostrate: fls. rose-purple. Sea-coast Calif. to B. C. Var. **grandiflora** has larger fls.

ABROPHYLLUM. *Saxifragaceæ.* One Australian shrub or small tree sometimes planted in S. Calif. **A. ornans.** Lvs. alternate, ovate-lanceolate, to 9 in. long: fls. small, yellowish or greenish, in forking clusters shorter than lvs., the sepals and petals deciduous: fr. a berry ⅓ in. across.

ABRUS. *Leguminosæ.* Slender more or less woody vines with pinnate lvs. of many small lfts., small papilionaceous fls. in axillary racemes, and short pods; native in trop. regions and sometimes grown under glass N. for ornament and the interesting seeds.

Propagated by seeds which germinate more quickly if soaked, or by cuttings of firm shoots in sand under glass.

precatorius. Rosary-Pea. Twining to 10 ft.: fls. red to purple, rarely white: pod oblong, to 1½ in. long, with shining scarlet seeds black at base, used in bead-work and for rosaries. Tropics.

pulchellus. Twining to 20 ft.; fls. pale purple: pods linear, to 2 in. long. Trop. Afr. to Malaya.

ABSINTHIUM: *Artemisia Absinthium.*

ABUMON: *Agapanthus.*

ABUTILON. Flowering Maple. *Malvaceæ.* Herbs and shrubs with alternate often lobed lvs. and bright red, yellow, white or striped mostly drooping fls.; distributed in warm climates.

Abutilons are used as house plants and for bedding out and *A. megapotamicum* makes an attractive basket-plant. They should be given the same cultivation as geraniums. Propagated by seeds and cuttings. Plants from seed sown in the open may be taken up in the fall and half of the new growth removed, for bloom in winter and spring. Some varieties are treated as annuals even if shrubby. Following are woody plants except *A. Theophrasti.*

Avicennæ: *A. Theophrasti.*

hybridum. Cultigens: lvs. slightly 3-lobed or unlobed, spotted: fls. of various colors. Most of the garden forms belong here as they cannot be referred to the pure species.

indicum. Shrubby per. to 5 ft.: lvs. entire or toothed, to 4 in. across. white-tomentose: fls. yellow, 1 in. across. Tropics.

insigne. Lvs. not lobed, wavy-toothed, to 4 in. long: fls. to 2½ in. across, white or rose with dark veins. Colombia.

megapotamicum (*A. vexillarium*). Habit drooping: lvs. not lobed, wavy-toothed, to 3 in. long, often arrow-shaped: fls. with yellow petals and red calyx, to 2 in. long, with exserted stamens, fuchsia-like. S. Amer.

mollissimum. To 10 ft.: lvs. ovate, to 6 in. or more long, pubescent: fls. yellow, about ½ in. long. S. Amer.

pictum. Lvs. 3-lobed, toothed, middle lobe broadest at base, green or variegated: fls. orange or yellow veined crimson, 1¼ in. long. S. Brazil to Argentina.—Often passes as *A. striatum.*

pleniflorum. Differs from *A. pictum* in the green lvs. and double fls. Of garden origin.

Savitzii: one of the *A. hybridum* group.

striatum. Lvs. 5–7-lobed, the middle lobe narrowed at base: fls. orange veined with dark crimson, to 1¾ in. long. Guatemala.—Not common in cult. Var. Thompsoni has lvs. variegated with yellow.

Theophrasti (*A. Avicennæ*). Ann. herb to 5 ft.: lvs. nearly entire or toothed, pubescent, to 1 ft. across: fls. yellow, to ¾ in. across. S. Asia; nat. in N. Amer.

Thompsoni: *A. striatum* var.

vexillarium: *A. megapotamicum.*

vitifolium. Lvs. 3–7-lobed, to 5 in. across, tomentose beneath: fls. light blue, to 3½ in. across. Chile.

ACACIA. *Leguminosæ.* Trees and shrubs mostly of the tropics or warm temp. regions, particularly Australia, with bipinnate lvs. or the lvs. reduced to leaf-like petioles or phyllodia and resembling a simple lf., small usually yellow fls. in stalked heads or spikes, mostly in early spring, and fr. a pod, ovate to linear, or moniliform (like a string of beads).

Acacias are grown extensively out-of-doors in warmer United States, particularly in California. They do not stand temperatures below 18–20° F. as a rule. They grow very quickly but are short-lived. In the tropics some species are grown as forage crops, for medicine, gums, soap, fibers, and other purposes. Acacias are often grown under glass for spring bloom. but are not usually well adapted to forcing as they do not thrive in temperatures above 40–50°. They need plenty of water and sunshine, and should be pruned after blooming and set out-of-doors for the summer.

Propagation is by seeds under glass or sown in the open. Germination is hastened by softening the hard seed-coats, either by placing the seed in hot ashes and leaving until cool, or by soaking in hot water which is allowed to cool for 12–48 hours. Propagated also by cuttings of half-ripened wood with a heel.

accola. Glabrous shrub to 8 ft.: phyllodia linear, 3–5 in. long, 1-nerved: fl.-heads several in racemes that are 1½–2 in. long: pods to 4 in. long and ½ in. broad, flat, with waxy lustre. Australia.

acinacea. Much branched shrub: phyllodia oblong, about ½ in. long: fl.-heads ⅛ in. or less across, usually in pairs: pods linear, curved. S. Australia.

acuminata. Tree to 40 ft.: phyllodia long-linear, to 10 in. long and ¼ in. broad, with fine parallel nerves: fls. in sessile spikes that are 1 ft. or less long: pods linear, less than ¼ in. broad, somewhat contracted between seeds. W. Australia.

adunca: *A. crassiuscula.*

alata. Shrub to 6 ft.: phyllodia decurrent along the st., forming wings to ½ in. across: fl.-heads ¼ in. across, solitary or in pairs. W. Australia. Var. platyptera (*A. platyptera*) has narrower phyllodia.

aneura. Mulga. Shrub or tree: phyllodia narrow-linear, to 3 in. long: fls. in spikes to ¾ in. long: pods to 1½ in. long. Australia, where it is used as fodder for cattle in times of drought.

arabica. Gum Arabic Tree. Tree with stipular spines: lvs. bipinnate, the lfts. to ¼ in. long: fl.-heads in pairs or clusters: pods to 6 in. long, moniliform. N. Afr., Eu.

armata (*A. paradoxa*). Kangaroo-Thorn. Shrub to 10 ft., with spines ¼ in. long: phyllodia half-ovate, to 1 in. long: fl.-heads ¼ in. across, solitary: pods to 2 in. long. Australia.

aspera. Shrub to 4 ft.: phyllodia oblong-linear, to 1½ in. long: fl.-heads solitary or in pairs: pods to 2 in. long, contracted between seeds. Victoria, New S. Wales.

Baileyana. Shrub or small tree: lvs. bipinnate, the lfts. to ¼ in. long, glaucous: fl.-heads about ⅛ in. across, in racemes to 3 in. or more long: pods to 4 in. long, glaucous. New S. Wales.

Betchei. Shrub to 12 ft.: phyllodia linear, 3 in. long: fl.-heads globular, small, in racemes 3 in. or less long: pods 4 in. long, nearly woody. New S. Wales.

binervata. Shrub or tree to 40 ft.: phyllodia falcate to lanceolate, to 4 in. long: fl.-heads in short racemes: pods to 5 in. long. New S. Wales, Queensland.

brachybotrya. Tall shrub: phyllodia obovate, to 1 in. or more long: fl.-heads in short racemes or solitary: pods linear. S. Australia.

buxifolia. Shrub, branches angled: phyllodia oblong-lanceolate and oblique, mostly 1 in. or less long, thickish, veins not prominent: fl.-heads globular, small: pods flat, ⅛ in. or less broad. New S. Wales.

calamifolia. Broom Wattle. Tall shrub: phyllodia narrow-linear, to 4 in. long: fl.-heads almost ¼ in. across, in short racemes or rarely solitary: pods to 6 in. long, constricted between seeds. S. Australia.

Catechu. Tree: lvs. bipinnate, the lfts. ¼ in. long: fls. in spikes to 5 in. long: pods to 3 in. long. E. Indies, Himalayas.—Yields black catechu.

Cavenia. Espino Cavan. Shrub to 20 ft. with stout spines, and good for hedges: lvs. bipinnate: fl.-heads clustered. Chile.

confusa. Tree to 50 ft., with terete branchlets: phyllodia narrow-lanceolate, to 5 in. or more long, rather obtuse, about 5-nerved: fl.-heads axillary and solitary: pods 3 in. or more long, somewhat inflated, more or less constricted. Philippines, Formosa.

cordata: hort. name.

cornigera. Bullhorn A. Shrub or small tree with large inflated spines resembling the horns of an ox, often twisted: lvs. bipinnate, the lfts. ¼ in. long: fls. in dense spikes to 1½ in. long: pods to 2½ in. long, beaked. Mex.

crassiuscula (*A. adunca*). Shrub, mostly with sharp-angled branches: phyllodia linear or some of them narrow-lanceolate, to 2 in. long, 1-nerved, thickish: fl.-heads small and dense, in racemes that are shorter than the phyllodia: pods linear, mostly less than ¼ in. broad, thick and coriaceous, contracted between seeds. Queensland to Tasmania.

cultriformis. Knife A. Tall shrub: phyllodia ovate, to 1 in. long, gray and glaucous: fl.-heads about ⅛ in. across, in long racemes forming a terminal panicle: pods to 3 in. long, glaucous. New S. Wales, Queensland.

cuneata. Tall shrub: phyllodia oblong, to 1 in. long: fl.-heads solitary, on stalks about as long as phyllodia: pods to 3 in. long, curved. W. Australia.

cyanophylla. Blue-leaf Wattle. Stoloniferous shrub to 18 ft.: phyllodia linear-oblong, 6–12 in. long: fl.-heads ¼ in. or more across, in short racemes: pods about 5 in. long, contracted between seeds. W. Australia.

cyclops. Shrub to 10 ft.: phyllodia narrow-oblong, to 3½ in. long: fl.-heads solitary or in short racemes, July-Dec.: pods to 2½ in. long, curved. W. Australia.

dealbata: *A. decurrens* var.

decipiens. Shrub to 12 ft.: phyllodia triangular, to ⅔ in. long: fl.-heads solitary or in pairs: pods to 2 in. long, much curved. W. Australia.

decora. Shrub, with angled branchlets: phyllodia lanceolate or linear, to 2 in. long, 1-nerved: fl.-heads globular, in racemes exceeding the phyllodia: pods flat, about ¼ in. broad, little if at all contracted between seeds. Queensland, New S. Wales.

decurrens. Green Wattle. Tree: lvs. bipinnate, the lfts. to ⅓ in. long: fl.-heads ¼ in. across, in racemes: pods to 4 in. long. Australia. Var. **dealbata** (*A. dealbata*). Silver Wattle. To 50 ft.: lvs. silvery-gray. Var. **mollis** (*A. mollissima*). Black Wattle. To 50 ft.: lvs. tomentose, yellowish when young. Var. **normalis.** Glabrous or young parts tomentose.

dentifera. Tall shrub: phyllodia narrow-linear, to 8 in. long: fl.-heads solitary or in pairs: pods to 3 in. long. W. Australia.

Dietrichiana. Phyllodia linear, to 3 in. and more long: fl.-heads about ⅛ in. across, solitary: pods 2½ in. long, contracted between seeds. Queensland.

diffusa. Shrub to 6 ft.: phyllodia linear, about ¾ in. long, stiff: fl.-heads usually in pairs: pods to 4 in. long. S. Australia, Tasmania.

discolor. Shrub or small tree: lvs. bipinnate, the lfts. ¼ in. long, pale beneath: fl.-heads in racemes: pods to 3 in. long. S. Australia, Tasmania.

dodonæifolia. Tall shrub: phyllodia lanceolate, to 4 in. long: fl.-heads solitary or in pairs: pods long and flat. S. Australia.

doratoxylon. Shrub or small tree: phyllodia to 8 in. long and ⅓ in. across: fl.-heads in dense spikes to 1 in. long: pods to 4 in. long. Australia.

Drummondii. Shrub or small tree: lvs. bipinnate, the lfts. ¼ in. long: fl.-heads in dense drooping spikes to 1½ in. long: pods to 1 in. long. W. Australia.

eburnea. Shrub with stipular spines to 2 in. long: lvs. bipinnate, the lfts. to ⅛ in. long: fl.-heads ½ in. or less across, solitary: pods to 6 in. long. Arabia to India and Ceylon.

elata. Tree to 60 ft.: lvs. bipinnate, the lfts. to 2 in. long: fl.-heads in racemes to 6 in. long, Sept.-Dec.: pods to 6 in. long. New S. Wales.

elongata. Tall shrub: phyllodia narrow-linear, to 4 in. long: fl.-heads solitary or in pairs: pods to 2½ in. long. S. Australia.

extensa. Shrub to 5 ft.: phyllodia linear, to 4 in. and more long, resembling branchlets: fl.-heads solitary or in short racemes: pods to 4 in. long, contracted between seeds. W. Australia.

falcata. Shrub or small tree: phyllodia lanceolate-falcate, to 6 in. or more long: fl.-heads in short racemes: pods to 3 in. long. Queensland, New S. Wales.

Farnesiana (*Vachellia Farnesiana*). Popinac. Opopanax. Cassie. Huisache. Sweet A. Thorny much branched shrub to 10 ft.: lvs. bipinnate, the lfts. to ⅙ in. long: fl.-heads ¼–½ in. across, very fragrant, in small clusters: pods to 3 in. long. Tex., Mex., Asia, Afr., Australia; original nativity uncertain.

filicina: *A. filicioides.*

filicioides (*A. filicina*). Shrub: lvs. bipinnate, the lfts. to ⅕ in. long: fl.-heads white, in racemes: pods 2 in. long. Tex., Mex.

fimbriata: a form of *A. linifolia* var. *prominens.*

floribunda: *A. longifolia* var.

Giraffæ. Camel-Thorn. Tree to 40 ft., with long stout spines: lvs. bipinnate: fl.-heads in clusters: pods oval, indehiscent. S. Afr.

glaucescens. Tree to 60 ft.: phyllodia lanceolate or falcate, to 6 in. long, gray-pubescent: fls. in spikes to 2 in. long: pods twisted or coiled. Queensland, New S. Wales.

grandis: *A. pulchella* var.

Greggii. Texas Mimosa. Shrub or sometimes tree to 20 ft.: lvs. bipinnate: fls. pale yellow, in spikes to 2¼ in. long, in summer: pods to 4 in. long, twisted. Tex. to Mex.

gummifera. Tree to 30 ft., with stipular spines: lvs. bipinnate: fl.-heads in spikes: pods white-tomentose, contracted between seeds. Afr.

harpophylla. Tall tree: phyllodia falcate-lanceolate, to 8 in. long, pale or glaucous: fl.-heads in clusters or short racemes: pods to 6 in. long, slightly contracted between seeds. Queensland.

hastulata. Shrub to 3 ft.: phyllodia crowded, hastate-lanceolate, to ¼ in. long, spiny-pointed: fl.-heads ⅛ in. or less across, solitary: pods to 2 in. long, curved. W. Australia.

heterophylla. Shrub to 5 ft.: phyllodia linear, often with bipinnate lvs. on adult branches: fl.-heads in racemes. Mascarene Isls.

hispidissima: *A. pulchella* var.

holosericea. Shrub or tree to 20 ft., covered with white silky pubescence: phyllodia oval-oblong, to 6 in. long: fl.-heads in spikes to 2 in. long: pods twisted. N. Australia.

homalophylla. Small tree: phyllodia lanceolate to linear, to 3 in. long: fl.-heads in pairs or clusters: pods linear, slightly curved. Australia.

implexa. Tree to 50 ft.: phyllodia lanceolate-falcate, to 6 in. or more long: fl.-heads in short racemes: pods narrow-linear, much twisted, contracted between seeds. Australia.

Jonesii. Shrub to 3 ft., very slender, branchlets hairy: lvs. bipinnate, with 5 or 6 pairs of pinnules that bear many lfts. ¼ in. or less long, nearly or quite linear: fl.-heads racemose: pods compressed and narrow, to 3 in. long. New S. Wales.

Julibrissin: *Albizzia Julibrissin.*

juncifolia. Tall shrub: phyllodia linear, to 6 in. or more long: fl.-heads solitary or in pairs: pods to 4 in. long. Australia.

juniperina. Prickly Wattle. Shrub to 12 ft.: phyllodia linear, to ½ in. long: fl.-heads solitary: pods to 2 in. long, contracted between seeds. Australia, Tasmania.

Koa. Koa. Tree to 60 ft.: phyllodia falcate, to 5 in. long: fl.-heads usually in short racemes: pods to 6 in. long and 1 in. wide. Hawaiian Isls.

latifolia. Phyllodia to 6 in. long and 2 in. across, glaucous: fl.-heads in loose spikes to 2 in. long: pods to 4 in. long. N. Australia.

Lebbek: *Albizzia Lebbek.*

leprosa. Shrub or small tree: phyllodia linear-lanceolate, to 3 in. long: fl.-heads in pairs or clusters: pod falcate. Victoria, New S. Wales.

ligulata: the plant grown under this name is probably *A. salicina.*

linearis. Shrub: phyllodia narrow-linear, to 6 in. or more long: fl.-heads in loose spikes to 2 in. long: pods to 4 in. long. Australia.

lineata. Shrub: phyllodia linear, to ¾ in. long: fl.-heads solitary: pods curved or twisted. Australia.

linifolia. Tall shrub: phyllodia linear, to 1½ in. long: fl.-heads in short racemes: pods to 4 in. long. Queensland, New S. Wales. Var. **prominens** (*A. prominens*) has broader phyllodia and pods.

longifolia. Sydney Golden Wattle. Shrub or small tree: phyllodia oblong-lanceolate, to 6 in. long: fl.-heads in loose spikes to 2¼ in. long: pods to 5 in. long. Australia. Var. **floribunda** (*A. floribunda*). Foliage at ends of branches: fls. whitish-yellow. Var. **mucronata** (*A. mucronata*). Phyllodia very narrow. Var. **Sophoræ** (*A. Sophoræ*). Phyllodia to 3 in. long and 1 in. wide, very obtuse.

lophantha: *Albizzia lophantha.*

lunata. Shrub: phyllodia oblong-falcate, to 1 in. long: fl.-heads in racemes longer than phyllodia: pods glaucous. Australia.

macracantha. Shrub or tree to 20 ft., with spines to 2 in. long: lvs. bipinnate, the lfts. ⅙ in. long: fl.-heads to ½ in. across, solitary or clustered: pods to 5 in. long. Mex., S. Amer.

macradenia. Shrub to 12 ft.: phyllodia lanceolate-falcate, to 6 in. and more long: fl.-heads in short racemes: pods to 4 in. long. Queensland.

Maideni. Shrub or tree to 50 ft.: phyllodia lanceolate-falcate, to 6 in. long: fl.-heads in spikes 1 in. long: pods much twisted. Australia.

Meissneri. Tall shrub: phyllodia obovate-oblong, to 1 in. long: fl.-heads solitary: pods long and narrow. W. Australia.

melanoxylon. BLACKWOOD A. Large tree: phyllodia oblanceolate, to 4 in. long and 1 in. wide, often with bipinnate lvs. also on young shoots: fl.-heads cream, ¼ in. across, in short racemes: pods to 5 in. long, twisted. Australia.

mollissima: *A. decurrens* var. *mollis.*

mucronata: *A. longifolia* var.

myrtifolia. Tall shrub: phyllodia obovate to linear, to 2 in. and more long: fl.-heads in short racemes: pods to 3 in. long, curved. Australia.

Nemu: *Albizzia Julibrissin.*

neriifolia. BALD A. Shrub or small tree: phyllodia linear-lanceolate, to 5 in. long: fl.-heads to ¼ in. across, in short racemes: pods to 6 in long. Australia.

nigricans. Shrub to 6 ft.: lvs. bipinnate, the lfts. to ⅕ in. long: fl.-heads solitary: pods to 1½ in. long. W. Australia.

obliqua. Drooping much branched shrub: phyllodia obovate or orbicular, to ½ in. long: fl.-heads solitary or in pairs: pods to 2 in. long, twisted. S. Australia.

obtusata. Tall shrub: phyllodia oblong-linear, to 3 in. long, stiff: fl.-heads in short racemes. New S. Wales.

Oswaldi. Shrub to 10 ft.: phyllodia falcate-lanceolate to linear, to 2 in. long, stiff: fl.-heads solitary or in clusters: pods curved or twisted. Australia.

ovata: hort. name.

oxycedrus. Stiff shrub: phyllodia linear-lanceolate, to 1 in. long: fl.-heads in dense spikes 1 in. long: pods to 3 in. long. Australia.

paradoxa: *A. armata.*

pendula. WEEPING MYALL. Small tree with drooping branchlets: phyllodia linear-lanceolate, to 3 in. long, stiff, gray: fl.-heads in pairs or clusters: pods to 3 in. long, the sutures narrowly winged. Queensland, New S. Wales.

penninervis. Tree to 40 ft. or more: phyllodia lanceolate-falcate, to 4 in. long or more: fl.-heads in short loose racemes: pods to 5 in. long. Australia. Var. **falciformis.** Shrub with longer and more falcate phyllodia.

pentadenia. Tall shrub, with usually 4-angled branchlets: lvs. bipinnate, the 2–5 pairs of pinnules bearing many lfts. ¼ in. or less long: fl.-heads globular, clustered: pods flat, 1½ in. or less long, the valves elastic. W. Australia.

pinifolia: a synonym of *A. juncifolia.*

platyphylla of lists is probably *A. alata.*

platyptera: *A. alata* var.

podalyriæfolia. PEARL A. Tall glaucous pubescent shrub: phyllodia ovate or oblong, to 1½ in. long: fl.-heads in long racemes: pods to 3 in. long. Queensland.

pravissima. SCREWPOD A. Tree to 20 ft., with drooping branchlets: phyllodia ovate, to 1 in. long: fl.-heads less than ⅛ in. across, in racemes longer than phyllodia: pods to 3 in. long, much twisted. Victoria.

prominens: *A. linifolia* var.

pruinosa. Small tree: lvs. bipinnate, the lfts. to ¾ in. long: fl.-heads in racemes: pods to 3 in. long. New S. Wales.

pubescens. HAIRY WATTLE. Shrub with drooping branchlets: lvs. bipinnate, the lfts. to ⅙ in. long: fl.-heads in racemes longer than lvs.: pods flat. New S. Wales.

pulchella. Spiny shrub: lvs. bipinnate, the lfts. to ¼ in. long: fl.-heads solitary: pods to 2 in. long. W. Australia. Var. **grandis** (*A. grandis*) is glabrous with larger lfts. Var. **hispidissima** (*A. hispidissima*) is hairy with narrow lfts.

pycnantha. GOLDEN or BROAD-LEAVED WATTLE. Small tree: phyllodia to 6 in. long and 1½ in. wide or sometimes 4 in. wide on seedlings: fl.-heads ¼ in. or more across, fragrant, in many-fld. racemes: pods to 5 in. long. S. Australia.

retinodes. Shrub or small tree: phyllodia linear-lanceolate, to 5 in. long: fl.-heads in short branched racemes: pods to 8 in. long. S. Australia. Vars. **floribunda** and **gracillima** are listed.

Riceana. Shrub or small tree: phyllodia linear, to 1½ in. long, scattered: fl.-heads in loose spikes to 2 in. long: pods to 3 in. long, curved, contracted between seeds. Tasmania.

salicina. Shrub or small tree with drooping branches: phyllodia oblong-linear, to 5 in. long: fl.-heads in short racemes or solitary: pods to 3 in. long. Australia. Var. **Wayæ.** Shrub to 8 ft.

saligna. Shrub or small tree: phyllodia lanceolate, to 8 in. and more long: fl.-heads ½ in. across, in racemes: fr. to 5 in. long, contracted between seeds. W. Australia.

Senegal. Tree to 30 ft.: lvs. bipinnate: fls. white, in axillary spikes. Trop. Afr.

Sentis. Tree to 40 ft.: lvs. lanceolate-oblong to linear, to 2 in. long: fl.-heads solitary or in pairs: pods to 3 in. long. Australia.

siculiformis. Tall shrub: phyllodia linear or linear-lanceolate, to 1½ in. long, stiff: fl.-heads solitary: pods to 1 in. long. S. Australia, Tasmania.

Sophoræ: *A. longifolia* var.

stenophylla. Tree: phyllodia linear, to 1 ft. long: fl.-heads mostly in short racemes: pods to 8 in. long, moniliform. Australia.

stenoptera. Stiff low shrub or bush: phyllodia running into long opposite wings, the upper or free part lanceolate or narrower: fl.-heads on very short peduncles: pods falcate, acuminate. W. Australia.

suaveolens. Shrub to 6 ft.: phyllodia linear, to 6 in. long: fl.-heads in racemes: pods to 1½ in. long, glaucous. Australia, Tasmania.

subulata. Shrub to 10 ft.: phyllodia narrow-linear, to 6 in. long: fl.-heads in racemes. New S. Wales.

Suma. Small tree: lvs. bipinnate, the lfts. to ¼ in. long: fl.-heads nearly white, in spikes to 4 in. long: pods to 4 in. long. India, Ceylon.

tenuifolia. Shrub with drooping branchlets: phyllodia linear-subulate, to 1 in. long: fl.-heads solitary: pods to 3 in. long. Victoria.

undulifolia. Shrub or low bush, sometimes becoming large: phyllodia ovate to nearly orbicular, to 1 in. or less long, 1-nerved, undulate: fl.-heads globular, on slender peduncles: pods flat, to ¾ in. broad. Queensland, New S. Wales.

verticillata. STAR or WHORL-LEAVED A. Shrub or small tree: phyllodia linear-subulate, to ¾ in. long, in whorls: fl.-heads in spikes 1 in. long: pods to 3 in. long. Victoria, Tasmania.

viscidula. Shrub to 15 ft.: phyllodia narrow-linear, to 3 in. long: fl.-heads mostly in pairs: pods to 2 in. long. New S. Wales.

ACACIA, BLACK: *Robinia PseudoAcacia.* **False**: *Robinia PseudoAcacia.* **Rose**: *Robinia hispida.*

ACÆNA. *Rosaceæ.* More or less evergreen trailing perennials used in mild countries as ground-cover, and sometimes N. with protection, with pinnate lvs., inconspicuous fls. in terminal heads or spikes, and fr. a bristly achene; native in the southern hemisphere, also Calif. Propagated by seeds, division and cuttings. Useful in rock-gardens.

argentea. St. creeping: lvs. silvery, of 3–4 lfts.: fls. in globose spikes. Chile.

Buchanani. Sts. prostrate and rooting: lvs. to ¾ in. long, of 11–13 lfts., whitish-green: fls. in small sessile heads, with yellowish spines. New Zeal.

cylindrostachya. Sts. prostrate: lvs. of 10–11 lfts. silky beneath: fls. in cylindrical spikes. Peru.

glauca: listed name.

inermis: *A. microphylla* var.

microphylla. New Zealand Bur. Sts. prostrate: lvs. to 2 in. long, with 7–13 lfts.: fls. in globose stalked heads to ¾ in. across, with purplish-red spines. New Zeal. Var. **inermis** has longer lvs. and spineless frs.

myriophylla. Sts. ascending: lvs. with 7–9 deeply cut lfts. silky beneath: fls. in interrupted spikes. Chile.

novæ-zelandiæ. Sts. creeping and rooting: lvs. to 3 in. long, with 11–13 lfts.: fls. in globose stalked heads to 1¼ in. across, with purplish-red spines. New Zeal.

ovalifolia. Similar to *A. microphylla* but with larger lvs. Chile.

ovina. Sts. ascending to 2 ft.: lfts. to ¾ in. long, crenate or pinnately cut: fls. purple, in long interrupted spikes. Australia.

Sanguisorbæ. Sts. creeping and rooting: lvs. to 3 in. long, of 7–11 lfts., pale beneath: fls. in globose stalked heads to ¾ in. across. Australia, New Zeal.

ACALYPHA. *Euphorbiaceæ.* Herbs, or the cult. species monœcious or diœcious shrubs with attractive foliage and small inconspicuous fls. often assembled in bracted, showy, axillary or terminal spikes or racemes. The species are many, in temp. and trop. regions of both hemispheres, some of them weedy annuals. Ours are conservatory ornamentals, employed also for bedding out far S. and for hedges and lawn specimens. The cult. is simple.

Propagated by cuttings taken from outdoor bedded plants in the fall; from plants lifted in the fall and cut back; and in summer from stock kept from the previous season; the last is the best method as cuttings with a heel may be obtained which give excellent plants for use in the conservatory in fall and winter.

Godseffiana. Profuse shrub, bushy and dense: lvs. mostly green with cream-colored margin, variable in form, lance-ovate to variously shredded: fl.-clusters shorter than lvs., greenish-yellow. New Guinea, but probably a state of *A. Wilkesiana*. The ***heterophylla*** form with ragged lvs. sometimes reduced to shreds may occur on the same plant with other lvs.

Hamiltoniana: probably a form of *A. Godseffiana* is meant.

heterophylla: *A. Godseffiana* var.

hispida (*A. Sanderi*). Chenille Plant. Redhot Cat-tail. Diœcious shrub to 15 ft.: lvs. green, broad-ovate, to 8 in. long: pistillate spikes drooping, dense, to 1½ ft. long and 1 in. wide, red or purple. E. Indies. Var. **alba** has creamy-white fls. and **ramosa** has compound spikes.

illustris: *A. Wilkesiana.*

Macafeana: *A. Wilkesiana* var.

macrophylla: *A. Wilkesiana* var.

marginata: *A. Wilkesiana* var.

Miltoniana. Described as differing from *A. Godseffiana* in larger size and more finely cut lvs.

musaica: *A. Wilkesiana* var.

obovata: *A. Wilkesiana* var.

ramosa: *A. hispida* var.

Sanderi: *A. hispida.*

tricolor: *A. Wilkesiana.*

triumphans: *A. Wilkesiana* var.

Wilkesiana (*A. illustris. A. tricolor*). Copper-leaf. Monœcious shrub to 15 ft.: lvs. profuse, elliptic or ovate, 5–8 in. long, serrate, bronzy-green mottled with copper, red or purplish: spikes slender, 8 in. long and ¼ in. wide, reddish. S. Sea Isls. There are many vars. in the trade: **Macafeana**, lvs. red marked crimson and bronze; **macrophylla**, lvs. russet-brown; **marginata**, lvs. with crimson or other margins; **musaica** (*mosaica*), lvs. green with orange and red markings; **obovata**, lvs. becoming bronzy-green with rosy-pink margins; **triumphans**, lvs. spotted crimson, green and brown. In its many color strains this plant is much planted in S. Fla. and the American tropics, less in S. Calif.

ACAMPE. *Orchidaceæ.* Strong epiphytes with thick two-ranked lvs. and small fls. mostly in short racemes, the lip with a short spur; require trop. conditions. For cult. see *Orchids.*

multiflora. To 16 in.: lvs. to 1 ft. long and 2 in. wide: fls. yellow spotted with brown, the lip white lined with dark red, in racemes to 6 in. long, July-Oct. China.

papillosa. To 10 in.: lvs. to 5 in. long and ¾ in. wide: fls. dark yellow spotted with brown, the lip white with rose wrinkles, in 16–12-fld. racemes to 1 in. long, Aug.-Sept. India.

ACANTHACEÆ. Acanthus Family. About 180 genera, mostly herbs widely distributed, largely in trop. countries, sometimes spine-bearing: lvs. opposite, simple: fls. bisexual, irregular; calyx 4–5-parted; corolla gamopetalous, 5-lobed or 2-lipped; stamens 2 or 4; ovary 2-celled with slender style: fr. a dry caps. Plants in many genera are grown for ornament in greenhouses and the open, both for showy fls. and for colored striking foliage, as Acanthus, Adhatoda, Anisacanthus, Aphelandra, Asystasia, Barleria, Beloperone, Crossandra, Dyschoriste, Eranthemum, Fittonia, Graptophyllum, Hemigraphis, Jacobinia, Justicia, Mackaya, Odontonema, Pachystachys, Peristrophe, Pseuderanthemum, Ruellia, Sanchezia, Schaueria, Stenandrium, Strobilanthes, Thunbergia.

ACANTHOCEREUS. *Cactaceæ.* Slender jointed mostly strongly 3-angled clambering or trailing cacti, usually several ft. long, the areoles with soft wool and several stiff spines: fls. white or greenish, funnelform, solitary, nocturnal; coasts of Fla. and Tex. to S. Amer. See *Cacti.*

pentagonus (*Cereus pentagonus. C. baxaniensis*). To 20 ft., sometimes rooting at tips: spines several, to 2 in. long: fls. 6–8 in. long. Fla. and Tex., south.—Sometimes employed as a greenhouse plant and in the open in its native regions.

ACANTHOLIMON. Prickly-Thrift. *Plumbaginaceæ.* Dwarf tufted hardy perennials with evergreen sharp-pointed linear rigid lvs. and fls. rose or white in tight heads, spikes or racemes; native S. E. Eu. to Asia.

The prickly-thrifts are slow-growing plants for rock-gardens and sandy places, needing sun and warmth. Propagated by cuttings in late summer and wintered under protection in a coldframe; also by layering.

glumaceum. To 6 in.: fls. small, rose, in dense one-sided racemes, July-Sept. Armenia.

lepturoides. To 3 in.: lvs. glaucous: fls. whitish, in loose racemes. Caucasus.

venustum. To 8 in.: lvs. glaucous: fls. rose or purple, in loose racemes, July-Sept. Asia Minor.

ACANTHOPANAX. *Araliaceæ.* E. Asian shrubs and trees, usually prickly, with alternate palmately lobed or compound lvs., small greenish fls. in umbels, and little blackish berries; grown for ornament and the following mostly hardy N.

Propagated by seeds sown at once or stratified, by root-cuttings over heat, or softwood cuttings from forced plants.

lasiogyne. To 20 ft.: lfts. 3, glabrous, obovate to oblong, to 2 in. or more, acute, sometimes serrate above middle: fls. in umbels. China.

pentaphyllum: *A. Sieboldianum.*

ricinifolium (*Kalopanax ricinifolium*). To 80 ft.: lvs. palmately 5–7-lobed, toothed, to 1 ft. across: fls. whitish. Japan. Var. **Maximowiczii** (*Aralia Maximowiczii*) has more deeply lobed lvs.

sessiliflorum. To 12 ft.: lvs. of mostly 3 toothed lfts. to 7 in. long: fls. dull purplish, in globular heads. Manchuria, N. China.

Sieboldianum (*A. pentaphyllum. Aralia pentaphylla*). To 10 ft., with arching branches: lvs. of 5–7 toothed lfts. to 2½ in. long: fls. greenish-white. Japan. —A good hardy shrub. Var. **variegatum** has lvs. edged with white.

spinosum. Differs from *A. Sieboldianum* in the thinner lvs. and 2 nearly distinct styles rather than 5 styles united almost to top. Japan.—Hort. material is usually *A. Sieboldianum.*

ACANTHOPHŒNIX. Spine-Areca. *Palmaceæ.* A very few monœcious feather-lvd. moderate-sized or tall trees of the Mascarene Isls., in the Indian Ocean, with spines on the long lf.-sheaths, petioles and rachis and sometimes on midribs as also on spathes: trunk swollen at base: infl. below the crown, branched and more or less drooping, the spathe-lvs. 2; fls. in 3's, the middle one pistillate; stamens 6 or more, exserted, pistillode present: fr. an oblong or globose body ¾ in. or less long; albumen not ruminate. Confusion has arisen in respect to this genus. It is one of the segregates from the old genus Areca, but two plants have been known as *Areca rubra;* one of them has come into Acanthophœnix and the other is a Dictyosperma; probably the plants cult. as Acanthophœnix are Dictyospermas, which are unarmed palms. It is doubtful whether the true Acanthophœnices are now planted in this country. See *Palm.*

crinita (*Areca crinita*). To 50 or 60 ft.: lvs. in young plant yellowish-green; petiole densely brown-tomentose, sheaths bristly and spiny; pinnæ silvery-white beneath: spathes tomentose; spadix spiny at base and on peduncle: fr. ovoid-oblong, about ½ in. or less long.

nobilis: *Deckenia nobilis.*

rubra (*Areca rubra* of botanists). To 60 ft.: lvs. of young plants with red veins; lf.-sheath with long dark spines, the pinnæ slightly glaucous beneath: spathes spiny near base; spadix armed near base and on peduncle: fr. globose, about ⅜ in. diam., prominently ridged.

ACANTHOPHYLLUM. *Caryophyllaceæ.* Several species of little stiff much branched per. often grayish plants of S. W. and Cent. Asia, one of which, **A. pungens** (*A. spinosum*) is listed among rock-garden and wall plants as *Dianthus spinosus.* Densely branched and shrubby, about 6 in. high, puberulent: lvs. subulate, spreading, about 1 in. long: fls. rose, small, in short-peduncled heads. Caucasus to Siberia.

ACANTHORHIZA. Rootspine Palm. *Palmaceæ.* Two fan-lvd. trees with bisexual fls. from Mex., Cent. Amer. and Panama, and 2 others of doubtful botanical standing from S. Amer.: trunk above carrying more or less remains of lf.-sheaths, toward base becoming clothed with hardened spiny aerial roots: lvs. orbicular in outline, cut nearly or quite to the base: fls. on short branchlets in a small spadix or cluster among the lower lvs.; stamens 6, filaments united in tube and thereby differing from Trithrinax and Thrinax: fr. globose or nearly so, with a fibrous somewhat succulent or dry outer covering; seed large, with homogeneous albumen. See *Palm.*

aculeata: *A. Mocinni.*

Mocinni (*A. aculeata. A.* and *Chamærops stauracantha*). Medium height, to 30 or 40 ft.: lvs. glaucous underneath, the petiole 3–4 ft. long on mature lvs., concave and sharp-edged: fls. white or pinkish, on short lateral spikes in the recurved infl.: fr. ⅝ in. or more diam., whitish, exocarp spongy or somewhat succulent. Mex., Guatemala; to be looked for as planted specimens in S. Fla.

stauracantha: *A. Mocinni.*

ACANTHOSABAL CÆSPITOSA: *Acœlorraphe Wrightii.*

ACANTHUS. Bears-Breech. *Acanthaceæ.* Per. herbs or small shrubs with mostly basal broad toothed or pinnatifid lvs., showy fls. dull white to rose or purple in long erect spikes; native in the Medit. region, Asia and Afr., only a few employed as ornamentals.

Heavy winter protection is needed in the North. They do best in rich well-drained soil. Propagated by seeds or by division in early autumn or spring. The bold leaves of acanthus have suggested important decorative features in art.

latifolius: *A. mollis* var.

lusitanicus: *A. mollis* var. *latifolius.*

mollis. To 2 ft.: lvs. not spiny, to 2 ft. long and half as broad, cordate at base, sinuately-lobed: fls. rose, lilac or whitish, in spikes 1½ ft. long. S. Eu. Var. **latifolius** (*A. latifolius, A. lusitanicus*) is larger-lvd., more hardy, 3 ft. tall.

montanus. To 3 ft.: lvs. 1 ft. long, pinnatifid, spiny: fls. rose-tinted, in a terminal spike to 10 in. long. W. Afr.

spinosus. To 3 ft.: lvs. pinnatifid, the lobes toothed or cut, spiny: fls. purplish, in dense spikes. S. Eu., Asia Minor.

ACAULESCENT: stemless, or apparently stemless; sometimes the stem is subterranean or protrudes only slightly and is not noticeable; a descriptive term.

ACER. Maple. *Aceraceæ.* Mostly deciduous trees with opposite usually palmately lobed or sometimes compound lvs., commonly unisexual fls., and fr. of 2 samaras long-winged on one side; native in north temp. zone.

Maples are used extensively for lawn, park and street planting; many are valuable timber trees. Most of the species are hardy in the northern states. They are strong and free-growing subjects. Ordinary soil is satisfactory for the maples. Propagated by seed sown soon after maturity or stratified and sown in spring; rare species and varieties may be budded in summer on species of the same group. Some shrubby species are propagated by layers or half-ripened greenwood cuttings, or by cuttings in early spring from plants forced in greenhouses. Fancy maples may be winter-grafted by the veneer method on seedlings of the same or related species.

argutum. To 25 ft.: lvs. 5–7-lobed, to 3 in. across, pale beneath: fls. in racemes to 2 in. long. Japan.

Buergerianum (*A. trifidum*). Trident M. Small tree: lvs. 3-lobed, to 3 in. across, pale beneath: fls. in panicles. China, Japan.

Campbellii. To 50 ft.: lvs. 5–7-lobed, to 5 in. across: fls. in cymes to 6 in. long. Himalayas.

campestre. To 50 ft. or more, the branches slightly corky: lvs. 3–5-lobed, to 4 in. across: fls. in erect corymbs. Eu., W. Asia. Some hort. vars. are: **albo-variegatum,** lvs. with large white blotches; **austriacum,** lvs. 5-lobed; **hebecarpum,** fr. pubescent; **pulverulentum,** lvs. speckled with white; **tauricum,** lvs. 5-lobed, pubescent beneath.

capillipes. To 30 ft.: lvs. 3-lobed, to 5 in. long: fls. in drooping racemes to 4 in. long. Japan.

cappadocicum (*A. lætum*). Coliseum M. To 50 ft.: lvs. 5–7-lobed, to 5½ in. across: fls. in corymbs. W. Asia. Var. **aureum,** lvs. red and golden-yellow. Var;

rubrum (*A. colchicum* var. *rubrum*, *A. lætum* var. *horticola*), lvs. when young blood-red. Var. **sinicum**, smaller, lvs. 5-lobed. China. Var. **tricaudatum**, lvs. 3-lobed. Var. **tricolor**, lvs. when young blood-red sprinkled with rosy-pink.

carpinifolium. HORNBEAM M. To 30 ft.: lvs. ovate-oblong, to 5 in. long, pinnately veined, toothed: fls. in short racemes. Japan.

catalpifolium. To 60 ft.: lvs. ovate, to 8 in. long, undivided or 3-lobed: fls. in loose corymbs. China; not hardy N.

caudatum. Large tree: lvs. 7-lobed, to 5½ in. across: fls. in erect spikes 6 in. long. Himalayas. Var. **multiserratum.** To 30 ft.: lvs. glabrous beneath. China. Var. **ukurunduense.** Small tree: lvs. pubescent beneath. Japan, Manchuria.

circinatum. VINE M. Small round-headed tree to 40 ft.: lvs. 7–9-lobed, to 5 in. across: fls. in drooping corymbs, the sepals purple: fr. red. B. C. to Calif.

cissifolium (*Negundo cissifolium*). To 30 ft.: lvs. of 3 lfts. to 3 in. long, toothed: fls. in racemes to 4 in. long. Japan.

cratægifolium. HAWTHORN M. To 30 ft.: lvs. oblong-ovate, to 3 in. long, often with 2 or 4 lobes near the base, pinnate-veined, bluish-green: fls. in erect racemes 2 in. long. Japan.

creticum: *A. orientale.*

dasycarpum: *A. saccharinum.*

Davidii. To 50 ft., with shining striped branchlets: lvs. ovate, to 6 in. long, pinnate-veined, in young plants lvs. often lobed at base: fls. in drooping racemes to 3½ in. long. China.

diabolicum. To 30 ft.: lvs. 5-lobed, to 6 in. across: fls. yellow, staminate in clusters, pistillate in racemes. Japan. Var. **purpurascens.** Fls. purple: lvs. red when young: fr. purplish.

Dieckii (*A. platanoides* var. *integrilobum*). Hybrid between *A. platanoides* and *A. Lobelii*, with lobes of lvs. entire.

Drummondii: *A. rubrum* var.

floridanum. To 50 ft., the bark white: lvs. 3–5-lobed, 2½ in. across, glaucous beneath: fls. in corymbs. Va. to Fla. and Tex.

Ginnala (*A. tataricum* var. *aidzuense*). AMUR M. Graceful shrub or tree to 20 ft.: lvs. 3-lobed, to 3 in. long, terminal lobe long, shining above, pale beneath: fls. fragrant, in panicles. Manchuria, China, Japan. Var. **Semenowii.** Shrub: lvs. deeply 3- or 5-lobed. Turkestan.

glabrum. ROCKY MT. M. Shrub or tree to 25 ft.: lvs. 3–5-lobed or 3-parted, to 5 in. across, shining above, pale beneath: fls. in corymbs: fr. often rose-colored. Mont. to Calif. Var. **rhodocarpum** has bright red frs. Var. **trisectum** (var. *tripartitum*) has lvs. usually 3-parted.

grandidentatum. To 40 ft., with dark brown scaly bark: lvs. 3–5-lobed, to 3 in. across, pubescent beneath: fls. in corymbs: fr. often rose-colored. Wyo. to N. Mex.

griseum. PAPERBARK M. To 25 ft., with cinnamon-brown flaky bark: lvs. of 3 coarsely toothed lfts. to 2½ in. long, pubescent beneath: fls. in cymes. China.

Heldreichii. BALKAN M. Medium-sized tree: lvs. 5-lobed, to 5 in. across, middle lobe divided nearly to base, shining above, glaucous beneath: fls. in erect panicles. S. E. Eu. Var. **purpuratum**, under surface of lvs. red.

Henryi. To 30 ft.: lvs. of 3 elliptic remotely toothed lfts. to 4 in. long: fls. in drooping racemes. China.

Hookeri. To 50 ft.: lvs. oblong-ovate, to 5½ in. long, toothed, caudate-acuminate: fls. in racemes to 4½ in. long. Himalayas; not hardy N.

hyrcanum (*A. Opalus* var. *hyrcanum*. *A. tauricum*). To 30 ft.: lvs. deeply 5-lobed, to 4 in. across, petioles red: fls. in drooping corymbs. S. E. Eu.

insigne. PERSIAN M. Large tree: lvs. 5-lobed, to 7 in. across, glaucous beneath: fls. in erect panicles 4 in. across. Caucasus, N. Persia. Var. **velutinum**, lvs. pubescent beneath. Var. **Van Volxemii**, lvs. to 1 ft. across. Var. **Wolfii**, lvs. red beneath.

italum: *A. Opalus.*

japonicum. FULLMOON M. Small tree or shrub: lvs. 7–11-lobed, to 5½ in. across: fls. purple, in nodding corymbs. Japan. Var. **aureum**, lvs. yellow. Var. **macrophyllum**, lvs. larger. Var. **Parsonsii** (var. *filicifolium* and *laciniatum*). FERNLEAF M. Lvs. divided nearly to base into 9–11 pinnately cut segms.

lætum: *A. cappadocicum.*

laxiflorum. To 50 ft.: lvs. oblong-ovate, to 4 in. long, sharp-toothed with 2 or 4 short lobes near base: fls. in drooping racemes. China; not hardy N. Var. **longilobum**, lvs. 5-lobed.

leucoderme. CHALK M. To 25 ft., rarely 40 ft., with light gray or grayish-brown bark: lvs. 3–5-lobed, to 3 in. across, pubescent beneath: fls. in corymbs. N. C. to Ga. and La.

longipes. To 30 ft.: lvs. 3–5-lobed, to 6½ in. across, the lobes entire, sometimes lvs. undivided: fls. in corymbs 4 in. across. China.

macrophyllum. OREGON M. To 100 ft.: lvs. 3–5-lobed or divided, to 1 ft. across, shining above: fls. fragrant, in drooping or spreading racemes to 5 in. long. Alaska to Calif.

mandshuricum. Shrub or tree to 30 ft.: lvs. of 3 oblong toothed lfts. to 4 in. long, glaucous beneath, petioles slender, red: fls. in cymes. Manchuria, Korea.

Miyabei. To 40 ft., bark of branches corky: lvs. 5-lobed, to 6 in. across, pubescent beneath: fls. in corymbs. Japan.

monspessulanum. MONTPELIER M. Shrub or tree to 25 ft.: lvs. 3-lobed, to 3 in. across, shining above, nearly evergreen: fls. in drooping corymbs. S. Eu., W. Asia.—Thrives in dry situations. Var. **ibericum**, lvs. larger, inner lobes slightly 3-lobed.

Negundo (*Negundo fraxinifolium*. *N. aceroides*. *Rulac Negundo*). BOX-ELDER. To 70 ft.: lvs. of 3–5 ovate to oblong lfts. to 4 in. long, rarely 7–9: fls. before lvs. Ont. to Fla. and Tex. Var. **argenteo-variegatum**, lvs. with white margins; **auratum** (var. *californicum aureum*), lvs. yellow; **aureo-marginatum**, lvs. edged with yellow; **aureo-variegatum**, lvs. spotted with yellow; **californicum** (*Negundo californicum*), lfts. 3; **crispum**, lfts. curled; **pseudo-californicum**, vigorous form with bloomy branchlets; **violaceum**, branchlets purplish or violet, lfts. usually 5–7.

neopolitanum: *A. Opalus* var. *tomentosum.*

nigrum (*A. saccharum* var. *nigrum*). BLACK M. To 120 ft., with black deeply furrowed bark: lvs. 3-lobed, to 5½ in. across: fls. in corymbs. Que. to Ky. and Mo.

nikoense. To 40 ft., branchlets pubescent: lvs. of 3 ovate to oblong slightly toothed lfts. to 5 in. long, pubescent beneath: fls. in nodding cymes. Japan, China.

oblongum. To 50 ft., partially evergreen: lvs. oblong, to 5 in. long, entire or sometimes 3-lobed, glaucous beneath: fls. in short panicles. Himalayas, China. Var. **concolor**, lvs. green beneath.

obtusatum: *A. Opalus* var.

Oliverianum. To 30 ft.: lvs. 5-lobed, to 4 in. across, lobes long-acuminate, shining beneath: fls. in panicles. China.

Opalus (*A. italum*. *A. opulifolium*). To 30 ft.: lvs. 5-lobed, the lobes short and broad, to 4 in. across: fls. in corymbs. S. Eu. Var. **obtusatum** (*A. obtusatum*), lvs. 5 in. across, pubescent beneath. Var. **tomentosum** (*A. neopolitanum*), lvs. to 6½ in. across, tomentose beneath. Italy.

opulifolium: *A. Opalus.*

orientale (*A. creticum*). To 15 ft. or more, half-evergreen: lvs. ovate or 3-lobed, to 2 in. long, leathery: fls. in corymbs. Medit. region.

palmatum (*A. polymorphum*). JAPANESE M. Shrub or tree to 25 ft.: lvs. deeply 5–9-lobed or divided, to 4 in. across, lobes acuminate: fls. purple, in corymbs. Japan, Korea. There are many hort. vars. as follows: **atrolineare**, lvs. dark red, divided nearly to base; **atropurpureum** (var. *nigrum*), lvs. deep purple; **aureum**, lvs. yellow; **bicolor**, lvs. purple and red; **crispum**, margins of lvs. rolled in; **Frederici-Guilelmi**, lvs. finely cut, spotted with pink and white; **Hessei**, lvs. dark purple; **linearilobum**, lvs. divided nearly to base into linear lobes; **multifidum** (var. *dissectum*, var. *decompositum*, *A. polymorphum* var. *palmatifidum*), lvs. divided to base into pinnately cut lobes; **Nicholsonii**; **ornatum**, lvs. pinnately cut, deep red; **reticulatum**, lvs. greenish-yellow with dark green veins and margin; **ribesifolium**, lvs. divided to base into jagged-edged lobes; **roseo-marginatum**, lvs. deeply cut, narrowly edged with pink; **rubellum**, a form of *multifidum* with young lvs. red; **rubrum**, lvs. large, deep red when young; **sanguineum**, lvs. purplish-red; **septemlobum**, lvs. usually 7-lobed; **sessilifolium**, lvs. deeply cut, very short-stalked; **sinuatum**; **Thunbergii**, lobes coarsely toothed or cut; **tricolor**, lvs. spotted with red, pink and white; **versicolor**, lvs. with large white spots.

pennsylvanicum (*A. striatum*). Moosewood. Striped M. To 40 ft., bark greenish striped with white: lvs. 3-lobed at apex, to 7 in. long: fls. in drooping racemes to 6 in. long. Que. to Ga.

pictum. Painted M. To 60 ft.: lvs. 5–7-lobed, to 6 in. across, the triangular lobes entire: fls. in corymbs 2½ in. across. Japan. Vars. **albo-maculatum** and **marmoratum** have lvs. spotted white. Var. **parviflorum**, lvs. cordate at base. China, Korea.

platanoides. Norway M. To 100 ft.: lvs. 5-lobed, to 7 in. across, shining above: fls. in erect corymbs. Eu., W. Asia. Some of the hort. vars. are: **aureo-marginatum**, lvs. margined with yellow; **columnare**, habit columnar; **cucullatum**, lvs. with short crimped lobes; **globosum**, with dense globose head; **laciniatum**, habit columnar, lvs. with irregular claw-like lobes; **Lorbergii**, lvs. divided nearly to base, light green; **palmatifidum** (var. *dissectum*), lvs. divided nearly to base, dark green; **rubrum** (var. *Reitenbachii*), lvs. greenish-red turning to dark red; **Schwedleri**, lvs. bright red when young; **Stollii**, lvs. with 3 entire lobes, purple when unfolding; **variegatum** (var. *albo-variegatum*), lvs. spotted with white.

polymorphum: *A. palmatum.*

Pseudo-Platanus. Sycamore M. To 100 ft.: lvs. 5-lobed, to 6 in. across: fls. in drooping panicles to 5 in. long. Eu., W. Asia. Some hort. vars. are: **bicolor**, lvs. spotted yellow turning white; **erythrocarpum**, lvs. shining, fr. red; **flavo-variegatum**, lvs. variegated with yellow; **Handjeryi**, lvs. purplish beneath; **Leopoldii**, young lvs. rosy-pink variegated with yellowish-pink; **nervosum**, of pyramidal habit, lvs. yellow between veins; **purpureum** (var. *purpurascens*, var. *atropurpureum*), lvs. purple beneath; **quadricolor**, lvs. spotted white, pink when young; **tomentosum** (var. *villosum*), lvs. pubescent beneath; **tricolor**, young lvs. purplish spotted with yellow; **variegatum** (var. *albo-variegatum*), lvs. variegated with white; **Worleei**, lvs. deep yellow, petiole reddish.

rubrum. Red, Scarlet, or Swamp M. To 120 ft.: lvs. 3–5-lobed, to 4 in. long, shining above, glaucous beneath: fls. red or scarlet, before lvs. Newf. to Fla. and Tex. Valuable as a street and park tree. Var. **columnare**, of columnar habit; **Drummondii** (*A. Drummondii*), lvs. 5-lobed, pubescent beneath, Ind. to La.; **globosum**, of compact habit; **magnificum**, lvs. scarlet in fall, veined green; **tomentosum**, lvs. 5-lobed, pubescent beneath; **tridens**, lvs. 3-lobed near apex, pubescent beneath.

rufinerve. To 40 ft., young branches glaucous: lvs. 3-lobed, to 5 in. long: fls. in erect racemes. Japan. Var. **albo-limbatum**, lvs. with margin of white spots.

saccharinum (*A. dasycarpum*). Silver or White M. To 120 ft.: lvs. deeply 5-lobed, to 6 in. across, silver-white beneath. Que. to Fla. and Okla. Garden vars. are: **albo-variegatum**, lvs. spotted white or pink; **crispum**, lvs. cut and crimped; **heterophyllum**, lvs. with deep unequal lobes; **lutescens**, lvs. yellow; **pyramidale**, of pyramidal habit; **tripartitum**, lvs. divided nearly to base into 3 lobes; **Wieri**, branches drooping, lvs. deeply divided into cut lobes.

saccharum. Sugar or Rock M. To 120 ft.: lvs. 3–5-lobed, to 6 in. across, light green beneath: fls. in corymbs. Que. to Fla. and Tex. Var. **monumentale**, Sentry M., of columnar habit. Var. **Rugelii**, lvs. usually with 3 entire lobes.

Sieboldianum. Shrub or small tree: lvs. 7–9-lobed, to 3 in. across, lobes acuminate: fls. in nodding corymbs. Japan. Var. **microphyllum** has lvs. about 2 in. across.

spicatum. Mountain M. Shrub or tree rarely 30 ft.: lvs. 3- or slightly 5-lobed, to 5 in. long, pubescent beneath: fls. in erect spikes to 5 in. long: fr. bright red in summer. E. N. Amer. Var. **laciniatum**, lvs. deeply lobed and cut.

striatum: *A. pennsylvanicum.*

tataricum. Shrub or tree to 20 ft.: lvs. ovate, to 4 in. long, pinnate-veined, toothed: fls. in erect panicles: fr. bright red in summer. S. E. Eu., W. Asia.

tauricum: *A. hyrcanum.*

tetramerum. To 30 ft.: lvs. ovate, to 3 in. long, usually 3-nerved at base, toothed, sometimes slightly lobed: fls. in racemes. China. Var. **lobulatum**, lvs. slightly lobed. Var. **tiliifolium**, lvs. cordate, pubescent beneath.

Trautvetteri. To 50 ft.: lvs. deeply 5-lobed, to 6 in. across, shining above, glaucous beneath: fls. in erect panicles. Caucasus.

trifidum: *A. Buergerianum.*

truncatum. To 25 ft.: lvs. deeply 5-lobed, 4 in. across, lobes entire or middle one sometimes 3-lobed, acuminate: fls. in erect corymbs to 3 in. across. China.

Tschonoskii. To 20 ft.: lvs. 5–7-lobed, to 4 in. across: fls. in racemes. Japan.

velutinum: *A. insigne* var.; the *A. velutinum* of botanists probably not in usual cult.

ACERACEÆ. Maple Family. Two genera, Acer and Dipteronia, of trees and shrubs. The plants bear opposite prevailingly simple lvs., polygamous or diœcious fls. having 4–5 sepals and petals, rarely apetalous, 4–10 stamens, superior 2-celled ovary, and fr. of 2 samaras.

ACERANTHUS. *Berberidaceæ.* Hardy herbaceous perennials from Asia, with fls. in loose racemes; useful in the rock-garden or other semi-shady positions. Cult. as for *Epimedium.*

diphyllus (*Epimedium diphyllum*). Maplewort. To 5 in.: lvs. in 2's, obliquely cordate-ovate: fls. white, small, May–June. Japan. Var. **roseus** has pink fls.

ACHANIA: *Malvaviscus.*

ACHENE (akene): a dry indehiscent one-seeded pericarp or fruit, as the "seeds" on the surface of the strawberry.

ACHILLEA. Yarrow. *Compositæ.* Hardy herbaceous perennials bearing clustered small white, yellow or pink heads and often finely cut foliage: heads rayed; pappus none. Native in north temp. zone.

Yarrows are grown in borders and the smaller species in rock-gardens, and bloom in spring and summer, often lasting until autumn. They are of easy culture. Propagated by division and rarely by cuttings. Seeds should give blooming plants the second year.

ageratifolia. To 8 in., tufted, silvery-pubescent: lvs. pinnatifid: fls. white. Greece. Var. **Aizoon** (*Anthemis Aizoon*) has lvs. entire or merely toothed.

Ageratum. Sweet Y. To 1½ ft.: lvs. oblong, toothed: fls. yellow. Eu.

argentea. Silvery Y. Less than 1 ft. high: lvs. 3-parted or pinnatifid, silvery-silky-pubescent: fls. white. Dalmatia.

cartilaginea. To 2 ft.: lvs. oblong-lanceolate, toothed: fls. white. Eu.

Clavennæ. To 1 ft., tufted, silvery-pubescent: lvs. pinnatifid: fls. white. Eu.

clypeolata. White-tomentose: lvs. linear-lanceolate, pinnatisect: fls. yellow, in dense clusters. Greece.

Eupatorium: *A. filipendulina.*

filipendulina (*A. Eupatorium*). Fernleaf Y. To 5 ft., stout: lvs. 1–2-pinnately parted: fls. yellow, in large clusters. Orient.

holosericea. To 1½ ft., silky-pubescent: lvs. pinnatifid: fls. yellow. Greece.

impatiens. To 3 ft., glabrous: lvs. pinnatifid: fls. white. Siberia, E. Eu.

ligustica. Hairy and glandular: lvs. pinnatifid: fls. white. Eu., W. Asia.

magna. To 3 ft.: lvs. 1–3-pinnately parted: fls. usually pink, the involucral lvs. edged dark brown. Eu.

Millefolium. Common Y. Milfoil. To 3 ft.: lvs. 1–2-pinnately parted: fls. white, but with pink in var. **roseum**. Eurasia, N. Amer.

mongolica: *A. sibirica.*

moschata. To 6 in., tufted: sts. simple and erect: lvs. glabrous, pinnately parted, the segms. obtuse and nearly or quite entire: fls. white. Eu.

nana. To 6 in., woolly: lvs. pinnatifid: fls. white. S. Eu.

Neilreichii: *A. nobilis.*

nobilis (*A. Neilreichii*). To 1½ ft., white-hairy or nearly glabrous: lvs. 2-pinnate: fls. dirty white. Eu.

odorata. To 1 ft., woolly: lvs. 2-pinnate: fls. white. S. Eu.

Ptarmica (*A. salicifolia*). SNEEZEWORT. To 2 ft.: lvs. lanceolate, toothed: fls. white. Eurasia, N. Amer. The var. Pearl, double, is common. Boule de Neige, Perry White and Globe are planted.

rupestris. To 8 in., tufted: lvs. linear-spatulate, entire: fls. white. S. Italy.

salicifolia: *A. Ptarmica.*

santolinoides. To 1 ft., woolly: lvs. pinnatisect: fls. white. Spain.

sericea: name of uncertain application in hort.

setacea. To 3 ft., pubescent: lvs. 2-pinnatifid, the lobes slightly prickly: fls. white or yellowish. Eu.

sibirica (*A. mongolica*). To 2 ft.: lvs. lanceolate, toothed: fls. white. Eu., N. Asia.

tomentosa. WOOLLY Y. To 1 ft., woolly: lvs. 1–2-pinnatifid: fls. yellow. Eu., Orient, N. Amer.

Tournefortii. To 1½ ft.: lvs. pinnatifid: fls. pale yellow. Greece.

umbellata. To 5 in., woolly: lvs. pinnatifid: fls. white. Greece.

ACHIMENES. *Gesneriaceæ.* Per. mostly branching herbs, 1–2 ft., with thickened, scaly or tuberous roots, grown under glass and sometimes planted out for the showy somewhat gloxinia-like fls. borne in the axils of the lvs., in reds, violet and white, spring and summer; native in trop. Amer. Most of the garden kinds are hybrids or variations from the original species.

After blooming the plants are dried off, the dry tubers being potted and started again in late winter or early spring. Propagated by offsets or division of the rhizomes, sometimes by cuttings.

grandiflora. Lvs. ovate, toothed, reddish beneath: fls. large, red-purple, often more than 1 in axil. Mex.

Haageana: *A. longiflora.*

longiflora (*A. Haageana*). TRUMPET A. Lvs. oval or ovate-oblong, toothed, pale beneath: fls. long-tubed, limb violet-blue, 1 in an axil. Guatemala.—There is a white var.

magnifica: hort. form with violet-blue fls.

patens. To 1½ ft.: lvs. ovate-pointed, unequal, serrate, hispid: fls. violet-blue, the tube shorter than limb. Mex.

Swainsoni: hort. form with mauve fls. spotted blue and throat white.

ACHLYS. *Berberidaceæ.* Per. herbs of 2 species in W. N. Amer. and Japan: lvs. of 3 lfts., long-stalked: fls. minute, without petals, borne in dense spikes on leafless scapes.

triphylla. DEER-FOOT. To 1 ft.: lfts. fan-shaped, to 6 in. across, wavy-toothed: spikes 1 in. long. Woods, B. C. to Calif.—Sometimes planted in rock-gardens and similar places.

ACHRAS (*Calocarpum*). *Sapotaceæ.* Evergreen trees grown in trop. Amer. for their edible fr.: lvs. simple, thick, clustered near ends of branchlets: fls. white, gamopetalous, in clusters of 6–12 in the lf.-axils.

Sapotes are grown in the tropics and will not endure frost. They thrive in clay or clay loam soils. Propagated by seeds from which the husk should be removed before planting. The seeds should be only slightly covered and transferred into pots when 6 or 8 inches high.

Sapota: *Sapota Achras.*

Zapota (*Lucuma mammosa*). SAPOTE. MARMALADE-PLUM. To 65 ft.: lvs. obovate, to 16 in. long: fls. ½ in. across: fr. to 6 in. long, russet-brown, flesh reddish, with 1 shining brown seed. Cent. Amer. but widely distributed in trop. Amer.

ACHYRANTHES: see *Alternanthera* and *Iresine.*

ACHYRODES: *Lamarckia.*

ACIDANTHERA. *Iridaceæ.* Tender summer-blooming cormous plants somewhat intermediate in appearance between Gladiolus and Ixia; species about 18, in Afr.

Propagation is commonly by means of the abundant spawn or cormels that form about the old corm. Treat as for gladiolus.

bicolor. To 18 in.: fls. long-tubed, drooping, creamy-white with very dark center, 1½–2 in. across. Trop. Afr.

ACINETA. *Orchidaceæ.* Strong epiphytes with large pseudobulbs, plaited lvs., and fls. in pendulous racemes on lateral leafless scapes, the lip 3-lobed; require hothouse temperatures. For cult. see *Orchids.*

Barkeri. Pseudobulbs to 6 in. long, bearing 2 lvs. to 20 in. long and 4 in. wide: fls. golden-yellow, the lip spotted with red, 1½ in. across, in racemes to 16 in. long, Sept.-Nov. Mex.

Humboldtii: *A. superba.*

superba (*A. Humboldtii*). Pseudobulbs to 4 in. long, bearing 3 lvs. to 15 in. long and 2 in. wide: fls. reddish-brown spotted with red, the lip yellow spotted with purple, 2½ in. across, in racemes to 1 ft. long. Venezuela, Peru.

ACKAMA. *Cunoniaceæ.* Small trees native in New Zeal., Australia and New Guinea, with opposite pinnate lvs., small unisexual fls. in compound panicles, and fr. a small leathery caps.; one species sometimes grown in S. Calif.

rosæfolia. To 40 ft.: lvs. of 3–8 pairs of oblong toothed lfts. to 3 in. long. New Zeal.

ACŒLORRAPHE. *Palmaceæ.* One gregarious handsome hermaphrodite fan-palm of everglade Fla. and W. Indies, unarmed except for the spiny slender petioles: spadix long and branched, among the lvs. and surpassing them; fls. small, solitary or in 2's or 3's; stamens 6, nearly or quite equal in length, the filaments broad at base: fr. a globular glabrous drupe about ⅜ in. thick, black. **A. Wrightii** (*Serenoa* and *A. arborescens. Paurotis androsana. Acanthosabal cæspitosa*). EVERGLADE PALM of Florida, SAW-CABBAGE P. Trunks slender, several or very many, strict, to 40 ft.: lvs. nearly or quite orbicular, 2–3 ft. and more across, divided below the middle into narrow segms., green above and silvery underneath. For cult., see *Palm.*

ACOKANTHERA (*Toxicophlœa*). *Apocynaceæ.* Shrubs or small trees, containing strong poisons, sometimes grown under glass and in the open in warm countries for the showy white or pinkish fragrant fls.; native in Afr. Propagated usually by cuttings in early spring.

spectabilis. WINTER-SWEET. Shrub 8–10 ft. or more with long narrow lvs. and clustered slender fls. nearly or about 1 in. long. S. Afr.

venenata. BUSHMANS-POISON. Lvs. broad and relatively short: fls. smaller. S. Afr.

ACONITE: *Aconitum.* Winter: *Eranthis.*

ACONITUM. Aconite. Monkshood. *Ranunculaceæ.* Herbaceous perennials, usually branched, sometimes semi-climbing, with tuberous or thickened roots, delphinium-like foliage, showy hooded fls. in blue, white and sometimes yellow in late summer and autumn; they contain violent poisons; native in north temp. zone.

Aconitums require a rich soil; partial shade is better than full sun as the flowers last longer. They should not be moved until absolutely necessary. They are useful in rear borders and as specimen clumps. Propagated by seed or division of the roots, seeds giving flowers second and third years. The tall slender kinds of the Fischeri group may need staking. The cultivated monkshoods are not clearly differentiated. The hood or helmet is formed of one of the sepals, in which the two upper petals are contained; the other three petals are minute or may be absent.

acutum: a synonym of *A. Napellus.*

Anthora (*A. pyrenaicum*). Pyrenees M. To 2 ft.: segms. of lvs. linear: fls. pale yellow, the rounded helmet produced into short beak. S. Eu. Var. **aureum** is deeper yellow.

aureum: *A. Anthora* var.

autumnale. To 5 ft.: lvs. pedately 5-lobed: fls. blue, lilac or whitish, the helmet closed. N. China.—It is not certain whether the plants cult. under this name really belong here.

barbatum: a synonym of *A. lycoctonum.*

bicolor: probably a form of *A. Fischeri.*

californicum: *A. columbianum.*

Cammarum (*A. exaltatum*). To 4 ft.: lvs. with bluntish lobes: fls. purple, in loose few-fld. panicles, the hood closed. Hungary.

carneum: listed name.

chinense. To 6 ft.: lvs. cut into 3 toothed or divided lobes: fls. bright blue, the helmet semi-circular. China.

columbianum (*A. californicum*). To 3 ft.: lvs. cut into 5 toothed or divided lobes: fls. blue or rarely white, the helmet strongly beaked and higher than broad. B. C. to Calif. and New Mex.—Very close to *A. Fischeri* and by some authorities not kept distinct.

exaltatum: *A. Cammarum.*

Fischeri. To 6 ft.: lvs. cut into 3 lobed or notched divisions: fls. blue or white, the helmet about as broad as long and produced into spur-like visor. Asia.—Many garden names are associated with this group which seems to be highly variable.

flavescens: hort. name.

japonicum. To 4 ft.: lvs. 2–3-divided, shining dark green: fls. deep blue or violet tinged red, the conical helmet with abruptly pointed beak. Japan.

Lamartini: listed name.

longiligulatum: listed name.

lycoctonum (*A. vulparia*). Wolfsbane. To 6 ft.: lvs. cut into 3–9 broad toothed or lobed divisions: fls. yellow or cream, the conical helmet constricted below the summit. Eu., Siberia.

moldavicum: a synonym or form of *A. lycoctonum.*

Napellus (*A. pyramidale*). To 4 ft.: lvs. 2–3-divided into linear segms: fls. blue, the helmet much broader than high and with beak-like visor. Eu. Very poisonous. Var. **album** has white fls. and var. **bicolor** blue and white. Var. **præcox** is advertised, also Sparksii or Sparks var.

orientale. To 4–5 ft., with broad panicle: lvs. palmatifid, the lobes acute: fls. cream-color, helmet long and narrowly cylindrical. Caucasus.

paniculatum. To 3 ft.: lvs. cut into 3–7 toothed or divided lobes: fls. blue, the helmet swollen on one side and beaked. Eu.

præcox: listed name.

pyramidale: *A. Napellus.*

pyrenaicum: *A. Anthora.*

Stoerkianum. The plant in the trade under this name is probably a form of *A. Fischeri.*

strictum: a synonym of *A. Napellus.*

uncinatum. To 5 ft., partially climbing: lvs. cut into 3–5 toothed or divided lobes: fls. blue, the helmet about as broad as long and decurved beak. Pa. to Ga. and Wis.

variegatum. To 6 ft.: lvs. cut into 3 lobed segms.: fls. blue to white, the helmet higher than broad and without prominent beak. Eu.

volubile. The plant in cult. under this name is probably *A. uncinatum.*

vulparia: *A. lycoctonum.*

Wilsonii. A form or variety of *A. Fischeri* with violet fls.

ACORUS. *Araceæ.* Herbs inhabiting marshy places, having long slender parallel-veined grass-like lvs., and fls. on a greenish spadix which appears to be borne laterally on the scape due to the leaf-like spathe; sometimes planted in bog-gardens; hardy. Propagated by division.

Calamus. Sweet Flag. To 6 ft.: lvs. to ¾ in. wide: spadix to 4 in. long. Northern hemisphere. Var. variegatus has lvs. striped yellow.

gramineus. To 1 ft.: lvs. grass-like: spadix to 2 in. long. Asia. Var. variegatus has lvs. striped white.

japonicus variegatus: *A. Calamus* var. *variegatus.*

ACRISTA MONTICOLA: *Euterpe globosa.*

ACROCLINIUM: *Helipterum roseum.*

ACROCOMIA. *Palmaceæ.* Armed monœcious feather-palms, some 15 kinds in trop. Amer., a few of which are planted in S. Calif. and S. Fla.: trunk mostly tall, cylindric or swollen, often prickly: lvs. pinnate, with narrow mostly drooping or curving pinnæ: spadices among the lvs., branched and drooping, with 2 stiff-hairy or prickly spathes; staminate fls. on upper part of branches; stamens 6: fr. rather large, usually 1 in. or more diam., the endocarp or inner shell with 3 pores near middle. Suitable for S. Fla. and *A. mexicana* reported hardy in S. Calif. See *Palm.*

aculeata (*A. media*). Grugru. To 40 ft. or more, cylindric or somewhat thickened upward, armed with rings of black prickles, bearing a handsome crown of arching and drooping foliage: lvs. 10 ft. and more long, with numerous linear pinnæ, shining above, rachis prickly: fr. globose, somewhat flattened at ends, about 1¾ in. diam., smooth and yellowish, in a large hanging truss. W. Indies.

media: *A. aculeata.*

mexicana. Trunk thick, 10–15 ft. high, with long prickles, more or less ringed below: lvs. 8–10 ft. long, arching, the short petiole and the rachis prickly and sheaths strongly black-spiny; segms. thin and narrow: fls. yellow, fragrant: fr. globose, 1 in. diam., edible. Mex., Guatemala.

sclerocarpa. Trunk 15–30 ft., thickened at base or near middle, with sharp spines: lvs. 10–15 ft. long, the outer ones arching; segms. narrow-linear and acuminate, puberulent and glaucescent underneath, 2½ ft. long, ⅓ in. broad, prickles on rachis 1½–2 in. long: fr. globose, 1½ in. diam. Jamaica to Brazil.

Totai. Trunk columnar, 30–40 ft., more or less swollen near middle, bearing a dense head of arching and drooping lvs., ringed and with many spines: lvs. medium size, glabrous and green both sides; segms. linear and acute, thickish; petiole tomentose and sparsely spiny: fr. globose, ½ in. diam. Paraguay, Argentina, Bolivia.

ACRONYCHIA. *Rutaceæ.* Trees or shrubs with mostly simple lvs. (of 1 lft.) and white or yellowish polygamous fls. in panicles or cymes; native from trop. Asia to Pacific Isls., one planted in S. Calif.

Baueri. Tree: lvs. opposite, ovate or obovate, to 4 in. long: fls. very small, pubescent outside: fr. ½ in. diam. Australia.

ACROPERA LODDIGESII: *Gongora galeata.*

ACROSTICHUM: *Elaphoglossum crinitum.*

ACTÆA. Actea. Baneberry. Cohosh. *Ranunculaceæ.* Herbaceous perennials with compound lvs., small white fls. in showy terminal clusters in spring, and attractive shiny berries in summer and autumn.

They are useful in the rockery, the wild-garden or the border. They also do well in woods or in other shady places. Propagated by seed sown in late fall or in spring; root-division in spring is the best method.

alba. White B. To 1½ ft.: berries white, on stout pedicels. N. S. to Ga. and Mo.

japonica: *Cimicifuga japonica.*

rubra. Red B. To 2 ft.: berries red, on slender pedicels. N. S. to Pa. and Neb.

spicata. Herb-Christopher. Black B. To 2 ft.: fls. white or bluish: berries purplish-black. Eu., Japan.

ACTINIDIA. *Dilleniaceæ.* Shrubby twining vines grown for their attractive foliage and *A. chinensis* also for the edible berries: lvs. alternate, long-stalked: fls. in axillary clusters or sometimes solitary, cup-shaped, usually white: native in Asia. The species here listed are hardy N. with the exception of *A. chinensis* and perhaps *A. coriacea.*

Actinidias grow equally well in sunny and half-shady locations. Propagated by seeds, sown in spring; also by cuttings of half-ripened wood in summer or of hard wood under glass; or even by layers. They are good vines for trellises and arbors.

arguta (*A. volubilis*). Bower A. Tara-Vine. Lvs. to 6 in. long: fls. white, brownish at base, ¾ in. across, anthers dark purple: fr. greenish-yellow, sweet. Japan, Korea, Manchuria.

chinensis. Yangtao. Lvs. to 5 in. long, white-tomentose beneath: fls. white turning yellow, to 2 in. across: fr. with gooseberry-like flavor. China.

coriacea. Lvs. oblong, to 4 in. long, glabrous: fls. reddish, small: fr. spotted. China.

Kolomikta. Lvs. often variegated with white or pink, to 5 in. long: fls. white, ¾ in. across, solitary: fr. yellow or greenish. Japan, Manchuria, China.

polygama. Silver-Vine. Lvs. to 6 in. long, usually variegated with white or yellowish: fls. white, ¾ in. across, solitary fr. yellow, bitter. Japan, Korea, Manchuria, China.

purpurea. Lvs. oblong or elliptic, to 4 in. or more long, dentate, glabrous underneath unless on midrib: fls. about ½ in. across: fr. purple, to 1 in. long, sweet. China.

volubilis: *A. arguta.*

ACTINOLEPIS CORONARIA: *Baeria aristata.*

ACTINOPHLŒUS. *Palmaceæ.* A very few unarmed monœcious small feather-palms, sometimes cespitose, of New Guinea and Australia and neighboring islands, distinguished from Ptychosperma by the homogeneous rather than ruminate albumen in the seed which is also very deeply sulcate, lvs. often irregularly pinnate and the segms. or pinnæ long or elongate. See *Palm.*

Macarthuri (*Ptychosperma* and *Kentia Macarthuri*). Cluster Palm. Handsome palm with few or several slender ringed green trunks to 10 ft. and more high and graceful spreading and curved bright green rather soft foliage: lvs. 2–3 ft. long, lighter colored underneath; pinnæ to 40 or more, 6–12 in. long, with prominent secondary ribs, truncate and erose or jagged and fingered at apex, upper ones opposite: infl. below the lvs., short but branched: fr. ½–¾ in. long, cartridge-shaped, wrinkled and furrowed in drying. Australia.—Does well in S. Fla. in partial shade; a good palm as a tub specimen under glass.

Sanderiana (*Kentia Sanderiana*). Attractive plant with many strongly ringed sts., to 10 ft. or so: lvs. 2–3 ft., gracefully spreading or arching on the mature plant; pinnæ more slender and narrow than in *A Macarthuri,* the lower ones very narrow and long-acuminate, others oblique and erose or the narrow terminal ones truncate or barely so: fr. much as in the above.—An attractive delicate pot-plant.

ACTINOSTROBUS. *Pinaceæ.* One species allied to Callitris but differing in having numerous scale-like bracts at base of cone. **A. pyramidalis** (*Callitris Actinostrobus*). Shrub, densely branched: lvs. scale-like or sometimes needle-like: cones of 6 scales, $^3/_5$ in. across. W. Australia.

ACUAN: *Desmanthus.*

ACUTE: sharp; ending in a point.

ADA. *Orchidaceæ.* Two epiphytic orchids of which one is sometimes grown in a cool greenhouse. **A. aurantiaca.** Pseudobulbs to 6 in. long, bearing 2–3 lvs. to 9 in. long and ½ in. wide: fls. orange- or cinnabar-red, 1½ in. long, with narrow sepals and petals and much shorter 2-keeled lip, in arching 8–13-fld. racemes about as long as lvs., Jan.-Mar. Colombia.

ADAM-AND-EVE: *Aplectrum.*

ADAMS-NEEDLE: *Yucca filamentosa.*

ADANSONIA. *Bombacaceæ.* Big trees of Afr. and Australia with digitately compound lvs., large solitary pendulous fls. and woody frs.; planted as a shade tree in the tropics. The bark yields fiber and the fr. is said to be edible, known as "monkeys-bread."

digitata. Baobab. Monkey-Bread Tree. To 60 ft., developing a relatively short soft trunk to 30 ft. in diam. and a spread of branches of 30 ft.: lfts. to 5 in. long: fls. white, 6 in. across, often in advance of lvs., on long stalks, the petals soon rolling back exposing the purplish stamens: fr. to 1 ft. long, densely tomentose. Trop. Afr., where it has many uses.

ADDERS-TONGUE: *Erythronium.*

ADELIA: *Forestiera.*

ADELOCARYUM. *Boraginaceæ.* Per. or bien. herbs with alternate simple lvs. and bell-shaped fls. in terminal cymes; rarely grown in the flower-garden in warm countries.

cœlestinum (*Cynoglossum* and *Paracaryum cœlestinum*). To 5 ft., somewhat hairy: lvs. broadly ovate, to 1 ft. long, upper ones becoming smaller: fls. blue, ⅓ in. diam., in branched racemes or cymes, nearly sessile. India.—The plant cult. under this name is likely to be *Cynoglossum Wallichii.*

ADENANTHERA. Bead-Tree. *Leguminosæ.* Trees, allied to Mimosa, with compound lvs., long slender racemes of small yellow or white fls., and fr. a narrow pod with bright colored seeds; native in Old World tropics. One species grown for the ornamental seeds, under glass or in the open far S. Propagated by seeds which have been soaked in hot water.

pavonina. Red Sandalwood Tree. Peacock Flower-Fence. Lfts. about 13, oblong or ovate, to 1½ in. long: fls. white and yellow, in racemes to 6 in. or more long: pods to 9 in. long, after dehiscing much coiled; seeds red, lens-shaped, "Circassian seeds," sometimes used as beads. Trop. Asia and Afr.

ADENOCALYMNA. *Bignoniaceæ.* S. American climbing shrubs with 2 lfts. and a terminal tendril or 3 lfts., showy funnelform fls. in racemes or panicles, and long woody frs.; grown under glass or in the open only in warm regions. Propagated by cuttings.

alliaceum (*Bignonia alliacea*). Lvs. of 2 oblong lfts. to 6 in. long: fls. whitish, 2 in. long, onion-scented, in 5–8-fld. racemes. Guiana.

ADENOCARPUS. *Leguminosæ.* Low shrubs with small alternate lvs. of 3 lfts., yellow papilionaceous fls. in terminal racemes, and fr. a flat pod; native in S. Eu., Afr. and Asia Minor. Grown under glass or in the open in the S. Propagated by seeds, by cuttings of green wood, and by layers.

viscosus. Evergreen: lfts. linear-oblong. Teneriffe.—Cult. in S. Calif.

ADENOPHORA. LADYBELL. *Campanulaceæ.* Per. herbs native in Eu. and Asia, like Campanula but differing chiefly in a cup-like or cushion-like disk surrounding the base of style. Cult. as for *Campanula.* Propagated by seeds or cuttings in spring. The roots should be disturbed as little as possible.

Bulleyana. To 4 ft.: lvs. oblong-ovate or lanceolate, toothed: fls. pale blue, to ½ in. long, funnelform, in panicles; calyx-lobes narrow-lanceolate, toothed. China.

communis: *A. lilifolia.*

denticulata. To 2 ft.: lvs. ovate-lanceolate, coarsely toothed: fls. blue, small, bell-shaped, in terminal racemes; calyx-lobes triangular, toothed and spreading. Dahuria.

lilifolia (*A. communis*). To 3 ft.: lvs. ovate-lanceolate, toothed, the radical lvs. round-ovate: fls. pale blue, 1¼ in. long, bell-shaped, fragrant, in pyramidal panicles; calyx-lobes narrow, finely toothed. Eu., Asia.

nikoensis. To 1 ft.: lvs. lanceolate, toothed: fls. blue, ¾ in. long, broad-bell-shaped, in few-fld. spikes; calyx-lobes linear, toothed. Japan.

ornata. To 4 ft.: lvs. obovate, toothed: fls. bright blue, 1 in. long, funnelform, in panicles; calyx-lobes narrow-lanceolate. China.

polymorpha. To 3 ft.: lvs. ovate or broad-lanceolate: fls. blue to purple, 1 in. across, in simple or branched spikes; calyx-lobes lanceolate, entire or toothed. Russia.

Potanini. To 3 ft.: lvs. ovate-lanceolate or lanceolate, coarsely toothed or nearly entire: fls. blue, ¾ in. long, broad-bell-shaped, in racemes; calyx-lobes pinnately cut. China.

remotiflora. To 1½ ft.: lvs. ovate, coarsely toothed: fls. blue, to 1 in. long, narrow-bell-shaped, few. Japan.

verticillata. To 3 ft.: lvs. whorled, ovate-lanceolate, toothed, the radical lvs. orbicular: fls. pale blue, ⅓ in. long, tubular-bell-shaped, in whorls; calyx-lobes linear, entire, erect. Dahuria.

ADENOROPIUM: *Jatropha multifida.*

ADENOSTOMA. CHAMISO. *Rosaceæ.* Evergreen shrubs with small needle-shaped and heath-like lvs., white fls. in terminal panicles, and fr. an achene.

Planted somewhat in their native or similar regions. They need a sunny position and well-drained soil. Propagated by greenwood cuttings or by seed in the spring.

fasciculatum. To 10 ft.: lvs. about ¼ in. long: panicles to 4 in. long, May–June. S. Calif., Lower Calif.

ADHATODA. *Acanthaceæ.* Trop. shrubs with opposite entire lvs., tubular 2-lipped fls. in terminal spikes, and capsular frs.; cult. as for Jacobinia, in mild climates.

Vasica. To 8 ft. or more: lvs. oval, to 8 in. long, pubescent: fls. white striped with red, to ½ in. across, in spikes to 3 in. long. India to Ceylon.

ADIANTUM. MAIDENHAIR-FERN. *Polypodiaceæ.* Dainty shade-loving ferns with shiny black or purplish sts. and thin delicate fronds or lf.-blades either simple or divided into fan-shaped segms.; sori borne at edges of fronds; mostly of trop. Amer., in many species, a few in temp. N. Amer. and 1 native as far north as Que. and Alaska.

The greenhouse species require a temperature of 60–65°, a fairly moist atmosphere, and should be protected from full exposure to sun; soil of good loam and leaf-mold. The native species may be grown in the open in places like their native habitat, protected from wind and sun.

acutum: a form or derivative of *A. tenerum.*

æmulum: *A. cuneatum.*

affine (*A. Cunninghamii*). Lvs. to 15 in. long and 9 in. wide, 2-pinnate, segms. to 1 in. long, the stalks black and shining. New Zeal.

Bardii: a form of *A. cuneatum* with fronds to 2 ft. long.

Bausei: hort. form of *A. tenerum.*

bellum. BERMUDA M. Lvs. tufted, bipinnate, to 1½ ft. long, the segms. to ¾ in. long. Bermuda.

Capillus-Veneris (*A. Fergusonii*). SOUTHERN M. VENUS-HAIR. Slender, erect, spreading, to 1½ ft. high: lvs. 2–3-pinnate, segms. to 1 in. across, very variable. Temp. and trop. Amer., warmer parts of Old World. Var. **daphnites** has simpler fronds.

cardiochlænum: *A. polyphyllum.*

caudatum. TRAILING M. Lvs. to 1 ft. long, 1-pinnate, segms. to ¾ in. long, stalks short, brownish, hairy, rooting at apex. Old World tropics.

concinnum. Lvs. 2–3-pinnate, to 1½ ft. long and 9 in. broad, on stout black stalks. Mex. to Brazil. Var. **latum** is stiff and upright with much larger lvs.

Croweanum: *A. cuneatum* var.

cuneatum (*A. æmulum*). DELTA M. Lvs. 3–4-pinnate, to 15 in. long and 9 in. wide, segms. to ½ in. across. Brazil. There are many forms as var. **Charlottæ**; var. **Croweanum** (*A. Croweanum*), large, vigorous, hardy; var. **gracillimum** (*A. gracillimum*), fronds finely divided; var. **grandiceps**, TASSEL M., tassel-like growths at ends of fronds; var. **variegatum** has white-striped segms. Vars. **deflexum** and **dissectum** are also listed.

Cunninghamii: *A. affine.*

decorum. Rather stiff, erect, sts. stout, brown-black: lvs. 10 in. long, half or more as broad, dull green. Peru.

diaphanum. Lvs. to 6 in. long, simply pinnate or usually 2-pinnate at base, segms. to ½ in. long. Asia to New Zeal.

elegans: hort. form of *A. decorum.*

excisum. Lvs. to 1 ft. long and 4 in. wide, 2–3-pinnate, lfts. with lobed margins. Chile. Var. **multifidum** has more finely cut lvs.

farleyense: *A. tenerum* var.

Fergusonii: *A. Capillus-Veneris.*

formosum. AUSTRALIAN M. Lvs. to 2 ft. long and two-thirds as broad, usually 3-pinnate, segms. to ¾ in. long, stalks rough. Australia.

fragrantissimum: hort. form of *A. cuneatum.*

gracillimum: *A. cuneatum* var.

hispidulum. Lvs. forked at base, 2–3-pinnate, segms. to ⅔ in. long, rachis hairy and rough. Old World tropics.

Lathomi: hort. form of *A. tenerum.*

LeGrandii: a form of *A. cuneatum* var. *gracillimum.*

lunulatum. WALKING M. Lvs. 1 ft. long, rooting at apex, simply pinnate, on shiny black stalks. Tropics.

macrophyllum. Lvs. 1 ft. long, simply pinnate, segms. to 2 in. long. Trop. Amer.

magnificum: form of *A. tenerum.*

Moorei. Lvs. to 15 in. long, 2–3-pinnate, segms. to ½ in. long, deeply lobed. Peru.

mundulum: a form of *A. cuneatum.*

O'Brienii: *A. cuneatum* form.

pedatum. AMERICAN M. Hardy: lvs. forked, nearly orbicular, to 1½ ft. across, segms. oblong, stalks purplish. Woods, N. Amer.

peruvianum. Lvs. 1 ft. long, simply pinnate, segms. to 2 in. long. Peru.

polyphyllum (*A. cardiochlænum*). Lvs. 2–3-pinnate, segms. to 1 in. long, the stalks smooth and polished. S. Amer.

princeps: hort. form of *A. tenerum*.

rhodophyllum: hort. form of *A. tenerum*.

Sanctæ-Catharinæ: a form of *A. trapeziforme* with deeper lobes.

scutum: a form of *A. tenerum*.

Siebrechtii. Supposed to be a cross between *A. decorum* and *A. Williamsii*.

tenerum. BRITTLE M. FAN M. Erect, to 3 ft.: lvs. 3-pinnate, segms. ¾ in. across, deeply notched, on stout shining brown-black stalks. Trop. Amer. Var. **farleyense** (*A. farleyense*). FARLEY or BARBADOS M. Lvs. to 3 ft. long and 2 ft. wide, infertile, drooping, delicate green sometimes rose-tinted, segms. deeply cut. The race of *farleyense* known as Gloriosa produces indusia and is said to be fertile.

trapeziforme. Lvs. to 1½ ft. or more long, 2-pinnate, segms. trapezoidal, to ¾ in. across. Trop. Amer.

versaillense: hort. form of *A. cuneatum*.

Victoriæ: hort. form of *A. tenerum*.

Wagneri: hort. form of *A. decorum*.

Weigandii: a form of *A. decorum* with larger less cuneate segms.

Williamsii. Lvs. triangular, nearly 1 ft. long, segms. nearly semicircular, 3–4-lobed. Peru.

Wrighti: probably a form of *A. cuneatum*.

ADICEA: *Pilea*.

ADIPERA: *Cassia lævigata*.

ADLAY: see *Coix*.

ADLUMIA. *Fumariaceæ*. One attractive bien. vine native in E. N. Amer. and sometimes planted for ornament. It thrives in a cool damp place protected from sun and wind, as in a thicket. Propagated by seeds in spring, and often spontaneous thereafter. **A. fungosa** (*A. cirrhosa*). CLIMBING FUMITORY. MOUNTAIN FRINGE. ALLEGHENY-VINE. Lvs. 3-pinnate, fern-like, the petioles holding st. to the support: fls. white or purplish, dicentra-like, ½ in. or more long, in drooping axillary panicles: fr. an oblong caps.

ADONIDIA. *Palmaceæ*. One attractive monœcious unarmed ringed feather-palm of the Philippines where it is cult., now planted in S. Fla.: spadices borne below the lf.-sheaths, at top of trunk, short-peduncled, branched; fls. in 3's, a pistillate between 2 staminate; stamens numerous: fr. drupe-like with thin pulp, elliptic-ovoid, upwards of 1 in. long, bright red; seed 1, with ruminate albumen. **A. Merrillii** (*Normanbya Merrillii*). Rather slender single trunk, 15–20 ft.: lvs. 6 ft. or so long, strongly arching; pinnæ many and closely placed, 24–30 in. long and to 2 in. broad, bifid at apex, 1-ribbed and prominently nerved at margins.

ADONIS. PHEASANTS-EYE. *Ranunculaceæ*. Hardy herbaceous perennials and annuals with alternate finely dissected lvs. and solitary terminal red or yellow fls.; native in temp. Eu. and Asia.

A few are grown in the border and rock-garden and sometimes in the front rows of margins, the annuals in flower-gardens. Cultivation simple as any soil is satisfactory and either sunny situations or partial shade. Both the annuals and perennials may be propagated by seed sown in the spring or fall; root-division in the spring may be used for perennials.

æstivalis. SUMMER A. Ann. to 1½ ft.: fls. crimson, to 1½ in. across, June-July. Cent. Eu. Var. **citrina**, fls. citron-yellow.

aleppica. Ann. to 1 ft.: fls. red, to 2 in. across. Syria.

amurensis. Per. to 1½ ft.: fls. golden-yellow, varying to white and pink, 2 in. across, Mar. Manchuria, Japan. Sometimes double.

annua (*A. autumnalis*). AUTUMN A. FLOS A. Ann. to 2 ft.: fls. deep red with darker center, about ¾ in. across, June–Sept. Cent. Eu. to W. Asia.

autumnalis: *A. annua*.

flammea. Ann. to 1½ ft.: fls. bright scarlet, sometimes with black spot at base, to 1¼ in. across, May–July. Eu., W. Asia.

pyrenaica. Per. to 1 ft.: fls. yellow, smaller than *A. vernalis*, June–July. Pyrenees.—Differs from *A. vernalis* in the lower lvs. not being reduced to scales.

vernalis. SPRING A. Per. to 1½ ft.: fls. yellow, to 3 in. across, early spring. Eu. A white form, **alba**, and a double-fld. var. are in cult.

ADOPOGON: *Krigia*.

ADOXA. *Adoxaceæ*. One little per. herb with tuberous roots, native in N. N. Amer., N. Eu. and N. Asia and sometimes grown in the rock-garden. **A. Moschatellina.** MUSK-ROOT. To 6 in.: lvs. ternately compound into ovate 3-parted segms.: fls. green, small, in heads to ⅓ in. across, above the foliage: fr. a small green drupe.

ADOXACEÆ. MOSCHATEL FAMILY. Only one genus, Adoxa, of one species: fls. gamopetalous, with wheel-shaped 4–6-lobed corolla, 8–12 stamens, and 3–5-celled ovary.

ADVENTITIOUS: foreign; said of a plant introduced but not yet naturalized or established; applied also to buds and shoots that arise otherwise than in the normal order or place.

ÆCHMEA. *Bromeliaceæ*. Epiphytic herbs from S. Amer. with stiff lvs. in a basal rosette and yellow or red fls. borne in spikes, panicles or racemes with often colored bracts; grown for ornament in the greenhouse. For cult. see *Bromelia*.

discolor: *Æ. fulgens* var. or *Æ. miniata* var.

fasciata (*Billbergia rhodocyanea*). Lvs. to 2 ft. long, toothed, lined and marbled with white on back: fls. pink with pale red bract-lvs., in globose heads. Brazil.

fulgens. Lvs. to 16 in. long and 3 in. wide, with small teeth: fls. red tipped with blue, in panicles branched below and simple above. Brazil. Var. **discolor** has lvs. brownish- or violet-red beneath.

Mariæ-Reginæ. Lvs. to 3 ft. long and 4 in. wide, prickly-margined: fls. red tipped with violet, in dense spikes to 1 ft. or more long, the bract-lvs. brilliant crimson. Costa Rica.

miniata. Lvs. with many close-set teeth: fls. red with blue petals, in branched panicles much longer than lvs. Brazil. Var. **discolor** has lvs. purplish or brownish on back.

Ortgiesii. Lvs. to 1 ft. long and ¾ in. wide, prickly-margined: fls. red with straw-colored bracts, borne on short spikes. Brazil.

polystachya. Lvs. to 2 ft. long and 1½ in. wide, prickly-margined: fls. violet with prominent bracts, in erect panicles. Brazil.

Thibautiana: hort. name.

ÆGLE. *Rutaceæ*. Only one species, the BAEL FRUIT of India, **Æ. Marmelos.** Small tree with lvs. of 3 ovate lfts. and greenish-yellow frs. 4–6 in. across, having a very hard shell and fragrant mucilaginous edible pulp. The pulp is used in making drinks and also has medicinal value. Propagated by seeds and suited to any good soil; may be grown in the warmer citrus regions, but little planted in the U. S.

ÆGLOPSIS. *Rutaceæ.* One species, Æ. Chevalieri, in swamps near the sea in trop. W. Afr., grown experimentally in this country as a possible stock for Citrus: spiny tree or large shrub with simple persistent lvs., small fls. in clusters and bearing 10 stamens, and globose or somewhat pear-shaped usually 6-celled whitish frs. ½–¾ in. diam. with a fragrant pulp or mucilage.

ÆGOPODIUM. *Umbelliferæ.* Coarse per. herbs with creeping rootstocks, biternate lvs., yellow or white little fls. in compound umbels; 2 species in Eu. and Asia. The variegated form is commonly planted for edgings and mats in shady places. Propagated by division.

Podagraria. GOUTWEED. BISHOPS-WEED. To 14 in.: fls. white, June. Eu.; nat. in N. Amer. Var. **variegatum** has lvs. margined with white.

ÆONIUM. *Crassulaceæ.* Succulent plants of Madeira and the Canary Isls. ordinarily referred to Sempervivum (which see) but by recent writers kept distinct. The group is marked by technical characters, such as calyx with 6–12 teeth or lobes, carpels partially sunk in calyx-tube; scales various. These plants are adapted to outdoor cult. in Calif., and are interesting under glass.

arboreum. Tender, to 3 ft.: rosettes terminal, 6 in. and more across, the oblanceolate or spatulate lvs. ciliate on margins: fls. golden-yellow, about ¾ in. across, numerous in terminal thyrse. Morocco.—Cult. in S. Calif. and known sometimes as *Sedum* or *Crassula purpurascens* because of color of foliage in autumn.

cæspitosum (*Sempervivum hybridum*). Tender plant to 6 in., woody: lvs. oblong-linear, ciliate, lined with brown: fls. yellow, in a forking corymb.

canariense. Evergreen subshrub grown under glass and in the open in Calif., to 1½ ft. or more in bloom: lvs. in a large flattened or bowl-like rosette, large, obovate to spoon-shaped, with velvety appearance: fls. many in clusters, white or yellowish; petals 7–9, very narrow.

cuneatum. St. fleshy and woody, plant glabrous, to 1½ ft.: lvs. rigid, long-cuneate, light green, mucronate, short-ciliate: fls. yellow.

decorum. Much branched shrublet: lvs. thick, lanceolate, attenuate at base and sessile, acuminate-pointed, shining green and rose-tinted: fls. corymbose; petals white with rose lines.

Haworthii. St. or trunk woody and much branched at base, to 1 ft. or more, the branches short: lvs. thick, ovate-acute, glaucous and ciliate: fls. pale yellow flushed rose, 40–50 in a terminal panicle.

holochrysum. St. woody and fleshy, with spreading branches: lvs. rosulate, glabrous, broad-spatulate, narrow to base, ciliate, purplish-keeled: fls. orange, in dense thyrse.

spathulatum. Tender shrubby plant, with stout sts. 1 ft. or more high: rosettes with lvs. marked with red-brown: fls. yellow, in large many-fld. panicles.

tabulæforme. Evergreen subshrub to 1 ft. or more, grown under glass and in Calif. in the open: lvs. in flat rosettes at ends of branches, oblong-spatulate, ciliate: fls. pale yellow; petals 10–12, narrow.

undulatum (*Sempervivum Doramæ*). Robust, woody, 1½ ft.: lvs. spatulate-ovate, narrowed at base, mucronate, undulate, ciliate, sometimes reddish: fls. yellow.

AËRANGIS. *Orchidaceæ.* Very short-stemmed epiphytes with mostly white fls. in long many-fld. racemes, the lip with long slender spur. See *Orchids* for cult.

modesta (*Angræcum modestum* and *Sanderianum*). Lvs. to 6 in. long: fls. snow-white, about 1¼ in. across, the spur to 3 in. long, in pendulous racemes, Apr.–May. Madagascar.

AËRIA: *Gaussia attenuata.*

AËRIDES. *Orchidaceæ.* Epiphytes with thick two-ranked lvs. sheathing at base and fls. in lateral pendulous racemes, the 2 lateral sepals attached to base of column, the dorsal sepals and petals similar, the lip 3-lobed and produced into a hollow usually upturned spur; cult. in the hothouse. See *Orchids.*

affine: *A. multiflorum.*

crassifolium. Lvs. to 8 in. long and 2 in. wide: fls. rose-purple, 1½ in. across, the spur greenish at tip, in racemes longer than lvs., May–June. Burma.

expansum: *A. falcatom.*

falcatum (*A. Larpentæ. A. expansum*). Similar to *A. crassifolium* but with amethyst-red lip and white sepals and petals spotted with purple, May–June. Burma. Var. **Houlletianum** (*A. Houlletianum*) has whiter lip and yellowish-brown sepals and petals. Var. **Leoniæ** (*A. Leoniæ*) has larger fls. with white lip spotted and edged with dark red.

Fieldingi. Lvs. to 10 in. long and 1½ in. wide: fls. white dotted and suffused with rose, 1½ in. across, the spur white, in racemes longer than lvs., May–June. India.

Houlletianum: *A. falcatum* var.

Larpentæ: *A. falcatum.*

Lawrenciæ. Lvs. to 1 ft. long and 2 in. wide: fls. 1½ in. across, sepals and petals white tipped with amethyst-purple, the lip white with purple central lobe and green spur, in racemes as long as lvs., June–Aug. Philippine Isls. Var. **Sanderianum** has creamy-white sepals and petals tipped with magenta and yellow, magenta and creamy-white lip.

Leonæi: *A. falcatum* var.

multiflorum (*A. affine. A. roseum*). Lvs. to 9 in. long and ¾ in. wide: fls. 1 in. across, the sepals and petals white spotted and tipped with purple, the lip light purple deeper in middle, in racemes longer than lvs., July–Sept. Himalayas to Cochin-China.

odoratum. Lvs. to 8 in. long and 2 in. wide: fls. fragrant, about 1 in. long, the petals and sepals white with purple spot at tip, the lip white spotted with red and the middle lobe rose, in racemes often longer than lvs., July–Sept. India to China, Philippine Isls. Var. **majus** has larger fls.

quinquevulnerum. Differs from the above only in having the middle lobe of the lip toothed on the edges. Philippine Isls.

roseum: *A. multiflorum.*

Sanderianum: *A. Lawrenceæ* var.

vandarum. Lvs. to 8 in. long, cylindrical: fls. 2 in. long, white and somewhat transparent, in 1-3-fld. racemes shorter than the lvs., Feb.–Mar. Himalayas.

ÆRVA. *Amaranthaceæ.* Herbs or subshrubs of trop. Asia and Afr.: lvs. alternate or opposite: fls. very small, often polygamous, in spikes. One is grown as a border plant in warm regions.

sanguinea: *Æ. scandens* var.

scandens. More or less climbing subshrub but may be trimmed as a tall edging subject: lvs. ovate to lanceolate, to 4 in. long: spikes to 1 in. long, white-woolly, shining. Asia, Afr. A variety or race has dark red lvs.

ÆSCHYNANTHUS: *Trichosporum.*

ÆSCULUS. HORSE-CHESTNUT. BUCKEYE. *Hippocastanaceæ.* Large deciduous shrubs or trees cult. for their showy clusters of red, white or yellow fls. mostly in May and June, for the large digitately compound lvs., and for the large often spiny frs.

Horse-chestnuts are mostly hardy north except Californian and Himalayan species. Propagated by seed sown in the autumn or stratified, by side-grafting, by budding on common species and the shrubby kinds also by layers. *Æ. parviflora* may also be propagated by root-cuttings.

arguta. Texas B. Shrub to 7 ft.: lfts. 7–9, lanceolate or broader, to 5 in. long, bluntly serrate, becoming glabrous: fls. yellowish-green. E. Tex.

austrina: *Æ. discolor* var. *mollis.*

Briotii: *Æ. carnea* var.

Bushii. Hybrid between *Æ. discolor* and *Æ. glabra:* tree to 30 ft.: fls. pink and yellow. Ark., Miss.

californica. Tree to 40 ft.: lfts. 5–7, stalked: fls. white or pale rose, in panicles to 8 in. long. Calif.

carnea (*Æ. rubicunda*). Red H. Hybrid between *Æ. Hippocastanum* and *Æ. Pavia:* tree to 40 ft.: lfts. usually 5, nearly sessile: fls. flesh-color to scarlet, in panicles to 8 in. long. Var. **Briotii,** fls. scarlet. Var. **plantierensis,** Damask H., fls. whitish tinged pink, fading to pink. Var. **pendula,** branches drooping.

chinensis. Tree to 60 ft.: lfts. 5–7: fls. white, ½ in. or less long. China.

discolor. Woolly B. Shrub or tree to 30 ft.: lfts. 5, short-stalked, white-tomentose beneath: fls. yellow and red, in panicles to 8 in. long. Ga. to Tex. Var. **mollis** (*Æ. austrina*), fls. bright scarlet. Var. **flavescens,** fls. yellow.

flava: *Æ. octandra.*

georgiana (*Æ. neglecta* var. *georgiana*). Shrub to 6 ft.: lfts. 5, nearly sessile: fls. red and yellow, in dense panicles to 6 in. long. N. C. to Fla. and Ala.

glabra (*Æ. ohioensis*). Ohio B. Tree to 30 ft.: lfts. 5, short-stalked: fls. greenish-yellow, in panicles to 6 in. long. Pa. to Ala. and Neb. Var. **leucodermis.** Bark smooth, nearly white. Mo., Ark. Var. **Sargentii** (var. *Buckleyi*). Shrub: lfts. 6–7. Ohio to Miss.

Harbisonii. Hybrid between *Æ. discolor* var. *mollis* and *Æ. georgiana:* fls. bright red, in panicles to 8 in. long.

Hippocastanum. Common H. Tree to 100 ft.: lfts. 5–7, sessile: fls. white blotched with red and yellow, in panicles to 1 ft. long. Balkan Peninsula. Some of the vars. are: **Baumannii,** fls. white, double; **Henkelii,** lfts. cut-lobed; **incisa,** lfts. deeply toothed or lobed; **laciniata,** lfts. deeply cut; **luteo-variegata,** lvs. variegated with yellow; **Memmingeri,** lvs. marked with white; **pumila,** dwarf; **pyramidalis,** habit pyramidal; **Schirnhoferi,** fls. yellowish-red, double; **umbraculifera,** head round.

humilis: *Æ. Pavia* var.

hybrida (*Æ. Lyonii*). Hybrid between *Æ. octandra* and *Æ. Pavia:* tree: lfts. 5, short-stalked: fls. red and yellow, in panicles to 6 in. long.

indica. Tree to 60 ft.: lfts. 5–9, short-stalked: fls. white, upper petals yellow blotched, lower tinged rose, in panicles to 15 in. long. Himalayas.

lutea: *Æ. octandra.*

Lyonii: *Æ. hybrida.*

macrostachya: *Æ. parviflora.*

marylandica. Hybrid between *Æ. glabra* and *Æ. octandra.*

Michauxii: *Æ. neglecta.*

neglecta (*Æ. Michauxii*). Tree to 60 ft.: lfts. 5, nearly sessile: fls. pale yellow veined red, in panicles to 6 in. long. N. C.

octandra (*Æ. flava. Æ. lutea*). Yellow B. Sweet B. Tree to 90 ft.: lfts. 5, short-stalked: fls. yellow, in panicles to 6 in. long. Pa. to Ga. and Ill.

ohioensis: *Æ. glabra.*

parviflora (*Æ. macrostachya*). Bottlebrush B. Dwarf H. Shrub to 12 ft.: lfts. 5–7, nearly sessile: fls. white, in panicles to 1 ft. long. S. C. to Fla. and Ala.

Pavia (*Pavia Michauxii. Æ.* and *P. rubra*). Red B. Shrub or small tree to 20 ft.: lfts. 5, short-stalked: fls. dark red or purplish, in panicles to 7 in. long. Va. to Fla. and La. Vars. **atrosanguinea,** fls. dark red; **humilis** (var. *nana, Æ. humilis*), low, often prostrate; **sublaciniata,** lfts. deeply toothed.

plantierensis: *Æ. carnea* var.

rubicunda: *Æ. carnea.*

rubra: *Æ. Pavia.*

sinensis: *Æ. turbinata.*

splendens. Shrub to 12 ft.: lfts. 5, densely pubescent beneath: fls. bright red, in panicles to 8 in. long. Ala. to La.

turbinata (*Æ. sinensis*). Japanese H. Tree to 30 ft.: lfts. 5–7, sessile: fls. yellowish-white with red spot, in panicles to 10 in. long. Japan.

Wilsonii. Tree to 80 ft.: lfts. 5–7, stalked: fls. white spotted yellow, in panicles to 1 ft. long. China.

woerlitzensis. Tree: fls. red, in panicles to 5 in. long. Garden origin. Var. **Ellwangeri** (*Æ. Pavia* var. *Whitleyi*), fls. darker.

ÆTHEOPAPPUS: *Centaurea pulcherrima.*

ÆTHIONEMA. Stone-Cress. *Cruciferæ.* Dwarf herbs and subshrubs allied to Iberis, mostly with small narrow lvs. and pink, lilac, purplish or rose-colored, sometimes white, fls. in terminal racemes: pod or silicle short and broad, mostly winged. About 50 species of the Medit. region, a few of them grown in the border or rock-garden, blooming mostly in May and June. They may be used also as cut-fls.; one species sometimes cult. is an ann. flower-garden subject, with broad lvs.

If grown in a light sandy soil in dry sunny locations, they will not need replanting or renewal for many years in regions where hardy, as in southern New England or southward. The perennial types are propagated by cuttings in summer or by seeds in the spring, and by division; the annuals and biennials only by seeds.

Buxbaumii (*Æ. cappadocicum*). Short-season ann., 3–6 in., with oblong lvs. to 1 in. long and minute lilac fls., grown for its erect racemes of large thin winged overlapping pods. S. E. Eu. and S. W. Asia.

cappadocicum: *Æ. Buxbaumii.*

coridifolium. Lebanon S. Per., 4–10 in.: lvs. crowded, nearly linear, 1 in. or less long: fls. light or rosy-lilac, in short dense racemes. Chalky summits of Mt. Lebanon and Taurus.—See *Æ. pulchellum.*

diastrophis. Per. to 6 in., little branched: lvs. oblong-linear: fls. small, rosy-lilac: pod dentate. Asia Minor.

glaucum: listed name.

grandiflorum. Persian S. Per., 1½ ft., with simple branches: lvs. oblong-linear, to 1½ in. long: fls. pink or rose, ¼ in. across, in slender racemes: fr. notched at top. Persia.

iberideum. Tufted low per.: lvs. crowded and very narrow: fls. large, showy, white, in short racemes. E. Medit. region, Asia Minor.

Kotschyi: listed name for a very dwarf plant with rosy-pink fls.

persicum: listed name for a foot-high plant with deep rose fls.

pulchellum. Per. with branched sts.: lvs. linear-oblong, obtuse: fls. rosy-pink, in heads or racemes: pod dentate. Asia Minor.—Cult. plants passing as *Æ. coridifolium* may belong here.

saxatile. Per. to 1 ft., simple or branched: lvs. many, oval to lanceolate: fls. small, pink, in a close but elongating raceme: pod oblong, notched. S. Eu., Algeria.

schistosum. Per., sts. many, 2 in. or more high, erect and simple: lvs. narrow-linear, somewhat acute: fls. large, rose-color: pod orbicular or broader than long. Asia Minor.

stylosum. Per. to 1 ft. or less: lvs. large, ovate-lanceolate, ½ in. long: fls. rosy-pink, in a head. Lebanon.

superbum: listed name.

trinervium (*Iberidella trinervia*). Per., woody: lvs. oblong to nearly linear, stiff, more or less 3-nerved, the upper ones somewhat clasping: fls. large, white. Persia.

warleyense. Said to be a hybrid: compact but spreading, 3–6 in. high: fls. brilliant rose-pink or rose-carmine or one form paler: foliage steel-blue.

AGAPANTHUS (*Abumon*). *Liliaceæ*. One African herb with tuberous rootstocks, popular as a tub plant or big subject in pots, and out-of-doors in warm regions. **A. africanus** (*A. umbellatus*). African-Lily. Lily-of-the-Nile. To 3 ft.: lvs. basal, linear-lanceolate: fls. funnel-shaped, bright blue, to 2 in. long, in terminal umbels. Hort. vars. are **albidus** with white fls., **Mooreanus** with dark blue fls., and **variegatus** with striped lvs.—It does well in large tubs and will bloom for several years without rehandling if given liquid manure; will also force satisfactorily. Propagated by division of roots or rarely by seeds.

AGARITA: *Mahonia trifoliolata*.

AGASTACHE (*Lophanthus*). *Labiatæ*. Per. N. American tall herbs with 4-angled sts., toothed lvs., 2-lipped purplish, blue or yellowish fls. in terminal spikes; sometimes grown in the border or wild-garden.

cana: *Brittonastrum canum*.

nepetoides. To 5 ft.: lvs. ovate to ovate-oblong, to 6 in. long: fls. greenish-yellow, ⅓ in. long, in dense spikes to 1½ ft. long. Que. to Ga. and Ark.

AGATHÆA CŒLESTIS: *Felicia amelloides*.

AGATHIS. Dammar-Pine. *Pinaceæ*. Very tall evergreen trees with broad leathery lvs., staminate fls. cylindrical, and globose cones; native from the Philippines to Australia and New Zeal. For cult. see *Conifers*. Can be grown out-of-doors only in the warmer parts of the country, as in Fla. and Calif.

alba (*A. orientalis*). Lvs. oblong to oblong-lanceolate, to 4 in. long: staminate fls. ¾ in. long. Malaya.

australis. Kauri-Pine. Lvs. oblong, to 1½ in. long or to 4 in. on young trees, sessile: staminate fls. to 1½ in. long. New Zeal., where it makes forests of ponderous trees.

orientalis: *A. alba*.

robusta. Lvs. ovate- to oblong-lanceolate, to 3 in. long: staminate fls. 1½ in. long. Australia.

AGATHOSMA (*Hartogia*). *Rutaceæ*. S. African shrubs with small lvs., small white, red or lilac fls. mostly in terminal umbels or heads, and fr. of 2–4 carpels; grown for ornament in warm regions, sometimes in pots under glass. For cult. see *Diosma*.

Ventenatiana. To 1 ft. or more, much branched: lvs. overlapping, ovate-lanceolate, ¼ in. long: fls. lilac, purple or white, in umbels.

villosa (*Diosma purpurea*). To 1 ft.: lvs. overlapping, lanceolate, ¼ in. long: fls. light purple, in dense terminal heads.

AGATI. *Leguminosæ*. One tree native in trop. Asia but nat. in W. Indies and S. Fla. **A. grandiflora** (*Sesbania grandiflora*). To 40 ft.: lvs. pinnate, of 10–30 pairs of lfts. to 2 in. long: fls. papilionaceous, red or white, to 4 in. long: pods linear, flat, to 2 ft. long. An ornamental tree for warm regions, with striking fls. and pods.

AGAVE. *Amaryllidaceæ*. Important economic and decorative plants with usually stiff spiny and often succulent long lvs. in rosettes or basal, fls. in spikes or panicles on long upright scapes or sts. produced in some types every year and in others at long intervals, in some cases the plants even dying after blooming; native in arid and semi-arid warm regions of western hemisphere. Many species are found in collections of succulents or of economic plants, some are grown as ornamentals in warm sections; in Mex. they furnish food, drink, fiber, razor strops and soap. *A. americana* is in common cult. as a porch and tub plant, but most of the species are known in hort. only to fanciers and in large or botanical collections.

Agaves need a soil mostly of loam and sand, good drainage and firm potting. Most species can be propagated by seeds, but often the flowers must be artificially hand-pollinated in order to secure them; some kinds are propagated by the suckers around the old plants or by underground stems; others by stem buds and a few by the bulbels which are found in the flower-clusters.

albicans. St. very short: lvs. to 1 ft. long and 4 in. wide: infl. about 3 ft.; fls. reddish-green, 1½ in. long. Mex.? Var. **medio-picta** is a milk-white striped-lvd. form.

altissima: *A. americana*.

americana (*A. altissima*). Century Plant. Trunkless: lvs. to 6 ft. long and 8 in. wide, gray, smooth, in enormous rosettes: fls. yellowish-green, 3½ in. long, in a bracted scape or stalk to 40 ft. tall, produced when plant is ten years or more old; suckers are usually produced at base as the plant dies. Trop. Amer. Var. **marginata** has yellowish-white or deep yellow margins. Var. **variegata**, lvs. dark green and yellow, twisted.

angustifolia (*A. Jacquiniana. A. ixtlioides. A. vivipara. A. Wightii*). Trunk to 1½ ft.: lvs. to 2 ft. long and 3 in. wide, gray-green: infl. to 8 ft. high; fls. greenish, 2 in. long. Cent. Amer.? Var. **marginata** (*variegata*) had lvs. margined with white.

antillarum. Trunkless: lvs. about 3 ft. long and 3 in. wide, bright green: infl. 15 ft.; fls. deep orange, 2 in. long. Haiti.

applanata. Trunkless: lvs. to 4 ft. long and 4 in. wide, gray-green: infl. to 30 ft.; fls. yellow, 3 in. long. Mex.

atrovirens. Pulque A. Trunkless: lvs. to 6 ft. long and 1 ft. wide, dark green: infl. to 30 ft.; fls. greenish-yellow, 4 in. long. S. Mex.—The drink pulque is derived principally from this species.

attenuata (*A. glaucescens*). Trunk to 5 ft., sometimes prostrate: lvs. unarmed, to 2½ ft. long and 10 in. wide: infl. spike-like, to 10 ft.; fls. greenish-yellow, 2 in. long. Mex.—Occasionally bulbels are produced.

cærulescens: *A. lophantha* var.

carchariodonta. Trunkless: lvs. to 1 ft. or more long and 3½ in. wide, prickly: infl. a spike to 12 ft. high; fls. greenish or brownish. Habitat unknown.

Consideranti: *A. Victoriæ-Reginæ*.

decipiens (*A. spiralis*). Trunk to 8 ft.: lvs. to 4 ft. long and 4 in. wide, prickly: infl. a panicle, to 20 ft.; fls. greenish-yellow, 3 in. long. S. Fla.

deserti. Trunkless: lvs. in dense rosettes, 1 ft. long and 2 in. wide, gray-green, with triangular prickles: infl. a panicle, 6 ft. high; fls. yellow, 1¼ in. long. Colo. Desert, Calif.

Eichlami. Trunkless: lvs. in rosettes, the edges with brown spines. Guatemala.

elegans: *A. potatorum*.

ferox. Trunkless: lvs. to 4 ft. long and 1 ft. wide, fleshy: infl. to 30 ft.; fls. yellow, 3½ in. long. Mex.

filifera. Trunkless: lvs. in dense rosette, to 1½ in. broad and 1 or 2 ft. long, entire, spine-tipped, margins with filaments: fls. maroon-purple, 2 in. or more long including the long stamens, the scape to 15 ft. (shorter under glass). Mex.

fourcroydes (*A. Ixtli. A. longifolia I. rigida*). Henequen. Trunk to 6 ft.: lvs. to 7½ ft. long and 4 in. wide, grayish-green: infl. to 20 ft.; fls. greenish, to 3 in. across, ill-smelling. Yucatan.—Furnishes fiber.

Franceschiana. Trunk very short: lvs. to 3 ft. long and 4 in. wide, dark or blue-green: infl. to 15 ft.; fls. green, 2½ in. long, ill-smelling. Mex.?

Franzosinii. Trunkless: lvs. to 8 ft. long and 1 ft. wide, whitish-green: infl. to 40 ft.; fls. yellowish, 3½ in. long. Mex.?

Ghiesbrechtii (*A. Ghiesbreghtii*). Trunkless: lvs. to 2½ ft. long and 4 in. wide, sometimes striped: infl. to 9 ft.; fls. greenish or brownish, 2 in. long. Mex.

glaucescens: *A. attenuata*.

heteracantha. Nearly trunkless: lvs. to 2½ ft. long and 2½ in. wide, slightly striped: infl. to 15 ft. Mex.

horrida: *A. noli-tangere*.

Houlletiana or **Houllettii**: *A. sisalana*.

hystrix: *A. stricta*.

ingens. Nearly trunkless: lvs. to 6 ft. long and 14 in. wide, dark green or grayish-green: infl. to 30 ft.; fls. yellowish-green, 3½ in. long. Mex. Var. picta, lvs. yellow-margined.

Ixtli: *A. fourcroydes*.

ixtlioides: *A. angustifolia*.

Jacquiniana: *A. angustifolia*.

Kerchovei. Trunkless or short-trunked: lvs. to 1½ ft. long and 2½ in. wide, gray-green, triangular, fibrous: infl. to 18 ft.; fls. 1½ in. long. Mex.

lævis: *A. sisalana*.

latifolia: *A. potatorum*.

Lecheguilla: *A. lophantha* var. *Poselgeri*.

longifolia: *A. fourcroydes*.

lophantha. Crested A. Short-trunked: lvs. to 3 ft. long and 3 in. wide, green, glossy, striped beneath: infl. spike-like, to 15 ft.; fls. greenish-yellow, 1½ in. long. Mex. Var. cærulescens (*A. cærulescens*) is a glaucous form without stripes. Var. Poselgeri (*A. Lecheguilla*) has smaller lvs. with a pale central band, bluish-green and striped beneath.

lurida (*A. mexicana*). Trunkless or nearly so: lvs. to 3 ft. long and 6 in. wide, with small teeth, glaucous: infl. a panicle, to 20 ft.; fls. greenish, 3 in. long. Mex.

macrantha. Trunkless: lvs. long and narrow, 5½ in. wide: infl. to 5 ft.; fls. yellowish, 3 in. long. Mex.

maculosa. Trunkless or nearly so: lvs. to 1 ft. long and ¾ in. wide, gray-green, spotted with dark green: infl. 3 ft. or more; fls. greenish or whitish more or less tinged with pink, fragrant, 2 in. long. S. Tex.

marmorata (*A. Todaroi*). Trunkless: lvs. to 6 ft. long and 1 ft. wide, very rough, gray and green-banded: infl. 10 ft. high; fls. golden, 1½ in. long. Mex.

mexicana: *A. lurida*.

micracantha. Trunkless: lvs. to 1½ ft. long and 5 in. wide, bright green, paler beneath: infl. about 10 ft.; fls. brownish-green, 1½ in. long. Mex.?

miradorensis. Dwarf Century Plant. Trunkless: lvs. to 3 ft. long and 5 in. wide: infl. to 9 ft.; fls. greenish, 2 in. long, fetid. Mex.

mitis. Trunk very short: lvs. to 15 in. long and 4 in. wide, with small teeth: infl. 6 ft. high; fls. brown, 2 in. long, in racemes. Mex.

neglecta. Blue Century Plant. Trunkless: lvs. to 3 ft. long and 6 in. wide, gray: infl. to 40 ft.; fls. yellowish-green, 2 in. long, fetid. Fla.

noli-tangere (*A. horrida*). Lvs. to 1½ ft. long and 3 in. wide, the margins toothed: infl. to 8 ft.; fls. green, 1½ in. long, in spikes. Mex.

Parryi. Trunkless: lvs. to 1 ft. long and 4 in. wide, glaucous, prickly-margined: infl. to 16 ft.; fls. creamy-yellow, 2¼ in. long, in panicles. Ariz., New Mex., Mex.

parviflora. Small: lvs. 4 in. long and ¼ in. wide: infl. to 5 ft.; fls. greenish-white, ½ in. long. S. Ariz.

polyacantha. Nearly trunkless: lvs. to 3 ft. long and 6 in. wide: infl. to 15 ft.; fls. 2 in. long. Mex.

potatorum (*A. elegans. A. latifolia. A. pulchra*). Trunkless: lvs. to 1 ft. long and 4 in. wide: infl. 12 ft.; fls. yellowish-green, 2½ in. long. Mex.

pulchra: *A. potatorum*.

rigida: *A. fourcroydes*.

Salmiana. Trunkless: rosettes very large, lvs. to 7 ft. long and 1½ ft. wide, prickly-margined: infl. 30 ft.; fls. yellow, in panicles. Mex.

scabra (*A. Wislizeni*). Trunkless: lvs. to 10 in. long and 6 in. wide, gray, prickly-margined: infl. 12 ft.; fls. yellow, 2½ in. long. Mex.

schidigera. Trunkless: lvs. to 1½ ft. long and ½ in. wide, with marginal threads: infl. 10 ft.; fls. 2 in. long, in racemes. Mex.

Sebastiana. Nearly trunkless: lvs. to 1 ft. long and 4 in. wide, gray-green: infl. 6 ft.; fls. yellow, 3½ in. long. Lower Calif.

Shawii. Nearly trunkless: lvs. 1½ ft. long and 5 in. wide, prickly-margined: infl. to 10 ft. high; fls. greenish-yellow, 3½ in. long, in panicles. Calif.

sisala: *A. sisalana*.

sisalana (*A. Houlletiana* or *Houllettii. A. lævis. A. sisala*). Sisal Hemp. Trunk to 3 ft.: lvs. to 5 ft. long and 4 in. wide, green or grayish: infl. to 20 ft.; fls. greenish, 2½ in. long, ill-smelling. Habitat unknown.

spiralis: *A. decipiens*.

striata. Trunkless: lvs. 1½ ft. long and 1 in. or more wide, gray striped with dark green: infl. to 12 ft.; fls. greenish, in spikes. Mex.

stricta (*A. hystrix. Bonapartea, Littæa* and *Yucca hystrix*). Hedgehog A. Trunkless: lvs. to 14 in. long and ¼ in. wide, often pale or purplish: infl. to 12 ft.; fls. 1¼ in. long. Mex. Var. glauca has glaucous lvs.

tequilana. Tequila A. Trunkless: lvs. to 3 ft. long and 3 in. wide, gray-green: infl. 20 ft.; fls. 2½ in. long. Mex.

Todaroi: *A. marmorata*.

Victoriæ-Reginæ (*A. Consideranti*). Trunkless: lvs. to 6 in. long and 2 in. wide, dark green with gray margin: infl. 12 ft.; fls. greenish, 1¼ in. long. Mex.

virginica: *Manfreda virginica*.

vivipara: *A. angustifolia*.

Weberi. Trunkless: lvs. to 2½ ft. long and 8 in. wide, margins entire: infl. a panicle. Mex.

Weingartii. Trunkless: lvs. variable, apple-green. Guatemala.

Wightii: *A. angustifolia*.

Wislizeni: *A. scabra*.

xylonacantha. Trunkless or nearly so: lvs. to 3 ft. long and 2 in. wide, dark striped beneath, with horny prickly margins: infl. to 7 ft.; fls. 1½ in. long, in spike-like racemes. Mex.

AGDESTIS. *Phytolaccaceæ.* One woody or herbaceous vine from a very large gray tuberous root, grown out-of-doors in S. U. S. and thriving in rich soil. Propagated by offsets. **A. clematidea.** Climbing to 50 ft.: lvs. alternate, cordate-ovate, to 3 in. or more across: fls. white, star-shaped, to ½ in. across, without petals, in panicled racemes. Mex., Guatemala.

AGERATUM. *Compositæ.* Herbaceous annuals with tassel-like clustered heads, usually blue or white, and mostly opposite lvs.: florets all tubular; pappus of scales. Ageratums require the usual cult. for annuals; the dwarfer kinds are excellent for edgings.

conspicuum: *Eupatorium glechonophyllum*.

conyzoides. To 2 ft.: lvs. ovate, toothed, blunt or rounded at base: fls. blue or white, in heads to ¼ in. across, all summer; involucral bracts oblong, slightly hairy. Tropics.

Houstonianum (*A. mexicanum*). Differs from *A. conyzoides* in lvs. usually heart-shaped at base, blue fls. in larger heads, and involucral bracts linear-lanceolate and densely hairy. Mex. Var. **nanum** is dwarf.

Lasseauxii: *Eupatorium Lasseauxii*.

mexicanum: *A. Houstonianum*.

AGLAONEMA. *Araceæ.* Trop. Asian and African rhizomatous or stoloniferous herbs with oblong or oblong-lanceolate lvs. having thick midribs and sheathed petioles, and unisexual fls. borne on a spadix subtended by a spathe.

Glasshouse subjects grown for the attractive often variegated foliage; succeed in fibrous loam with rotted manure, sand and charcoal added. Propagated by division and cuttings.

commutatum. To 2 ft.: lvs. to 6 in. long and 2 in. across, deep green marked on veins with pale green. Malaya.

costatum. Sts. short, branching at base: lvs. to 8 in. long and 4 in. across, variously spotted with white. Malaya.

Curbesi: hort. name.

pictum (*A. versicolor*). Sts. to 10 ft. long: lvs. to 6 in. long and 2 in. across, clouded or spotted with white. Malaya.

Robelinii. Very robust: lvs. to 10 in. long and 5 in. wide, obscurely marked with pale green. Malaya.

siamense. Sts. to 1½ ft. long: lvs. to 10 in. long and broad, the petioles about 6 in. long. Siam.

simplex. Erect to 3 ft., rooting below: lvs. lance-oblong or somewhat broader, acuminate, to 12 in. long at maturity, green: spathe greenish or whitish inside, to 2 in. long. Borneo, Celebes.—Grown in water as "Chinese evergreen," thriving in poorly lighted places, infrequently blooming.

versicolor: *A. pictum.*

AGONIS. *Myrtaceæ.* Australian shrubs or trees with alternate simple lvs., fls. in dense sessile heads, and fr. a leathery caps.; grown for ornament in S. Calif. For cult. see *Leptospermum.*

flexuosa (*Leptospermum flexuosum*). To 40 ft.: lvs. willow-like, to 6 in. long: fls. white, the axillary heads ½ in. across; stamens usually 20. W. Australia.

linearifolia. To 12 ft. or more: lvs. linear or linear-lanceolate, to 1 in. long: fls. white, in small axillary heads; stamens 10. W. Australia.

marginata. Tall shrub: lvs. obovate-oblong, to 1 in. long: fls. white, in terminal or axillary heads; stamens 10. W. Australia.

AGRIMONIA. AGRIMONY. *Rosaceæ.* Per. erect herbs mostly of the north temp. zone, with alternate pinnate lvs., small yellow fls. in racemes, and fr. a bristly burr; sometimes grown in shady or rear places for interest but not particularly ornamental; also medicinal. There are several N. American species, but apparently not planted. Propagated by root-division in spring and by seeds.

Eupatoria. To 3 ft.: lfts. gray-hairy beneath: bristles of fr. spreading. Eu.

pilosa. To 5 ft.: lfts. with stiff hairs on veins beneath: bristles of fr. incurved. Eu.

AGRIMONY: *Agrimonia.* **Hemp**: *Eupatorium cannabinum.*

AGRITO: *Mahonia trifoliolata.*

AGROSTEMMA. CORN COCKLE. *Caryophyllaceæ.* As now defined, a genus of 2 species of ann. or bien. herbs, Eu. and Asia, one of them a showy weed and sometimes known as a cult. plant, **A. Githago** (*Lychnis Githago*). Grayish erect branching silky-hairy plant to 3 ft., with long-linear erect lvs.: fls. purplish-red and more or less spotted, 1 in. or more across, petals obcordate and exceeded by the very long leaf-like calyx-lobes (which are deciduous in fr.). Common in wheat-fields. See *Lychnis.*

AGROSTIS. BENT-GRASS. *Gramineæ.* Tufted annuals and perennials of small or medium size and many narrow lvs., the small spikelets borne in open diffuse panicles; of world-wide distribution and furnishing familiar hay, pasture, and lawn grasses as well as flower-garden subjects. The names in this genus are not well standardized. See *Grasses.*

alba: *A. palustris.*

canina. BROWN BENT. VELVET BENT. Per. to 2 ft.: lvs. to 2 in. long and 1/12 in. wide: panicles to 7 in. long, branches very slender. Newf. to Alaska, Pa. and Tenn.—Used for lawns.

capillaris (*A. vulgaris. A. tenuis*). RHODE ISLAND BENT. Similar to *A. palustris* but smaller and with shorter redder panicles. Eu.; nat. in N. Amer.—Used for pasture.

hiemalis. HAIR-GRASS. SILK-GRASS. Per. to 2 ft.: lvs. to 5 in. long and 1/12 in. wide: panicles often purplish, to 2 ft. long, branches hair-like and bearing spikelets only toward tips. N. Amer.—Ornamental.

laxiflora: *A. retrofracta.*

maritima (*A. alba* var. *maritima*). CREEPING BENT. Creeping per. to 1½ ft., sts. often decumbent and stoloniferous: lvs. to 3½ in. long and 1/12 in. wide, rough: panicles dense, to 4 in. long, branches erect. Shores Eu., E. N. Amer.—Used in lawns.

nebulosa. CLOUD-GRASS. Ann. to 1 ft.: lvs. short and very narrow: panicles to 6 in. long, with many very fine branches bearing spikelets near tips. Spain.—Ornamental.

palustris (*A. alba*). REDTOP. FIORIN. Per. to 3½ ft.: lvs. to 8 in. long and ¼ in. wide: panicles to 1 ft. long, green or reddish. Eu.; nat. in N. Amer.—Used for pastures.

pulchella: *Aspris capillaris* var.

retrofracta (*A. laxiflora*). Ann. to 2 ft.: lvs. to 8 in. long and ⅛ in. wide, rough above: panicles to 1 ft. long, branches hair-like and bearing prominently awned spikelets toward tips. New Zeal., Australia, Hawaii; intro. into U. S.—Ornamental.

tenuis: *A. capillaris.*

vulgaris: *A. capillaris.*

AICHRYSON. *Crassulaceæ.* Succulents of the Canary Isls., intermediate between Sedum and Sempervivum (see the latter), with cup-shaped calyx 5–12-lobed, scales ciliate, carpels partially immersed in calyx-tube.

dichotomum. Ann. or bien.: sts. erect and forked, hairy: lvs. obovate or spatulate: fls. yellow, in loose corymb, petals 8 or 9.

domesticum (*Sempervivum tortuosum* of DeCandolle) is an old garden hybrid: erect slightly shrubby free-flowering somewhat hairy plant: lvs. spatulate, to 1 in. long: fls. yellow.

AILANTHUS (*Pongelion*). *Simaroubaceæ.* Large deciduous trees of Asia and N. Australia, one planted widely as a street and yard tree as it is smoke-resistant and free from insects: lvs. pinnately compound, ill-scented when bruised: fls. small, green, in large terminal panicles, polygamous: fr. a samara with the seed in the middle.

The ailanthus grows on any upland soil and tends to spread as seedlings; propagated by seed sown soon after ripening and by root-cuttings.

altissima (*A. glandulosa. A. japonica*). TREE-OF-HEAVEN. To 60 ft. or more, rapid growing: lvs. of 13–25 lfts. to 5 in. long, glabrous beneath, with large gland-bearing or callous teeth at base: fr. 1½ in. long. China; nat. in E. N. Amer.—Only the fertile-fld. types should be planted as the staminate fls. exhale a sweetish or to some persons a disagreeable odor. Var. **erythrocarpa** (*A. rubra*), fr. bright red. Var. **pendulifolia**, lvs. large and drooping. Var. **sutchuenensis**, petioles purplish, frs. larger.

glandulosa: *A. altissima.*

imberbiflora. To 100 ft.: lvs. of 15–20 glabrous lfts. to 3 in. long: fr. 2 in. long. Australia.

japonica: *A. altissima.*

rubra: *A. altissima* var. *erythrocarpa.*

Vilmoriniana. To 50 ft.: lvs. of 17–35 lfts. to 6 in. long, pubescent beneath: fr. 2 in. long. China.

AIRA (*Deschampsia*). *Gramineæ.* Low or medium-sized mostly per. grasses of temp. regions, the shining, pale or purplish spikelets borne in open loose panicles; rarely grown for ornament. See *Grasses.*

cærulea: *Molinia cærulea.*

capillaris: *Aspris capillaris.*

flexuosa. To 2½ ft.: lvs. involute, 3–6 in. long: panicles to 8 in. long, open, the branches flexuous. Eu., E. N. Amer.

pulchella: *Aspris capillaris* var.

AIR-PLANT: *Bryophyllum pinnatum.*

AIZOACEÆ. Carpet-Weed Family. Widely distributed low mostly succulent herbs or subshrubs, of about 20 formerly listed genera but now of much greater number with the segregations from Mesembryanthemum, with regular bisexual fls. having many or no petals, 4–5-parted calyx, 4–5 or many stamens, superior or inferior 2- or more-celled ovary, and fr. a caps. The plant body is sometimes reduced to nearly or quite globular proportions, particularly in the dry and desert regions of S. Afr. Known to hort. in the plants of the Mesembryanthemum group grown for ornament and fancy, and in the New Zealand spinach grown as a pot-herb: Aptenia, Aridaria, Bergeranthus, Carpanthea, Carpobrotus, Conicosia, Conophytum, Cryophytum, Delosperma, Disphyma, Dorotheanthus, Drosanthemum, Erepsia, Faucaria, Fenestraria, Glottiphyllum, Hereroa, Lampranthus, Lithops, Malephora, Mesembryanthemum, Nananthus, Oscularia, Pleiospilos, Rhombophyllum, Sceletium, Semnanthe, Tetragonia, Titanopsis, Trichodiadema.

AJUGA. Bugle-Weed. *Labiatæ.* Herbaceous annuals and perennials, grown in the rock-garden and the border, with numerous blue, white or rose fls. in whorls in terminal spikes in early summer. Propagated by seeds and division; of simple cult.

alpina: *A. genevensis.*

Brockbanki: hort. name for a blue-fld. form.

genevensis (*A. alpina. A. rugosa*). To 14 in.: lvs. oblong or obovate, toothed: fls. blue. Eu., Orient.

metallica var. crispa: hort. name for a form to 5 in. high with curled metallic glossy blue fls. in a pyramidal spike.

nutans: listed name.

reptans. Carpet B. To 1 ft., st. more or less prostate: lvs. oblong or obovate, entire or wavy: fls. white or in some vars. blue or purplish. Eu. Var. atropurpurea has blue fls. and bronze lvs. Var. multicolor, foliage spotted and variegated with yellow, brown and red. Var. rubra, lvs. dark purple. Var. variegata, lvs. splashed and edged creamy-yellow.

rugosa: *A. genevensis.*

AKEBIA. *Lardizabalaceæ.* Hardy twining shrubs with half-evergreen digitately compound lvs., odd purplish unisexual fls. in axillary racemes in spring, and fr. a purple berry; 2 species from China and Japan.

Akebias are neat vines where heavy shade is not needed; they are also used in cool greenhouses for covering walls and pillars. They need sun and well-drained soil. Propagated by seeds, by hardwood and greenwood cuttings, and by root-division.

lobata: *A. trifoliata.*

quinata. Five-leaf A. Lfts. 5, entire: fls. fragrant. China, Japan, Korea.

trifoliata (*A. lobata*). Three-leaf A. Lfts. 3, coarsely toothed or entire. Japan, China. Var. australis has leathery entire lfts. China. Var. clematifolia has thin entire lfts. Japan.

AKEE: *Blighia sapida.*

ALBIZZIA. *Leguminosæ.* Small trees or shrubs with deciduous bipinnate lvs., fls. more or less plume-like or tassel-like due to exserted stamens, in heads or spikes, white, yellow, pink, blooming in summer, and pods strap-shaped and flat without partitions; native in trop. and subtrop. Asia, Afr. and Australia, and 1 in Mex. Cult. as for *Acacia. A. Julibrissin* may be grown as far north as Washington and hardy races much farther, and the others in S. Fla. and S. Calif. and southward.

Julibrissin (*Acacia Julibrissin. A.* and *Mimosa Nemu*). Silk-Tree. Tree 30–40 ft.: lfts. ¼ in. long: fls. pink, in heads crowded on the upper ends of branches: pods to 6 in. long. Persia to Japan. Var. rosea, smaller bright pink fls., hardier.

Lebbek (*Acacia Lebbek*). Lebbek-Tree. Siris-Tree. Womans-Tongue-Tree. Tree to 50 ft.: lfts. to 1½ in. long: fls. greenish-yellow, in axillary heads: pods to 1 ft. long. Trop. Asia, N. Australia; nat. in W. Indies.

lophantha (*Acacia lophantha*). Plume A. Shrub or tree to 20 ft.: lfts. ⅓ in. long: fls. yellow, in spikes 2 in. long: pods 3 in. long. Australia.

procera. Tall tree: lfts. to 1 in. long: fls. greenish-white, in heads: pods to 7 in. long. Trop. Asia, Australia.

ALCHEMILLA. Ladys-Mantle. *Rosaceæ.* Ann. or per. herbs with palmately-lobed or -divided lvs., small greenish or yellowish fls. in corymbs, and fr. an achene; native in the north temp. zone and sometimes cult. Some of the species make good mats or low clumps of attractive foliage; fls. not showy. Propagated by seeds or division.

alpina. Per. to 8 in.: lvs. divided into 5–7 oblong lfts. toothed at tip and shining silvery-hairy beneath. Mts. of Eu.

arvensis (*Aphanes arvensis*). Ann. to 6 in.: lvs. deeply 3-parted into cut segms., pubescent, about ⅓ in. long. Eu.; nat. in E. N. Amer.

chirophylla. Per. to 8 in.: lvs. divided into 5–7 oblong-obovate lfts. toothed at tip, silky-hairy on both sides. Eu.

japonica: listed name.

major. Per. to 10 in. or more, much branched: lvs. divided into 9–11 oval lfts., hairy beneath. Mts. of Eu.

micans. A form of *A. vulgaris*, very dark green turning red in autumn. Eu.

pratensis. Tall per.: lvs. orbicular, with 5–9 shallow-toothed lobes, pubescent beneath. Eu.; nat. in N. Amer.—By some considered a form of *A. vulgaris.*

pubescens. Per. to 8 in.: lvs. with 7–11 shallow coarsely toothed lobes, silky-hairy. Eu.

sylvestris. A form of *A. vulgaris*, bluish-green turning red-brown in autumn. Eu.

vulgaris. Per. to 1½ ft.: lvs. orbicular, to 6 in. across, with 7–9 shallow toothed lobes, grayish-pubescent. Eu.

ALCICORNIUM: *Platycerium.*

ALDER: *Alnus.* **Black-**: *Ilex verticillata.* **White-**: *Clethra.*

ALECTRYON. *Sapindaceæ.* Evergreen trees with alternate pinnate lvs., bisexual or unisexual fls. in many-fld. panicles, without petals, and fr. a leathery caps.; variable; one species is grown in S. Calif.

excelsum. TITOKI. To 60 ft.: lvs. of 4–6 pairs of ovate-lanceolate nearly entire lfts. to 4 in. long: panicles to 1 ft. long: caps. ½ in. long. New Zeal.

ALETRIS. STAR-GRASS. *Liliaceæ.* Per. fibrous-rooted herbs with a basal cluster of narrow or grass-like lvs. and small white or yellow fls. in erect spikes or spike-like racemes terminating a slender scape.

Star-grass does well in moist sunny positions; useful for colonizing. Propagated by seed or division.

farinosa. To 3 ft.: lvs. pale yellowish-green, to 6 in. long: fls. white. Me. to Fla. and Ark.

ALEURITES. *Euphorbiaceæ.* Trees native in the eastern tropics, with milky juice, large alternate simple often lobed lvs., monœcious fls. in terminal panicled cymes, and rather large æsculus-like frs.; grown far S. for shade and for the seeds which yield valuable oil.

Propagated by seed sown where plants are to stand or seedlings transplanted when about 1 foot high. Also propagated by hardwood cuttings. Trees begin to bear nuts in three to six years.

cordata. JAPAN WOOD-OIL-TREE. To 30 ft.: lvs. broadly ovate-cordate, 3–5-lobed or toothed: fls. ¾ in. long, ovary 3–4-celled: fr. warty. S. E. Asia.

Fordii. CHINA WOOD-OIL- or TUNG-OIL-TREE. To 25 ft.: lvs. ovate, sometimes 3-lobed, to 5 in. long: fls. reddish-white, ovary 3–5-celled: fr. 2–3 in. across, smooth. Cent. Asia.—Now planted in Fla.

moluccana. CANDLENUT. CANDLE-BERRY-TREE. VARNISH-TREE. To 60 ft.: lvs. ovate, often with 3–5 triangular lobes, to 8 in. long: fls. white, ovary 2-celled: fr. 2 in. or more across. Malaya; nat. in tropics.

ALFALFA: *Medicago.*

ALFILARIA: *Erodium cicutarium.*

ALGERITA: *Mahonia trifoliolata.*

ALISMA. WATER-PLANTAIN. *Alismaceæ.* Aquatic mostly per. herbs with erect or floating basal lvs. and fls. in panicles, having 3 white or rose-tinged petals; a widely distributed genus. Sometimes grown about ponds and in bogs for the foliage and many small white fls. Propagated by division or seeds.

Plantago-aquatica. Lvs. oblong to ovate: fls. to ½ in. across, in whorls on panicles to 3 ft. high. Northern hemisphere; in N. Amer. as far north as Mass. and Minn.

subcordatum: the common N. American plant, by some authors considered to be distinct from the Old World *A. Plantago-aquatica.*

ALISMACEÆ. WATER-PLAINTAIN FAMILY. About 13 genera in swamps and streams around the world. Herbs with basal long-stalked lvs., regular bisexual or unisexual fls. borne in whorls on racemes or panicles, having 3 sepals, 3 deciduous petals, 6 or more stamens, many 1-celled ovaries becoming achenes in fr. Alisma and Sagittaria are grown in outdoor ponds and bogs.

ALKANET: *Anchusa.*

ALKEKENGI: *Physalis Alkekengi.*

ALLAGOPTERA (*Diplothemium*). *Palmaceæ.* Cespitose stemless S. American feather-palms of about 5 species, one of which has been planted in the open in Fla.: mostly monœcious in each spadix, which arises from the base on a long peduncle; fls. densely placed on the simple short spadix, the upper ones staminate; stamens 6–20, the filaments joined at the bottom: fr. an ovoid or oblong small yellowish or reddish drupe. See *Palm.*

campestris. Pinnæ linear-lanceolate, glaucous underneath, assembled in separate or distant groups: stamens 6–9: fr. ovoid, short-apiculate, glabrous. S. Brazil, Argentina, Bolivia.

ALLAMANDA. *Apocynaceæ.* Trop. shrubs, erect or clambering climbers, grown in conservatories and in the open far S., with opposite or whorled lvs. and large funnel-shaped yellow or purplish showy fls., essential organs deep in the tube, and fr. a large prickly caps., which is not to be expected under glass.

The cultivation of allamandas is simple, but they need extra feeding during the whole growing season. The plants should be kept nearly dry after growth ceases in late autumn till February or March; they should then be cut back and started in a moist position; all repotting should be done before the new growth is 6 inches long. Propagated from old and new wood cuttings. In warm countries they thrive profusely on walls and fences.

cathartica. COMMON A. Tall climbing: lvs. usually in 4's, obovate, to 6 in. long: fls. golden-yellow, to 3 in. across. Brazil. Vars. are: grandiflora, fls. to 4½ in. across; Hendersoni (*A. Hendersoni*), lvs. leathery, fls. to 5 in. across; nobilis (*A. nobilis*), fls. to 5 in. across, with magnolia-like fragrance; Schottii (*A. Schottii*), fls. with dark striped throat; Williamsii, fls. with reddish-brown throat.

Hendersoni: *A. cathartica* var.

neriifolia. OLEANDER A. Half climbing or erect shrub to 3 ft.: lvs. in whorls of 2–5, oval or oblong, to 5 in. long: fls. golden-yellow, 1½ in. across, swollen at base. Brazil.

nobilis: *A. cathartica* var.

Schottii: *A. cathartica* var.

violacea. Slender climber: lvs. usually in 4's, oval, to 6 in. long: fls. reddish-purple, 2½ in. across. Brazil. —Thrives best if grafted on *A. cathartica* var. *Hendersoni* or *Schottii.*

Williamsii: *A. cathartica* var.

ALLEGHENY-VINE: *Adlumia fungosa.*

ALLIONIA (*Oxybaphus*). UMBRELLA-WORT. *Nyctaginaceæ.* Mostly American herbs with opposite lvs. and fls. in terminal panicles or solitary in the axils, without petals and subtended by involucres; occasionally transplanted from the wild.

nyctaginea. Per. to 3 ft.: lvs. broad-ovate to oblong, to 4 in. long: fls. red, longer than involucre, in panicles. Ill. to Colo. and Tex.

ALLIUM. *Liliaceæ.* Bulbous herbs with mostly strong odor, narrow basal and sometimes a few cauline lvs., and small white, green, yellow, pink or purple fls. borne in umbels or heads terminating slender scapes. In some species the lvs. are terete and fistular (hollow), and in others they are broad and flat. The roots are sometimes more rhizomatous than strictly bulbous.

Several species are grown for food and others for ornament, the latter mostly for colonizing or in wild-gardens and sometimes placed in the rock-garden. The flower-garden alliums, as *A. Moly* and *A. neapolitanum*, require no special treatment and flower in spring; *A. neapolitanum* is useful for cut-flowers when grown in boxes or beds under glass. Propagated by seeds sown in early spring, by offsets and bulbels in autumn or spring. Most of the species are hardy North. See *Chive, Garlic, Leek, Onion.*

acuminatum. To 1 ft.: lvs. to ⅛ in. wide: fls. rose-purple, in many-fld. umbels. B. C. to Ida. and Calif.

albopilosum. To 3 ft.: lvs. to 1¾ in. wide: fls. deep lilac, in many-fld. umbels to 7 in. across. Persia.

ammophilum. Often united with *A. angulosum* but lower, with smaller lvs. and golden-yellow fls. Eu.

angulosum. To 1½ ft.: lvs. to ¼ in. wide: fls. lilac or purple, rarely white, in many-fld. often elongated umbels. Eu.

ascalonicum. SHALLOT. To 1 ft.: lvs. awl-shaped: fls. lilac or white, in globose heads. Probably a cultigen. See *Onion.*

atropurpureum. To 2½ ft.: lvs. to 2 in. wide: fls. rose-purple, in heads to 2½ in. across. Hungary to Himalayas.

azureum: *A. cæruleum.*

baicalense: *A. montanum* var. *glaucum.*

cæruleum (*A. azureum*). To 3 ft.: lvs. 3-angled: fls. deep blue, in dense globose umbels to 2 in. across. Siberia, Turkestan.

canadense. WILD GARLIC. Slender, to 2 ft., from a small bulb: lvs. flat or nearly so: umbel often bearing only bulblets, the fls. if any long-pediceled and pinkish. N. B. to Tex., mostly in low ground.

carinatum. To 2 ft.: lvs. ⅙ in. across: fls. rose-pink, with long protruding stamens, in loose heads. Eu.

Cepa. ONION (which see). To 3 or 4 ft.: lvs. cylindrical and hollow: fls. lilac to white, in large umbels. W. Asia. Var. **solaninum** (var. *multiplicans*), POTATO and MULTIPLIER ONION, propagates by natural divisions of the bulb. Var. **viviparum** (var. *bulbelliferum*), TOP ONION, is propagated by bulbels borne in the umbels.

cernuum (*A. recurvatum*). To 2 ft.: lvs. to ⅙ in. wide: fls. rose or white, in many-fld. nodding umbels. N. Amer.

controversum: a name of uncertain application.

crispum: *A. peninsulare* var.

cyaneum. To 1 ft.: lvs. narrow-linear: fls. blue, in many-fld. nearly globose umbels. China.

fallax: *A. montanum* var. *petræum.*

fistulosum. WELSH or SPRING ONION. To 1½ ft., glaucous: lvs. cylindrical and hollow: fls. white, in dense umbels. Asia. See *Onion.*

flavum. To 1 ft.: lvs. cylindrical: fls. yellow, in drooping umbels. S. Eu.

galanthum. Glabrous, with large bulb, st. hollow and somewhat inflated, to 16 in.: lvs. few, at base, cylindrical and hollow: fls. whitish, in an umbel. Siberia.

giganteum. To 4 ft.: lvs. to 2 in. wide: fls. lilac, in dense globose umbels 4 in. across. Himalayas.

globosum. To 1 ft.: lvs. linear and thread-like: fls. rose or white striped with rose, in many-fld. globose umbels. E. Eu., Asia Minor.

Helleri: *A. Nuttallii.*

Hermettii: *A. neapolitanum.*

hyalinum. To 14 in.: lvs. to ⅕ in. wide: fls. pale pink or white, in 6–10-fld. umbels. Calif.

hymenorrhizum. To 2 ft.: lvs. to ⅓ in. wide: fls. rose, in many-fld. globose umbels. E. Eu., W. Asia.

japonicum. Glabrous, with oblong bulb and a rhizome, st. cylindrical, to 2 ft.: basal lvs. cylindrical, 2 or 3 on st. plane: fls. purple, in a globose head. Japan.

karataviense. To 8 in.: lvs. very broad: fls. white or very light, in dense globose umbels to 3 in. across. Turkestan.

lineare. Glabrous, with bulbose rhizome, st. cylindrical, to 1½ ft., with lvs. at middle and below: lvs. linear, plane: fls. purple, in a nearly or quite globose umbel. Russia, Siberia.

Moly. To 1½ ft.: lvs. to 2 in. wide: fls. bright yellow, in umbels to 3 in. across. S. Eu.

montanum (*A. senescens*?). To 2 ft.: lvs. ½ in. wide: fls. pale purple, in dense heads. Eu. Var. **glaucum** (*A. baicalense*) is grayish-green. Var. **petræum** (*A. fallax*) grows to 1 ft. high and has narrower lvs.

narcissiflorum (*A. pedemontanum*). To 1 ft.: lvs. ⅙ in. or less wide: fls. rose, in 3–8-fld. umbels. Italy.

neapolitanum (*A. Hermettii*). To 2 ft.: lvs. to 1 in. wide: fls. white with colored stamens, in loose umbels to 3 in. across. S. Eu.

nutans. Glabrous, with long bulb and rhizome, st. usually 2-edged, to 2 ft.: lvs. only at base, broad-linear, shorter than st.: fls. rosy-white, on long pedicels in globose umbel. Siberia.

Nuttallii (*A. Helleri*). Slender, to 1 ft., from mostly solitary small bulb: lvs. flat: fls. rose or white, in umbels on pedicels to ½ in. long. Prairies, S. D. to Ariz.

odorum. To 1½ ft.: lvs. to ¼ in. wide: fls. white often striped green, in many-fld. umbels. Siberia to Japan.

oleraceum. To 3 ft.: lvs. to ⅛ in. wide: fls. greenish tinged with red, in loose umbels. Eu.

Ostrowskianum. Glabrous, with subglobose bulb, st. cylindrical, to 1 ft.: lvs. linear-oblong, plane, soft: fls. rose, on filiform pedicels in many-fld. umbel. Turkestan.

paniculatum. To 2 ft.: lvs. $^1/_{12}$ in. wide, partly cylindrical: fls. white or rose, in loose umbels. Medit. region.

pedemontanum: *A. narcissiflorum.*

peninsulare. To 1 ft. and more, from reticulated bulb: lvs. flat, about as long as scape: fls. 8–20 in umbel, deep rose-purple. Calif. Var. **crispum** (*A. crispum*) has inner segms. of fl. undulate or crisped.

platyspathum. Glabrous, with conical mostly solitary bulb, st. cylindrical, leafy at base, to 10 in.: lvs. plane, broad-linear: fls. rose, in many-fld. nearly globose umbel. Turkestan, Siberia.

polyphyllum. Glabrous, with ovate-oblong bulb, st. cylindrical, leafy below middle, to 1½ ft. high: lvs. plane and long: fls. rose, in dense umbel. Turkestan.

Porrum. LEEK (which see). To 3 ft.: lvs. to 2 in. wide: fls. pinkish, in dense umbels. Cultigen.

recurvatum: *A. cernuum.*

reticulatum: *A. textile.*

Rosenbachianum. Glabrous, with subglobose bulb, st. cylindrical, to 2 ft.: lvs. oblong-lanceolate: fls. purple, in large umbel. Turkestan.

roseum. To 1½ ft.: lvs. to ½ in. wide: fls. rose, in a loose few-fld. umbel to 3 in. across. S. Eu.

rotundum. To 2½ ft.: lvs. to ¾ in. wide: fls. purple, rarely rose or whitish, in globose heads 1 in. across. Eu.

sativum. GARLIC (which see). To 2 ft.: lvs. to 1 in. across: fls. pinkish, in small dense umbels, often with bulbels in cluster. Eu.

Schœnoprasum. CHIVE (which see). Tufted to 2 ft.: lvs. cylindrical and hollow: fls. rose-purple, in many-fld. umbels. Eu., Asia.

Scorodoprasum. ROCAMBOLE. GIANT GARLIC. To 3 ft.: lvs. about ⅓ in. broad, flat and keeled; fls. dark purple, in umbels, often changed to bulblets. Eu., Asia Minor.—The long-pointed cloves or bulbs are used instead of garlic.

senescens: a name of dubious usage; the plant intended in lists is probably *A. montanum.*

stellatum. To 18 in. or more, from finely reticulated bulb: lvs. nearly flat: fls. rose, in umbels on pedicels to ¾ in. long. Ill. to Kans. and north.

Stellerianum. Glabrous, with long mostly aggregated bulbs, st. cylindrical or flattened, to 1 ft.: lvs. semi-cylindrical and somewhat grooved, very narrow, basal: fls. rose, in nearly globose lax umbel. Siberia.

strictum. To 1½ ft.: lvs. to ⅕ in. wide: fls. purple or rose, in upright many-fld. umbels. Eu.

textile (*A. reticulatum*). To 1 ft.: lvs. to ⅙ in. wide: fls. white or pale pink, in several-fld. umbels. Sask. to Ariz.

tricoccum. WILD LEEK. To 1 ft.: lvs. to 2 in. wide: fls. greenish-white, in erect umbels. N. B. to N. C. and Tenn.

urceolatum. Glabrous or scabrous on lvs., bulb ovoid, solitary, st. cylindrical, leafy below middle, to 2 ft.: lvs. linear, hollow: fls. pale bluish to nearly white, in many-fld. umbel. Siberia, Turkestan.

validum. To 2½ ft.: lvs. to ½ in. wide: fls. rose or nearly white, in many-fld. umbels. Ore., Calif., Nev.

victorialis. To 2 ft.: lvs. 1–3 in. wide: fls. white or yellowish, in nodding umbels. Eu., Asia.

viviparum. Glabrous, or scabrous on lvs., bulb nearly globose, st. cylindrical, to about 3 ft.: lvs. linear, somewhat 3-angled: fls. blue, the umbel bulbiferous. Siberia, Turkestan.

ALLOPHYTON. *Scrophulariaceæ.* Three somewhat woody small per. herbs of Mex. and Guatemala: lvs. simple, crowded, opposite, tapering to a sessile or clasping base: fls. bell-shaped, purple and spotted, in close long-peduncled clusters; lobes of corolla shorter than tube. **A. mexicanum** (*Tetranema mexicanum, Penstemon mexicanus*) is sometimes grown under glass for its attractive bloom: lvs. near the ground at the top of a very short st., oblong-obovate, to 6 in. long, nearly entire, glaucous underneath: fls. nearly ½ in. long, many in a cluster on peduncles to 8 in. long.

ALLOPLECTUS (*Crantzia*). *Gesneriaceæ*. Trop. shrubs with opposite lvs., fls. clustered or solitary in the axils having straight or curved tube and 5-lobed limb, and fr. a berry; grown in the greenhouse.

Schlimii. Lvs. ovate or ovate-oblong, to 4 in. long, toothed, violet or purple beneath: fls. yellow and red, 1 in. long, urn-shaped, the calyx red. Trop. S. Amer.

ALLOSURUS: *Pellæa rotundifolia.*

ALLSPICE: *Pimenta officinalis.* **Carolina:** *Calycanthus floridus.*

ALMOND. Two kinds of plants are known as almonds. The one grown in orchards as a fruit-tree is *Prunus communis*, native probably in western Asia. It is grown for the "nut," which is the kernel in the pit or stone. The fruit is a hard dryish drupe, the flesh more or less splitting at maturity and disclosing the stone; the thin flesh is inedible. The bitter almond is employed in certain manufacture. The sweet almond, in which the kernel is edible, is the kind grown pomologically; it may be either soft-shell or hard-shell, the former including the commercial kinds. The almond tree is much like the peach and the culture is in general the same; as it blooms early and is liable to injury from spring frosts, it is grown little in North America outside California. It is about as hardy as the peach. Propagation of named varieties is by budding on seedlings grown from either the soft-shell or hard-shell kinds.

Other almonds are grown for the ornamental bloom. There are showy and double-flowered forms of the common almond, *Prunus communis.* The usual "flowering almonds," however, are little bushes of other species, prized for the spring bloom, single and double, in pink, blush, rose and white. Two species are common, *Prunus triloba* and *P. glandulosa*, and *P. japonica* is sometimes seen. The true dwarf almond is *P. nana*, not much grown: flowers single, pink or white. These various small ornamental almonds are commonly grown on plum stock, and the grower should be diligent to keep down the sprouts from the plum root.

ALMOND, EARTH-: *Cyperus esculentus.* **Indian-:** *Terminalia Catappa.* **Tropical-:** *Terminalia Catappa.*

ALNUS. Alder. *Betulaceæ.* Deciduous monœcious trees and shrubs with alternate toothed lvs., staminate fls. in long catkins and the pistillate in short catkins becoming woody cones with 5-lobed scales; native in the northern hemisphere and the Andes of S. Amer. The bloom is not showy but interesting because it appears in advance of foliage in many species.

Alders are best adapted to moist soils and cool or cold climates. Propagated by seeds dried in the autumn and sown in spring under a light covering; also by cuttings, suckers, and rarer kinds by grafting on potted seedling stocks under glass.

Alnobetula: *A. viridis.*

barbata: *A. vulgaris* var.

californica: *A. rhombifolia.*

communis: *A. vulgaris.*

cordata (*A. tiliacea*). Italian A. Tree to 75 ft.: lvs. broad-ovate, to 4 in. long, heart-shaped at base: cones 1–3. Italy, Corsica.

crispa (*A. Mitchelliana*). American Green A. Shrub to 10 ft.: lvs. ovate, to 3 in. long, rounded at base, aromatic when young: cones 3–6. Lab. to N. C.

firma. Shrub or tree to 10 ft.: lvs. ovate-oblong, to 5 in. long, rounded at base. Japan. Var. **hirtella** grows to 30 ft.

glutinosa: *A. vulgaris.*

hirsuta. Manchurian A. Tree to 60 ft.: lvs. broad-ovate, to 6 in. long, rounded at base, glaucous and reddish-pubescent below: cones 3–4. N. E. Asia, N. Japan.

hybrida: hybrid between *A. vulgaris* and *A. incana.*

imperialis: *A. vulgaris* var.

incana. Speckled A. Shrub or tree to 60 ft.: lvs. ovate, to 4 in. long, rounded at base, glaucous or grayish-green beneath: cones 4–8. Eu., Asia, N. Amer. Var. **acuminata** (var. *laciniata*) has lvs. lobed about half way. Var. **monstrosa** has much flattened branches. Var. **pendula**, branches drooping. Var. **pinnatifida** has small deeply lobed lvs.

incisa: *A. vulgaris* var.

japonica. Tree to 80 ft.: lvs. narrow-elliptic, to 5 in. long, wedge-shaped at base, light green beneath: cones 2–6. N. E. Asia, Japan.

latifolia: *A. rugosa.*

macrophylla: *A. subcordata.*

maritima. Seaside A. Shrub or tree to 30 ft.: lvs. oblong, to 4 in. long, wedge-shaped at base, glossy above, light green beneath: cones 2–4. Del., Md., Okla., on banks of streams and ponds.

Mitchelliana: *A. crispa.*

multinervis: *A. pendula.*

nepalensis. Tree: lvs. elliptic-lanceolate, to 7 in. long: cones in lateral panicles. Himalayas.

oregana: *A. rubra.*

pendula (*A. multinervis. A. firma* var. *multinervis*). Shrub or tree to 30 ft.: lvs. oblong-lanceolate, to 5 in. long: cones in nodding racemes. Japan.

purpurea: probably a form of *A. vulgaris.*

rhombifolia (*A. californica*). White A. To 100 ft. or more: lvs. ovate to nearly orbicular, to 4 in. long, tapering at base. Wash. to Calif.

rotundifolia: *A. vulgaris.*

rubra (*A. oregana*). Red A. Tree to 70 ft.: lvs. ovate, to 5 in. long, truncate at base, grayish-green or glaucous beneath: cones 6–8. Alaska to Ida. and Calif.

rugosa (*A. serrulata. A. latifolia*). Hazel or Smooth A. Shrub or tree to 25 ft.: lvs. elliptic or obovate, to 4 in. long, wedge-shaped at base: cones 4–10. Me. to Fla. and Tex.

serrulata: *A. rugosa.*

subcordata (*A. macrophylla*). Tree to 50 ft.: lvs. ovate or oblong-ovate, to 6 in. long, rounded at base, light green and pubescent on veins beneath: cones 1–4. Caucasus, Persia.

tenuifolia. Mountain A. Tree to 30 ft.: lvs. ovate or ovate-oblong, to 4 in. long, mostly rounded at base, usually yellowish-green. B. C. to Lower Calif. and New Mex.

tiliacea: *A. cordata.*

viridis (*A. Alnobetula*). European Green A. Shrub to 6 ft.: lvs. ovate, to 2½ in. long, broad at base, pale green beneath: cones in racemes. Mts. of Eu.

vulgaris (*A. glutinosa. A. rotundifolia. A. communis*). Black A. Tree to 80 ft., the young growth very sticky: lvs. oval or nearly orbicular, to 4 in. long, broad at base: cones 3–5. Eu., N. Afr., Asia; somewhat escaped in E. N. Amer. Several vars. are in cult., as: **aurea** with yellow lvs.; **barbata** (*A. barbata*), lvs. pubescent beneath; **denticulata**, lvs. finely toothed; **imperialis**, lvs. small, deeply lobed into linear lobes; **incisa** (var. *oxyacanthifolia*), lvs. small, deeply lobed into broad lobes; **laciniata**, lvs. regularly lobed to about middle; **pyramidalis** (var. *pyramidals Birkiana*), of narrow pyramidal habit; **quercifolia**, lvs. with deep irregular lobes; **rubrinervia**, lvs. shining dark green with red veins and petioles; **sorbifolia**, lvs. small, with broad deep lobes.

ALOCASIA. *Araceæ.* Trop. Asian herbs with thick short sts., mostly large arrow- or heart-shaped lvs. which are always peltate when young, sheathed petioles, and unisexual fls. borne on a spadix which is shorter than the spathe; grown in greenhouses for the ornamental often variegated foliage.

In the growing season plants should be given an abundance of water, protected from direct sunlight, and a night temperature of 70°; the latter should never fall below 60° even in winter. Propagated by suckers or cuttings of the roots placed in pots and plunged in sand over bottom heat; also by seed sown in pots and kept in a temperature of about 75°.

argyræa. Lvs. to 1½ ft. long, dark green with silvery sheen, the basal lobes ovate. Trop. Asia.

cuprea. Lvs. to 1½ ft. long and 1 ft. across, purple beneath, above dark metallic shining green, the basal lobes ovate: spathes purple and green. Malaya.

indica. To 6 ft.: lvs. to 15 in. long and 6 in. wide, green, arrow-shaped, margins slightly wavy, the basal lobes ovate: spathes yellowish-green or purplish inside. Malaya. Var. **metallica** (*A. plumbea*) has deep purple lvs. and petioles with a metallic sheen. Var. **variegata** has lvs. and petioles lined or mottled with grayish-white.

Korthalsii (*A. Thibautiana*). St. short: lvs. to 14 in. long and 6 in. wide, olive-green above veined with white and purple beneath: spathes pale green. Malaya.

Lowii. St. short: lvs. to 1½ ft. long and 6 in. wide, olive-green above with pale nerves, dark purple beneath, the basal lobes oblong-triangular; petioles rose-color: spathes whitish-green. Malaya. Var. **Veitchii** (*A. Veitchii*) has lvs. broadly margined with white and white nerves. Java.

macrorhiza. To 15 ft. or more high: lvs. 2 ft. or more long, green, arrow-shaped, the margins wavy: spathes glaucous-green or yellowish. Malaya. Var. **variegata** has lvs. blotched and mottled with white.

megarrhiza: hort. name; perhaps *A. macrorhiza.*

metallica: *A. indica* var.

mortefontanensis. Hybrid between *A. Sanderiana* and *A. Lowii* with green lvs. margined and veined with white and purple beneath.

odora. St. to 2½ ft.: lvs. to 3 ft. long and 2½ ft. wide, arrow-shaped, the margins wavy: spathes glaucous-green or yellowish. Asia.

plumbea: *A. indica* var. *metallica.*

porphyroneura (*A. princeps*). Nearly stemless: lvs. pale green with purplish veins, arrow-shaped, the margins wavy, basal lobes triangular; petioles spotted white and yellow: spathes pale yellow. Malaya.—Another *A. porphyroneura* is a form of *Caladium picturatum.*

princeps: *A. porphyroneura.*

Rodigasiana. Hybrid between *A. regina* and *A. Korthalsii* with grayish-green lvs. purple beneath and with paler veins.

Sanderiana. Lvs. 1½ ft. long and 6 in. wide, shining metallic green above veined with white or pale yellow, purplish beneath, arrow-shaped, the margins deeply sinuate-lobed, basal lobes narrowly triangular; petioles striped with brown: spathes green. Philippines.

Sedeni. Hybrid between *A. cuprea* and *A. Lowii,* having lvs. purple beneath and veined white above.

Thibautiana: *A. Korthalsii.*

Van Houtteana. Hybrid of uncertain parentage, having deep green shining lvs. margined with white.

Veitchii: *A. Lowii* var.

Watsoniana. Lvs. to 2 ft. long and 14 in. wide, green above and purplish beneath margined with white, the basal lobes ovate. Malaya.

zebrina. St. short: lvs. 1½ ft. long, green, arrow-shaped, margins slightly wavy, the basal lobes oblong-triangular; petioles banded with green and white: spathes green and white. Philippines.

ALOE. *Liliaceæ.* Per. succulent herbs with stiff spiny-toothed lvs. and showy red or yellow fls. in mostly elevated racemes or spikes on a stout scape-like st.; sometimes grown in the greenhouse or out-of-doors in the S. for their unusual stiff and fleshy aspect. Not to be confused with agaves which are American but aloes are from the Old World, mostly Afr. As a Latin generic name, Aloe has three syllables; as a vernacular or "common" name it has two syllables.

Aloes are well-known pot subjects and are likely to be conspicuous about public buildings and parks in countries not subject to killing frost. They commonly do well in the same pot for some years when not grown for bloom. Propagated by suckers; sometimes by cuttings of new growths and by seeds when available.

arborea: *A. arborescens.*

arborescens (*A. arborea*). To 15 ft.: lvs. to 2 ft. long and 2 in. wide, at top of trunk: fls. red, 1½ in. long, in dense racemes. S. Afr. Var. **frutescens** is a shrubby form with glaucous lvs.

candelabrum. To 20 ft.: lvs. to 2 ft. long and 3 in. wide: fls. red, 1½ in. long, in racemes borne in a candelabrum-like branching panicle to 2 ft. high. S. Afr.

chinensis: *A. vera* var.

ciliaris. Sts. weak and decumbent, with more or less climbing habit, bearing linear-lanceolate lvs. to 6 in. long and 1¼ in. wide, and bright red fls. with greenish tips about 1¼ in. long, in stalked racemes about 8 in. high. S. Afr.—Rather frequent in greenhouses and in S. Calif.

distans. Sts. procumbent, to 9 in. long: lvs. to 4 in. long and 2 in. wide, glaucous, yellow-spined: fls. red tipped with green, 1¾ in. long, in infl. to 1½ ft. high. S. Afr.

ferox. To 9 ft.: lvs. to 2½ ft. long and 6 in. wide, purplish at margin with yellow-brown teeth: fls. greenish-yellow, 1½ in. long, in infl. to 4 ft. high. S. Afr.

frutescens: *A. arborescens* var.

humilis. Tufted: lvs. to 4 in. long and ¾ in. wide, with white marginal teeth, tuberculate: fls. red tipped with green, 1½ in. long, in racemes to 1½ ft. high. S. Afr.

macrocarpa. Stemless, to 2 ft.: lvs. in a basal tuft, to 14 in. long and 2 in. wide, lined and mottled in cross bands: fls. pale red, 1 in. long, in racemes to 6 in. high. Trop. Afr.

Marlothii. Tree-like, with simple stout st.: lvs. to 2½ ft. long and 7 in. wide, very spiny: fls. red, 1¼ in. long, in one-sided horizontal racemes in a branching infl. S. Afr.

obscura. Short-stemmed: lvs. to 8 in. long and 3 in. wide, lined and spotted with pale green, with spiny cartilaginous margins: fls. red, 1¼ in. long, in infl. to 3 ft. high. S. Afr.

Salm-Dyckiana. To 6 ft., branching: lvs. tufted, to 2½ ft. long and 3½ in. wide, yellowish-margined: fls. light red, 1½ in. long, in panicled racemes to 3 ft. high. S. Afr.

saponaria. Densely tufted, stemless, to 2½ ft.: lvs. 8 in. long and 2½ in. wide, blotched with pale green: fls. red, to 1¾ in. long, in dense many-fld. heads. S. Afr.

soccotrina: *A. succotrina.*

striata. Nearly stemless, to 3 ft.: lvs. 20 in. long and 6 in. wide, with entire white cartilaginous margins: fls. red or yellowish, 1¼ in. long, in panicled umbels. S. Afr. Var. **rhodocincta** has lvs. blotched with white.

succotrina (*A. soccotrina*). To 4 ft., branching: lvs. 20 in. long and 2 in. wide, with white marginal prickles: fls. light red, 1¼ in. long, in racemes. S. Afr.

supralævis. Unbranched, to 6 ft.: lvs. to 2½ ft. long and 6 in. wide, spiny below and with red-brown marginal spines: fls. reddish-yellow, to 1 in. or more long, in racemes about 1 ft. long in a branching infl. S. Afr.

vera. TRUE A. BARBADOS A. To 3 ft.: lvs. thick, to 2 ft. long, in a basal rosette: fls. yellow, nodding, in dense raceme terminating the scape. Medit. region. Var. **chinensis** is a smaller form with red-tinged fls. India.

zebrina. Stemless or nearly so, to 4 ft.: lvs. in a dense rosette, to 1 ft. long and 2½ in. wide, often purplish, blotched with whitish, edged with large red- or brown-tipped teeth: fls. red, 1½ in. long, in racemes 1 ft. or more long. Trop. Afr.

ALOINOPSIS: *Nananthus.*

ALONSOA. Mask-Flower. *Scrophulariaceæ.* Herbs and small shrubs grown as annuals in the garden, or indoors for the attractive winter bloom: fls. red, 2-lipped, in terminal racemes, the corolla with very short tube, turned upside down by the twisting of the st.: lvs. opposite or in whorls of 3: native in trop. Amer.

Propagated from seed, and by cuttings for winter plants. They are all of simple cultural requirements in warm open exposures.

acutifolia (*A. myrtifolia*). Bushy, to 3 ft.: lvs. broad-lanceolate, sharp-toothed: fls. cinnabar-red, upper lip 3–4 times longer than calyx. Peru. Var. **candida** (*A. albiflora*), fls. white

albiflora: *A. acutifolia* var. *candida.*

caulialata. To 1 ft. or more, with 4-angled sts.: lvs. ovate or ovate-lanceolate, toothed: fls. scarlet, upper lip twice as long as calyx. Peru.

compacta: *A. Warscewiczii.*

grandiflora: *A. Warscewiczii.*

incisifolia. To 2 ft.: lvs. oval or ovate-lanceolate, deeply cut-toothed: fls. scarlet, purple-black in throat, upper lip 2–4 times longer than calyx. Peru.

linearis (*A. liniflora*). Bushy, much branched, to 1½ ft.: lvs. linear, fine-toothed or entire: fls. numerous, scarlet. Peru. Var. **gracilis** (*A. pumila*), smaller and graceful.

liniflora: *A. linearis.*

linifolia. To 1½ ft.: lvs. linear, entire: fls. scarlet, large. Peru.

meridionalis (*A. Mutisii*). Similar to *A. caulialata* but with uniformly dull orange fls. about ¼ in. long. Colombia.

Mutisii: *A. meridionalis.*

myrtifolia: *A. acutifolia.*

pumila: *A. linearis* var. *gracilis.*

Warscewiczii (*A. compacta. A. grandiflora*). Very bushy, to 3 ft.: lvs. ovate-lanceolate, toothed: fls. cinnabar- or scarlet-red, upper lip 4–5 times longer than calyx. Peru.

ALOPECURUS. *Gramineæ.* Ann. and per. grasses resembling timothy and grown in meadows, the spikelets crowded into dense narrow spikes; native mostly in the north temp. zone. See *Grasses.*

pratensis. Meadow Foxtail. Per. to 3 ft.: lvs. to 6 in. long and ¼ in. wide, rough: spikes to 3 in. long, above the foliage, florets awned. Eu.; nat. in E. N. Amer.—Lower grass than timothy, with shorter spikes and many awns.

ALOYSIA: *Lippia.*

ALPHITONIA. *Rhamnaceæ.* Probably a single species, a tall tree with alternate lvs., fls. ¼ in. or less across, in forking cymes, and fr. a dry drupe-like body the outer part of which often falls and leaves the 2 or 3 seeds standing on the torus. **A. excelsa.** Lvs. ovate to lanceolate, to 6 in. long, entire, leathery, white-tomentose beneath. Australia. Occasionally planted in S. Calif. for ornament.

ALPINES. The word *alpine* denotes narrowly pertaining to the Alps, but usage allows its application to any very high mountain regions. Alpine plants are particularly those that grow above the tree-line, but in common writing and speech the term is too frequently employed for mountain plants in general, and alpine-gardening is likely to mean only rock-gardening. The real alpine-gardening attempts to make an approximate imitation of alpine conditions; it is possible in cool places, with good supply of cold water, and soils something like those of alpine places. The selection of plants requires experience and the handling of them demands skill. The growing season is short. True alpine-gardening is little attempted in North America.

ALPINIA. *Zingiberaceæ.* Per. herbs with leafy sts. and often showy fls. in terminal spikes or panicles, having 1 petal-like staminode or lip.

Grown for ornamental foliage and habit in the tropics and subtropics or in a moist greenhouse with a temperature of 60°. They require abundant watering. Propagated by division in spring; the plants make large clumps. Some of the kinds have striped leaves. See *Zingiberaceæ.*

calcarata. To 5 ft.: lvs. to 1 ft. long and 2 in. wide: fls. greenish-white, the lip variegated with red and yellow, in dense panicles to 4 in. long. India.

formosana. Lvs. to 16 in. long and 3 in. wide: fls. with crinkled lip 1 in. long, in panicles to 6 in. long. Formosa.

mutica. To 6 ft.: lvs. to 16 in. long and 1¾ in. wide: fls. white, the lip yellow marked with red, in panicles to 7 in. long. Malay Peninsula.—The material cult. under this name may not be this species.

nutans: *A. speciosa.*

Sanderæ (*A. vittata*). Lvs. to 8 in. long and 1 in. wide, striped and marked with clear white. Botanical position uncertain; plant sterile; frequent in cult.

speciosa (*A. nutans. Renealmia nutans. Languas speciosa*). Shell-Flower. To 12 ft.: lvs. to 2 ft. long and 5 in. wide: fls. white tinged with purple, the lip crinkled and yellow variegated with red and brown, fragrant, in pubescent racemes which become nodding. E. Asia.—Commonly planted in warm regions.

tricolor. Like *A. Sanderæ* except that the lf.-markings are yellowish-white.

vittata: *A. Sanderæ.*

vitellina (*Amomum vitellinum*). To 3 ft.: lvs. to 16 in. long and 3 in. wide: fls. yellow, the lip crisped and marked with red, in panicles to 3½ in. long. Malacca.

ALSEUOSMIA. *Caprifoliaceæ.* New Zealand evergreen shrubs with alternate lvs., tubular or funnelform fragrant fls. solitary or clustered in the axils, and crimson berries; one species may be planted in S. Calif.

macrophylla. To 8 ft., glabrous: lvs. obovate to linear-oblong, to 7 in. long: fls. crimson, to 1½ in. long: berries ½ in. long.

ALSINE: see *Arenaria* and *Stellaria.*

ALSOPHILA. Tree-Fern. *Cyatheaceæ.* Tree-ferns with large finely divided lvs. light green in color, the stipes covered with scales, spiny or smooth, with naked sori on back of segms.; mostly tropical. See *Ferns.*

australis. To 20 ft., trunk straight bearing a spreading head of 2–3-pinnate lvs. to 12 ft. long; segms. to 6 in. long and 1 in. wide. Australia.—Rather common under glass.

dealbata: *A. glauca;* sometimes *Cyathea dealbata.*

glauca (*A. dealbata*). Very tall, prickly: lvs. glaucous beneath, segms. to 5 in. long and 1 in. wide. Trop. Asia.

ALSTONIA. *Apocynaceæ.* Trees or shrubs with mostly whorled lvs., salver-shaped fls. in corymbose cymes, and fr. of 2 linear follicles; native Malaya to Pacific Isls.

scholaris. Devil-Tree. Pali-Mara. To 60 ft. and more: lvs. narrow-oblong to oblanceolate, verticillate, to 8 in. long, with many parallel side-veins: fls. pubescent, white, in thyrses: pods very long and slender. India.

venenata. To 8 ft. or more, glabrous: lvs. oblong-lanceolate, to 8 in. long: fls. white, 1 in. across: frs. to 5 in. long. India.

ALSTRŒMERIA. *Amaryllidaceæ.* S. American herbs with thick fibrous roots, leafy sts., and showy red, yellow or purple fls. in terminal umbels, the perianth-segms. distinct.

Alstrœmerias are probably not hardy in the North except *A. aurantiaca*, but may be planted out in spring, lifted after blooming, and stored over winter. They should be set in shady positions in rich moist soil. Also may be grown as pot-plants in the greenhouse but should be lifted and shaken out annually. Propagated by division of roots and by seeds.

aurantiaca (*A. aurea*). To 3 ft.: lvs. lanceolate, to 4 in. long: fls. bright yellow spotted with brown, 1½ in. long. Chile.

aurea: *A. aurantiaca.*

brasiliensis. To 4 ft.: lvs. oblong-lanceolate, 2 in. long: fls. reddish-yellow spotted with brown, 1¼ in. long. Brazil.

chilensis. To 4 ft.: lvs. obovate to lanceolate, fringed: fls. rose or red. Chile.

hæmantha. To 3 ft.: lvs. lanceolate to linear, to 4 in. long, glaucous beneath: fls. reddish-yellow spotted purple and tipped green, to 2 in. long. Chile. Var. rosea has rose fls.

Pelegrina. To 2 ft.: lvs. lanceolate, to 2 in. long: fls. lilac spotted with red-purple, to 2 in. long. Chile. Var. alba has white fls.

pulchella. To 3 ft.: lvs. lanceolate, to 3 in. long: fls. dark red tipped with green and spotted with brown. Brazil.

revoluta. To 1 ft.: lvs. linear, to 1½ in. long: fls. purplish, yellowish and spotted within, to ¾ in. long. Chile.

versicolor. To 1 ft.: lvs. linear, 1 in. long: fls. yellow spotted with purple, 1 in. long. Chile.

ALTERNANTHERA. *Amaranthaceæ.* Probably nearly 100 herbs or shrubs of warm or trop. countries, a few of which are grown as carpet-bedding subjects. The species in cult. are placed in the genus Achyranthes by some authors and in Telanthera by others. In gardens the plants are commonly known as Alternantheras. The hort. kinds are low compact herbs of the New World tropics with small opposite entire variously colored and variegated lvs.: fls. minute, in small dense axillary clusters, but in cult. the plants are not often allowed to reach the blooming stage.

Alternantheras are usually kept only 6 inches high by shearing. They grow best in warm sunny situations. The plants are propagated by division or by cuttings; the latter are usually made from strong plants in the garden in August, wintered over in hotbeds or the greenhouse and potted off in March or April. Division requires less time; the plants, after the first frost, are lifted and cut back to 3 or 4 inches; in early spring they are divided, the rooted shoots potted or placed in flats with plenty of room; in four to six weeks they should be ready for bedding-out.

amœna. Very dwarf: lvs. lanceolate to elliptic, green veined and blotched with red and orange. Brazil. Here belong the garden forms amabilis, spectabilis, rosea.

Bettzickiana. Lvs. narrow-spatulate, blotched and colored in many shades cream-yellow to red. Brazil. Most of the cult. forms belong here, as aurea, aurea nana compacta, magnifica. Var. typica is 2–3 in. tall, lvs. olive-colored, upper red at apex. Var. spathulata, to 8 in., with red lvs. and st.

paronychioides of hort.: *A. Bettzickiana.*

philoxeroides. Usually decumbent: lvs. obovate to lanceolate, very short-stalked. Brazil.

versicolor. Copper A. Lvs. round-spatulate, copper- or blood-red. Brazil.

ALTHÆA. *Malvaceæ.* Tall straight leafy-stemmed pubescent or tomentose annuals, biennials and perennials with fls. in terminal erect racemes or spikes, grown in gardens for their showy bloom; native in the temp. regions of the Old World.

The perennials are given the usual cultivation. The biennials, especially *A. rosea*, are planted most often in July and transplanted to their permanent quarters the following spring. A new strain, sold as "annual hollyhocks," produces bloom the first summer by sowing the seed indoors in February.

ficifolia. Figleaf or Antwerp Hollyhock. Bien. to 6 ft.: lvs. deeply 7-lobed and toothed: fls. lemon-yellow or orange, in terminal spikes, single or double, to 3 in. and more across. Eu.

frutex: *Hibiscus syriacus.*

officinalis. Marsh-Mallow. Per. to 4 ft.: lvs. 3-lobed or unlobed, tomentose: fls. 1 in. across, blush or rose, in axillary clusters. E. Eu.; escaped in coast marshes in N. Amer.

rosea. Hollyhock. Hairy bien. or semi-per. to 9 ft.: lvs. 5–7-lobed or -angled: fls. in long spike or wand-like raceme, red, rose, pink, yellow, white, to 3 in. and more across. China.—There are double vars. See *Hollyhock.*

ALTHEA, SHRUB-: *Hibiscus syriacus.*

ALUM-ROOT: *Heuchera.*

ALYSSUM. Madwort. *Cruciferæ.* Ann. and per. mostly gray herbs and subshrubs: lvs. small, alternate on the st., sometimes making rosettes at base: fls. small, yellow or white, in terminal short racemes or clusters: pods or silicles short, nearly or quite orbicular in outline. Species about 100, in Eu. and W. Asia.

A few are grown in rock-gardens and borders, in open or sunny situations. They require the usual culture for perennials and are propagated by seed or by division of the roots.

alpestre. Variable gray tufted per. 3 or 4 in. high: lvs. obovate or oblong to linear, about ¼ in. long: fls. yellow, in short racemes. Eu.—Some of the plants known as *A. serpyllifolium* probably belong here.

alyssoides (*A. calycinum*). Ann., mostly branching at base, to 10 in. high: lvs. narrow-oblong to spatulate, usually under 1 in. long, grayish-canescent: fls. yellowish-white, in narrow terminal racemes. Eu.; nat. in N. Amer.

argenteum. Yellow-Tuft. Per., dwarf, dense, woody at base, 15 in. high: lvs. oblanceolate to spatulate, silvery-tomentose underneath: fls. deep yellow, in clustered heads, all summer. Eu.—Incorrectly known also as *A. rostratum.*

Benthami: *Lobularia maritima.*

calycinum: *A. alyssoides.*

compactum: *A. saxatile* var.; also *Lobularia maritima* var.

creticum. Woody per., 1 ft. or less: lvs. obovate-oblong and obtuse, silvery: fls. rather large, yellow, in short racemes. Crete.

gemonense. Whitish per. woody at base, 1 ft. or less: lvs. oblong-oblanceolate to spatulate, to ½ in. broad: fls. yellow, in short clusters, the petals notched. S. Eu.

giganteum: *Lobularia maritima.*

idæum. Silvery-green per. with short simple sts.: lvs. ovate-oblong: fls. whitish, in short panicle. Crete.

incanum: *Berteroa incana.*

leucadeum. Per. to 15 in., leafy, silvery-gray: lvs. broad-linear, obtuse, entire, to 3 in. long: fls. yellow, in racemes: pod orbicular and flattish. Italy.

maritimum: *Lobularia maritima.*

minimum: *Lobularia maritima* var.

Moellendorfianum. Per., silvery: lower lvs. more or less spatulate, the upper ones ovate, all obtuse and

½ in. or so long: fls. yellow, in an umbel-like head. Bosnia.

montanum. Per. to 10 in., but commonly low and compact: lvs. obovate-oblong to linear, grayish-canescent: fls. yellow, fragrant, in short clusters elongating in fr. Cent. and S. Eu., Caucasus.

podolicum: *Schivereckia podolica.*

pyrenaicum. Dwarf shrublet without spines: lvs. obovate, white-tomentose: fls. white, anthers dark. Pyrenees.

repens. Low per. much like *A. montanum* but with larger orange fls. S. E. Eu.

rostratum: see *A. argenteum.*

saxatile. Golden-Tuft Gold-Dust. Basket-of-Gold. Rock M. Spring-flowering per. forming a spreading mat, woody at bottom: lvs. oblanceolate to somewhat spatulate, mostly with few obscure teeth, grayish, the greater part basal and 2–4 in. long: fls. golden-yellow, in racemes on branching sts. Cent. and S. Eu. Several vars. are in cult.: **compactum**, Dwarf G.; **compactum flore-pleno**; **flore-pleno**; **luteum** (*citrinum, sulphureum*); Silver Queen, palest yellow; **variegatum.**

serpyllifolium: see *A. alpestre.*

spinosum. Woody and spiny, to 1 ft., silvery: lvs. long-lanceolate, to 2 in. long: fls. white or pinkish, in short racemes. S. Eu., N. Afr.

Wierzbickii: *A. rostratum* of botanists, an ann. probably not cult.; *A. rostratum* of hort. is *A. argenteum.*

Wulfenianum. Gray-canescent per. differing from *A. montanum* mainly in the smooth pod twice as large. S. Eu.

ALYXIA (*Gynopogon*). *Apocynaceæ.* Trop. evergreen woody plants in many countries with mostly fragrant fls. and glossy whorled or opposite lvs.: corolla salverform, the cylindrical tube swollen above the middle or contracted at throat: fr. a drupe. Propagated by seeds and cuttings.

olivæformis. Maile. Somewhat twining glabrous shrub: lvs. ovate to oblong, to 2 in. or more long, entire: fls. yellowish, mostly 4-lobed, to 2½ in. long, very fragrant. Hawaii, where it is much prized in garlands or leis.

AMARANTH: *Amaranthus.* **Globe**: *Gomphrena globosa.*

AMARANTHACEÆ. Amaranth Family. Mostly herbs of wide distribution, with opposite or alternate lvs., small unisexual or bisexual fls. subtended by dry scales, usually showy in mass, having small 2–5-parted perianth, 1–5 stamens, superior ovary, and fr. a utricle, achene or berry-like. Many of the genera are weedy, but some species are grown for ornament and pot-herbs, as Achyranthes, Ærva, Amaranthus, Bosea, Celosia, Deeringia, Frœlichia, Gomphrena, Iresine, Nototrichium. All are of simple cult., grown from seeds and from soft cuttings, and prefer open sunny positions.

AMARANTHUS. Amaranth. *Amaranthaceæ.* About 50 coarse annuals native in mild and trop. climates in many parts of the world, some of them widely distributed as weeds of tilled lands and waste places; a few of them are cult. for the colored foliage and the heavy red spikes, and in some countries grown for greens: fls. minute and unshowy, in chaffy often colored heads or spikes: lvs. alternate, in ours broadly ovate or oval unless otherwise noted.

The species grow readily from seeds; sunny positions are best; the leaf colors are likely to be less brilliant in very fertile soils. Some of the weedy kinds may be grown in collections for general interest.

abyssinicus: *A. caudatus.*

atropurpureus: *A. caudatus.*

bicolor: *A. tricolor.*

caudatus (*A. cruentus. A. paniculatus*). Love-Lies-Bleeding. Tassel Flower. Stout, branching, upright, 3–5 ft., with large colored showy coarse erect or somewhat nodding panicle which may be open and graceful or thick and clumpy. Tropics; commonly cult. and sometimes spontaneous.—Variable; the effort to distinguish two species, *A. caudatus* and *A. cruentus*, does not hold. Garden plants known as *A. abyssinicus, atropurpureus, Dussii, elegantissimus, Margaritæ, monstrosus, sanguineus, superbus*, belong here.

chlorostachys: *A. hybridus.*

coleifolius: *A. tricolor.*

cruentus: *A. caudatus.*

Dussii: *A. caudatus.*

elegantissimus: *A. caudatus.*

gangeticus: *A. tricolor.*

Henderi: *A. tricolor* var. *angustior.*

hybridus (*A. chlorostachys*). Common tall weed, usually with green herbage, but sometimes reddish but plants not showy. Var. **hypochondriacus.** Princes-Feather. The cult. form, with many-branched showy panicles, red or brownish-red, the branches slender and graceful, short and erect or only somewhat spreading, terminal one erect or curving from the middle: bracts very sharp, about twice exceeding calyx: herbage usually reddish. Tropics.

hypochondriacus: *A. hybridus* var.

Margaritæ: *A. caudatus.*

melancholicus: *A. tricolor.*

monstrosus: *A. caudatus.*

paniculatus: *A. caudatus.*

salicifolius: *A. tricolor* vars.

sanguineus: *A. caudatus.*

splendens: *A. tricolor* var.

superbus: *A. caudatus.*

tricolor (*A. gangeticus. A. melancholicus*). Erect, mostly much branched, 1–4 ft.: fl.-clusters small, globular, sessile in axils of lvs. or the upper ones 1 or 2 in. long and interrupted and contiguous in a narrow panicle-like infl.: lvs. oval or ovate, the main ones 2½–4 in. broad, often blotched and colored and the plants then sometimes known as Josephs-Coat (*A. bicolor, A. coleifolius*) and brilliant forms as "Combustion," "Molten Fire," "Sunshine" etc. Tropics; grown in the Orient for greens. Var. **angustior** (*A. salicifolius* partly. *A. Henderi*). Plant usually slender: lvs. mostly 1–1½ in. broad. Var. **angustissimus** (*A. salicifolius* partly). Lvs. long-linear or nearly so, usually not surpassing ½ in. in width, often drooping. Var. **splendens** (*A. splendens*) is rich red with brilliant light red foliage at top of plant.

AMARCRINUM. *Amaryllidaceæ.* As the name indicates, a hybrid between the genera Amaryllis and Crinum. **A. Howardii**, recorded as *A. Belladonna* crossed with pollen of *C. Moorei:* fls. soft pink, somewhat fragrant, open funnelform with recurving segms. and declinate style, borne in very large clusters on sts. to 4 ft. long, of lasting quality. Produced in Calif., where it blooms in the open in summer and autumn; suitable also for pot cult. An earlier hybrid in Eu. of similar parentage has been called *Crinodonna.*

AMARYLLIDACEÆ. Amaryllis Family. Over 70 widely distributed genera of per. herbs having bulbous or fibrous roots or rhizomes, usually bisexual fls. with 6-parted perianth, 6 stamens and inferior 3-celled ovary, and fr. a caps. or berry. The family furnishes many choice ornamental subjects as well as medicinal products and fiber. Those treated herein are: Agave, Alstrœmeria, Amarcrinum, Amaryllis, Ammocharis, Anigozanthos, Bomarea, Brunsvigia, Clivia, Cooperia, Crinodonna, Crinum, Curculigo, Doryanthes, Eucharis, Furcræa, Galanthus, Hæmanthus, Hippeastrum, Hymenocallis, Hypoxis, Leucojum, Lycoris, Manfreda, Narcissus, Nerine, Pancratium, Polianthes, Sprekelia, Sternbergia, Vallota, Zephyranthes. Many of these plants bear lily-like fls., but the family differs from the Liliaceæ in having inferior rather than superior ovary.

AMARYLLIS. *Amaryllidaceæ.* One S. African bulbous herb with large lily-like fls., grown in pots or planted out in warm climates: peduncle or scape solid (not hollow). The bulbs should be stored in a dry cool place during the winter in cold climates, then repotted in a mixture of fibrous loam, leaf-mold and sand and placed in a warm position. Liquid manure should be applied when the fls. develop. Most of the plants known as amaryllis in cult. are hippeastrums and other genera.

Atamasco: *Zephyranthes Atamasco.*

aurea: *Lycoris aurea.*

Belladonna. BELLADONNA-LILY. Lvs. strap-shaped, appearing before or after the fls. which bloom in summer or autumn: fls. rose-red, to 3½ in. long, fragrant, in umbels at top of solid scape to 2 ft. high.—There are many color forms from purple to white.

equestre: *Hippeastrum puniceum.*

formosissima: *Sprekelia formosissima.*

Hallii: *Lycoris squamigera.*

Johnsoni: *Hippeastrum Johnsoni.*

Josephinæ: *Brunsvigia Josephinæ.*

longifolia: *Crinum longifolium.*

lutea: *Sternbergia lutea.*

purpurea: *Vallota speciosa.*

radiata: *Lycoris radiata.*

Reginæ: *Hippeastrum Reginæ.*

reticulata: *Hippeastrum reticulatum.*

sarniensis: *Nerine sarniense.*

vittata: *Hippeastrum vittatum.*

AMASONIA. *Verbenaceæ.* Trop. American subshrubs with scattered lvs. and yellow fls. in clusters which are racemed or panicled; grown in the greenhouse the same as Clerodendrum, but little known to gardeners.

calycina. Lvs. to 1 ft. long, irregularly toothed: fls. drooping, to 2 in. long. British Guiana.

punicea. The plant known to hort. under this name is probably *A. calycina.*

AMATUNGULA: *Carissa grandiflora.*

AMBARELLA: *Spondias cytherea.*

AMBERBOA (*Volutarella*). *Compositæ.* Herbaceous annuals sometimes grown in flower-garden, with alternate jagged-toothed or pinnately-cut lvs. and purple, violet or blue heads: fls. all tubular, outer row sterile; pappus of scales. Native in Medit. region, W. Asia and India.

muricata (*Centaurea muricata*). To 2 ft.: lvs. lanceolate: heads pink or purple. Spain, Morocco.

AMBROSIA MEXICANA: *Chenopodium Botrys.*

AMELANCHIER. SERVICE-BERRY. JUNEBERRY. SHADBUSH. *Rosaceæ.* Deciduous showy shrubs or small trees of the north temp. zone, with alternate toothed lvs., white fls. mostly in terminal racemes, and fr. a small dark blue or black pome, sometimes edible. Desirable because of the abundant bloom in early spring, mostly preceding the foliage; also plants of good habit and attractive fr.

Amelanchiers are hardy in the North and do well on a variety of soils. Propagated by seeds sown when ripe or stratified, by suckers when produced, or rare kinds by budding. See also *Juneberry.*

alnifolia. To 7 ft., stoloniferous: lvs. obtuse, densely pubescent beneath when young: racemes erect, to 1½ in. long. Sask. to Colo.

asiatica. To 40 ft.: lvs. acute, densely white-tomentose beneath when young: racemes nodding. Japan, Korea; hardy N.

canadensis. To 30 ft.: lvs. acute or acuminate, tomentose on both sides when young: racemes nodding, to 2 in. long, fls. before lvs. Me. to Ga. and La.

florida. To 15 ft.: lvs. obtuse, becoming glabrous beneath: racemes erect, to 3 in. long. Mich. to Wash.

lævis. To 40 ft.: lvs. short-acuminate, quite glabrous, purplish when young: racemes nodding. Newf. to Ga. and Ala.

oblongifolia. To 25 ft.: lvs. oblong, obtuse or acute, white-tomentose beneath when young: racemes erect, short. Me. to S. C.

ovalis (*A. rotundifolia. A. vulgaris*). To 8 ft.: lvs. obtuse, tomentose beneath when young: racemes erect. Eu.—Differs from other species in the styles free and very short.

rotundifolia: *A. ovalis.*

stolonifera. To 4 ft., spreading by underground stolons and forming patches or colonies: lvs. elliptic to nearly orbicular, serrate toward apex, at first white-pubescent beneath: fr. purplish, with bloom, sweet, sepals mostly recurved. Newf. to Mich. and Va.—Cult. as Dwarf Juneberry.

vulgaris: *A. ovalis.*

AMELLUS. *Compositæ.* S. African herbs with oblong lvs. and blue-rayed fls. in many-fld. solitary heads; disk-fls. with double pappus of scales and bristles; one species sometimes planted in the flower-garden.

annuus (*A. strigosus* var. *Willdenovii*). Ann., diffuse or prostrate: lvs. to 2 in. long, usually with 1 tooth on each side.

AMESIA. *Orchidaceæ.* Terrestrial orchids with creeping rootstocks, leafy sts. and fls. in terminal racemes, the sepals and petals similar, the lip free; sometimes grown in the wild-garden.

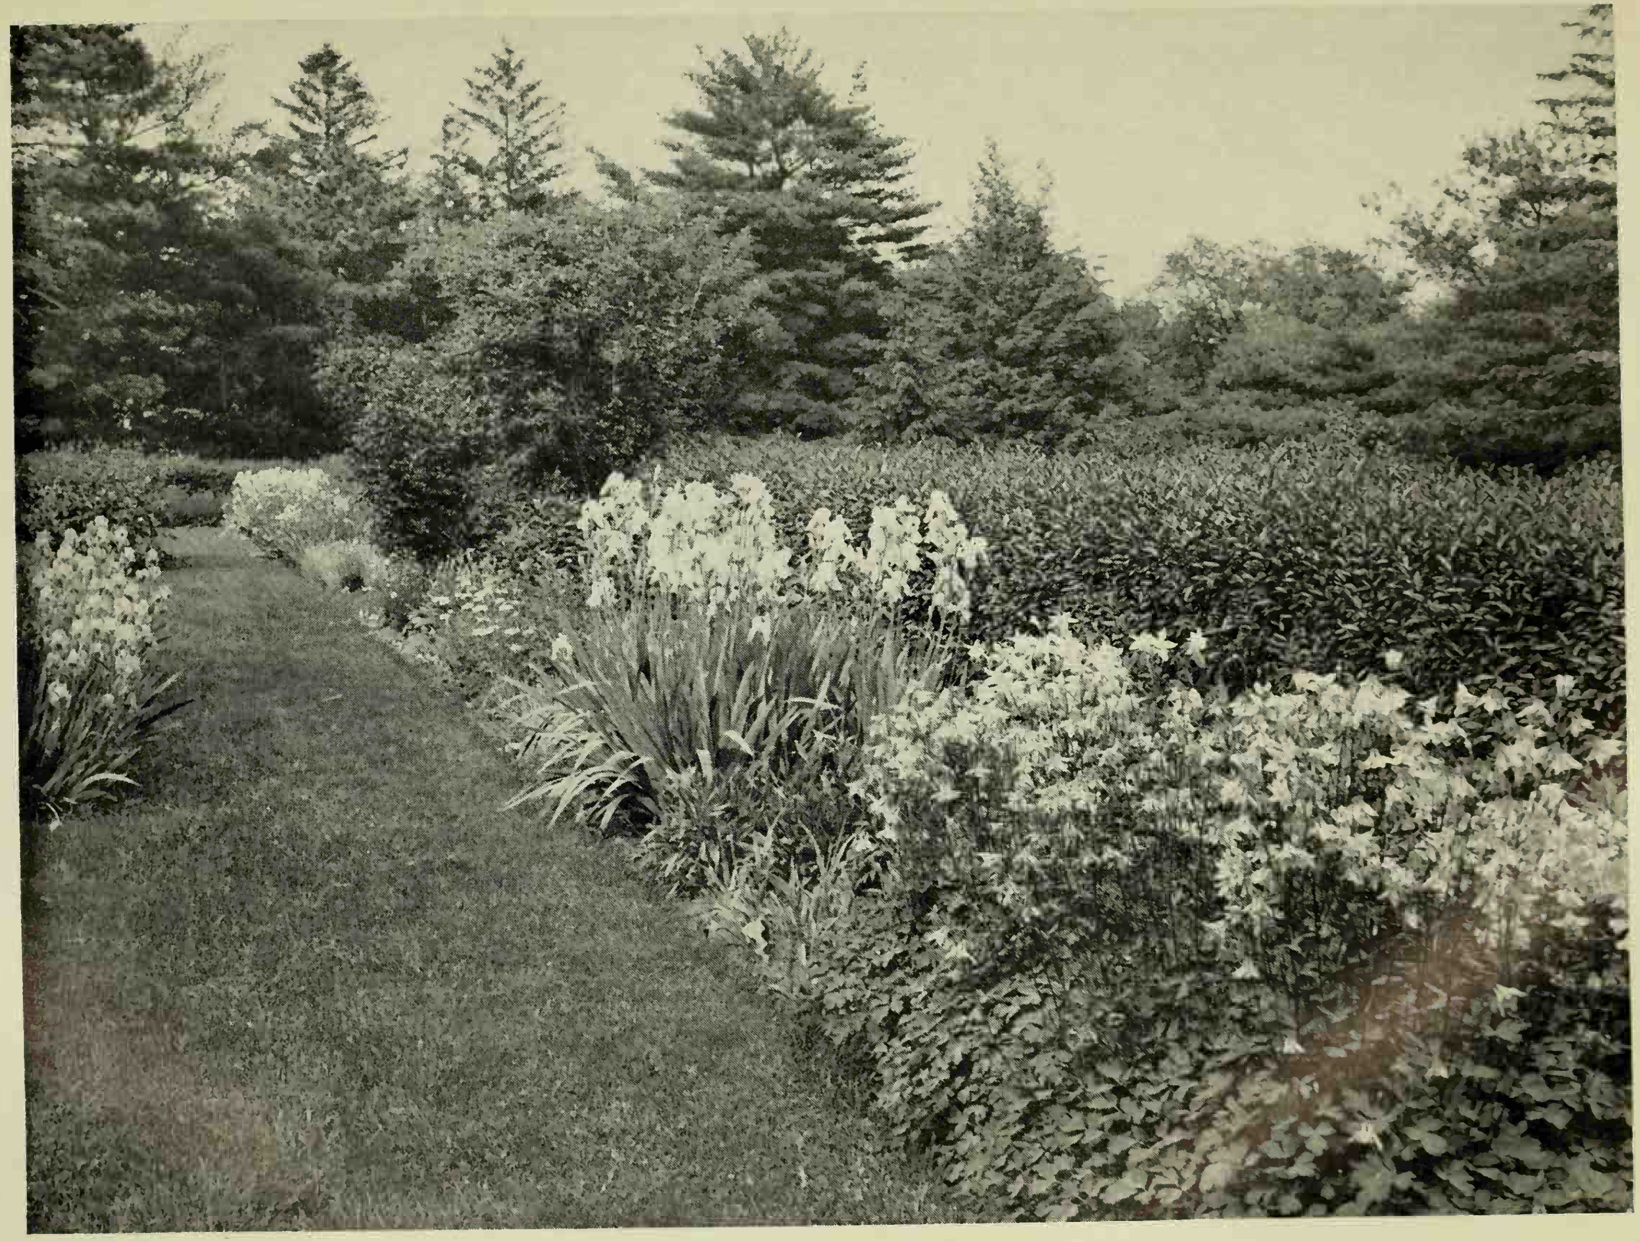
gigantea (*Epipactis gigantea. Serapias gigantea*). To 3 ft.: lvs. to 6 in. long: fls. greenish-rose striped with dark red, about 1 in. across, July–Aug. W. N. Amer.

AMHERSTIA. *Leguminosæ.* One showy Indian tree, **A. nobilis,** reaching 40 ft. in height, with large pinnate lvs., the lfts. to 1 ft. long, pendulous long racemes of bright red and yellow fls. with 2 red petal-like bracts at base of calyx-tube, upper petal 2 in. broad, staminal column prominent; pods woody, to 7 in. long and 2 in. wide.—It requires rich well-drained soil and a trop. moist climate; propagated by layering or cuttings of half-ripened wood over bottom heat.

AMIANTHIUM. *Liliaceæ.* Per. bulbous herbs having linear lvs. and small white fls. in terminal racemes, the perianth-segms. distinct; sometimes grown in the wild-garden. Propagated by division or rarely by seeds.

angustifolium: *Zygadenus angustifolius.*

muscætoxicum (*Zygadenus muscætoxicus. Chrosperma muscætoxicum*). FLY-POISON. To 4 ft. high: lvs. to 2 ft. long and 1 in. wide: racemes to 5 in. long. N. Y. to Fla. and Ark.



II. Borders. — A well-bordered walk; columbines and irises now dominant

AMICIA. *Leguminosæ.* Shrubs or subshrubs with alternate pinnate lvs., yellow papilionaceous fls. mostly in racemes, and fr. a narrow flat pod; native Mex. to Bolivia. One species is sometimes planted in S. Calif.

Zygomeris. To 8 ft.: lfts. 4 or 6, wedge-shaped, to 2½ in. long, glandular-dotted: fls. to 1½ in. long, subtended by large bracts. Mex.

AMMOBIUM. *Compositæ.* Australian per. herbs grown as everlastings or immortelles, with yellow fls. in solitary heads surrounded by involucre of silvery-white bracts; pappus of few teeth.

Of easy cultivation, sometimes treated as a biennial when the seed is sown in September, but may be grown as an annual with seeds sown in spring. Flowers remain white if cut before full bloom and hung in shady airy place to dry.

alatum. WINGED EVERLASTING. To 3 ft., white-woolly, the branches winged: lvs. mostly basal: heads to 2 in. across. Var. **grandiflorum** has larger heads.

AMMOCALLIS: *Vinca rosea.*

AMMOCHARIS. *Amaryllidaceæ.* Two S. African bulbs, one of which may be cult. **A. falcata.** To 1 ft.: lvs. to 2 ft. long and 1 in. wide: fls. bright red, fragrant, in many-fld. umbels terminating a flat solid scape, the perianth-segms. clawed and reflexed.—It may be grown in pots in the greenhouse or planted out and the bulbs stored in winter. It blooms in summer or autumn or in winter under glass; requires rich loamy soil.

AMMOPHILA. *Gramineæ.* Per. grasses with creeping rootstocks, one useful as a binder in sandy soil, particularly along seacoasts: lvs. long and stiff: spikelets in dense spike-like panicles: native along shores in the northern hemisphere. See *Grasses.*

arenaria. EUROPEAN BEACH-GRASS. SEA SAND-REED. MARRAM. To 4 ft.: lvs. to 1 ft. long, rolled inward, rough above, the ligule to 1 in. or more long: panicles to 1 ft. long and ½ in. thick. Eu.; intro. on Pacific Coast.—Propagated by rootstocks.

breviligulata. AMERICAN BEACH-GRASS. The plant of shores and dunes of the Atlantic Coast and Great Lakes, formerly confused with the European species, is a larger plant, with longer panicle and very short ligules: a good sand-binder.

AMOLE: *Chlorogalum pomeridianum.*

AMOMIS CARYOPHYLLATA: *Pimenta acris.*

AMOMUM. *Zingiberaceæ.* Per. herbs with creeping rootstocks, leafy sts. and fls. in dense cone-like spikes beneath the foliage, having 1 petal-like staminode or lip.

Grown as foliage plants in warm regions; sometimes seen in economic collections under glass, as some of the species yield medicinal products. See *Elettaria.* They require rich soil and abundant moisture. Propagated by division in spring. See *Zingiberaceæ.*

Cardamon. To 8 ft.: lvs. to 10 in. long and 3 in. wide: fls. yellow. E. Indies.

vitellinum: *Alpinia vitellina.*

AMORPHA. FALSE INDIGO. *Leguminosæ.* Shrubs bearing alternate pinnate lvs. with small lfts., small fls. in dense terminal spikes, and short slightly curved pods; native in N. Amer. and Mex.

Grown for ornament out-of-doors. Propagated by seeds, greenwood cuttings under glass, hardwood cuttings planted in sheltered position in autumn and left for a year, suckers or layers. The cultivated species are mostly hardy North.

angustifolia: *A. fragrans.*

canescens. LEAD-PLANT. To 4 ft., plant usually densely white-hairy: lfts. to ¾ in. long: fls. blue, in spikes to 6 in. long, July–Aug. Man. to La. and New Mex.

fragrans (*A. angustifolia*). To 1 ft.: lfts. to 1½ in. long: fls. purple-blue, in racemes to 6 in. long, June. Ill. to Tex.

fruticosa. BASTARD INDIGO. To 20 ft.: lfts. to 1½ in. long: fls. dark purple, varying to pale blue and white, in spikes to 6 in. long, May–June. Sask. to Fla. and Mex. Var. **crispa** has lfts. with curled edges. Var. **croceo-lanata**, young parts yellow-pubescent.

glabra (*A. montana*). To 6 ft.: lfts. to 2 in. long: fls. blue, in racemes to 6 in. long, in spring. N. C. to Ga. and Ala.

herbacea. To 4 ft., grayish-pubescent: lfts. to 1 in. long: fls. violet-purple varying to white, the spikes clustered, to 1 ft. long, in spring. N. C. to Fla.

microphylla: *A. nana.*

montana: *A. glabra.*

nana (*A. microphylla*). To 1 ft.: lfts. to ½ in. long: fls. purplish, in racemes to 6 in. long, in spring. Minn. to Rocky Mts.

nitens. To 9 ft.: lfts. to 2½ in. long, shining: fls. in racemes to 10 in. long, in summer. Ga.

tennesseensis. To 20 ft.: lfts. to 1 in. long: fls. violet-purple, in racemes to 6 in. long, in spring and summer. Tenn.

AMORPHOPHALLUS. *Araceæ.* Very large herbs native in trop. Asia, with tuberous roots, large 3-parted lvs. with the segms. pinnately cut, and unisexual fls. borne on an upright spadix surrounded by a conspicuous spathe; grown as curiosities in the greenhouse. The fls. have a disagreeable odor and appear in advance of lvs.

Plants thrive in a rich loamy soil and should be kept dry and warm in winter. Propagated by offsets of the tubers potted singly and kept in a temperature of 65–70°. Grown in greenhouses and sometimes in tubs for summer bloom, or planted out in mild climates.

campanulatus. To 2 ft.: lvs. to 3 ft. long and broad, the petioles spotted with white: spathes ovate, 8 in. long and 10 in. across, fleshy below spotted with white, purplish in center, with wavy margins; spadix about 10 in. long. E. Indies.

giganteus. Lvs. 3 ft. or more broad, pale green, the petioles variegated with white: spathes broadly ovate, 1 ft. long and 8 in. across, clouded with purple, the margins wavy; spadix slightly shorter than spathe. Malaya.

Rivieri: *Hydrosme Rivieri.*

AMPELODESMA. *Gramineæ.* One per. tufted grass with stiff erect sts. to 5 ft. tall, grown for ornament in Calif. **A. mauritanicus** (*A. tenax*). Lvs. very long and narrow, becoming convolute, rough on edges: spikelets in long loose one-sided nodding panicles. Medit. region. See *Grasses.*

AMPELOPSIS. *Vitaceæ.* Tendril-climbing shrubs native in N. Amer. and Asia, with alternate simple or compound lvs., small greenish fls. in long-stalked cymes, and fr. a berry. In Ampelopsis the tendrils do not bear expanded disk-like tips and the disk in the fl. is separate from the ovary and prominent, thus differing from Parthenocissus.

Ampelopsis is grown as a covering for walls and arbors, and is not particular as to soil. Propagated by seeds, also by cuttings and layers. Cuttings of hard wood may be made in September under glass or stored until spring after the manner of grape cuttings; those of soft wood can be struck in the summer.

aconitifolia (*A. dissecta. A. aconitifolia* var. *dissecta*). Lvs. of 3 or 5 lanceolate pinnately lobed lfts. to 3 in. long: fr. orange or yellow, sometimes bluish when young. China. Var. **palmiloba**, lvs. 3-parted and segms. toothed and lobed. See note under *Vitis vinifera*.

arborea (*A.* and *Vitis bipinnata. Cissus arborea*). PEPPER-VINE. Lvs. bipinnate, lfts. ovate, to 1½ in. long, coarsely toothed: fr. dark purple. Va. to Fla. and Mex.

bipinnata: *A. arborea.*

brevipedunculata (*A. heterophylla* var. *amurensis*). Lvs. cordate-ovate, to 5 in. long, with 3 coarsely toothed lobes: fr. lilac becoming blue. N. E. Asia. Var. **citrulloides**, lvs. deeply 5-lobed. Var. **elegans** (*A. variegata*), lvs. variegated with white, green or pink. Var. **Maximowiczii** (*A. heterophylla, Vitis heterophylla* and var. *humulifolia*), lvs. deeply 3–5-lobed.

cordata (*A.* and *Vitis indivisa*). Lvs. broad-ovate, to 5 in. long, toothed and only slightly 3-lobed: fr. blue. Va. to Fla. and Mex.

Delavayana. Lvs. cordate-ovate, to 5 in. long, 3-lobed or -parted or sometimes simple, crenate-toothed, usually pubescent beneath: fr. dark blue. China.

dissecta: *A. aconitifolia.*

Engelmannii: *Parthenocissus quinquefolia* var.

flexuosa: *A. brevipedunculata*, at least in part.

hederacea: *Parthenocissus quinquefolia.*

Henryana: *Parthenocissus Henryana.*

heptaphylla: *Parthenocissus heptaphylla.*

heterophylla: *A. brevipedunculata* var. *Maximowiczii.*

hirsuta: *Parthenocissus quinquefolia* var.

humulifolia (*Vitis humulifolia*). Lvs. broad-ovate, to 5 in. long, 3–5-lobed, coarsely toothed, shining above, whitish beneath: fr. pale yellow or pale blue. China.

hypoglauca: *Cissus hypoglauca.*

indivisa: *A. cordata.*

japonica. Root tuberous: lvs. of 3–5 pinnate or pinnately lobed lfts. to 4 in. long, shining above, the rachis broadly winged: fr. blue. Japan, China.—Some of the material cult. under this name belongs to *Parthenocissus tricuspidata.*

Lowii: *Parthenocissus tricuspidata* var.

megalophylla. Lvs. pinnate or bipinnate, lfts. ovate, to 5 in. long, coarsely toothed: fr. black. China.

micans. Lvs. ovate, to 4 in. long, unlobed or shallowly lobed, coarsely toothed, pale beneath: fr. dark blue. China.

orientalis (*Vitis orientalis*). Lvs. pinnate or bipinnate, lfts. to 3 in. long, sharply notched: fr. red. S. W. Asia.

quinquefolia: *Parthenocissus quinquefolia.*

Saint-Paulii: *Parthenocissus quinquefolia* var.

Thomsoni: *Parthenocissus Thomsoni.*

tricuspidata: *Parthenocissus tricuspidata.*

variegata: *A. brevipedunculata* var. *elegans.*

Veitchii: *Parthenocissus tricuspidata* var.

vitacea: *Parthenocissus quinquefolia* var.

Watsoniana. Lvs. pinnate, lfts. oblong, to 4½ in. long, slightly toothed, purplish beneath. China.

AMPHICOME. *Bignoniaceæ.* Himalayan per. herbs, sometimes woody at base, with alternate pinnate lvs. and funnelform red fls. in terminal racemes; one species is grown in rock-gardens and greenhouses.

arguta. To 3 ft.: lfts. 5–9, lanceolate, to 1½ in. long, deeply toothed: fls. 1 in. long, narrowed at base, in racemes to 8 in. long.

AMPHILOPHIS: *Andropogon saccharoides.*

AMSONIA. *Apocynaceæ.* Per. herbs with alternate lvs., terminal panicles of narrow blue fls., included stamens, and long slender frs.; native in N. Amer. and E. Asia.

The amsonias are grown in shady positions in the hardy border for ornament. Propagated by division, seeds or cuttings.

salicifolia: *A. Tabernæmontana* var.

Tabernæmontana. To 3½ ft.: lvs. ovate to lanceolate, to 4 in. long: fls. ¾ in. long, pubescent outside, in a dense cluster, May–July. N. J. to Fla. and Tex., in low grounds. Var. **salicifolia** (*A. salicifolia*) has narrower lvs., and fls. few in a loose cluster.

texana. To 2½ ft.: lvs. ovate to oblong, and to linear above, to 2½ in. long: corolla-tube to ½ in. long, glabrous outside, Apr.–July. Okla., Tex.—Probably a var. of *A. ciliata* (*A. angustifolia*), more eastward, with rather smaller fls. and narrower lvs.

AMYGDALUS: *Prunus.*

ANACAMPSEROS. *Portulacaceæ.* S. African succulent herbs with fleshy lvs. and racemose fls. opening only in the sun, with 2 sepals and 5 fugacious petals; occasionally grown in the greenhouse. Propagated by seeds or by stem- and leaf-cuttings.

arachnoides. Lvs. ovate, ¼ in. long, cobwebbed, green and shining: fls. white, in 2–3-fld. racemes on scapes to 4 in. high. Var. **grandiflora** (*A. rufescens*) has purplish lvs. and fls.

rufescens: *A. arachnoides* var. *grandiflora.*

Telephiastrum. Lvs. ovate, ⅛ in. long, glabrous: fls. reddish, in 2–4-fld. racemes on scapes to 6 in. high.

ANACARDIACEÆ. CASHEW FAMILY. About 60 genera of woody plants with resinous bark, mostly in the tropics but some of them extending into cool temp. regions, sometimes evergreen; some species have medicinal, tanning and poisonous properties and yield material for varnishes, others are grown for their edible fruit, and still others for ornament. The family is characterized by alternate lvs., the small bisexual or unisexual fls. with a disk between the stamens, 1–6-celled ovary with 1 seed in each cell and 1–6 styles, and fr. commonly a drupe or nut. The following genera are sometimes cult. in our territory: Anacardium, Cotinus, Harpephyllum, Lithræa, Mangifera, Pistacia, Pleiogynium, Rhus, Schinus, Spondias.

ANACARDIUM. *Anacardiaceæ.* Trees and shrubs of trop. Amer., one cult. for its nuts, with simple leathery lvs., numerous small polygamous fls. in terminal panicles, 7–10 stamens, and kidney-shaped fr. borne on a greatly enlarged soft receptacle. Of simple cult. in regions free from frost. Propagated by seeds or choice varieties by shield-budding.

occidentale. CASHEW. Evergreen spreading tree to 40 ft.: lvs. to 8 in. long and 4 in. wide: fls. yellowish-pink: fr. consisting of fleshy bright yellow or red receptacle (cashew-apple, from which sweetmeats and beverages are made) 2–3½ in. long, and kidney-shaped nut containing kernel edible when roasted. Trop. Amer.; nat. in all trop. countries; planted also in S. Fla.

ANACHARIS: *Elodea canadensis.*

ANACYCLUS. *Compositæ.* Ann. or per. herbs, somewhat like the chrysanthemums and chamomiles, with pinnately cut lvs. and many-fld. solitary heads of yellow disk-fls. and white, yellow or purplish ray-fls.; pappus none or consisting of a crown or scales; native in Medit. region and Orient. Sometimes grown in the flower-garden.

officinarum. Ann. to 10 in.: lvs. 2-pinnatisect into linear segms.: ray-fls. white marked purple beneath, heads 1 in. across. S. Eu.

Pyrethrum. Per., procumbent: lvs. 2-pinnatisect into linear segms: ray-fls. white, purplish beneath. S. E. Eu.

radiatus. To 1 ft.: lvs. 2-pinnatisect into linear segms.: ray-fls. yellow, heads 1 in. across. Medit. region..

ANAGALLIS. Pimpernel. *Primulaceæ.* Widely distributed herbs having usually opposite or whorled lvs., axillary solitary fls. in shades of red, blue and white, wheel- or bell-shaped corolla, usually hairy stamens, and fr. opening transversely.

Seeds of the annual species may be sown where the plants are to be grown. The perennials are propagated by division and cuttings.

arvensis. Poor Mans Weatherglass. Spreading ann.: lvs. ovate, to ¾ in. long: fls. scarlet or white, about ¼ in. across. Nat. from Eu. and Asia. Var. **cærulea** has blue fls. Var. **phœnicea** has red fls.

grandiflora: *A. linifolia.*

linifolia (*A. grandiflora. A. Phillipsii*). Per. or bien. to 1½ ft.: lvs. linear or linear-lanceolate, to 1 in. long: fls. blue, reddish beneath, ¾ in. across. Medit. region. Var. **collina**, fls. rose or purplish. Var. **Monelli**, lvs. ovate or oblong.

Phillipsii: *A. linifolia.*

ANANAS. *Bromeliaceæ.* One stiff terrestrial per. herb native in trop. Amer., grown for the edible fr.-head. **A. sativus** (*A. comosus*). Pineapple. St. to 4 ft.: lvs. in rosettes, to 3 ft. long and 1½ in. wide, with spiny tips and prickly edges: fls. bisexual, violet or reddish, borne in dense heads crowned with a tuft of lvs.: fr. fleshy and watery, being really a thickened st. in which the berries are imbedded, becoming 1 ft. long. A few forms are cult. for ornament, as var. **variegatus** with striped lvs. and **A. Porteanus** with olive-green lvs. having a central yellow band. For cult., see *Bromelia* and *Pineapple.*

ANAPHALIS. *Compositæ.* White-woolly perennials with leafy sts., interesting for the rock-garden and hardy border, the small white or gray corymbose heads remaining stiff and dry; fls. all tubular; pappus bristly. They are often cut before maturity, dried and dyed for use as everlastings.

margaritacea (*Antennaria margaritacea*). Pearl Everlasting. To 3 ft.: lvs. linear-lanceolate, to 5 in. long, entire, green above, white-tomentose beneath: heads white, ¼ in. across. N. Amer., Eu., N. Asia.

ANASTATICA. *Cruciferæ.* One little ann., **A. hierochuntica,** is sometimes grown for curiosity as Resurrection-Plant or Rose-of-Jericho. When ripe and dead the branches curve inward forming a ball-like object that rolls over the deserts and which opens out when moist. The seeds are borne in small hairy pods or silicles close along the branches and soon germinate when wet weather comes. The balls are sometimes sold; they open and close with moisture and dryness. It is a gray unattractive plant a few inches high, with oblong-spatulate toothed lvs. and minute white fls. The plant is easy to grow in warm locations. Algeria to Arabia and Persia.

ANASTROPHUS: *Axonopus compressus.*

ANATHERUM. *Gramineæ.* Per. grasses with aromatic roots from which perfumery and medicines are made, narrow lvs. and spikelets borne in narrow terminal panicles. See *Grasses.*

zizanioides (*Vetiveria zizanioides*). Vetiver-Khus-Khus. To 8 ft.: lvs. to 3 ft. long and ⅓ in. wide, rough on edges: panicles to 1 ft. long, the branches ascending. Asia, E. Indies; escaped in La.—Sometimes planted far S. along divisions between areas.

ANAY: *Hufelandia.*

ANCHISTEA: *Woodwardia virginica.*

ANCHOR-PLANT: *Colletia cruciata.*

ANCHUSA. Alkanet. Bugloss. *Boraginaceæ.* Old World hairy herbs with alternate simple lvs. and blue, violet or white funnelform or tubular fls. in coiled leafy-bracted cymes or racemes; throat of corolla bearing scales. Of easy cult. in the flower-garden or border. Propagated by seeds in spring or division of the roots.

angustifolia: *A. officinalis* var.

azurea (*A. italica*). Per. to 5 ft.: lvs. lanceolate to ovate-lanceolate: fls. bright blue, to ¾ in. across, in summer and autumn; calyx-lobes long-pointed. Medit. region.—Known in several hort. forms, as Dropmore, Opal, Perrys, Picotee, Pride of Dover.

Barrelieri. Per. to 2 ft.: lvs. ovate-lanceolate: fls. blue with white tube and yellow throat, in spring. Eu., Asia Minor.

capensis. Bien. to 1½ ft.: lvs. narrowly lanceolate: fls. blue margined with red and with white throat, ¼ in. across, in summer and autumn. S. Afr. Var. **alba** has white fls.

italica: *A. azurea.*

myosotidiflora: *Brunnera macrophylla.*

officinalis. Bien. or per. to 2 ft.: lvs. lanceolate: fls. bright blue or purple, ¼ in. across, in summer and autumn. Eu. Var. **incarnata** has flesh-colored fls. Var. **angustifolia** has narrowly lanceolate lvs.

sempervirens: *Pentaglottis sempervirens.*

ANDIRA. Angelin-Tree. *Leguminosæ.* Trees mostly native in trop. Amer., with alternate pinnate lvs., fragrant papilionaceous fls. in terminal panicles, and drupe-like pods. They require trop. temperature and rich loamy soil. Propagated by cuttings over bottom heat, when seeds are not available.

inermis (*Vouacapoua americana*). Cabbage-Tree. To 40 ft. or more: lfts. to 2½ in. long: fls. lilac or pale rose: pods 1½ in. long. Trop. Amer., W. Afr.

ANDROMEDA. Bog-Rosemary. *Ericaceæ.* Low evergreen shrubs, now restricted to 2 species, with narrow entire revolute lvs., pinkish urn-shaped fls. in nodding terminal umbels, and capsular frs.

Grown in rockeries and borders and very hardy North. Propagated by seeds, cuttings of mature wood under glass, and by layers.

arborea: *Oxydendrum arboreum.*

cærulea: *Phyllodoce cærulea.*

calyculata: *Chamædaphne calyculata.*

cassinifolia: *Zenobia pulverulenta* var. *nuda.*

Catesbæi: *Leucothoë Catesbæi.*

floribunda: *Pieris floribunda.*

glaucophylla. Similar to *A. polifolia* but the lvs. white-tomentose beneath and fr. glaucous. Newf. to N. J. and Ind.

japonica: *Pieris japonica.*

ligustrina: *Lyonia ligustrina.*

mariana: *Lyonia mariana.*

polifolia. To 1 ft., the rootstocks creeping: lvs. oblong to linear, to 1½ in. long, the margins revolute, glaucous beneath: fls. ¼ in. long. Eu., N. Asia, N. N. Amer.

pulverulenta: *Zenobia pulverulenta*

speciosa: *Zenobia pulverulenta.*

ANDROPOGON. Beard-Grass. *Gramineæ.* Per. grasses widely distributed in both hemispheres, having narrow lvs. and spikelets in spike-like racemes which are borne singly, in pairs or clusters, florets awned, rachis prominently bearded; a few grown for forage. See *Grasses.*

argenteus: *A. saccharoides;* see also *A. hirtus.*

furcatus. To 6 ft., branched above: lvs. to 1½ ft. long and ½ in. wide: racemes to 5 in. long, 2–6 at tips of sts., florets awned. Me. to Fla. and N. Mex.

halepensis: *Holcus halepensis.*

hirtus. To 3 ft.: lvs. to 1 ft. long and 1/12 in. wide, slightly glaucous with white midrib: racemes to 1½ in. long, silvery-hairy, in pairs in loose panicles to 1 ft. long. Warm regions of Old World.—Some of the material cult. as *A. argenteus* belongs here.

saccharoides (*A. argenteus. Amphilophis saccharoides*). To 3½ ft.: lvs. to 8 in. long and ⅓ in. wide: racemes 1½ in. long, silky-hairy, in shining white panicles to 4 in. long. Colo. to Mex., W. Indies, N. S. Amer.

Sorghum: *Holcus Sorghum.*

ANDROSACE. Rock-Jasmine. *Primulaceæ.* Small tufted herbs of Eu., Asia and N. Amer., sometimes grown in rock-gardens or low borders: lvs. mostly basal: fls. in shades of red and white, resembling primroses but the corolla shorter than the calyx and constricted at the throat.

Androsaces require well-drained soil which must not be allowed to dry out in time of drought. Propagated by seeds, division or cuttings.

alpina (*A. glacialis*). Per. to 3 in., loosely tufted: lvs. in rosettes at ends of branches, oblong-lanceolate, ⅕ in. long, hairy: fls. rose, solitary, ⅕ in. across. Alps.

arachnoidea: *A. villosa* var.

brigantiaca: *A. carnea* var.

carnea. Per. to 3 in.: lvs. linear, to ¾ in. long, forming rosettes: fls. in 3–7-fld. umbels, rose or whitish with a yellow eye, ⅓ in. across. Alps and Pyrenees. Var. **brigantiaca** has narrower lvs. and white fls. Var. **Halleri** (*A. Halleri*) has longer shining hairy lvs. Var. **Laggeri** (*A. Laggeri*) is more densely tufted and with short scape.

Chamæjasme. Per. to 3 in.: lvs. lanceolate to ovate, to ½ in. long, hairy, forming rosettes: fls. in umbels, white with yellowish eye, to ½ in. across. N. Asia, Eu., N. N. Amer.

Chumbyi, chumbyiense: *A. sarmentosa* var.

ciliata. Per. to 3 in.: lvs. oblong-ovate, ¼ in. long, ciliate on margins, forming rosettes: fls. rose, ⅓ in. across, solitary. Pyrenees.

coronopifolia: *A. lactiflora.*

foliosa. Per. to 5 in., stoloniferous: lvs. all basal but not in rosettes, obovate, to 1½ in. long: fls. pink, in umbels. Himalayas.

glacialis: *A. alpina.*

Halleri: *A. carnea* var.

hedreantha. Per. to ½ in.: lvs. oblong-lanceolate, ⅓ in. long, in rosettes: fls. violet-red, in 5–10-fld. umbels. Balkans.

helvetica. Per., densely tufted: lvs. lanceolate, very small, in dense rosettes, hairy: fls. white, ⅙ in. across, solitary, nearly sessile. Alps.

lactea. Per. to 8 in.: lvs. linear or linear-lanceolate, to ¾ in. long: fls. snow-white, ⅓ in. across, in umbels, the pedicels to 2 in. long. Mts. of Eu.

lactiflora (*A. coronopifolia*). Ann. to 1 ft.: lvs. linear-lanceolate, to 2 in. long, forming rosettes: fls. in large clusters, white, to ½ in. across. Siberia.

Laggeri: *A. carnea* var.

lanuginosa. Per. covered with silky white hairs, prostrate: lvs. both basal and st., lanceolate-ovate, to ¾ in. long: fls. in dense clusters on scapes about 2 in. long, rose-colored, ⅓ in. across. Himalayas.

obtusifolia. Per. to 6 in.: lvs. lanceolate, to ¾ in. long, in rosettes: fls. white or pinkish, ⅓ in. across, in umbels. Alps.

primuloides. Stoloniferous, the runners to 4 in. long: lvs. linear-lanceolate, to ½ in. long or the larger ones 2 in. or more, in rosettes, covered with silvery hairs: fls. in clusters on scapes to 5 in. high, pink, to ½ in. across. Himalayas.

puberulenta. Ann. to 8 in.: lvs. oblanceolate, to 1¼ in. long, pubescent, in rosettes: fls. white, ⅙ in. across, in umbels, the pedicels to 2 in. long. Alaska to New Mex.

sarmentosa. Stoloniferous, the runners to 5 in. long: lvs. lanceolate or ovate-lanceolate, to 1½ in. long, in rosettes, covered with silvery hairs when young: fls. many, in clusters on scapes to 5 in. high, rose-colored, ¼ in. across. Himalayas. Var. **Chumbyi** (*A. Chumbyi* and *chumbyiense*). More cespitose and woolly. Var. **Walkinei** is listed.

sempervivoides. Stoloniferous, the runners to 2 in. long: lvs. ovate, to ¼ in. long, fleshy, in rosettes on the stolons: fls. rose, ¼ in. across, in umbels on scapes to 4 in. high. Himalayas.

septentrionalis. Ann. to 8 in.: lvs. lanceolate or oblong, to ¾ in. long, in rosettes: fls. white or pink, to ⅕ in. across, in umbels. Eu., Asia, N. N. Amer.

spinosissima: listed name.

villosa. Per. to 3 in., densely white-hairy: lvs. lanceolate, in rosettes: fls. white or rose with yellowish-red throat, ⅓ in. across, in umbels. Eu., Asia. Var. **arachnoidea** (*A. arachnoidea*), lvs. oblong-ovate, to 1 in. high.

Vitaliana: *Douglasia Vitaliana.*

ANDROSTEPHIUM. *Liliaceæ.* Cormous American herbs with basal linear lvs. and blue fls. in terminal umbels, the perianth-segms. united about half way; one species is sometimes planted in the wild-garden or border.

cæruleum (*A. violaceum*). To 8 in.: fls. lilac or violet, 1 in. long. Kans. to Tex.

violaceum: *A. cæruleum.*

ANEMONE. Anemone or Anemony. Windflower. *Ranunculaceæ.* Attractive perennials, blooming in spring, summer or autumn, white, rose, red or even purplish; the lvs. are more or less divided or dissected or even compound; fr. an achene which in the Pulsatilla section has long feathery styles; mostly native in the north temp. zone. As a Latin generic name the word is pronounced Anemo′-ne; as an English vernacular, Anem′-one.

Anemones are valuable in all types of gardens, where they thrive in rich sandy loam, many in partial shade. Aside from the florists' and Japanese anemones, the species are employed mostly in wild borders and for colonizing. The florists' tuberous-rooted kinds, as St. Brigid and The Bride, are useful for late winter and spring bloom in the house, being started in autumn in flats and handled after the manner of freesias. These and similar anemones may also be flowered out-of-doors, with the culture of tulips and hyacinths, if given good winter protection as they will not stand much frost. These florists' plants are of the species *A. coronaria, A. fulgens, A hortensis.*

The Japanese anemones are amongst the best perennial herbs for autumn bloom. They stand for some years in good land; the situation should be protected from strong wind.

Most species can be propagated by seed or by root-division, the best time for the latter being in early spring; sow the seed in the fall as soon as it has ripened.

acutipetala: *A. alpina.*

Allenii: *A. apennina* var., *A. nemorosa* var.

alpina (*A. acutipetala. Pulsatilla alpina*). To 1½ ft.: involucral lvs. short-petioled: fls. few in a cluster or solitary, cream inside, purple outside, to 3 in. across, May–June. Eu. Var. **sulphurea** is soft sulfur-yellow.

angulosa: *Hepatica angulosa.*

apennina. To 9 in., with tuberous roots: involucral lvs. long-petioled: fls. solitary, sky-blue, 1½ in. across, Mar.–Apr. Woods, Italy. Var. **Allenii**, fls. pale blue; var. **plena**, fls. double; var. **purpurea**, fls. mauve.

baldensis. To 6 in.: involucral lvs. petioled: fls. solitary, white, often tinged rose outside, to 2 in. across, July–Aug. Rocky places in the high Alps.—*A. Drummondii* of the Rocky Mts. and Calif. is considered to belong here.

blanda. To 6 in., with tuberous root: fls. deep sky-blue, larger than in *A. apennina*. Greece, Asia Minor.

borealis: a synonym of *A. parviflora*.

cærulea: *A. nemorosa* var. *Robinsoniana*.

canadensis (*A. pennsylvanica. A. dichotoma*). Meadow A. To 2 ft.: involucral lvs. sessile: fls. solitary, white, to 2 in. across, May–Aug. On shores, in low places and open meadows, N. Amer.

caroliniana (*A. decapetala*). To 1 ft., with tuberous root: involucral lvs. sessile: fls. solitary, cream or purple, to 1½ in. across, Apr.–May. Open places, Ill. to Fla. and Tex.

coronaria. Poppy-flowered A. Poppy A. To 1½ ft., root tuberous: involucral lvs. sessile, finely divided: fls. solitary, poppy-like, of many shades and combinations of red, blue, white, to 2½ in. across, early spring–June. Meadows, Medit. region.—The most common anemone of the florists for forcing. In the trade are The Bride, St. Brigid, semi-double many colors, Victoria Giant. Var. **flore-pleno** has double fls. in many colors, and var. **chrysanthemiflora** very double fls.

cylindrica. Candle A. To 2 ft.: involucral lvs. long-petioled: fls. in clusters, greenish-white, ¾ in. across, June–Aug.: fr. long and narrow. Open places, N. Amer.

decapetala: *A. caroliniana*.

deltoidea. To 1 ft.: involucral lvs. sessile, 3-parted: fls. solitary, white, about 2 in. across. Wash. to Calif.

dichotoma: *A. canadensis*.

Drummondii: see *A. baldensis*.

fulgens. Flame A. Scarlet A. To 1 ft., the root tuberous: involucral lvs. sessile, entire or slightly cut: fls. solitary, scarlet, the stamens black, to 2½ in. across, May–June. France.

globosa (*A. multifida*). To 20 in.: involucral lvs. short-petioled: fls. red to whitish or yellowish, about 1 in. across, May–Sept. Meadows and hillsides, W. N. Amer.

Halleri (*Pulsatilla Halleri*). To 6 in., covered with silky white hairs: involucral lvs. sessile: fls. lilac, 2½ in. across, June. Sunny places, Switzerland.

Hepatica: *Hepatica americana* and *nobilis*.

hortensis. Garden A. Broad-leaved A. To 10 in., the root tuberous: involucral lvs. sessile, entire or only slightly divided: fls. red, rose, purple or white with brownish-violet stamens, to 3 in. across, May. S. Eu.

hupehensis: reported as a dwarf early-flowering form of *A. japonica* with pink or pale mauve fls. shaded with deeper pink on back.

hybrida: name of indefinite and various application.

japonica. Japanese A. Stout, branching, to 3 ft.: lvs. of 3 ovate toothed or lobed lfts.: peduncles several: fls. purplish, red, rose, white, to 3 in. across, Sept. to late frosts. Japan, China. Var. **alba**, fls. white; var. **crispa**, lvs. crisped on edges; var. **rosea superba**, fls. rose; var. **rubra**, fls. red, waxy. Some of the vernacular-named forms are: Alice, rosy-carmine; Coupe d'Argent, white; Frau Marie Manshart, Herbstrose, double, rose; Honorine Joubert, white; Kriemhilde, lilac; Lady Ardilaun, white; Loreley, silver pink; Louise Uhink, white; Magdalena Uhink, double; Max Vogel, deep rose, semi-double; Mount Rose, double, deep pink; Prince Henry, dark red; Profusion, semi-double, rose; Queen Charlotte, semi-double, pink; Richard Ahrens; Whirlwind, semi-double, white.

magellanica. Trade name, applied sometimes to a yellow-fld. plant, and sometimes to a white-fld. subject with deeply cut foliage.

montana (*Pulsatilla montana*). Similar to *A. Halleri* but with glabrous lvs. and dark violet drooping fls. Eu., Caucasus. Vars. **alba** and **rubra** are color forms.

multifida: *A. globosa*. The true *A. multifida* of botanists, native in S. S. Amer., is probably not in cult.

narcissiflora. To 1½ ft.: involucral lvs. sessile: fls. several in a cluster, white, to 1 in. across, May–July. Mts. of Eu.—The American representative has been separated as *A. zephyra* which is distinguished by its lemon-yellow usually solitary fls. and lvs. less lobed.

nemorosa. European Wood A. To 8 in.: involucral lvs. petioled: fls. white or purplish, solitary, 1 in. across, Apr.–May. Eu., Siberia. Hort. vars. are: **alba** (var. *flore-pleno*), pure white; **Allenii**, lavender-mauve; **major**, white; **Robinsoniana** (var. *cærulea*), blue, Mar.–Apr.: **rosea** (var. *rubra fl. pl.*), reddish-purple.

Nuttalliana: *A. patens* var.

occidentalis (*Pulsatilla occidentalis*). To 1½ ft.: involucral lvs. sessile: fls. solitary, white or purplish, to 2 in. across, May. B. C. to Calif.

palmata. To 9 in., the root tuberous: lvs. nearly orbicular, not divided, involucral lvs. sessile: fls. golden-yellow, solitary or in 2's, about 1 in. across, May–June. Medit. region. Var. **albida** (var. *alba*), fls. white; var. **flore-pleno**, fls. double; var. **lutea**, fls. yellow.

parviflora. To 1 ft.: involucral lvs. nearly sessile: fls. white or tinged with rose, to 1 in. across, May–June. N. Asia, N. N. Amer.

patens (*Pulsatilla patens*). Per. to 3–6 in. high when in bloom but becoming 1 ft. and more in fr.: lvs. basal, appearing after the bloom, ternate (petiole not running through the blade), divided into many linear lobes, the involucre of sessile divided bracts: fls. purplish, rarely white, to 2½ in. across. Eu., N. Asia; native Ill. to B. C. and Alaska in races sometimes separated as var. *Nuttalliana* (or var. *Wolfgangiana*), and *Pulsatilla hirsutissima* and *P. ludoviciana*.

pennsylvanica: *A. canadensis*.

pratensis. One of the Pulsatilla group from N. Eu.: to 12 in.: lvs. pinnately parted into linear segms.: fls. dark purple, hanging, with 6 reflexed sepals.

Pulsatilla (*Pulsatilla vulgaris*). Pasque Flower. To 1 ft.: lvs. pinnately dissected (along a rachis), appearing with the fls.: involucral lvs. sessile, silky-hairy: fls. solitary, blue to reddish-purple, bell-shaped, to 2½ in. across, Apr. Eu. Color vars. are **lilacina, rubra, variegata.**

quinquefolia (*A. nemorosa* var. *quinquefolia*). American Wood A. Differs from *A. nemorosa* in the slender sts., less lobed involucral lvs. and smaller fls. E. N. Amer.

ranunculoides. Yellow Wood A. To 8 in., the rootstock somewhat tuberous: involucral lvs. nearly sessile: fls. usually solitary, golden-yellow, to 1 in. across, Apr.–May. Eu., Siberia. Var. **flore-pleno** has partially double fls.

rivularis. To 3 ft., branched: fls. white or tinged blue outside, 1½ in. across, in many-fld. cymes. India, Ceylon.

Robinsoniana: *A. nemorosa* var.

rupicola. To 1 ft., silky: lvs. 3-parted, the segms. toothed or cut, the radical ones long-stalked: fls. 1 or 2, large and showy, white, often pinkish outside. Himalayas.

sibirica. To 6 in.: involucral lvs. short-stalked: fls. solitary, white. Siberia.

sulphurea: *A. alpina* var.

sylvestris. Snowdrop A. To 1½ ft.: involucral lvs. long-petioled: fls. solitary or in 2's, pure white, fragrant, to 1½ in. across, often nodding, May–June. Eu., S. W. Asia. Var. **flore-pleno** has double fls.

thalictroides is *Anemonella thalictroides*.

vernalis (*Pulsatilla vernalis*). To 6 in.: involucral lvs. pinnate, silky-hairy: fls. purple outside, white inside, Apr. Eu.

virginiana. To 3 ft., branching above: involucral lvs. long-petioled: peduncles 2–5; fls. white or greenish, to 1½ in. across, June–Aug. Woods, N. S. to S. C. and Kans.

vitifolia. Grape-leaf A. Vine-leaved A. To 3 ft., branched: lvs. deeply 5-lobed, densely tomentose beneath; involucral lvs. petioled: fls. white, to 2 in. across, in many-fld. cymes, July. Himalayas.

zephyra: see *A. narcissiflora*.

ANEMONE, RUE-: *Anemonella thalictroides*.

ANEMONELLA (*Syndesmon*). *Ranunculaceæ*. One delicate per. herb with tuberous roots, native in E. N. Amer., sometimes transferred to the wild-garden or colonized. **A. thalictroides** (*Thalictrum anemonoides*). Rue-Anemone. To 9 in.: lvs. ternately compound, those of the involucre sessile: fls. white or pink, to 1 in. across, in terminal umbels, Mar.–June. Var. **flore-pleno** has double fls. —It thrives in partial shade in light moist soil. Propagated by division of roots in spring or autumn.

ANEMONOPSIS. *Ranunculaceæ.* One Japanese per. herb to 3 ft., grown as a border plant. **A. macrophylla.** Lvs. ternately compound and cut: fls. pale purple, drooping, 1½ in. across, with many petals and petal-like sepals, borne in loose racemes.—Does best in rich soil in partially shady well-drained situations. Propagated by division of roots in spring or autumn or by seeds sown in sandy loam.

ANEMONY: *Anemone.*

ANEMOPÆGMA. *Bignoniaceæ.* Mostly Brazilian climbing shrubs with lvs. of 2–3 entire lfts., funnelform fls. in lateral racemes, and fr. a woody or leathery caps.; grown under glass or in the open in warm regions.

Chamberlaynii (*A. racemosum. Bignonia Chamberlaynii*). Lvs. of 2 oblong or ovate lfts. to 7 in. long and a terminal tendril: fls. pale yellow striped in throat with purple or white, to 3 in. long, in racemes longer than lvs.: fr. oval, to 6 in. long.—*Doxantha Unguis-cati* is sometimes grown under this name.

racemosum: *A. Chamberlaynii.*

ANEMOPSIS. *Saururaceæ.* One per. aquatic herb with aromatic rootstocks having medicinal properties. **A. californica.** Yerba Mansa. To 1½ ft., the st. with 1 broad clasping lf. bearing 1–3 small lvs. in axil: lvs. mostly basal, elliptic-oblong, to 6 in. long: fls. very small, in a dense spike to 1½ in. long which is subtended by white petal-like involucral bracts. Calif., Ariz., Mex.

ANETHUM. *Umbelliferæ.* Ann. or bien. herbs native in the Old World, with lvs. 3–4-pinnately divided into linear segms., small yellow fls. in umbels, and flattened frs.; one species grown for the seeds which are used for flavoring. Easily grown from seeds which should be sown in a warm open situation.

graveolens. Dill. To 3 ft.: lvs. very finely cut into thread-like divisions. Eu.; nat. in N. Amer.

ANGELICA. *Umbelliferæ.* Per. herbs with compound lvs., small white or greenish fls. in terminal umbels, and compressed frs.; sometimes planted in borders for bold effects. Propagated by seeds and sometimes by division.

Archangelica (*Archangelica officinalis*). Stout bien. or per., to 6 ft.: lvs. 2-pinnate into 3-parted lfts. Eu., Asia, in low ground.

Curtisii. To 4 ft.: lvs. biternate, the divisions pinnate: umbels to 6 in. across. Pa. to Ga., in woods.

rosæfolia. Sts. to 5 ft. long, scrambling: lvs. of 2–5 pairs of toothed lfts. to 2½ in. long: umbels to 3 in. across. New Zeal.

ANGELICA, JAPANESE: *Aralia elata.*

ANGELIN-TREE: *Andira.*

ANGELONIA. *Scrophulariaceæ.* Per. herbs and subshrubs with opposite lvs. or the upper alternate and showy 2-lipped tubular blue fls. solitary and axillary or in terminal racemes; native in trop. Amer. Grown readily in greenhouses in the N. and in the open far S. Propagated by seeds or softwood cuttings.

angustifolia. Per. to 1 ft., glabrous: lvs. narrow-lanceolate, toothed: fls. violet or purple, in long racemes. Mex., Cuba.

grandiflora: probably a hort. form of *A. salicariæfolia.*

salicariæfolia. Per. to 2 ft., sticky-pubescent: lvs. lanceolate to linear-oblong, to 3 in. long, toothed: fls. blue, to ¾ in. across, in leafy racemes. N. S. Amer.

ANGELS-TRUMPET: *Datura arborea.*

ANGIOPTERIS. *Marattiaceæ.* Large ferns with short thick sts. and bipinnate lvs. with sori in a marginal row; native in the southern hemisphere and grown sometimes in greenhouse collections. For cult. see *Ferns.*

evecta. St. or caudex 2 ft. thick and 2–6 ft. high: lfts. to 1 ft. long, entire or toothed. Japan to Australia and Madagascar.

pruinosa. Probably a pruinose-nigrescent form of *A. evecta.* Java.

ANGOPHORA. Gum-Myrtle. *Myrtaceæ.* E. Australian trees or shrubs told from Eucalyptus by opposite lvs.; fls. white, in terminal corymbs; frs. capsular. Rarely planted in S. U. S.

lanceolata. Large tree with smooth deciduous bark: lvs. lanceolate, to 5 in. long.

ANGRÆCUM. *Orchidaceæ.* Epiphytes with very thick lvs. and fls. usually in racemes, the sepals and petals similar, the lip with side lobes small or lacking, entire middle lobe and long slender spur; grown in the hothouse. For cult. see *Orchids.*

distichum: *Mystacidium distichum.*

eburneum. Sts. to 4 ft. high: lvs. to 2 ft. long and 2 in. wide: fls. to 4 in. across, the sepals and petals greenish-white, the lip ivory-white with green spur about 3 in. long, in 8–15-fld. racemes longer than lvs., Oct.–Nov. Madagascar.

Eichlerianum. Sts. pendulous, to 3 ft. long: lvs. to 5 in. long and 2 in. wide: fls. about 3 in. across, solitary or 2 together on stalks about length of lvs., the sepals and petals yellow-green, the lip white, greenish-yellow at base, with spur about 2 in. long, June–Sept. Trop. Afr.

Leonis. Nearly stemless: lvs. to 8 in. long, lanceolate: fls. to 3 in. across, the sepals and petals yellowish, the lip white with spur to 6 in. long, in 3–5-fld. racemes, Jan.–Apr. Comoro Isls.

modestum: *Aerangis modesta.*

Sanderianum: *Aerangis modesta.*

Scottianum. Sts. pendulous, to 1 ft. long: lvs. to 4 in. long and cylindrical: fls. to 2½ in. across, white with yellow spur to 4 in. long, borne singly or 2 together on stalks about 1½ in. long, July–Aug. Comoro Isls.

sesquipedale (*Macroplectrum sesquipedale*). Sts. to 3 ft. high: lvs. to 1 ft. long and 2 in. wide: fls. 5 in. or more across, ivory-white, the spur to 1 ft. long, in 2–4-fld. racemes about length of lvs., Dec.–Feb. Madagascar.

ANGULOA. *Orchidaceæ.* Terrestrial orchids from the Andes of Colombia with pseudobulbs bearing 2–3 plaited lvs. and fls. solitary on erect scapes, the fleshy sepals and petals united and almost concealing the smaller 3-lobed lip; grown in a cool greenhouse. See *Orchids.*

Clowesii. Pseudobulbs to 6 in. long: lvs. to 2 ft. long: fls. yellow, solitary on scapes to 1 ft. long, May–June. Var. eburnea has ivory-white fls.

eburnea: *A. Clowesii* var.

Ruckeri. Somewhat smaller than *A. Clowesii* but with olive-green fls. which are brown or spotted within, on scapes to 8 in. long, May–June.

ANHALONIUM: *Ariocarpus, Lophophora, Roseocactus.*

ANIGOZANTHOS. *Amaryllidaceæ.* Odd Australian per. herbs with thick rootstocks, linear or sword-shaped basal lvs. and large red, purple, green or yellowish fls. borne in one-sided woolly racemes or spikes, the perianth-tube very long.

Grown in the greenhouse or out-of-doors in the South. It does best in a mixture of peat, loam and sand and should be well watered except in the winter rest period. Propagated by division of the roots.

Manglesii. To 3 ft., the st. covered with red wool: fls. green, red at base, 3 in. long, with very narrow tube, woolly.

ANISACANTHUS. *Acanthaceæ.* Shrubs native in Mex. and W. N. Amer., with opposite entire lvs. and red tubular 2-lipped fls. in one-sided terminal spikes; sometimes cult. in S. Calif.

Thurberi. To 5 ft.: lvs. lanceolate or oblong, to 2 in. long, pubescent: fls. to 1½ in. long. Ariz., New Mex., Mex.

Wrightii. To 4 ft., glabrous or nearly so: lvs. oblong to ovate-lanceolate, acute, to 2 in. long: fls. purplish-red, to 1½ in. long, in naked panicles. Tex.

ANISE: *Pimpinella Anisum.* **Star:** *Illicium verum.*

ANISOSTICHUS: *Bignonia capreolata.*

ANISOTOME. *Umbelliferæ.* Aromatic herbs of New Zeal., having pinnate lvs. and mostly unisexual white or red fls. in compound umbels; one species is sometimes grown in mild regions for ornament.

latifolia (*Ligusticum latifolium*). Per. to 6 ft. or more: lvs. leathery, shining, 2-pinnate: fls. red, in umbels to 3 in. across.

ANNATTO: *Bixa Orellana.*

ANNESLIA: *Calliandra.*

ANNONA. *Annonaceæ.* Mostly trop. American trees and shrubs grown for the edible frs. in warm climates: lvs. alternate, simple and entire: fls. solitary or clustered, mostly thick or fleshy and of odd dull colors: fr. a large fleshy syncarp formed by the fusion of the carpels and receptacle. For cult. see *Cherimoya.*

Cherimola. CHERIMOYA. To 25 ft., deciduous: lvs. ovate to ovate-lanceolate, to 10 in. long, velvety-pubescent beneath: fls. fragrant, yellow- or brown-tomentose outside, 1 in. long: fr. globular to conical, light green, to 5 in. long, smooth or with small tubercles. Andes of Peru and Ecuador.

diversifolia. ILAMA. To 25 ft.: lvs. elliptic to oblanceolate, to 5½ in. long: peduncles with leaf-like bracts at base: fls. maroon, 1 in. long: fr. oval or round, to 6 in. long, pale green or pink, with stout tubercles or sometimes smooth. Mex., Cent. Amer.

glabra. POND-APPLE. To 40 ft., evergreen: lvs. ovate to oblong, to 7 in. long: fls. yellowish marked with red inside, fragrant, 1 in. or more long: fr. ovoid, yellowish, to 4 in. long, smooth. Trop. Amer., W. Afr.—Grown as a stock.

muricata. SOURSOP. GUANABANA. To 20 ft., evergreen: lvs. obovate to elliptic, to 5 in. long: fls. yellow, 1 in. or more long: fr. ovoid, to 8 in. long, dark green, covered with short fleshy spines. Trop. Amer.

reticulata. CUSTARD-APPLE. BULLOCKS-HEART. To 25 ft., deciduous or half-evergreen: lvs. oblong-lanceolate to lanceolate, to 8 in. long: fls. yellowish, 1 in. long: fr. heart-shaped or oval, reddish-yellow or -brown, to 5 in. across, smooth, the carpels marked by impressed lines. Trop. Amer.

squamosa. SUGAR-APPLE. SWEETSOP. To 20 ft., deciduous: lvs. oblong-lanceolate to lanceolate, to 6 in. long: fls. greenish-yellow, to 1 in. long: fr. round, heart-shaped or conical, yellowish-green and glaucous, to 3 in. across, tuberculate and the carpels falling apart. Trop. Amer.

ANNONACEÆ. ANNONA FAMILY. Over 70 genera of trees and shrubs of wide distribution, mostly in the tropics, having simple alternate lvs., usually bisexual fls. with 3 sepals and 6 similar petals, numerous stamens, and fr. a syncarp or caps. The family yields edible frs. as well as ornamental subjects in the genera Annona, Artabotrys, Asimina, Cananga, Rollinia.

ANNUALS. An annual (abbreviated ann. in this book) is a plant that naturally completes its life within one year (Latin *annuus*, of a year's duration) from germination to seeding and death. In a horticultural sense the word frequently denotes a plant that blooms the first year from seed, whether or not it then completes its cycle and dies. Thus, the common bachelor button or cornflower (*Centaurea Cyanus*) is an annual, but four-o'clock is a perennial that blooms freely from seed the first year and is listed with annuals. Herbaceous plants that live only one year because they are killed by frost but which in mild climates or under glass may live two years or more are properly *plur-annuals*, as the tomato and many others. Other plants treated as annuals but that are carried over winter as bulbs or tubers are *pseud-annuals*, of which dahlia, potato, gladiolus are examples. In this book the term annual is employed mostly in the horticultural sense to designate plants that are grown from seeds for bloom or fruit only the same season.

Annuals are of simple cultural requirements as a rule. They lend themselves well to amateur gardening and experiment, and they possess a fascination all their own. The range of stature, habit and flower-color is very wide. Some of them are attractive vines. Mostly they can be grown with success in the northern states if sown directly in the garden when the weather becomes settled, in well-prepared "quick" soil. In warm climates many of them are grown in the cool season. Species that bloom very late, as cosmos, single dahlias, moonflowers, castor-beans, may be started indoors in pots or flats. Some kinds are classed as "hardy," which may be sown before frosts have ceased; others are "half-hardy," an intermediate indefinite class that may be sown before the full warm weather comes; others are "tender," that require the arrival of steady warmth before sowing or that are commonly started under glass. In North America these terms are now little used.

It is well to sow the seeds of annuals liberally. Many may not germinate. Even if they all come up, the combined strength of the rising plantlets will break the crust on hard soils; and in the thinning which follows, only strong and promising plants are allowed to remain. Better effects are also often obtained when the colors are in masses, especially if the flowers are thrown into the bays of heavy shrub borders. Plants continue to bloom for a longer period if they are not allowed to produce seeds. The flowers should be picked, if possible, as soon as they begin to fade. Most annuals should be in good bloom at three months from seed, and many of them at two months.

There is wide choice in the kinds of annuals. One's personal preference must be the guide. Yet there are some groups considered to be standard or general-purpose plants. They are easily grown almost anywhere, and are sure to give satisfaction. The remaining plants are mostly such as have secondary value, or are adapted to particular purposes or uses. Following are some of the groups of general-purpose annuals: Petunia, phlox, pink or dianthus, larkspur or delphinium, calliopsis or coreopsis, pot-marigold or calendula, bachelors-button or Centaurea Cyanus, clarkia, zinnia, marigold or tagetes, mignonette, collinsia, gilia, California poppy or eschscholzia, verbena, poppy, China aster, sweet pea, nemophila, portulaca, silene, candytuft or iberis, alyssum, stock or mathiola, morning-glory, nasturtium or tropeolum, scabiosa, salpiglossis, amaranthus, cockscomb.

White-flowered annuals: acroclinium, ageratum, alyssum, ammobium, antirrhinum, arctotis, argemony, aster, balsam, brachycome, browallia, candytuft, centaurea, chrysanthemum, clarkia, cosmos, delphinium, dianthus, four-o'clock, gomphrena, helichrysum, lavatera, lobelia, lupinus, malope, matricaria, nemesia, nemophila, nicotiana, nigella, petunia, phlox, poppy, portulaca, rhodanthe, scabiosa, schizanthus, verbena, zinnia.

Pink-, rose-, and red-flowered annuals: abronia, acroclinium, amaranthus, anagallis, antirrhinum, aster, balsam, cacalia, candytuft, centaurea, chrysanthemum, clarkia, cockscomb, convolvulus, coreopsis, cosmos, delphinium, dianthus, four-o'clock, gaillardia, godetia, gomphrena, gypsophila, helichrysum, lavatera, linaria, linum, lupinus, lychnis, malope, morning-glory, nasturtium, nemesia, phacelia, phlox, poppy, portulaca, rhodanthe, salpiglossis, salvia, saponaria, scabiosa, stock, sweet pea, verbena, zinnia.

Blue-, lilac-, lavender-, and purple-flowered annuals: ageratum, anagallis, anchusa, antirrhinum, aster, balsam, brachycome, browallia, campanula, candytuft, centaurea, convolvulus, cosmos, delphinium, gilia, linaria, lobelia, lupinus, nemesia, nemophila, nicotiana, nigella, nolana, petunia, phacelia, phlox, portulaca, salpiglossis, salvia, scabiosa, specularia, sweet pea, torenia, trachymene, verbena.

Yellow- and orange-flowered annuals are to be found in the following genera and groups: abronia, argemony, cacalia, calendula, California poppy, centaurea, chrysanthemum, coreopsis (calliopsis), cosmos, dimorphotheca, emilia, erysimum, evening-primrose, four-o'clock, gaillardia, helichrysum, hunnemannia, marigold, nasturtium, poppy, sanvitalia, sunflower, thelesperma, venidium, zinnia.

Annuals adapted to edgings: abronia, ageratum, alyssum, antirrhinum (dwarf), brachycome, California poppy, candytuft, collinsia, coreopsis (dwarf), dianthus, godetia, Gypsophila muralis, lobelia, marigold (dwarf), mesembryanthemum, nemophila, nigella, pansy, phlox, portulaca, sanvitalia, Saponaria ocymoides (perennial), verbena.

Annuals that continue to bloom after the first autumn frosts: Abronia umbellata, Adonis æstivalis, Adonis annua (autumnalis), Argemone grandiflora, calendulas, callirrhoë, Centaurea Cyanus, centauridium, Cheiranthus Cheiri, chrysanthemums, Convolvulus tricolor, dianthus of various kinds, Erysimum Perofskianum, Erysimum asperum (arkansanum), eschscholzias in several varieties, Gaillardia pulchella picta, Gilia achilleæfolia, Gilia capitata, Gilia laciniata, Gilia tricolor, Iberis affinis, Lavatera trimestris, Lychnis Cœli-rosa (oculata), Lychnis elegans, Lychnis Viscaria, mathiolas or stocks, Œnothera Lamarckiana, Œnothera Drummondii, Œnothera rosea, Phlox Drummondii, Salvia splendens, Salvia farinacea, Salvia Horminum, verbenas, Virginia stocks.

Annuals that are tendril- or petiole-climbers: balloon-vine, balsam-apple, balsam-pear, canary-bird-flower, cobea, eccremocarpus (grown as annual North), gourds, nasturtium, sweet pea, wild cucumber.

Annuals that are twiners: bean (scarlet runner and hyacinth bean), cardinal climber, cypress-vine, Japanese hop, moonflower, morning-glory and related plants, thunbergia.

ANODA. *Malvaceæ.* Mostly ann. herbs, or grown as such in cold regions, of warm countries, with alternate commonly lobed lvs. and purple or lilac fls. solitary in the axils; occasionally grown under glass or in the open for summer and autumn bloom. Propagated by seeds.

hastata. Lvs. arrow-shaped, the upper heart-shaped and 5-angled: fls. blue or white, about 1½ in. across. Mex. to Peru.—Differs from *A. lavateroides* in the reticulated carpels.

lavateroides. Lvs. heart-shaped to arrow-shaped, toothed or entire: fls. violet, purple or white, to 2 in. across. Tex. to Mex. and S. Amer.

triangularis. To 3 ft., much branched: lvs. triangular, toothed at base: fls. lilac, 1¾ in. across. Mex.

Wrightii. To 2 ft.: lvs. ovate or oblong-ovate, scarcely lobed: fls. yellow, ¾ in. across. New Mex.

ANŒCTOCHILUS: *Dossinia marmorata.*

ANOGRA: *Œnothera.*

ANOMATHECA: *Lapeirousia cruenta.*

ANOPTERIS. *Polypodiaceæ.* One delicate fern native in the W. Indies and sometimes seen under glass. **A. hexagona** (*Pteris heterophylla*). Lvs. tufted, of two kinds, to 2 ft. long, 2–3-pinnate, with marginal indusia. See *Ferns.*

ANOTA. *Orchidaceæ.* Epiphytic orchids with leafy sts. and fls. in racemes, the lip entire and spurred. See *Orchids* for cult.

densiflora (*Vanda densiflora. Saccolabium giganteum*). Sts. to 8 in.: lvs. to 1 ft. long and 2 in. wide: fls. 1 in. across, in many-fld. pendulous racemes to 16 in. long; sepals and petals white spotted at base with violet; lip purple, white near base, Nov. Burma.

violacea (*Vanda violacea. Saccolabium violaceum. Rhynchostylis violacea*). Similar to the above but with white sepals and petals spotted with violet and violet lip, Feb. Philippines.

ANSELLIA. *Orchidaceæ.* African epiphytic orchids of a few closely related species, of which one is sometimes grown in the hothouse. See *Orchids.* **A. africana.** Sts. short, bearing 4–7 linear lvs. to 1 ft. long: fls. yellow spotted with chocolate-brown, about 1 in. long, in many-fld. terminal panicles to 16 in. long, Mar.–June.

ANTELOPE-BRUSH: *Purshia.*

ANTENNARIA. EVERLASTING. PUSSYS-TOES. *Compositæ.* Per. white-woolly herbs with lvs. mostly basal and small clustered heads, the fls. diœcious and tubular; pappus of bristles.

Sometimes grown for the dry fl.-heads or in rock-gardens and adapted to poor soil. Propagated by seeds and division.

aprica. Soft-woolly, making patches, to 12 in. or less, with leafy stolons: lvs. mostly spatulate and obtuse, to 1 in. or more long, those on st. linear: heads about ⅓ in. across, the involucral bracts white or pink. S. D. to New Mex. and west.

canadensis. To 12 in., slender: lvs. spatulate or oblanceolate, to 1½ in. long, nearly or quite obtuse, with 1 prominent nerve: heads about ⅓ in. high, in close cluster, the involucre green. Newf. to Conn. and west.

candida: *A. dioica.*

carpathica. To 10 in., woolly: lvs. oblanceolate to linear, to 2 in. long: heads ¼ in. across, with brownish-purple involucral bracts. N. N. Amer., Eu., N. Asia.

dioica (*A. candida. A. tomentosa*). To 1 ft., stoloniferous: lvs. spatulate, to 1 in. long: heads ¼ in. across, with white or rose involucral bracts. Eu., Asia; reported as having escaped in N. Amer.

glauca: a listed name.

microphylla (*A. parvifolia* probably). Slender, to 12 in., with very short stolons: lvs. spatulate, obtuse or apiculate, ¾ in. or less long, silky both sides: heads about ¼ in. high. Sask. south and west.

margaritacea: *Anaphalis margaritacea.*

neglecta. To 12 in., the slender stolons leafy at tip: lvs. mostly oblanceolate, tapering to base, tomentose but nearly glabrous above, 1-nerved, to 1½ in. long: heads about ⅓ in. across, the involucre brownish with white tips. Me. to Va., Kans. and Wis.

neodioica. Slender, to 12 in., woolly, with many leafy stolons: lvs. broad-ovate to spatulate, only indistinctly 3-nerved, to 1 in. long, apiculate, white-tomentose underneath: heads to ⅓ in. broad, the involucre with white tips. Newf. to Va. and west.

parvifolia: see *A. microphylla.*

rhodantha. To 6 in.: lvs. spatulate to linear, to ¾ in. long: heads ½ in. long, involucral bracts tipped with red. Wash,

rosea. To 1½ ft., stoloniferous, white-tomentose: lvs. oblanceolate, to ¾ in. long: heads to ¼ in. long, with rose involucral bracts. Alaska to Calif. and Colo.

tomentosa: *A. dioica.*

ANTHEMIS. *Compositæ.* Herbs with finely cut strong-scented foliage and solitary fl.-heads, the ray-fls. yellow or white, disk-fls. yellow; pappus none or a minute crown.

A few kinds are useful in wild-gardens and the border, blooming from midsummer to frost. Propagated by seeds and division.

Aizoon: *Achillea ageratifolia* var.

altissima. Ann. to 3 ft.: lvs. 2–3-pinnatisect into lanceolate segms.: ray-fls. white, in heads to 2 in. across. S. Eu.

arabica: *Cladanthus arabicus.*

cinerea. Spreading per. to 1 ft., gray-pubescent or -tomentose: lvs. ovate, bipinnatisect into oblong obtuse segms.: heads large, with white rays longer than the disk. Balkans.

Kelwayi. Similar to *A. tinctoria* (of which it is apparently a form) but with deeper yellow fls. and foliage more finely cut.

montana. Per. to 10 in., silky-pubescent: lvs. pinnatisect into linear segms.: ray-fls. white. S. Eu.

nobilis. CHAMOMILE. Per. to 1 ft.: lvs. pinnatisect into narrow-linear segms.: ray-fls. white. Eu. Var. **grandiflora** has larger sometimes yellow fls. and **flore-pleno** double.

tinctoria. GOLDEN MARGUERITE. Per. to 3 ft.: lvs. 2-pinnatisect into oblong or ovate segms.: ray-fls. golden-yellow, in heads to 2 in. across. Eu., Asia. Vars. **pallida** and **alba** are listed.

ANTHER: the pollen-bearing part of the stamen, borne at the top of the filament or sometimes sessile.

ANTHERICUM. *Liliaceæ.* Herbs with tuberous or fleshy roots, linear basal lvs., and small white wheel-shaped fls. in loose racemes terminating slender scapes.

Grown as border plants with protection or in cool greenhouses in pots or benches. Of easy cultivation. Propagated by stolons, division, and by seeds when available.

Bicheti. Lvs. variegated with white. W. trop. Afr.—The botanical identity of this plant is uncertain, as is also that of *Phalangium Bichei* which is probably the same.

comosum: *Chlorophytum comosum.*

elatum: *Chlorophytum elatum.*

Liliago. ST.-BERNARD-LILY. To 3 ft., not branched: lvs. to 1 ft. long: fls. about 1 in. across. Eu. Var. **major** is a larger form.

Liliastrum: *Paradisea Liliastrum.*

Mandaianum: *Chlorophytum elatum.*

picturatum: *Chlorophytum elatum.*

ramosum. To 2 ft., st. branched: fls. smaller than in *A. Liliago.* Eu.

variegatum: *Chlorophytum elatum.*

vittatum: *Chlorophytum elatum.*

ANTHOLYZA. *Iridaceæ.* African summer-blooming herbs with corms, leafy sts. and red or yellow long-tubular fls. in terminal spikes, the perianth-segms. unequal. Cult. as for Gladiolus, to which the plants are related.

æthiopica. To 4 ft.: basal lvs. to 1½ ft. long and 1 in. broad: fls. red-yellow, to 2½ in. long, curved. S. Afr.

ANTHOPOGON: *Gentiana thermalis.*

ANTHOXANTHUM. *Gramineæ.* Ann. and per. grasses adapted to meadows, fragrant when drying, the spikelets in spike-like terminal panicles, florets awned; native of Eu., Asia, and N. Afr. See *Grasses.*

aristatum (*A. Puelii*). Ann. to 1 ft.: lvs. to 4 in. long and ⅛ in. wide: panicles to 1½ in. long, conspicuously awned. Eu.; escaped in E. N. Amer.

gracile. Tufted ann. to 8 in.: lvs. hairy: spikelets ½ in. long, silvery and shining, conspicuously awned, in racemose panicles. Medit. region.

odoratum. SWEET VERNAL-GRASS. Per. to 2 ft.: lvs. to 6 in. long and ¼ in. wide: panicles to 3 in. long, bronzy-green, early. Eu., Asia; nat. in N. Amer.

Puelii: *A. aristatum.*

ANTHRISCUS. *Umbelliferæ.* Herbs with pinnately compound lvs., small white fls. in compound umbels, and compressed frs.; grown for the lvs. which are used like parsley.

They are of easy cultivation in any soil, thriving in shaded situations. Propagated by seeds.

Cerefolium. SALAD CHERVIL. Ann. to 2 ft.: lvs. 2-pinnate, the segms. ovate and deeply cut, giving the foliage a very finely divided appearance: fr. beaked. S. E. Eu., W. Asia; nat. in N. Amer. See *Chervil.*

sylvestris. Per. or bien. to 3 ft.: lvs. 2-pinnate, the segms. ovate-lanceolate and deeply cut: fr. not distinctly beaked. Eu., W. Asia.

ANTHURIUM. *Araceæ.* Trop. American perennials of varied habit, having arrow- or heart-shaped entire or lobed lvs. and bisexual fls. in densely-fld. spadices subtended by widely spreading or reflexed often colored spathes; grown in the greenhouse for the striking foliage or spathes.

Anthuriums require high temperatures, never below 55° in winter, and a humid atmosphere. They thrive in rough fibrous loam and the roots should be kept well covered. Repotting is necessary only every few years with older plants. Propagated by suckers or root-cuttings placed in pots over bottom heat; also by seeds under a bell-glass in a temperature of about 80°.

album. Hybrid with *A. Andrœanum* as one parent, or a variant, having white spathes.

Andræanum. Lvs. oblong-ovate, heart-shaped at base with deep narrow sinus, to 1 ft. long and 6 in. wide, the petiole longer than blade: spathes spreading, cordate, to 6 in. long, orange-red varying to rose or white. Colombia.

bogotense. Lvs. cordate, to 2 ft. long and 16 in. wide, long-acuminate: spathes broadly lanceolate, spreading, 8 in. long, yellowish. Colombia.

Brownii. Lvs. lanceolate-cordate, to 3 ft. long and 20 in. across, shining green above, paler beneath: spathes lanceolate, spreading, 6 in. long, green tinged with purple. Colombia.

carneum. Hybrid between *A. Andrœanum* and *A. nymphœfolium* with rose-colored spathes.

Clarkianum: hort. name.

crystallinum. Lvs. cordate-ovate, to 14 in. long and 10 in. across, deep velvety-green prominently veined with white, pale rose beneath: spathes linear-oblong, to 6 in. long, green. Colombia.

Duchartii: hort. name.

ferrierense. Hybrid between *A. Andrœanum* and *A. ornatum* with ovate-cordate lvs. and spathes, the latter rosy, and white spadices.

Forgeti. Lvs. to 14 in. long and 9 in. wide, peltate, deep velvety-green: spathes to 6 in. long and ⅔ in. wide, green. Colombia.

grande. Lvs. oblong-ovate, to 2 ft. long and 16 in. wide: spathes ovate-cordate, 6 in. long, white or purplish. Bolivia.

illustre: hort. name.

Lowii: hort. name.

magnificum. Lvs. cordate-ovate, to 1½ ft. long and 10 in. wide, olive-green above with prominent white veins, the petioles 4-angled: spathes lanceolate, 8 in. long, becoming recurved, green or reddish. Colombia.

regale. Lvs. cordate-oblong, to 16 in. long and 8 in. wide, very long-acuminate, green above, paler beneath: spathes broadly lanceolate, 3 in. long. Peru.

Reynoldsianum: hort. name.

Scherzerianum. Lvs. oblong-lanceolate, 8 in. long and 2 in. wide, long-pointed, green: spathes broadly ovate, 3 in. long, deep red varying to rose and white; spadix spirally coiled, yellow. Cent. Amer. Var. **giganteum** has larger spathes. Var. **maximum,** spathes scarlet, large. Var. **Rothschildianum** has red spathes spotted with white.

tetragonum. Lvs. oblong to obovate-lanceolate, to 4 ft. long and 1½ ft. wide, glaucous-green above, yellowish below: spathes oblong-lanceolate, to 8 in. long. Costa Rica.

Veitchii. Lvs. long-oblong, to 3 ft. long and 10 in. wide, cordate at base, rich metallic-green with prominent veins: spathes ovate-lanceolate, 3 in. long, erect or becoming reflexed, greenish-white. Colombia.

velutinum. Lvs. cordate, 10 in. long and 6 in. wide, shining green. Colombia.

Warocqueanum. Lvs. cordate-lanceolate, 3 ft. long and 10 in. wide, velvety-green veined with white: spathes linear-lanceolate, reflexed, 4 in. long, green. Colombia.

ANTHYLLIS. *Leguminosæ.* Per. herbs or subshrubs from Eu., N. Afr. and Asia, with pinnate lvs. and papilionaceous fls. in dense clover-like heads; grown for ornament and *A. Vulneraria* for forage in Eu. on poor soils. Propagated by seeds, division and cuttings.

Barba-Jovis. JUPITERS-BEARD. Silky-hairy evergreen shrub to 12 ft.: lfts. to ¾ in. long: fls. yellowish-white. S. Eu.

montana. To 1 ft. or less, white-silky lvs. pinnate, the many lfts. small and entire, oval or oblong: fls. purple or pink, in dense involucrate heads. Alps. Vars. **carminea** and **rubra** are color forms.

tetraphylla. Ann., mostly prostrate: lvs. with large terminal lft. and 2–4 small lateral lfts.: fls. yellowish-white striped with pink. Medit. region.

Vulneraria. KIDNEY VETCH. WOUNDWORT. To 1 ft.: lvs. with terminal lft. 1 in. long, lateral lfts. small or none: fls. yellow to deep red. Eu., W. Asia.

ANTIARIS. *Moraceæ.* Evergreen trees of Malaya and Australia with alternate lvs. and unisexual fls., the staminate in dense heads and the pistillate solitary; one intro. in S. Calif.

toxicaria. UPAS-TREE. To 250 ft., the milky juice poisonous: lvs. oblong, to 8 in. long, entire or slightly toothed: fr. a fleshy purple or red drupe. Malaya.

ANTICLEA: *Zygadenus elegans.*

ANTIDESMA. *Euphorbiaceæ.* Trees and shrubs native in the tropics of the Old World; the bark of some species furnishes cordage and frs. are sometimes edible: lvs. alternate, simple: fls. diœcious, without petals, in spikes or racemes: fr. a small fleshy drupe. Sometimes cult. for ornament in warm regions. Propagated by cuttings.

Bunius. BIGNAY. Evergreen tree to 30 ft.: lvs. oblong, shining, to 6 in. long: fls. green, in spikes: frs. currant-like, red, often made into preserves. India, Malaya.

ANTIGONON. *Polygonaceæ.* Tendril-climbing vines with alternate entire lvs. and red, pink, white or yellowish fls. in racemes terminating in a tendril.

One species is commonly grown in warm climates to cover verandas, bushes and fences. Of easy cultivation, but the soil should not be too rich, for the best bloom; it may also be grown in a warm light greenhouse. Propagated by seeds and cuttings.

africanus: an erroneous name.

leptopus. CORAL-VINE. PINK-VINE. CORALLITA. CONFEDERATE-VINE. ROSA DE MONTANA. Climbing to 40 ft.: lvs. arrow-shaped or cordate-ovate: fls. bright pink, in axillary racemes. Mex. Var. **albus** has white fls.

ANTIPHYLLA: *Saxifraga oppositifolia.*

ANTIRRHINUM. SNAPDRAGON. *Scrophulariaceæ.* Erect, climbing or procumbent herbs usually grown as annuals, with sac-shaped 2-lipped fls. in rose, red, purple, yellow and white.

The snapdragon grown in gardens and for cut-flowers in greenhouses is *A. majus.* For the garden, treat the same as any annual. Plants sometimes winter over, if well protected, and bloom early in spring. For greenhouse culture the seed for the first lot is planted in July; by successive sowings the grower may have snapdragons all the year.

angustifolium: *A. siculum.*

antirrhiniflorum: *Maurandia antirrhiniflora.*

Asarina. Procumbent per., sticky-pubescent: lvs. cordate-ovate and crenate, 5-lobed or -nerved: fls. white or pinkish, 1½ in. long, solitary. S. W. Eu.

assurgens: *A. siculum.*

Coulterianum. Chaparral S. Ann. to 3 ft., erect or climbing, glabrous except the infl.: basal lvs. ovate, to 1¼ in. long, entire: fls. purplish to white with yellowish hairy palate, ⅓ in. long, in spike-like racemes. Calif.

glandulosum. Viscid erect per. to 5 ft.: lvs. lanceolate, sessile, to 2½ in. long, those on sterile shoots linear: fls. pink, in dense racemes, to ¾ in. long. Calif.

glutinosum. Prostrate much branched per., sticky-pubescent: lvs. oval, entire: fls. yellowish-white with lip red-striped, in racemes. Spain.

Huetii: *A. sempervirens.*

majus. Common or Large S. Per. to 3 ft., glabrous except infl.: lvs. lanceolate or oblong-lanceolate, to 3 in. long, entire: fls. purplish-red varying to white and other colors, to 1½ in. long, in long terminal racemes. Medit. region; escaped in E. U. S. Forms in the trade are grouped under Tall, 2–3 ft., Intermediate or Half Dwarf, 15–18 in., Dwarf or Tom Thumb, 6–9 in.

maurandioides: *Maurandia antirrhiniflora.*

Nuttallianum. Ann. to 3 ft., climbing, sticky-pubescent: lvs. broad-ovate, to 2 in. long: fls. blue or violet with white spot on lower lip. S. Calif.

Orontium. Ann. to 1 ft., glabrous or pubescent: lvs. linear, to 2 in. long: fls. purple, ½ in. long, solitary. Eu., Asia; escaped in N. Amer.

sempervirens (*A. Huetii*). Evergreen procumbent much branched per., tomentose: lvs. ovate or oblong: fls. white spotted purple, with yellow throat. Pyrenees.

siculum (*A. angustifolium. A. assurgens*). Much branched per. to 2 ft., pubescent or glabrous: lvs. linear-lanceolate, to 1½ in. long: fls. white or yellowish with yellow throat, to 1 in. long, in racemes. Medit. region.

speciosum: *Galvezia speciosa.*

ANYCHIA: *Paronychia argyrocoma.*

APETALOUS: lacking or without petals.

APHANES: *Alchemilla arvensis.*

APHANOSTEPHUS. *Compositæ.* Ann. or bien. herbs having alternate lvs. and solitary fl.-heads with white, violet or purple ray-fls. and golden disk-fls.; pappus a crown.

skirrobasis. To 1½ ft.: lvs, spatulate to linear, to 2½ in. long, gray-pubescent, the lower toothed or cut; ray-fls. white, to 1 in. across. Tex. to Fla.—Adapted to the flower-garden, with the look of erigeron.

APHELANDRA. *Acanthaceæ.* Trop. American herbs or shrubs with opposite simple lvs. and yellow, orange or red 2-lipped fls. in dense terminal spikes with large overlapping bracts.

Aphelandras are grown under glass for the showy bracted spikes and are of easy cultivation. After blooming the plants should be rested. Propagated by cuttings of half-ripened wood or of young growth with a heel, and by seeds when obtainable.

aurantiaca. Lvs. ovate to oblong, to 1 ft. long, deep green above, pale beneath: fls. orange, 2½ in. long, in spikes to 6 in. long. Mex. to S. Amer.

Leopoldii: *A. squarrosa.*

squarrosa (*A. Leopoldii*). Lvs. ovate, to 1 ft. long, dark green veined with white above: fls. pale yellow, 1½ in. long, in spikes to 1 ft. long, bracts orange-yellow. Brazil.

tetragona. Lvs. oval, to 9 in. long, green: fls. scarlet, 2 in. long, the lateral lobes of lower lip very small, in clustered spikes to 8 in. long. W. Indies, S. Amer.

APIO: *Arracacia xanthorrhiza.*

APIOS. *Leguminosæ.* Tuberous-rooted twining herbs with pinnate lvs., papilionaceous fls. in short racemes, and long flat pods; native in E. N. Amer. and Asia, one sometimes grown in the wild-garden. Propagated by tubers and by seeds.

tuberosa (*Glycine Apios*). Groundnut. Potato Bean. Wild Bean. To 8 ft., the roots with strings of tubers: lfts. 5–7, to 3 in. long: fls. brown, fragrant, in late summer. N. B. to Fla. and Tex.

APIUM. *Umbelliferæ.* Herbs with pinnately compound lvs., small white fls. in compound umbels, and compressed frs.; one species is a common vegetable grown for the blanched lf.-stalks and a var. for the edible roots. See *Celery.*

graveolens var. dulce (*Celeri graveolens*). Celery. Bien. to 3 ft., strong-smelling: lvs. pinnate, each of the 5–7 lfts. ternately compound and often again divided or toothed. Widely distributed. Var. rapaceum, Celeriac, has thickened turnip-like edible root-crown.

Petroselinum: *Petroselinum hortense.*

APLECTRUM. *Orchidaceæ.* One N. American terrestrial species, sometimes transplanted to the wild-garden or border. **A. hyemale** (*A. spicatum*). Putty-Root. Adam-and-Eve. Lf. to 6 in. long and 3 in. wide, arising from the corm: fls. yellowish-brown, with narrow sepals and petals and 3-lobed lip, borne on racemes to 4 in. long on leafless scapes to 1 ft. high, May–June.

APLOPAPPUS: *Ericameria ericoides.*

APOCYNACEÆ. Dogbane Family. Herbs, shrubs and trees, sometimes vines, of about 130 genera most abundant in trop. countries, grown for ornament or a few for the edible fr. The family is characterized by the prevailingly milky juice, regular fls. with gamopetalous corolla, sagittate anthers, single style, and fr. usually of 2 long follicles; from Asclepiadaceæ the family is distinguished by the absence of corona in the corolla, separate filaments, and anthers not connected with the stigmas, and other technical characters. Genera herein treated are Acokanthera, Allamanda, Alstonia, Alyxia, Amsonia, Apocynum, Aspidosperma, Beaumontia, Carissa, Dipladenia, Echites, Ervatamia, Mandevilla, Mascarenhasia, Nerium, Plumeria, Tabernæmontana, Thevetia, Trachelospermum, Vallaris, Vinca.

APOCYNUM. Dogbane. *Apocynaceæ.* Per. herbs with milky juice, tough fibrous bark, opposite entire lvs., small white or pink bell-shaped fls. with appendages in the throat, borne in cymes, and long slender frs.; sometimes planted in the hardy border and the roots have medicinal qualities; propagated commonly by division.

androsæmifolium. Spreading D. To 4 ft.: lvs. to 4 in. long and 2½ in. wide, pale beneath: fls. pinkish, ⅓ in. across. N. Amer.

cannabinum. Hemp D. Indian Hemp. To 8 ft.: lvs. to 6 in. long and 3 in. wide: fls. greenish-white. Conn. to Wis. and Kans.

APONOGETON. The only genus of *Aponogetonaceæ.* Aquatic per. herbs from Asia, Afr. and Australia, with tuberous rootstocks, floating or submerged lvs., fls. in spikes, and fr. of 3 or more hard follicles.

Aponogetons are grown in ponds in the greenhouse, or *A. distachyus* out-of-doors although tender North. They should be potted and plunged 1½ to 2 feet under water. Temperatures of 65–70° should be given *A. fenestralis*. Propagated by division, offsets, or by seed when available. The flowers should be pollinated and kept above water to produce good seeds.

distachyus. CAPE POND-WEED. WATER-HAWTHORN. Lvs. floating, solid, linear-oblong. Cape of Good Hope. Var. **Lagrangei** has lvs. violet beneath and fls. with violet instead of white bracts. Var. **giganteus** is an improved form.

fenestralis (*Ouvirandra fenestralis*). LACE- or LATTICE-LEAF. Lvs. submerged, only a network of veins, broad-oblong. Madagascar.—Grown in tubs or under protected conditions.

APOROCACTUS. *Cactaceæ.* A small genus of slender creeping, hanging or clambering vine-like diurnal cacti, emitting aerial roots: fls. rather small, solitary on the areole, funnelform, pink or red: spines several at each areole, small. See *Cacti.*

Conzattii. Sts. ½–1 in. diam., with 8–10 rather prominent ribs: fls. nearly straight, to 3½ in. long, red, inner perianth-segms. acute but not acuminate. Mex.

flagelliformis (*Cereus flagelliformis*). RAT-TAIL CACTUS. Sts. ½ to nearly 1 in. diam., with 10–12 ribs: fls. strongly bent just above ovary, about 3 in. long, crimson, outer segms. more or less reflexed. Probably Mex.; undiscovered wild.—A good window, conservatory and basket plant; often grafted on other and erect cacti, also hybridized with other species; of easy cult.

Martianus (*Cereus Martianus*). Much like *A. Conzattii* but fls. deep rose-color and inner perianth-segms. long-acuminate: sts. to ¾ in. diam. Mex.

APPLE. All the common cultivated varieties of apple are forms of *Pyrus Malus* (or *Malus sylvestris*), probably native in Europe and southwestern Asia. The paradise (or "garden," as the name signifies) apple is a bush or small-stature form of the same species, on which common varieties are sometimes budded or grafted to prevent the trees from growing large or to dwarf them. The true crab-apples are *Pyrus baccata*, and some of the larger crabs may be hybrids between the two species. Other species may be involved in the long development of the domesticated apple, but this subject is not yet sufficiently understood. See *Pyrus Malus.*

The great variation in the adaptability of varieties of apple to different soils and climates makes its cultivation possible over a wider range of territory than with most other temperate zone fruits. Commercial orchards are located as far south as the mountains of Georgia and New Mexico and north into Maine, Wisconsin, and parts of Canada. In home plantings, by careful choice of varieties, the range is much wider, extending from the Gulf states to the more rigorous climates of the northern plains states. The larger commercial plantations, however, are localized in regions particularly well adapted to the apple, as, for example, western New York, the Shenandoah-Cumberland Valley and the valleys of the Pacific Northwest, and others.

Soils for the apple are of wide range. Although some apple varieties are restricted to certain soil types for their best development, most kinds will succeed on any good agricultural soil that is fairly deep and well-drained. Friable, rather heavy, sandy, or gravelly loams with good humus content and with an open subsoil are considered ideal. In general, for any given variety, climate is of much more importance than soil type, provided the soil is at all suitable.

Propagation of named varieties is by either budding or grafting on one-year apple seedlings, either French or American grown. For budding, the seedlings are set out in early spring in the nursery row, and the buds set in July and August when the bark of the stock slips readily. Early the following spring the stocks are cut off above the bud forcing it into vigorous growth. Root-grafting is a common practice in the southern nurseries. Cions 4–6 inches long are whip-grafted on either whole or piece roots in the winter and the grafts stored. In early spring the grafts are planted out and make two-year trees at the end of the second season. Root-grafted trees are preferable for planting hardy varieties in cold climates because the graft union is below the surface of the ground and thus the tender stock is protected from the cold.

Planting is undertaken with either one- or two-year nursery trees. These are best set out in the early spring in the northern states but may be set in the fall to advantage in milder climates. The standard planting distance on good soils for vigorous sorts, such as Baldwin and Greening, is 50 x 50 feet. On light soils or with weaker-growing varieties, such as Wealthy or Wagner, 35 feet is ample. A common commercial practice is to plant filler trees of early bearing varieties between the permanents. These are removed after twelve to fifteen years, when they begin to crowd. The most important consideration in planting trees is to tamp the soil firmly about the roots.

Tillage and fertilizers are various. Apples can be grown successfully under either sod or tillage. The latter method is usually followed in commercial orchards where the soil is readily tillable, and consists of annual fall or spring plowing followed by three or four cultivations with disk or harrow in the early spring. The last cultivation should be about July first after which a natural cover-crop of weeds or sowed crop, such as buckwheat, rape, or vetch, is allowed to grow. In sod culture, which is adapted to home plantings and where the land is too rough or stony for tillage, the trees are allowed to grow in a natural sod of grass, or one composed of sowed clover or alfalfa. This is mowed once or twice a year and the mowings either allowed to lie where they fall or placed about the tree as a mulch. Trees growing in sod must be fertilized with manure or commercial nitrates if good yields are to be obtained. Sodium nitrate, or ammonium sulfate, at the rate of 8–10 pounds to a mature tree, applied just as the buds open, is effective.

Younger trees, of course, require much less, as for example, 2–4 pounds for a ten-year-old tree. The nitrate should be spread under the ends of the branches, not next the trunk. Cultivated trees need no fertilizer of any kind except on very poor soils where nitrate may be beneficial to the tree, or a complete fertilizer may be used to increase the growth of the cover-crop and so benefit the trees indirectly by increasing the supply of humus.

Pruning at time of setting the one-year whip consists in heading at the desired point, 30 to 50 inches being a satisfactory height. In the case of two-year trees all lateral branches are cut off except one upright growing shoot at the top, called the leader, and one to three others spaced as far apart as possible along the main stem. A good practice is to head these back about a third of their length, leaving the uppermost branch the longest. From this time until the tree comes into bearing it should be pruned as little as possible, removing only suckers and such branches as interfere with the development of the framework of the tree. When the trees are in full bearing and especially with old trees, the tops must be thinned to reduce the number of fruit-spurs and to prevent injury to the lower limbs by shading. Dead or diseased limbs, those that rub others badly, and suckers should be removed as soon as discovered. If trees are too tall they may be headed back to vigorous side branches. Apple trees may be pruned at any time when they are dormant.

Harvesting, marketing, and yields require few special comments. The apple crop is hand-picked into bags or buckets, when the fruit is mature but still firm. The degree of care necessary in handling varies with the variety. Tender fruits like McIntosh should never be poured from one container to another, whereas Baldwin and Ben Davis may, with care, be handled in that way. Marketing is done in various ways. Recently much fruit has been sold in roadside markets, at the farms. Where the markets are near, the crop, packed in bushels or hampers, is trucked directly to the wholesaler or to retail stores. In most of the large fruit districts, however, the fruit goes to the general market, either in barrels or boxes. Under good cultural conditions, early bearing varieties such as Wealthy and McIntosh begin bearing four to six years after planting and by the tenth year may yield 5–15 bushels to a tree in the bearing year. Late bearing varieties like Northern Spy may not fruit until after eight to ten years in the orchard. Mature trees may yield from 10 to 50 bushels in a single year. On the average, however, 15 to 20 bushels to a tree or 300 to 500 bushels an acre are considered good yields.

Storage should be provided as soon as the crop is off the trees, if it is to be kept for any length of time. The best cold storage temperature is about 31° F. Apples will not freeze above 29° F. Fruit can be stored fairly well for home use in outside storage cellars or in a special compartment of the house cellar. In either case the temperature should be kept as near as possible to 31° F. by regulating ventilators or windows. An earth floor in such a storage will aid in keeping the air moist. Sprinkling the floor now and then with water may be necessary to keep the fruit from shrivelling.

Varieties are numberless but the commercial kinds are not numerous. The choice of suitable varieties for planting in different regions is of the greatest importance. The following lists include most of the best varieties arranged in order of ripening and are chosen to give a succession for the home planting. Commercial varieties are starred (*).

Varieties of more than average hardiness adapted to the northern states or cold situations: Yellow Transparent,* Red Astrachan, Gravenstein,* Oldenburg,* Wealthy,* McIntosh,* Fameuse, Pewaukee, Winter Banana, Delicious,* Tolman Sweet, Northern Spy.*

Varieties of medium hardiness adapted to such regions as western New York and Michigan: Yellow Transparent, Red Astrachan, Oldenburg,* Chenango, Maiden Blush, Wealthy,* McIntosh,* Rhode Island Greening,* Mother, Baldwin,* Sweet Winesap, Stark,* Red Canada,* Delicious,* Northern Spy.*

Varieties adapted to the southeastern states, especially the Shenandoah-Cumberland Valley and the Eastern Shore: Yellow Transparent,* Red June,* Williams Favorite,* Summer Rambo,* Grimes Golden,* Jonathan,* Stayman Winesap,* Winesap,* York Imperial,* Yellow Newtown.*

Varieties adapted to the southern and Gulf states: Red Astrachan, Red June, Hackworth, Rome, Delicious, Arkansas, Winesap, York Imperial, Yates, Terry, Romanite.

Varieties for the Middle West: Yellow Transparent,* Red Astrachan, Oldenburg, Benoni,* Maiden Blush, Wealthy, Jonathan,* Grimes Golden,* Delicious,* Ben Davis, Missouri Pippin.

Varieties for the Pacific Coast and Rocky Mountain states: Red Astrachan, Gravenstein,* Jonathan,* Winesap,* Stayman Winesap,* Ortley,* Esopus,* Winter Banana, White Winter Pearmain, Grimes Golden, Delicious,* Golden Delicious,* Arkansas Black.

In the parts of Canada bordering the Great Lakes the varieties recommended for Michigan and the northern states are satisfactory. The following list is made up of the hardiest varieties that will stand extreme cold: Tetofsky, Oldenburg, Charlamoff, Whitney, Wealthy, Hibernal, Longfield, Patten Greening, McIntosh, Milwaukee, Baxter, Scott Winter.

To insure cross-pollination, several varieties of apples should be planted together, in blocks more than three rows wide. Although most varieties are satisfactory sources of pollen, Baldwin, Gravenstein, Winesap, Rhode Island Greening and a few others are exceptions and should not be relied on as pollinizers. In commercial orchards, yields can often be increased by bringing in colonies of bees at blooming time to distribute pollen. One strong colony to every two or three acres is considered to be sufficient.

Of the many diseases affecting the apple the most important is apple scab which may cause many of the blossoms to drop off, and disfigure fruit and leaves. The most important pest is the codlin-moth which is responsible for most wormy apples. Other insects of lesser, though often of great importance, are the San José scale, apple red-bugs, aphids, apple maggots, borers, and a number of caterpillars. The control of these pests and diseases is a complicated problem in which the commercial grower needs expert guidance based on a knowledge of the pests present and their stage of development. In home orchards of many localities, reasonably good control of scab and codlin-moth and other chewing insects can be obtained with three sprays. The first, called the delayed dormant spray, should be applied just as the tips of the buds are showing green, the second or calyx spray just after the petals have fallen, and the third about two or three weeks later. Liquid lime-sulfur, 1 gallon to 40 of water with 1 pound of powdered arsenate of lead added, may be used in all of these sprays. Scale can be controlled by using lime-sulfur, 1 gallon to 8 of water in the delayed dormant spray. Aphids, red-bugs, and other sucking insects can be kept in check by adding ½ pint of nicotine sulfate to 50 gallons of spray. The delayed dormant is the most effective spray for aphid control, the calyx for red-bugs. If only one spray can be applied, the calyx application is of the most importance.

In many regions east of the Rocky Mountains borers are a serious pest. These are found at the base of young trees where their presence is indicated by sawdust-like fragments of wood on the ground next the trunk, or by dark sunken areas in the bark. An effective control is to dig out the grubs with a sharp knife, or to kill them by forcing a wire into the burrow. This should be done in September and again in the early spring.

Mice frequently cause great damage, especially in the sod orchard, by girdling the young trees at the base. Effective protection may be secured by placing guards of ½-inch mesh wire netting about the trees. A piece of netting 15 x 18 inches will make a guard that will be adequate until the tree is 5–6 inches in diameter. Pine mice, if present in the region, may dig under such guards; they may be controlled by poisoned bait (oats and strychnine) placed in the burrows.

APPLE, BALSAM-: *Momordica Balsamina.* **Custard-**: *Annona reticulata.* **Kei-**: *Dovyalis caffra.* **Malay-**: *Eugenia malaccensis.* **Mammee-**: *Mammea americana.* **May-**: *Podophyllum.* **-of-Peru**: *Nicandra Physalodes.* **Otaheite-**: *Spondias cytherea.* **Pond-**: *Annona glabra.* **Rose-**: *Eugenia Jambos.* **Star-**: *Chrysophyllum Cainito.* **Sugar-**: *Annona squamosa.* **Vi-**: *Spondias cytherea.* **Wood-**: *Feronia Limonia.*

APRICOT. A stone-fruit, ripening mostly in advance of peaches, pubescent or smooth at maturity, with a flat stone or pit that is not corrugated or furrowed on the side; much prized as a summer fruit in the regions where it is grown, also for dessicating and canning. It is about as hardy as the peach. The apricot is of one prevailing species, ***Prunus Armeniaca,*** native in China, the so-called Russian race being small-fruited hardy kinds adapted to severer winters than the usual large-fruited commercial kinds. The Japanese ***Prunus Mume*** yields a few fruit-bearing varieties, as Bungo and Bungoume, but it is not greatly grown except as an ornamental tree for its early bloom (the "plum flowers" of Japan).

Regions of apricot-growing are determined largely by the early blooming period and consequent damage from late spring frosts. Its cultivation, therefore, is confined mostly to regions where such frosts are not common. Commercially it is grown on the Pacific Coast, and in some of the Rocky Mountain states, about 95 per cent of the crop being produced in California. In home gardens it is planted sparingly wherever peaches thrive, and while not dependable in bearing gives occasional crops and in some cases may supply local markets.

Soil and planting for apricot depend somewhat on the stocks on which the tree is worked. Light soils are best in the case of peach and apricot stocks, whereas plum stocks adapt the apricot for growth upon the heavier soil types. As with other fruits, good drainage is necessary. One- or two-year trees are planted in the early spring in the East and in the late fall in California. The common planting distance is 24 x 24 feet.

Cultivation, cover-crops, and in the West irrigation, are the common commercial practices, as with the peach. Trees in the home planting should be mulched to keep down the grass and if growth is not fairly vigorous they should be fertilized with manure or 2–3 pounds of nitrate to a tree, applied early in the spring.

Propagation is by budding on apricot, peach or myrobalan stocks. Apricot stocks are considered best in the West and peach or plum is used in the East.

Pruning is simple. The young trees are pruned to give them a balanced head with four to five well-spaced scaffold limbs. In California the trees are thinned out by removing the crowding branches without severe heading. In the East they can be pruned much the same as the peach, but the pruning should not be as severe.

Harvesting and marketing are much as for the peach. For home use the fruit ripens on the tree to advantage. Commercially, for shipping and canning, it is hand-picked, preferably with the stems attached, while still firm but full size and just beginning to take on the yellow color. For drying the fruit is allowed to become riper but not soft and in some cases is shaken from the trees. For eastern shipment, apricots are packed in five-pound baskets, four baskets to the crate, and sent through in iced cars. Storing this fruit for any length of time is not practicable.

Varieties recommended for planting in the East are the Early Moorpark, Early Golden, Helmskirk, Moorpark and Peach. In California the Newcastle, Blenheim, Royal, Tilton, Peach, Helmskirk and Moorpark are among the most important. For the northern limits of apricot-growing, the Russian varieties are to be recommended.

Pests and diseases are several, but two of them may be mentioned. Curculio and brown-rot are difficult to control in the case of the apricot. In the East the same spray program recommended for the peach is of value. Borers can be controlled with paradichlorobenzine as with the peach, using about ¾ ounce to a tree. In the commercial orchards of the West the spray program is more complex and special practices with expert guidance are advised.

APPRESSED: closely and flatly pressed against, as bracts applied to or appressed against a stem; adpressed.

APTENIA. *Aizoaceæ.* Monotypic S. African genus, separated from Mesembryanthemum mostly by technical characters of fr.; calyx lobed to the ovary; parts of caps. lacking wings or flaps. Frequently seen in conservatories and window-gardens. For cult. see *Mesembryanthemum.* **A. cordifolia** (*M. cordifolium*). Diffuse per., sts. to 2 ft. long, minutely papillose: lvs. opposite, flat, ovate, to 1 in. long: fls. purple, about ½ in. across. Var. **variegata** has variegated lvs.

AQUATICS are plants that pass their life in deep water; the word is frequently but improperly employed for those that grow in bogs, swamps and about the borders of ponds and lakes. The true aquatic plants usually have floating parts, and some of them are not permanently attached to the bottom. See *Bog Plants.*

AQUIFOLIACEÆ. Holly Family. Three genera of trees and shrubs, sometimes evergreen, with alternate simple lvs., small fls. with mostly 4–6 sepals, petals and stamens, a superior ovary, and fr. a berry-like drupe. Ilex and Nemopanthus are cult. for ornament.

AQUILEGIA. Columbine. *Ranunculaceæ.* Hardy per. herbs with attractive ternately compound lvs. and spurred fls. in white, yellow, blue, lavender, red.

Columbines are favorites in rock-gardens and the perennial border. They thrive in light sandy loam and some of them in shaly soils. Propagated by seed or by division in the spring; seeds sown in spring should give good blooming plants the following year. The clumps should stand 12–18 inches apart. Protection from strong winds favors their development and safeguards the bloom.

The common garden aquilegias do not belong to clearly recognized species; they are mutants or hybrids. Probably *A. glandulosa, A. vulgaris, A. sibirica, A. cærulea, A. chrysantha,* and *A. Skinneri* are the main parents. The Old World species are characterized by strongly hooked spurs and the American kinds (except certain undomesticated ones in the Rocky Mountains and westward) by straight or at least not hooked spurs although there may be a knob at the end. It is supposed that the character of the spur in the horticultural kinds is an indication of parentage. The "long-spurred hybrids" are now popular.

akitensis. Fls. with pale purple sepals and pale yellow petals, the spurs nearly straight. Japan.

alpina. To 1 ft.: fls. blue, to 2 in. across, with incurved spurs about length of petal-limb and sepals twice as long, July–Aug. Switzerland. Var. **alba**, fls. white. Var. **superba** does not differ from the type.

arctica: *A. formosa.*

baikalensis: hort. name for a form with large violet-blue long-spurred fls.

Bertolonii (*A. Reuteri*). To 1 ft., alpine: lvs. small, glaucous: fls. about 1 in. across, blue-violet; spurs very short, knobbed. S. Eu.

bicolor: *A. sibirica.*

cærulea. Colorado C. To 3 ft.: fls. to 2 in. across, the blue-purple sepals longer than white petal-limbs; spurs to 2 in. long, straight or spreading, knobbed at end, May–June. Rocky Mts.; the state fl. of Colo. Vars. **alba** and **candidissima** have white fls., **citrina** yellowish, **Helenæ** blue and white, **hybrida** and **lutea** sepals blue or pink and petals white or yellow. There is a wild var. *albiflora* with white fls.

californica: *A. formosa.*

canadensis. Common American C. To 2½ ft.: fls. 1½ in. across, with yellowish or red sepals about as long as yellowish petal-limb; spurs red, nearly straight, knobbed at end, to ¾ in. long, May–July. N. S. to Fla. and Tex. Var. **nana**, 1 ft. high. Var. **flavescens**, fls. yellow.

chrysantha. Golden or Golden-spurred C. To 4 ft., much branched: fls. to 3 in. across, yellow, the sepals much longer than petal-limb; spurs straight, to 2½ in. long, May–Aug. Rocky Mt. region and Tex. Some of the vars. are: **alba**, fls. whitish, **alba-plena** (var. *grandiflora alba*), fls. whitish, partly double; **flavescens**, fls. tinged with red; **flore-pleno**, fls. double; **grandiflora sulphurea**, fls. deep yellow; **Jæschkanii**, Red-spur C., dwarf, with red spurs, probably a hybrid; **nana**, dwarf.

clematiquilla. Fls. large, white, with long spurs; hort. form.

elegantula. To 16 in., usually with only 1 lf.: fls. yellow, with straight scarlet spur to ¾ in. long. Colo., Utah, New Mex.

eximia: a synonym of *A. formosa.*

flabellata. Fan C. To 1½ ft.: fls. 2 in. across, nodding, lilac, sepals twice as long as petal limb which is often white; spurs incurved, shorter than petal-limb, summer. Japan. Var. **nana-alba** (var. *flore-alba*) is dwarf with pure white fls.

flavescens: *A. canadensis* var., *A. chyrsantha* var.

florariensis: hort. name.

formosa (*A. arctica*). Sitka C. To 3 ft.: fls. to 2 in. across, nodding, the red sepals twice as long as yellow petal-limb; spurs red, straight, about length of sepals, May–Aug. Calif. to Alaska and Siberia. Var. **hybrida** (*A. californica* var. *hybrida, A. superba*), supposed hybrid between *A. formosa* and *A. chrysantha.* Var. **nana-alba**, dwarf, pale sometimes nearly white. Var. **rubro-plena**, fls. double. Var. **truncata** (*A. truncata, A. californica*), petal-limb very short.

glandulosa. Altai C. To 1½ ft.: fls. to 3 in. across, nodding, lilac-blue, the sepals twice as long as the white-bordered petal-limb; spurs much incurved, ½ in. long, spring, early summer. Siberia. Var. **jucunda** (*A. jucunda*), fls. somewhat double, with white petal-limb.

haylodgensis. A blue-fld. race with long spurs; hort. form.

Helenæ: *A. cærulea* var.

hybrida. A name of uncertain application to include hybrids between several species.

Jæschkanii: *A. chrysantha* var.

jucunda: *A. glandulosa* var.

longissima. To 3 ft.: fls. pale yellow, the sepals longer than petals, the spurs 5 in. and more long, July–Oct. S. W. Tex., Mex.

lutea. Probably a hybrid between *A. cærulea* and *A. chrysantha.*

nivea: *A. vulgaris* var.

olympica: *A. vulgaris* var.

oxysepala. Early C. To 2½ ft.: fls. to 1½ in. across, with blue sepals much exceeding the white petal-limbs; spurs bent inward, knobbed, shorter than petal-limb, June. Siberia.

pubescens. To 1½ ft.: fls. about 1 in. across, erect, cream-yellow varying to white or pink, spurs 1 in. long. Calif.

pubiflora. A soft-pubescent form of *A. vulgaris* with short spurs. Himalayas.

pyrenaica. To 1 ft.: fls. deep blue, about 2 in. across, the sepals about length of petal-limb, the spurs short and incurved, June–July. Pyrenees.

Reuteri: *A. Bertolonii.*

sibirica (*A. bicolor*). Siberian C. To 2 ft.: fls. to 3 in. across, lilac-blue, the sepals twice as long as petal-limb; spur very incurved or even coiled, to ¾ in. long, summer. E. Siberia. Var. **flore-pleno**, fls. double. Var. **spectabilis** (*A. spectabilis*), fls. large, with tips of petal-limbs yellow.

Skinneri. Mexican C. To 3 ft.: fls. about 1½ in. across, nodding, the greenish-yellow sepals much longer than yellowish petal-limb; spurs pale red, straight, to 2 in. long, July–Sept. Mts. Mex., Guatemala. Var. **flore-pleno** has double fls.

spectabilis: *A. sibirica* var.

stellata: *A. vulgaris.*

Stuartii. Hybrid between *A. glandulosa* and *A. vulgaris* var. *olympica;* fls. lilac-blue, very large, spurs incurved, May–June.

superba: *A. formosa* var. *hybrida.*

truncata: *A. formosa* var.

Vervæneana: *A. vulgaris* var.

virdiflora. To 1½ ft.: fls. about 1 in. across, greenish, sepals and petals about equal; spurs straight, ½ in. long, summer. Siberia.

vulgaris (*A. stellata*). European C. To 2½ ft.: fls. to 2 in. across, nodding, blue, purple, white, the sepals longer than petal-limb; spurs knobbed and much incurved, about length of petal-limb, summer. Eu., Siberia. Vars. **alba-plena** and **flore-pleno** have double fls. Var. **hybrida** is probably a cross between *A. canadensis* and *A. vulgaris*, with lilac-purple spurs. Var. **nivea** (var. *alba*), Munsteads White C., fls. large, pure white. Var. **olympica** (*A. olympica*, *A. Wittmanniana*), sepals lilac, petal-limb white. Var. **Vervæneana**, lvs. lined with yellow.

Wittmanniana: *A. vulgaris* var. *olympica.*

ARABIS. Rock-Cress. *Cruciferæ.* Annuals, biennials and perennials, mostly low, with white, pink or purpls fls. in terminal spikes or racemes, pods or siliques long and narrow; more than 100 species in widely separated temp. regions, a few native to Amer.

Some of the rock-cresses are alpine, grown in the border or rock-garden. They require plenty of sun but many of them thrive even in poor soil. They are prevailingly spring and early summer bloomers. Some of them produce attractive mats of late-season foliage. Propagated by division, seeds or cuttings.

albida. Wall R. Tufted whitish soft-pubescent per. to 1 ft.: lvs. spatulate and tapering to base, 1–3 in. long, coarsely toothed on upper broad part: fls. to ½ in. long, white, in early spring, fragrant, in loose racemes. Caucasus.—Sometimes double-fld., and forms with vari-colored foliage. There are also compact forms.

alpina. Mountain R. Per., mostly more slender than above and less pubescent: lvs. oblong to oblong-acute, broad at base, sharply toothed along sides: fls. smaller, white. Mts., Eu.—Apparently not common in cult., the stock usually grown under this name being *A. albida.*

Allionii. Per.: lvs. glabrous, ovate-oblong and somewhat toothed, those on st. ovate and sessile: fls. white, with erect petals. Italy.

arenosa. To 6 in., hairy: lvs. pinnatifid, upper ones toothed: fls. rose, sometimes white or bluish, on spreading pedicels. Eu.

aubretioides. Densely tufted little per., either somewhat tomentose or green: lvs. very small, obovate and obtuse, those on st. ovate and clasping: fls. purple. Asia Minor.

bellidifolia. Per. to 9 in.: lvs. glabrous, spatulate or those on st. oblong-ovate and sessile, sparingly toothed: fls. white, in short racemes. Pyrenees, Alps.

Ferdinandi-Coburgi. Small: lvs. in gray rosettes that become green in winter: fls. small, yellowish. Macedonia.

glabra. Bien., strictly erect, to 4 ft., glabrous above, glaucous: lvs. oblong to oblanceolate, dentate, on sts. sagittate and sessile: fls. yellowish-white, small: pods erect-appressed. N. B. to Pacific Coast, south to Pa., Eu., Asia.

Halleri. Slender weak pubescent or nearly glabrous bien. to 1 ft.: lvs. lyrate with large terminal lobe, on st. oblong or lanceolate and toothed: fls. apparently purple. Hungary.

hirsuta. Bien., erect, to 2½ ft., mostly hairy-pubescent: lvs. spatulate and dentate, on st. oblong and clasping: fls. greenish-white, small. Widely distributed in N. Amer., Eu., Asia.

Koehleri. Per. to 6 in.: lvs. narrow-lanceolate to spatulate, to 1 in. long, entire, on st. few and very narrow: fls. scarlet, to ½ in. long, in short racemes. Ore.

Lyallii. Per. to 10 in., mostly glabrous: lvs. spatulate to narrow-oblanceolate, to 1 in. long, entire, on st. narrow: fls. rose, ¼ in. long. N. W. U. S., B. C.

mollis. Per. to 2 ft., lightly pubescent, erect, little branched: lvs. ovate or roundish, cordate and blunt-dentate, long-petioled, on st. clasping: fls. white, in terminal racemes. Caucasus.

muralis (*A. rosea*). Bien. or per., tufted at base, pubescent, to 10 in.: lvs. spatulate and dentate, on st. oblong and sessile: fls. white or rose, in elongating terminal racemes. S. Eu.

procurrens. Per. to 1 ft., with creeping stolons: lvs. oblong to lanceolate or obovate, entire, pointed: fls. white, in elongating racemes. S. E. Eu.—There is a form with vari-colored foliage.

rosea: *A. muralis.*

Stelleri. Small: lvs. oblong or spatulate, the upper ones toothed and partly clasping: fls. white, in a corymbose raceme. E. Asia.

stricta. Per. to 6 in., nearly glabrous: lvs. thickish and shining, oblong, crenate, radical ones in rosette, on st. small and sessile: fls. yellowish-white, in short racemes. Eu.

Sturii. Compact garden plant with large clear white fls.: botanical position uncertain.

ARACEÆ (sometimes written Aroideæ). Arum Family. Aroids. Over 100 genera widely distributed (but most abundant in trop. countries), of varied habit and foliage but characterized by the infl. which is composed of a densely-fld. spadix having the staminate fls. at the top and the pistillate below, and subtended by a bract or spathe which is often colored and showy and constitutes (as in the florist's calla) the ornamental part of the plant: fls. without perianth or these parts merely scale-like; stamens 1-many: fr. a berry borne tightly on the spadix. The family furnishes many plants grown for ornament, curiosity and food; some of them are prominent "foliage plants." All are essentially herbs, but some have more or less woody sts. and attain a shrub-like character and many of them are tree root-climbers. The family yields acrid and medicinal qualities, and a few species produce edible tubers and frs. Among cult. kinds are the genera Acorus, Aglaonema, Alocasia, Amorphophallus, Anthurium, Arisæma, Arum, Caladium, Calla, Colocasia, Dieffenbachia, Dracunculus, Helicodiceros, Homalomena, Hydrosme, Lysichitum, Monstera, Orontium, Peltandra, Philodendron, Pistia, Rhektophyllum, Sauromatum, Schismatoglottis, Scindapsus, Spathiphyllum, Symplocarpus, Xanthosoma, Zantedeschia.

ARACHIS. *Leguminosæ.* Peanuts are grown in gardens as a novelty and in conservatory collections of economic plants and commercially in field culture in mild long-season climates: lvs. compound: fls. papilionaceous, axillary, some of them showy: seed-pods, the peanuts, are carried beneath the ground where they mature: mostly native in Brazil, one only cult.

Since the vines are very tender to frost, the plant cannot be grown in the garden farther north than central New York, but commercially from Virginia south. If the pods are too hard, the seeds should be removed for planting. When sown under glass a medium temperature only is required. In the open the plants of the bunch type should stand 6–10 inches apart, in rows 30–36 inches apart.

hypogæa. Peanut. Goober. Groundnut. Ann. to 20 in., procumbent: lfts. 4, to 2½ in. long.

ARACHNANTHE: *Arachnis.*

ARACHNIS. *Orchidaceæ.* Epiphytes native in Asia, with fls. in panicles, the sepals and petals equal, lip shorter and 3-lobed. See *Orchids.*

Clarkei (*Arachnanthe Clarkei. Esmeralda Clarkei*). Sts. long and pendulous: lvs. to 6 in. long and 1½ in. wide: fls. about 2½ in. across, the spreading sepals and petals yellow striped transversely with brown, the lip about the same length and yellow spotted with brown, in 3–4-fld. clusters to 6 in. long, June–Aug. Himalayas.

Lowei (*Arachnanthe, Renanthera, Vandopsis* and *Vanda Lowei*). To 6 ft.: lvs. to 2½ ft. long and 2½ in. wide: fls. to 3 in. across, the lower ones orange-yellow finely spotted with red, the upper ones greenish-yellow with large brown spots, in pendulous many-fld. racemes to 5 ft. long, Aug.–Nov. Borneo.

ARAGALLUS: *Oxytropis.*

ARALIA (*Dimorphanthus*). *Araliaceæ.* Herbs, shrubs or trees with alternate pinnate lvs., small whitish fls. in umbels which form terminal panicles, and berry-like frs.; planted out-of-doors and most of them nearly or fully hardy N.

Some of the smaller native aralias are planted in borders or naturalized in woods; the larger species make bold lawn specimens and provide somewhat subtropical effects with the large leaves; some of them, as *A. spinosa*, are grown for curiosity. They thrive in rich soil. Propagated by seeds in spring, or by root-cuttings with heat.

aurea: a yellow-lvd. form, probably of *Polyscias Guilfoylei* or *P. Balfouriana.*

Balfouriana: *Polyscias Balfouriana.*

cachemirica (*A. cashmeriana*). Per. herb to 8 ft.: lvs. 1–3-pinnate, the lfts. to 3 in. long: infl. with prominent bracts to 1½ in. long. Himalayas; to be planted only far S.

californica. Per. herb to 10 ft.: lvs. 2-pinnate, the lfts. to 1 ft. long: fls. in panicles to 1½ ft. long. Ore. to Calif.

cashmeriana: *A. cachemirica.*

Chabrieri: *Elæodendron orientale.*

chinensis (*A. sinensis*). To 30 ft., somewhat spiny: lvs. 2-pinnate, the lfts. to 6 in. long and pubescent beneath: fls. in panicles to 2 ft. long. China.

cordata (*A. edulis*). Udo. Per. herb to 8 ft.: lvs. of 3–5 lfts. to 8 in. long. Japan.—In spring the young blanched shoots are eaten.

crassifolia: *Pseudopanax crassifolium.*

edulis: *A. cordata.*

elata (*A. chinensis* var. *mandshurica. A. japonica. Dimorphanthus mandshuricus*). Japanese Angelica. To 50 ft., usually prickly: lvs. 2-pinnate, the lfts. to 5 in. long, when young pubescent on veins beneath: infl. with spreading somewhat umbellate branches to 1½ ft. long. Manchuria, Korea, Japan. Var. **aureo-variegata** has lvs. variegated with yellow.

elegantissima: *Dizygotheca elegantissima.*

filicifolia: *Polyscias filicifolia.*

fruticosa: *Polyscias fruticosa.*

Guilfoylei: *Polyscias Guilfoylei.*

hispida. Bristly Sarsaparilla. Per. herb or subshrub to 3 ft., bristly: lvs. 2-pinnate, the lfts. to 3 in. long. Newf. to N. C. and Minn.

japonica: *A. elata* and *Fatsia japonica.*

Kerchoveana: *Dizygotheca Kerchoveana.*

mandshurica: *A. elata.*

Maximowiczii: *Acanthopanax ricinifolium* var.

monstrosa: *Polyscias Guilfoylei* var.

Moseri: *Fatsia japonica* var.

nudicaulis. Wild Sarsaparilla. Per. herb to 1 ft., nearly stemless: lvs. 2-pinnate, the 3–5 lfts. to 5 in. long. Newf. to Ga. and Colo.

papyrifera: *Tetrapanax papyriferum.*

pentaphylla: *Acanthopanax Sieboldianum.*

quinquefolia: *Panax quinquefolium.*

racemosa. American Spikenard. Per. broad herb to 6 ft.: lvs. very large, of 3–5 lfts. to 6 in. long: berries brown-purple. N. B. to Ga. and Mo.

Sieboldii: *Fatsia japonica.*

sinensis: *A. chinensis.*

spinosa. Devils Walking-Stick. Hercules Club. To 30 ft., very spiny: lvs. 2-pinnate, the lfts. to 3 in. long and glabrous beneath: fls. in panicles to 4 ft. long. S. N. Y. to Fla. and Tex.

trifolia: *Panax trifolium.*

Veitchii: *Dizygotheca Veitchii.*

Victoriæ: *Polyscias Guilfoylei* var.

ARALIACEÆ. Aralia or Ginseng Family. More than 50 genera, widely distributed in temp. and trop. regions of eastern and western hemispheres, herbs, shrubs and trees, often having aromatic or odoriferous foliage, with mostly alternate simple to much compound lvs., small, regular, bisexual or polygamous fls. that are individually not showy, borne in close umbels or heads, having very small calyx, usually 5 petals, 5 stamens, inferior 1- or more-celled ovary, and fr. a berry or drupe in which feature the family differs from Umbelliferæ. Many species have medicinal value, and the following genera are planted for ornament: Acanthopanax, Aralia, Dizygotheca, Echinopanax, Fatsia, Gilibertia, Hedera, Meryta, Nothopanax, Oreopanax, Panax, Polyscias, Pseudopanax, Schefflera, Stilbocarpa, Tetrapanax, Trevesia, Tupidanthus. Various plants formerly known as Aralia and Panax are now distributed in other genera. In the juvenile stage many of the woody araliads are attractive in foliage and are prized under glass, but it may be impossible to name them confidently until they arrive at flower and fruit. Those with palmately compound lvs., the petioled entire large glossy lfts. arising from the top of the petiole, are likely to be Schefflera or Tupidanthus.

ARALIA, FALSE: *Dizygotheca.*

ARAR-TREE: *Tetraclinis articulata.*

ARAUCARIA. *Pinaceæ.* Evergreen trees reaching great height, of about a dozen species in S. Amer., Australia and Pacific Isls., having scale-like or awl-like or flat stiff lvs. usually closely overlapping, and large woody cones with deciduous scales.

They are grown in warm regions and as pot-plants in juvenile forms. See *Conifers.* Specimens can be grown in the open only in the warmer parts of the country, as in Florida and California, except *A. araucana* which will stand considerably farther north.

araucana (*A. imbricata*). Monkey-Puzzle. Lvs. densely imbricated, ovate-lanceolate, 1–2 in. long, leathery, sharp-pointed. Chile.

Balansæ. Lvs. imbricated, ovate, ⅛ in. long, obtuse, dark olive-green. New Caledonia.

Bidwillii. Bunya-Bunya. Lvs. spreading in 2 rows, ovate-lanceolate, to 1½ in. long, sharp-pointed, thick and glossy. Australia.

brasiliana. Lvs. loosely imbricated, oblong-lanceolate, to 2 in. long, sharp-pointed, glaucous-green. Brazil. Var. **elegans**, branches more slender and lvs. narrower; var. **Ridolfiana**, robust form with larger lvs.

Cookii. Mature lvs. densely imbricated, ovate, obtuse, to ⅓ in. long. New Caledonia, New Hebrides.

Cunninghamii. Hoop-Pine. Lvs. needle-like, to 1½ in. long, spiny-pointed. Australia. Var. **glauca** has silvery-glaucous foliage.

excelsa. Norfolk-Island-Pine. Lvs. densely imbricated, awl-shaped, to ½ in. long, sharp-pointed. Norfolk Isl. Var. **albo-spica**, Silver-Star A., young branchlets white-tipped; var. **glauca**, lvs. bluish-green; var. **robusta**, Emerald A., lvs. deep green; var. **virgata**, secondary branchlets very short.—This species is the one usually grown by florists for pot-plants, propagated by cuttings of vigorous erect tip shoots.

imbricata: *A. araucana.*

Rulei. Lvs. densely imbricated, oblong-lanceolate to elliptic, to ¾ in. long, obtuse, silvery-gray above, glossy below. New Caledonia. Var. **Goldieana**, less branched and lvs. narrower; var. **polymorpha** is a juvenile stage.

ARAUJIA. *Asclepiadaceæ.* Woody twiners with salver- or bell-shaped fls. in axillary cymes, large leafy calyx, and long leathery pods; native in Brazil and Argentina. Grown under glass from cuttings or out-of-doors from seed sown in heat in early spring.

sericofera (*Physianthus albens*). Lvs. oblong, to 4 in. long, dark green above, white and mealy beneath: fls. white or pinkish, to 1 in. across. S. Brazil.

ARBORETUM. A growing collection of trees (Latin *arbor*, tree); in common application, a living collection of trees and shrubs, that is, of woody plants. The term ordinarily connotes a plantation of many kinds of woody plants permanently maintained for purposes of study, investigation, and education, in distinction from a grove, forest, nursery, or a parking. An arboretum may be one of the integral parts of a botanic garden.

ARBORICULTURE. The cultivation of trees; in common usage often applied to the growing of woody plants, as trees and shrubs. It implies the cultivation of the plants as individuals rather than as elements in a forest, the latter subject being silviculture and part of the larger domain of forestry. Arboriculture is to be distinguished also from the growing of trees for a particular product, as the raising of fruit which is fruit-growing or pomology. The study of trees is a large and important branch of human activity.

ARBOR-VITÆ: *Thuja.* False: *Thujopsis dolobrata.* Hiba: *Thujopsis dolobrata.*

ARBUTUS. *Ericaceæ.* Evergreen trees and shrubs native in the Medit. region and W. N. Amer., having red flaking bark, alternate lvs., red or white urn-shaped fls. in terminal panicles, and fr. a red berry-like drupe.

Arbutuses are grown out-of-doors in warm regions or under glass in the North. They do best in well-drained soil with protection from the wind. Propagated by seeds, by cuttings of half-ripened wood in the fall under glass, and also by layers, budding or veneer-grafting.

Andrachne. To 40 ft.: lvs. ovate, to 4 in. long, usually entire: fls. dull white, in panicles to 4 in. long. Medit. region.

canariensis. To 30 ft.: lvs. oblong-lanceolate, to 6 in. long, toothed, glaucous beneath: fls. greenish-white, nearly ½ in. long, in erect panicles in spring. Canary Isls.

Menziesii. Madrona. To 50 or 100 ft.: lvs. oval to oblong, to 5 in. long, entire, glaucous beneath: fls. white, ⅓ in. long, in erect panicles to 6 in. long, May–June. B. C. to Calif.

Unedo. Strawberry-Tree. To 30 ft.: lvs. oblong, to 4 in. long, toothed, shining above: fls. white or pinkish, ¼ in. long, in drooping panicles to 2 in. long, in autumn. S. Eu., Ireland; stands in Ga. Var. **integerrima** has entire lvs. Var. **rubra** (var. *Croomii*) has deep pink fls.

ARBUTUS, TRAILING: *Epigæa repens.*

ARCEUTHOBIUM: see *Loranthaceæ.*

ARCHANGELICA: *Angelica Archangelica.*

ARCHONTOPHŒNIX (*Loroma*). King Palm. *Palmaceæ.* Two or 3 tall unarmed monœcious forest feather-palms of trop. and subtrop. Australia: trunk single, ringed, the upper part represented by a smooth green sheathing column of lf.-sheaths: pinnæ many, long and narrow, entire or somewhat bifid at apex, mostly drooping or hanging and often turned edgewise: spathe-lvs. 2, formed in the sheath of lower lvs. and expanding after the lf. falls: infl. compound on a short white peduncle, the long strands at first hanging; fls. typically in 3's, the middle one small and pistillate but often bearing staminodes; staminate fls. 3-angled, with a pistillode; anthers 8–24: fr. small, red, globose or ellipsoid, ¾ in. or less diam., the exocarp or outer shell soon decaying on the ground and exposing a covering of strong fibers; seed not furrowed, the albumen strongly ruminate. King palms are grown in S. Calif., Fla., Bermuda and in American tropics. For cult. see *Palm.*

Alexandræ (*Ptychosperma Alexandræ*). To 70 or 80 ft., in native regions: trunk enlarged or bulging toward base: under surface of pinnæ prominently grayish-white, middle width of largest ones 1½–2 in. or less, side nerves very prominent: fls. white or cream-color: fr. about ½ in. long, the fibers (under shell) close and not very prominent.

Cunninghamiana (*Ptychosperma* and *Loroma Cunninghamiana. Loroma amethystina*). Piccabeen Palm. Trunk not enlarging below, unless merely at surface of ground: under surface of pinnæ green or not gray-glaucous, the side nerves not particularly prominent, width 2–4 in. at middle in the central part of lf.: fls. lilac or purplish: fr. somewhat larger, the fibers or strands strong and loose.—This palm is known to planters as *Seaforthia elegans.*

ARCTIUM. Burdock. *Compositæ.* Coarse rank-smelling biennials or short-lived perennials with large alternate lvs. and tubular florets, purple to nearly white, clustered in bur-like heads; pappus of short scales; native in Eu. and Asia, some widely distributed as weeds.

One species is grown for its edible roots and one for medicinal purposes. In Japan the roots are eaten when 2 feet long or less; the plant is treated as an annual, seeds sown in May producing edible roots by autumn and the fall-sown crop harvested in spring.

Lappa (*Lappa major. L. edulis*). Great B. Gobo of the Japanese. Stout, much branched, to 8 ft.: lvs. cordate-ovate, to 20 in. long, white-woolly beneath: heads 1½ in. across, in flat-topped clusters. Eu.; nat. in N. Amer.

minus (*Lappa minor*). Common B. Similar to *A. Lappa* but not over 6 ft. high, the lvs. smaller and heads to ¾ in. across. Eu.; nat. in N. Amer.

ARCTOSTAPHYLOS (*Uva-Ursi*). Bearberry. Manzanita. *Ericaceæ.* Evergreen shrubs and small trees with alternate usually entire lvs., small urn-shaped nodding fls. in terminal racemes or panicles, and fr. a red or brownish drupe. The trailing species are grown for ground-cover in the N. and the others in warmer regions for ornament. Cult. as for *Arbutus.*

alpina: *Arctous alpinus.*

bicolor (*Xylococcus bicolor*). To 6 ft.: lvs. oblong, to 2½ in. long, shining above, white-tomentose beneath, the margins revolute: fls. rose; ovary hairy at top. Calif., Lower Calif.

diversifolia (*Comarostaphylis diversifolia*). To 15 ft.: lvs. elliptic or oval, to 3½ in. long, tomentose beneath, the margins toothed and revolute: fls. light pink; ovary pubescent. S. Calif., Lower Calif.

glauca. Great-berried M. To 30 ft.: lvs. oval or broad-ovate, to 2 in. long, glabrous, pale green: fls. white; ovary glabrous. S. Calif., Lower Calif.

manzanita. Erect shrub to 12 ft. and sometimes much more, crooked-branched, young parts pubescent: lvs. thick, oblong, pale green, to 1½ in. long: fls. white, sometimes tinged pink, in drooping panicles. Calif.

nummularia. To 1 ft.: lvs. ovate to oblong, to ¾ in. long, glabrous: fls. white; ovary pubescent. Calif.

pungens. To 8 ft.: lvs. oblong to elliptic, to 1 in. long, becoming glabrous: ovary glabrous. Calif. to Mex.

tomentosa. Woolly M. To 18 ft.: lvs. broad-ovate to oblong, to 2 in. long, tomentose beneath: fls. white or pink; ovary tomentose. B. C. to Calif.

Uva-ursi. Bearberry. Prostrate and creeping: lvs. obovate, to 1 in. long, glabrous, the margins revolute: fls. white or pinkish. Eu., N. Asia, N. Amer.

ARCTOTIS. *Compositæ.* More or less white-woolly S. African annuals with alternate lvs. and solitary radiate heads; pappus lacking or a crown of scales; grown in the flower-garden. Propagated by seeds.

breviscapa (*A. leptorhiza* var. *breviscapa*). Stemless: lvs. oblong-lanceolate, to 6 in. long, pinnately cut, longer than scape: fls. with orange rays and dark center, the heads to 2 in. across.

calendulacea: *Cryptostemma calendulaceum.*

grandis: *A. stœchadifolia.*

Gumbletoni. St. very short: lvs. to 1 ft. long and 1½ in. wide, pinnately cut or lobed: ray-fls. deep orange-red marked at base with brown, the heads 3 in. across, on peduncles to 1 ft. high. S. Afr.

stœchadifolia (*A. grandis*). African Daisy. Bushy, to 2½ ft.: lvs. obovate, to 4 in. long, toothed: ray-fls. white or white and pale violet, in heads to 3 in. across, the stalks much longer than lvs.

ARCTOUS (*Mairania*). *Ericaceæ.* One deciduous low shrub grown for ground-cover and another species probably not cult., having alternate finely toothed lvs., urn-shaped fls. in terminal clusters, and fr. a berry-like drupe. Propagated by seeds and cuttings. It does best in shady cool locations.

alpinus (*Arctostaphylos alpina*). Black Bearberry. Lvs. obovate or oblanceolate, to 1½ in. long, turning red in autumn: fls. white tinged with pink, ⅙ in. long: fr. black. N. Eu., N. Asia, N. N. Amer.

ARDISIA. *Myrsinaceæ.* Trees and shrubs with alternate simple leathery lvs., small white or rose fls. in cymes or panicles, and berry-like frs.

Grown out-of-doors in warm climates and one a popular greenhouse subject. Propagated by seeds sown late in winter or early in spring; also by cuttings of half-matured wood over bottom heat.

crenata: *A. crispa.*

crenulata: *A. crispa.*

crispa (*A. crenulata. A. crenata*). Lvs. oblong-lanceolate, to 3 in. long, wavy-margined, pale beneath: fls. white: berries coral-red, ¼ in. across. Malaya, China.—Shrub, but grown as a pot-plant in conservatories and residences for its abundant crop of durable bright red berries.

paniculata (*A. Pickeringia. Icacorea paniculata*). Marlberry. To 20 ft.: lvs. oblanceolate, to 7 in. long, entire: fls. white: berries black and shining, ⅓ in. across. S. Fla., W. Indies, Mex.

Pickeringia: *A. paniculata.*

ARECA. *Palmaceæ.* Graceful mostly very slender-stemmed unarmed monœcious ringed feather-palms of trop. Asia and the Pacific Isls. and Australia, with spadix below the lf.-crown or in some species among the foliage, some of the species soboliferous: base of petiole widely expanded and clasping; pinnæ close together and often joined, with several prominent ribs: spadix much branched, staminate fls. occupying the terminal part of the branches or spikes, stamens 3–6; large and few pistillate fls. at the base: fr. oblong or ovoid, more or less drupe-like, 1-seeded, base inclosed in the enlarging perianth. Formerly the genus Areca was very broadly conceived, and many genera have been segregated from it. Planted in S. Fla. See *Palm.*

alba: *Dictyosperma album.*

Alicæ. Sts. clustered and rather slender, to 10 ft.: lvs. 3–6 ft. long, the pinnæ somewhat erect: spadix below the lvs.; stamens 3: fr. long-pyriform or fusiform. Australia.—Plants grown under this name may be *Arikuryroba schizophylla.*

aurea: *Dictyosperma album* var. *aureum.*

Baueri: *Rhopalostylis Baueri.*

Cathecu. Betel Palm. Very slender palm with solitary trunk to 100 ft. and 6 in. diam., leafless below the relatively small crown: lvs. 3–6 ft. long, with many broad rather soft pinnæ not taper-pointed and irregularly notched or erose at apex and the upper ones confluent: fr. ovoid to globular-ovoid, mostly 2 in. or less long, orange or scarlet, with soft fibrous covering. Probably Malaya; cult. in India and elsewhere for the nut which is chewed along with the lf. of betel pepper. Lvs. sometimes variegated. Fls. fragrant. The name is commonly spelled Catechu but it was not so written by Linnæus, author of the name, in the three editions of Species Plantarum.

crinita: *Acanthophœnix crinita.*

glandiformis. Tall and slender, with marked rings: lvs. to 8 ft. long; pinnæ long-pointed, the midrib prominent underneath and secondary nerves more or less marked: spadix short, branched near base into branches 1 ft. or so long; pistillate fls. aggregated at base of branches, perianth enlarging. Moluccas.

Ilsemannii. Hort. name for a palm from the Pacific Isls., perhaps not an Areca: sts. red: young lvs. dark red, becoming green.

lutescens: *Chrysalidocarpus lutescens.*

Normanbyi: *Normanbya Normanbyi.*

rubra: *Dictyosperma album* var. *rubrum; Acanthophœnix rubra.*

sapida: *Rhopalostylis sapida.*

singaporensis: probably *Ptychoraphis singaporensis.*

speciosa: *Hyophorbe amaricaulis.*

triandra. Very attractive soft-lvd. palm making several green strongly ringed slender leafy sts. 5–10 ft.: lvs. bright green, 3–5 ft. long, with decurved broad pinnæ toothed or shallowly cut-lobed at the apex, the terminal pinnæ confluent or deeply 2-lobed: fr. oblong or long olive-like, red or orange-scarlet at maturity. India, Malaya.

Verschaffelti: *Hyophorbe Verschaffelti.*

ARECA, SPINE-: *Acanthophœnix.*

ARECASTRUM. *Palmaceæ.* Segregate from Cocos, considered as a single polymorphous species; native from Bahia in Brazil to Uruguay, Argentina, Paraguay and Bolivia. Unarmed monœcious feather-lvd. tree with solitary ringed trunk; spadix from axils of lower lvs., the staminate fls., with 6 stamens, on upper part of the branches and pistillate on lower part; spathe strongly plicate-sulcate, or grooved, on outside; pistillate fls. ovate when closed, the petals valvate at apex: fr. variable, 1 or 2 in. long, globose, ovate, elliptic or obovate; nutlet with thick bony wall; albumen of seed solid and not ruminate. In cultivation the trees vary widely in stature and habit, but these differences may not be botanically significant any more than comparable divergencies in apple trees, American elms and coconuts. See *Palm.*

Romanzoffianum (*Cocos Romanzoffiana. C. plumosa*). Queen Palm. Medium-sized tree to 30 ft. or more, the trunk smooth and plainly ringed, usually carrying a few dead hanging lvs. and old bases under the graceful crown: lvs. 8–15 ft. long, decurved, many or most of the mature pinnæ (which are soft in texture) making a characteristic bend or knuckle beyond or near the middle at the point where they begin to droop; pinnæ many, green both sides, mostly not exceeding 1 in. broad and most of them narrower, long-pointed, with faint side nerves: spathe 2–3 ft. or more long; branches of big spadix drooping: fr. globose to globose-ovate, about 1 in. lengthwise (to 1¼ in.) and nearly or quite as long as broad, borne in a heavy hanging truss. Cent. and S. Brazil. Var. australe (*Cocos australis* of botanists, not hort. *C. Arechavaletana. C. Datil. C. flexuosa* of hort.). Fr. ovate-elliptic, the breadth distinctly less than the length and sometimes only about half as much: considered to be a more slender and graceful tree than the species and with rather smaller crown, but this is to be confirmed; this var. appears to be the prevailing form of the tree commonly planted in S. Calif., Fla. and elsewhere as *Cocos plumosa.* S. Brazil, Uruguay, Paraguay, Argentina. Var. **botryophorum** (*Cocos botryophora*). Very tall robust tree with heavy upright crown: fr. large, globose-ovate or -obovate, 1½–2 in. long. Brazil.

AREGELIA. *Bromeliaceæ.* Epiphytic herbs with prickly-toothed lvs. in a basal rosette and white, violet or blue fls. in simple dense heads among the lvs.; sometimes grown under glass. For cult. see *Bromelia.*

tristis. Lvs. to 1 ft. long and 6 in. wide, mottled with brown: fls. purple. Brazil.

ARENARIA. Sandwort. *Caryophyllaceæ.* Low herbaceous annuals and perennials, often forming mats, suitable for borders, carpets, rock- and alpine-gardens, walls and lawn clumps: spring or summer-blooming; fls. usually white, small, terminal or clustered, sometimes axillary: lvs. entire, narrow and opposite: native around the world but rare in the tropics. Includes plants listed as *Alsine.*

A few of the kinds entered here are listed in the trade also as Alsine, and a troublesome question of nomenclature is involved. For our purposes, however, they are retained in Arenaria. Usually only the perennial species are cultivated and these require no special soil or treatment unless they are alpines. Propagated by division and by seeds, the rare species sometimes by cuttings.

balearica. Corsican S. To 3 in., creeping: lvs. ovate, glossy, thick and ciliated: fls. white, solitary. Balearic Isls., Corsica; not hardy north of N. Y. City.

banatica. To 8 in. or less: lvs. ciliate: fls. white with white sepals striped green, in 3–5-fld. clusters. S. E. Eu.

Bauhinorum. Tufted, to 8 in.: lvs. very narrow: fls. white, large. Eu.—Botanical position uncertain; sometimes referred to *A. liniflora* but this is also a dubious species.

cæspitosa: *A. verna* var.

cephalotes. Sts. erect: lvs. filiform, ciliate: fls. in a compact thyrse. S. Russia.

cuspidata: listed name.

gracilis. Slightly tufted sticky-pubescent per. to 4 in.: lvs. linear: fls. white, in 2's. S. E. Eu.

graminifolia. To 1½ ft.: lvs. long and thread-like: fls. white, in 3-forked loose panicles. Eu.

grandiflora. To 10 in. or less: lvs. flat awl-shaped, ciliate: fls. white, large, solitary or in 2's or 3's. Eu.—Runs into many forms.

grœnlandica. Ann., very low, forming mats, the decumbent or erect sts. bearing 1–5 white fls.: lvs. small and narrow. Greenland and Lab. to mts. of N. C.

Hookeri. Tufted per. to 6 in.: lvs. subulate: fls. white, in dense cymes. Mont. to Colo.

juniperina. Tufted, to 6 in.: lvs. awl-like: fls. white, in clusters. E. Eu., Asia Minor.

laricifolia. To 8 in.: lvs. awl-shaped, ciliate: fls. large, white, hairy, solitary or clustered. Switzerland.

Ledebouriana. Alpine per., cespitose, glabrous, dichotomous, branches to 6 in. long: lvs. rigid, narrow-awl-shaped and crowded: fls. on stiffish slender pedicels. S. E. Eu.

liniflora: see *A. Bauhinorum.*

longifolia. Sts. erect, to 1 ft.: lvs. awl-shaped, thread-like: fls. white, in 3-forked panicles. Siberia.

montana. To 4 in.: lvs. narrow: fls. white, large, solitary. S. W. Eu.

peploides. Branches procumbent, fleshy, to 4 in.: lvs. ovate, light green, fleshy: fls. white. Seashores of Britain.

pinifolia. Dwarf cespitose per., with ascending parts: lvs. narrow-awl-shaped or bristle-like: fls. white, in small corymbs. Asia Minor.

pungens. Forming bristly tufts to 8 in. and more high: lvs. thorny, very narrow: fls. white, solitary, terminal or in axils near tip of branches. Spain.

purpurascens. Decumbent, tufted, to 4 in.: lvs. ovate-lanceolate: fls. rose-lilac, 2–3. Pyrenees.

racemosa. Somewhat woody per. to 3 in. high, making mats: lvs. awl-shaped, curved: fls. white, solitary. Spain.

Rosani. To 2 in. with erect coarsely hairy sts.: lvs. narrow, hairy: fls. white, in 3's. Italy.

rotundifolia. Spreading tufted branches to 6 in.: lvs. roundish, ciliate, ¼ in. across: fls. white, solitary. Siberia.

Saxifraga. Alpine cespitose per., glandular-hirsute: lvs. in rosettes, linear-lanceolate, about ½ in. long, acute, 5–7-nerved: fls. 2–7 in a cluster. S. E. Eu., Asia Minor.

tmolea. Tufted, st. very short: lvs. ovate-oblong, to ⅛ in. long: fls. white, in clusters of 1–3. Asia Minor (Mt. Tmolus, etc.).

verna. To 3 in.: lvs. flat, narrow: fls. white, on thread-like sts. Eu. and Rocky Mts. Var. **cæspitosa** is a compact leafy form making dense moss-like masses.

ARENGA. *Palmaceæ.* Monœcious feather-palms (lvs. sometimes pinnatisect) of trop. Asia and Malaya, unarmed except for needles in the heavy lf.-sheath fibers in some species, flowering from the upper lf.-axils downwards, in some kinds the tree dying when the last spadix has fruited: trunk solitary or several:

pinnæ or parts with many strong nerves beside the midrib, whitish or gray underneath, jagged, notched or cut off at apex which is sometimes broadened, and often notched on sides: spadix much branched, peduncle short, branches drooping; sexes usually separate on different spadices but sometimes a pistillate between two staminates; stamens many: fr. more or less drupe-like, obovoid to globose, 2–3-seeded. See *Palm.*

Ambong (*A. mindorensis. A. tremula*). Trunk short and thick, but plant becoming a tree: lvs. very large, the blade to 10 ft. long and petiole to 6 ft.; pinnæ to 2 ft. and more long, somewhat paper-like, with several deep indentations or constrictions on either side: fr. globular, about 1 in. diam. Philippines.

Engleri. Handsome, dwarf, perhaps to 10 ft.: lvs. gray-tomentose or -pubescent underneath, with many pinnæ that are narrow at the base of the lf. and broad towards its top, the sides and apex variously notched and jagged: spadix short: fr. about 1 in. or less across, subglobose, 3-seeded. Formosa; stands outdoors in S. Calif.

mindorensis: *A. Ambong.*

saccharifera. Sugar Palm. Monocarpic large palm, dying when the last spadices have ripened their fr.: trunk solitary, to 40 ft.: lvs. to 20 ft. and more long, whitened beneath; pinnæ to 100 or more on either side, single and fascicled, variously dentate or notched or 2-lobed at apex: fr. oblong-turbinate, about 2 in. long or somewhat more, flat or depressed on top, borne on very long spadices. Malaya.—Cult. in India for sugar made from the sap and for other uses; planted in S. Fla.

tremula: *A. Ambong.*

ARETHUSA. *Orchidaceæ.* Low terrestrial orchids, one native in bogs in E. N. Amer. and sometimes planted in cool moist protected places. **A. bulbosa.** To 10 in., with small bulbs: lf. solitary, linear, to 6 in. long: fls. solitary or rarely 2, rose-purple, 2 in. long; lip drooping, fringed or toothed, spotted with purple.

ARGANIA. *Sapotaceæ.* One hard-wooded evergreen tree to 20 ft., often with spiny branches, native in Morocco. **A. Sideroxylon.** Lvs. lanceolate-spatulate, entire, glabrous: fls. greenish-yellow, 5-parted, in clusters: fr. an oblong berry, the seeds yielding oil.—May be planted in S. Calif. Propagated by layers and cuttings.

ARGEMONE. Prickly-Poppy. *Papaveraceæ.* American prickly herbs (1 shrubby, not in cult.) with yellow juice, pinnatifid spine-tipped lvs., and large terminal fls., sepals often horn-tipped; grown as annuals in the flower-garden. They thrive in any good soil and sunny exposure.

alba. To 3 ft. and more, with pale or glaucous foliage: fls. large, white, the sepals with only slight tips: caps. somewhat hispid. Southern states.

grandiflora. To 3 ft.: lvs. white-veined: fls. white, 2 in. across, the sepals with stout long tips: caps. not prickly or only slightly so. Mex. Var. **lutea** has yellow fls.

hispida: *A. platyceras* var.

mexicana. To 3 ft.: lvs. white-veined, glaucous: fls. yellow or orange, 2 in. across: caps. prickly. Trop. Amer.

platyceras. Crested P. To 4 ft.: lvs. somewhat glaucous: fls. white or rarely purple, 2 in. across, closely subtended by bract-like lvs.: caps. very spiny. N. and S. Amer.—Apparently most common garden kind. Var. **hispida** (*A. hispida*), Hedgehog P., is densely bristly as well as having yellow spines. Var. **rosea** has brownish-purple fls.

ARGENTINA: *Potentilla Anserina.*

ARGYREIA. *Convolvulaceæ.* Asiatic twining (seldom nearly erect) pubescent or tomentose shrubs or per. herbs with alternate simple lvs. and showy purple or rose funnelform fls.; grown under glass, and in the open far S. Propagated by seeds and cuttings over heat.

speciosa. Woolly Morning-Glory. Large climber: lvs. to 1 ft. across, ovate-cordate, white-tomentose underneath: fls. rose, 2–3 in. long, on stalks to 6 in. long. India, Java, China.

splendens. Silver Morning-Glory. Tall climber: lvs. to 7 in. long and 4 in. across, elliptic with angular or rounded never cordate base, white-silky-hairy underneath: fls. rose, 1½ in. long, on stalks 1–4 in. long. India.

ARIDARIA. *Aizoaceæ.* Segregate from Mesembryanthemum, differing in technical characters: corolla showy, ¾–1½ in. or more across: seeds compressed and tuberculate. S. Afr., in dry habitats. For cult. see *Mesembryanthemum.*

splendens (*M. splendens*). Somewhat woody per., branched, erect: lvs. half-cylindric, glaucous, to 1 in. long, crowded: fls. white, on short thickened peduncle, the petals dentate.

ARIKURYROBA. Arikury Palm. *Palmaceæ.* One small graceful monœcious feather-palm of trop. Brazil, unarmed except for the strongly spined petioles, differing from Cocos (from which it is a segregate) in the small ovate pistillate fls. with valvate petals and plicate-sulcate spathe as well as in habit and much smaller fr. which has a solid and ruminate albumen; nutlet with thin fragile wall. **A. schizophylla** (*Cocos schizophylla. Arikury schizophylla. Arikuryroba Capanemæ*). Trunk 2–8 ft., solitary, covered for the most part with lf.-bases: pinnæ green both sides with strong midrib and faint side nerves, about 1 in. broad, notched or cut at apex: spadices in the axils of lower lvs., long-peduncled and becoming declined; staminate fls. on upper part of branches: fr. ellipsoid, 1 in. or more long, in a grape-like cluster. Probably adapted to S. Fla. *Butia Bonneti* has apparently been confused with this palm. See also *Areca Alicæ.* Not well understood.

ARIL: an appendage or an outer covering of a seed, inside the pericarp, growing out from the hilum or funiculus; sometimes it appears as a pulpy covering.

ARIOCARPUS (*Anhalonium*). *Cactaceæ.* Spineless or nearly so, making a small nearly globular or top-shaped body of which the larger part is in the ground, with spirally arranged leaf-like thick tubercles: fls. diurnal, opening wide, from axillary areoles located between the tubercles, the areoles on the apex of the tubercles being barren. One species now recognized (see *Roseocactus*). See *Cacti.* **A. retusus** (*A. furfurascens. A. prismaticus. A. trigonus*). Seven Stars. Body globular or flattish, woolly in center, about 4 in. across; tubercles not grooved on upper side: fls. nearly or quite white, to 2 in. or more long. Mex.

ARISÆMA. *Araceæ.* Widely distributed herbs mostly with tuberous roots, palmately compound or dissected lvs., and unisexual fls. borne on a spadix which is surrounded by the tubular spathe, the limb often arching above.

A few species are sometimes transplanted from the wild into moist shady places. Propagated by tubers and seeds.

Dracontium. Dragon-Root. To 4 ft.: lvs. pedately 5–17-parted into lfts. to 10 in. long and 4 in. wide: spathe greenish, the tail-like spadix projecting: berries reddish-orange. Me. to Fla. and Tex.

japonicum: *A. serratum* var. *Blumei.*

serratum. Lvs. pedately 5–11-parted into slender-pointed more or less serrate lfts. to 6 in. long and 2 in. wide: spathes green or purplish, on stalks to 20 in. high. Japan. Var. **Blumei** (*A. japonicum*) has entire lfts. and pale spathes.

triphyllum. Jack-in-the-Pulpit. Indian Turnip. To 3 ft.: lvs. of 3 ovate or oblong-ovate lfts. to 7 in. long and 3½ in. wide: spathes green striped with purple, arched in a broad flap over the spadix: berries red. E. N. Amer.

ARISTEA. *Iridaceæ.* African herbs with lvs. in basal rosette and blue fls. in spikes, racemes or corymbs, the perianth-tube short and segms. twisting up spirally after flowering; grown under glass or in the open in Calif. Propagated by seeds and division.

capitata. To 4 ft.: lvs. to 4 ft. long and ½ in. wide, rigid: fls. ½ in. long, in long narrow panicles. S. Afr.

Eckloni. To 1 ft. or more: lvs. to 1½ ft. long and ½ in. wide: fls. ⅓ in. long, in loose panicles. S. Afr.

ARISTOLOCHIA. Birthwort. *Aristolochiaceæ.* Per. herbs and shrubs, mostly climbers, with usually heart-shaped entire lvs., bent odd-shaped very irregular tubular calyx simulating a corolla, often constricted at the mouth and sometimes tailed, and fr. a caps.; native in warm and temp. regions, and grown as porch vines or in the greenhouse, and a few of them as erect garden herbs.

The tender kinds do best in a greenhouse border of rich soil. Propagated by cuttings of ripened wood over heat, layers, and seeds. *A. durior*, hardy North, is a rapid grower and makes good screens for porches and for covering buildings.

brasiliensis. Climbing: fls. dingy-yellow veined with purple, with 2 very unequal lips, the upper narrow and to 4 in. long, the lower to 4 in. long and 7 in. across. Brazil. Var. **macrophylla** has large lvs.

californica. Climbing to 12 ft., woody, deciduous: fls. greenish-purple, with strongly bent tube about 1½ in. long, and 2-lipped limb, the upper lip 2-lobed. Calif.

Clematitis. Erect, to 2 ft., herbaceous: fls. yellowish-green, to 1½ in. long, with straight tube, in axillary clusters. Eu.; nat. in E. U. S.

durior (*A. macrophylla. A. Sipho*). Dutchmans-Pipe. Woody, climbing to 30 ft.: fls. yellowish-green, with curved U-shaped tube to 3 in. long and 3-lobed brownish-purple limb to 1 in. across. Pa. to Ga. and Kans.

elegans. Calico-Flower. Slender woody climber with drooping branches: fls. with yellowish-green inflated tube to 1½ in. long and nearly circular entire limb to 3 in. across, white veined purple outside, purple-brown inside. Brazil.

fimbriata. Sts. scarcely climbing: fls. with green strongly curved tube inflated at base and one-sided cordate limb to 1 in. across, greenish-brown outside, purple-brown inside veined with yellow, edged with long hairs. Argentina.

galeata. Climber: fls. with curved tube inflated below, to 3 in. long, and 2-lobed dark purple lip, the upper to 3 in. long and lower to 5 in. long which is clawed and expanding into broad blade purple outside and whitish inside. Brazil.

Galeotti. Herbaceous climber: fls. brown, with straight tube inflated below and broad-lanceolate limb barbed within. Mex.

gigantea: *A. grandiflora* var. *Hookeri.*

gigas: *A. grandiflora.*

grandiflora (*A. gigas*). Pelican-Flower. Climbing, woody: fls. with yellowish-green inflated tube and cordate-ovate wavy limb 6 in. and more across, veined and spotted purple, with long tail. Jamaica. Var. **Hookeri** (*A. gigantea*), fls. with short tails. Var. **Sturtevanti**, fls. very large with tails to 3 ft. long.

hastata. Erect herb to 3 ft.: lvs. narrow-lanceolate or linear, hastate or sagittate: fl. S-shaped, greenish, near the ground. S. U. S.

kewensis. Hybrid between *A. trilobata* and *A. brasiliensis*, the former a vine in trop. Amer. with greenish-yellow large fls.

macrophylla: *A. durior.*

macroura. Herbaceous climber: fls. brownish-green, with strongly curved tube inflated below and broad-cordate dark brown lip with slender twisted tail to 1½ ft. long. Brazil.

odoratissima. Sweet-scented climber: fls. purple, with inflated tube about 1 in. long and cordate-oblong limb to 3 in. long. Jamaica, Cent. Amer.

Serpentaria. Virginia Snakeroot. Erect, to 3 ft., herbaceous: fls. about 1 in. long, greenish, with curved tube and short slightly lobed limb. Conn. to La.

Sipho: *A. durior.*

Sturtevanti: *A. grandiflora* var.

tomentosa. Climbing to 30 ft., woody: fls. about 1½ in. long, with greenish-yellow U-shaped tube and yellow reflexed 3-lobed limb ¾ in. across. N. C. to Fla. and Mo.

triangularis. Herbaceous climber with triangular lvs.: fls. bright purple, spotted and veined, about 1 in. long, with curved tube inflated below and broad-ovate emarginate lip. Brazil.

ARISTOLOCHIACEÆ. Birthwort Family. Five genera mostly of warm regions, herbs or shrubs with alternate lvs., bisexual fls. with corolla-like 3-lobed calyx of various forms and colors, 6–36 stamens, mostly inferior 4–6-celled ovary, and capsular frs. Aristolochia and Asarum are known to hort.

ARISTOTELIA. *Elæocarpaceæ.* Evergreen trees or shrubs native in the southern hemisphere, with simple lvs. opposite or nearly so, small unisexual fls. and fr. a berry; planted in S. Calif. for ornament. Propagated by cuttings of ripe wood under glass.

Colensoi. Similar to *A. racemosa* but smaller with quite glabrous lvs., simple racemes and smaller berries. New Zeal.

fruticosa. Shrub to 8 ft., much branched: lvs. leathery, obovate, to 1 in. long, entire or lobed or on young plants pinnatifid: fls. solitary or in 3–6-fld. cymes. New Zeal.

Macqui. Shrub to 7 ft.: lvs. oblong, about 3 in. long, toothed, shining and sometimes variegated: fls. greenish. Chile.

racemosa. New Zealand Wineberry. Tree to 25 ft.: lvs. ovate, to 5 in. long, deeply sharp-toothed: fls. rose, in many-fld. panicles: berry dark red or nearly black, size of pea. New Zeal.

ARMED: provided with any kind of strong and sharp members, as if for defense, as of thorns, spines, prickles, barbs.

ARMERIA: *Statice.*

ARMORACIA. *Cruciferæ.* A few per. herbs in Eu. and Asia, one widely grown in the vegetable-garden and also run wild in N. Amer.; one native species in N. Amer. is considered by some to be referable to this genus: radical lvs. large and often dock-like, variously dissected: fls. white, small: fr. an ovoid or short-oblong pod or silicle. **A. rusticana** (*Nasturtium, Radicula* and *Roripa Armoracia*), Horse-Radish (which see), is a deep-rooted glabrous strong per.: lower lf.-blades to 15 in. long and 9 in. across, crenate-dentate or jagged and sometimes dissected into linear segms., upper st.-lvs. lanceolate to oblong: fls. in spring in a terminal panicle: seedless. S. E. Eu.

ARNEBIA. *Boraginaceæ.* Old World herbs with alternate simple lvs. and yellow or violet slender-tubed fls. in racemes or cymes, throat without scales; sometimes grown in the border or rock-garden. Of easy cult. Propagated by seeds, division or cuttings.

cornuta. Arabian-Primrose. Ann. to 2 ft.: lvs. lanceolate: fls. yellow spotted with black, changing to maroon, ¾ in. across. Orient.

echioides. Prophet-Flower. Per. to 1 ft.: lvs. obovate-oblong: fls. yellow with purple spots, changing to pure yellow. Armenia.

ARNICA. *Compositæ.* Herbaceous perennials with clustered root-lvs. and opposite st.-lvs. and large long-stalked heads of yellow ray- and disk-fls.; pappus of bristles; native in Eu., Asia and N. Amer.

Arnicas are grown in the rock-garden or border or colonized in woodsy places. Tincture of *A. montana* has medicinal uses. Propagated usually by division, seldom by seeds.

alpina. To 15 in., pubescent: lvs. lanceolate or spatulate, to 4 in. long, nearly entire: heads about 2 in. across, usually solitary; pappus white. N. N. Amer., N. Eu.

Chamissonis. To 2 ft., soft-pubescent: lvs. oblong-lanceolate, to 6 in. long, toothed or entire: heads to 2 in. across, corymbose; pappus white or yellowish. B. C. to Mont.

Clusii: *Doronicum Clusii.*

longifolia. To 2 ft., pubescent: lvs. linear-lanceolate, to 6 in. long, entire or toothed: heads in flat-topped panicles; pappus brownish, plumose. Wash. to Mont. and Calif.

mollis. To 2 ft., pubescent: lvs. oblong-lanceolate, to 6 in. long, toothed: heads 1–3; pappus brownish, plumose. B. C. to Colo.

montana. To 2 ft.: radical lvs. oblong-lanceolate, glabrous, entire: heads to 3 in. across, 3–4 in a cluster; pappus white. Eu.

nevadensis. To 1 ft., pubescent: lvs. orbicular or ovate, to 2¼ in. long, usually entire: heads ½ in. long. Calif.

sachalinensis. To 2 ft., nearly glabrous: lvs. oblong-lanceolate, toothed: heads few. Sachalin Isl.

AROIDEÆ, AROIDS: *Araceæ.*

AROMA: *Cailliea glomerata.*

ARONIA. Chokeberry. *Rosaceæ.* N. American deciduous shrubs with alternate toothed lvs., white or pinkish fls. in terminal corymbs in early spring, and fr. a small berry-like pome.

Propagated by seeds sown when ripe or stratified and by suckers, layers and cuttings of green wood under glass. Useful for colonizing in low places, showy in bloom; fruit attractive in autumn.

arbutifolia (*Pyrus arbutifolia*). Red C. To 10 ft.: lvs. gray-tomentose beneath: fr. red. Mass. to Fla. and Tex. Var. **brilliantissima** is advertised.

atropurpurea (*A. floribunda. Pyrus arbutifolia* var. *atropurpurea*). Purple C. To 12 ft.: lvs. pubescent beneath: fr. purple-black. Newf. to Fla. and Ind.

floribunda: *A. atropurpurea.*

melanocarpa (*A. nigra. Pyrus melanocarpa* and *P. nigra*). Black C. To 4 ft.: lvs. nearly glabrous beneath: fr. black. N. S. to Fla. and Mich. Var. **grandifolia** grows to 10 ft. and has larger lvs. and frs.

nigra: *A. melanocarpa*

ARPOPHYLLUM. *Orchidaceæ.* Trop. American epiphytes with pseudobulbs bearing solitary lvs. and red fls. in thick racemes, the sepals and petals similar, the lip concave and slightly 3-lobed; do best in a temperate greenhouse. See *Orchids* for cult.

giganteum. To 2 ft.: pseudobulbs to 8 in. high: lvs. linear, to 1 ft. long: fls. small, light rosy-red with somewhat darker lip, in stiffly erect racemes to 1 ft. high, Apr.–June. Mex., Guatemala.

ARRACACIA. *Umbelliferæ.* Stout per. herbs native from Mex. to Peru, with pinnately compound lvs., small white or dark purple fls. in compound umbels, and compressed frs.

One species is grown in the mountains of the tropics for the thick edible roots. Propagated by the small heads which form at the bases of the leaf-stalks.

esculenta: *A. xanthorrhiza.*

xanthorrhiza (*A. esculenta*). Apio. Roots branching, with starchy yellow flesh: lvs. ternate or 2-pinnate. Colombia.

ARRHENATHERUM. *Gramineæ.* Tall per. grasses resembling oats, the spikelets in panicles, florets awned; native in Medit. region, nat. in N. Amer.; sometimes sown as a meadow grass. See *Grasses.*

bulbosum: *A. elatius* var. *tuberosum.*

elatius (*Avena elatior*). Tall Oat-Grass. To 4 ft., tufted: lvs. to 1 ft. long and ¼ in. wide, rough: panicles 1 ft. or more long, shining, light green or purplish, the branches erect. Nat. in N. Amer. Var. **tuberosum** (*A. bulbosum*) has a string of tubers at the ground; often with striped lvs.

[**ARROWHEAD:** *Sagittaria.*

ARROWROOT: *Maranta arundinacea.*

ARROW-WOOD: *Viburnum dentatum.*]

ARSENOCOCCUS: *Lyonia ligustrina.*

ARTABOTRYS. Tail-Grape. *Annonaceæ.* Trop. climbing evergreen shrubs with alternate simple lvs., hooked peduncles adapted to climbing, fls. constricted above the closely packed stamens, and fr. of separate carpels borne in clusters on the hardened receptacle; one species is grown in greenhouses or the open far S. It requires fertile soil. Propagated by seeds.

odoratissimus. Climbing Ylang-Ylang. Lvs. oblong, to 6 in. long: fls. very fragrant, greenish or yellowish, to 2 in. long: carpels yellow, smooth, 1 in. or more long. Old World tropics.

ARTEMISIA. Wormwood. *Compositæ.* Aromatic and bitter herbs or small shrubs with alternate mostly dissected lvs. and small numerous yellow or white heads; fls. all tubular; pappus none. They are per. unless otherwise noted.

Wormwoods are grown for ornament but mostly for the medicinal and aromatic qualities. They thrive even in poor dry soil. Usually increased by division; also by seed when obtainable.

Abrotanum. Southernwood. Old Man. Glabrous green subshrub to 5 ft.: lvs. 1–3-pinnately divided into thread-like segms.: heads yellowish-white, ⅛ in. across, in a loose panicle. Eu.

Absinthium. Common W. Absinthium. Subshrub to 4 ft., white-silky: lvs. 2–3-parted into oblong segms.: heads yellowish, ⅛ in. across, in many-fld. leafy panicles. Eu.

albula. White-tomentose, to 3½ ft., with slender spreading branches: lower lvs. ovate, to 2 in. long, with 3–5 short broad lobes, upper lvs. linear or nearly so: heads small and numerous in little racemes terminating the branches. Tex., Colo., S. Calif.—Hardy N. and sometimes grown as "Silver King Artemisia"

annua. Sweet W. Ann. to 5 ft., glabrous, very sweet-scented: lvs. 2–3-pinnate, the segms. deeply cut: heads yellow, 1/12 in. across, in a loose many-fld. panicle. Asia; nat. in N. Amer.

arborescens. Shrubby, to 2 ft.: lvs. finely divided, silvery: heads bright yellow, in one-sided racemes. Medit. region.

arbuscula. Low Sage-Brush. Shrub to 1 ft., silvery-pubescent: lvs. wedge-shaped, 3-lobed, to ½ in. long: heads brownish, in simple panicles, often spike-like. Wash. to Calif. and Wyo.

argentea. Shrubby, to 2 ft., white-silky: lvs. 2-pinnate into linear or lanceolate segms.: heads woolly, nodding, in raceme-like panicles. Madeira.

Baumgarteni. To 1 ft., silvery-pubescent: lvs. 3-pinnatifid: heads yellow, racemose. Alps.

campestris. To 2 ft., shrubby, glabrous or becoming so: lvs. pinnatifid into linear segms.: heads yellow, minute, racemose. Eu., Asia.

camphorata. Shrubby, to 2½ ft., camphor-scented: lvs. 2–3-pinnate into thread-like segms., glabrous: heads yellow, nodding, silvery-pubescent, in panicles. S. Eu.

canadensis. Nearly or quite glabrous per. to 2 ft.: lvs. mostly 2-pinnate, with very slender segms.: heads greenish, small, in long narrow panicle. Newf. to New England and far west, Eu.

canescens: hort. name.

diversifolia. White-tomentose, st. simple, to 4 ft. or more: lower lvs. to 4 in. long, mostly pinnately cut into narrow acute lobes, upper ones linear-lanceolate: fls. in a narrow panicle. Neb. to Calif. and north.

Dracunculus. Tarragon. Estragon. Per. to 2 ft., glabrous, green: basal lvs. 3-parted at tip; st.-lvs. linear or lanceolate, entire or small-toothed: heads whitish-green, to ⅛ in. across, in spreading panicles. Eu.—The lvs. are used as seasoning.

frigida. Fringed W. Per. to 1½ ft., silvery-pubescent: lvs. 2-pinnate into linear segms.: heads yellow, nodding, in racemes. W. N. Amer., Asia.

glacialis. Per. to 4 in., gray-pubescent: lvs. pinnatisect: heads golden-yellow, in corymbs. Alps.

gnaphalodes. White-tomentose per. to 3 ft. or more: lvs. simple, oblanceolate and somewhat serrate, the upper ones linear and entire: heads many in leafy panicles, small, grayish. N. U. S. and Canada.

gracilis: *A. scoparia.*

lactiflora. White Mugwort. To 4 ft., nearly glabrous: lvs. pinnately parted or cut into large toothed or incised segms., pale beneath: heads white, about 1/16 in. across, loosely panicled. China.—Much like *A. vulgaris.*

longifolia. White-tomentose per. to 3 ft. or so: lvs. linear or linear-lanceolate, simple and entire: heads erect, in narrow panicle. Neb. northwest.

maritima. To 2 ft., much branched, silvery-pubescent: lvs. 2-pinnate into linear segms.: heads brownish-yellow, in erect or drooping oblong racemes. Eu.

montana: a listed name, botanical position uncertain.

Moxa. Shrubby, gray-pubescent: lvs. 2-pinnate into linear-lanceolate segms.: heads ⅙ in. across, nodding, in panicles. China.

mutellina. To 6 in.: lvs. pinnatisect into linear-lanceolate segms., silvery-pubescent: heads yellowish-green, in racemes. Alps.

pedemontana. Small silvery-woolly per. to 6 in.: lvs. more or less rounded in outline, cut into linear divisions: fls. pale yellow, few toward top of st., sometimes not produced. Alps, S. Eu.—See *A. pontica.*

persica. Per. or bien. to 4 ft., white-tomentose: lvs. pinnatisect: heads yellow, ⅙ in. across, in racemes. W. Asia.

pontica. Roman W. To 4 ft., shrubby: lvs. hoary below, pinnately cut into linear segms.: heads whitish-yellow, ⅛ in. across, nodding in long open panicles. Eu.—Often remains sterile, forming patches of low feathery shoots; has been planted as *A. pedemontana.*

Purshiana. Cudweed W. To 2 ft.: lvs. ovate to lanceolate, mostly entire, white-woolly on both sides: heads white, in spike-like panicles. B. C. to Calif. and Neb.

rupestris. To 6 in.: lvs. somewhat silky, 2-pinnatisect into linear segms.: heads yellow, nodding, in panicles. Eu.

sacrorum. Russian W. Ann. or bien., shrubby below: lvs. hoary or white-pubescent, sinuately cut: heads nodding, in slender racemes. Russia, Siberia. Var. viride. Summer-Fir. Pyramidal, to 10 ft., with rich green much dissected foliage.

scoparia (*A. gracilis*). Ann., slender, to 5 ft.: lvs. much divided into hair-like segms.: heads small, white, in broad densely packed panicles. E. Eu.

serrata. Per. to 10 ft., much branched: lvs. lanceolate, to 6 in. long, serrate, white-woolly beneath: heads greenish, 1/12 in. across, in panicles. Ill. to S. D.

spicata. To 6 in.: lvs. pinnatisect, silvery-pubescent: heads yellow, in spikes. Alps.

Stelleriana. Beach W. Old Woman. Dusty Miller. Per. to 2½ ft., densely white-woolly: lvs. pinnatisect into oblong entire or toothed lobes: heads ¼ in. across, yellow, in compact many-fld. racemes. Coasts, N. E. Asia, Que. to Del.

tridentata. Sage-Brush. Shrub to 12 ft., silvery-pubescent: lvs. wedge-shaped, to 1 in. long, 3–6-toothed or lobed, tips blunt: heads ⅛ in. across, many, in panicles. B. C. to Calif. and Neb.

vulgaris. Mugwort. Per. to 3½ ft., much branched, sts. often purplish: lvs. pinnatifid into oblong toothed or entire segms., fragrant, white-tomentose beneath, dark green above: heads yellow, ⅛ in. across, in panicled spikes. Eu., Asia; nat. in E. N. Amer.

ARTHROPODIUM. *Liliaceæ.* Tufted per. herbs with fleshy roots, mostly basal lvs., and white or purplish fls. in racemes or panicles, the perianth-segms. distinct; grown in S. Calif. and cult. as for *Anthericum.*

candidum. To 14 in.: lvs. to 10 in. long and ¼ in. wide, grassy: fls. white, ¼ in. across, in simple racemes. New Zeal.

cirrhatum. To 3 ft.: lvs. to 2 ft. long and 2½ in. wide: fls. white, to 1 in. across, in panicles to 1 ft. long; filaments with 2 tendril-like appendages. New Zeal.

ARTICHOKE: *Cynara Scolymus.* Chinese: *Stachys Sieboldii.* Japanese: *Stachys Sieboldii.* Jerusalem: *Helianthus tuberosus;* see *Girasole.*

ARTICULATE: jointed; provided with nodes or joints, or places where separation may naturally take place.

ARTILLERY PLANT: *Pilea microphylla.*

ARTOCARPUS. *Moraceæ.* Trees with milky juice, large alternate lvs., staminate fls. in stiff spikes, pistillate in heads, and fr. imbedded in the fleshy perianth forming a heavy syncarp; native in the Asian tropics and grown in trop. climates for the fr. or general interest. For cult. see *Breadfruit.*

Cannoni. Purple-lvd. greenhouse plant from the S. Seas, of doubtful botanical position: lvs. 3-ribbed from base and 2 basal side lobes and other lobes farther up, all the lobes toothed, sinuses open.

communis (*A. incisa*). Breadfruit. To 60 ft.: lvs. ovate, pinnately lobed, to 2 ft. and more long, dark green, thick and leathery: staminate spikes yellow, club-shaped, to 1 ft. long: fr. round or oval, to 8 in. across, yellow when ripe, covered with prickles. Polynesia.—The seedless forms are the breadfruits and those with seeds are known as breadnuts.

incisa: *A. communis.*

integra (*A. integrifolia*). Jakfruit or Jackfruit. To 70 ft.: lvs. elliptic or obovate, to 8 in. long, stiff and glossy, entire: staminate spikes cylindric or club-shaped, to 4 in. long: fr. oblong, to 2 ft. long, greenish-yellow turning brownish, covered with hard points. India to Malaya.

integrifolia: *A. integra.*

Lakoocha. To 60 ft.: lvs. oblong or elliptic, to 1 ft. long, entire, pubescent beneath: fr. globose, to 3 in. across, smooth or wrinkled. India to Malaya.

ARUM. *Araceæ.* Tuberous herbs native in Eu. and Asia, having arrow-shaped lvs. and unisexual fls. borne on a spadix surrounded by a spathe which is often colored; many plants once named in Arum are now transferred to other genera. See *Sauromatum* for the plant sometimes known as *A. cornutum.*

Arums require rich soil, plenty of water, and shady positions. Grown in pots in the greenhouse or some species hardy out-of-doors Propagated by offsets of the tubers or by seeds.

crinitum: *Helicodiceros muscivorus.*

Dracunculus: *Dracunculus vulgaris.*

italicum. A variable species of robust habit: lvs. about 8 in. long and broad, with petioles about 1½ ft. long: spathes green, white inside with purple limb which is reflexed over opening. Eu., N. Afr.

maculatum. Cuckoo-Pint. Lords-and-Ladies. A variable species to about 1 ft. high: lvs. to 10 in. long, the petioles about twice as long: spathes erect, to 10 in. long, green margined and often spotted with purple. Eu., N. Afr.

palæstinum. Black Calla. Lvs. to 8 in. long, the petiole about 1 ft. long: spathes green with limb deep purple inside. Syria, Palestine.

ARUM, ARROW-: *Peltandra.* **Ivy-:** *Scindapsus.* **Twist-:** *Helicodiceros muscivorus.* **Water-:** *Calla palustris.*

ARUNCUS. Goats-Beard. *Rosaceæ.* Per. erect hardy herbs with 2–3-pinnate long-stalked lvs., small white unisexual fls. in spikes forming large panicles, and fr. of separate follicles, stamens numerous; native in the north temp. zone.

These plants thrive in moist partially shady locations; attractive because of the upright astilbe-like panicles of numerous small flowers. Propagated by seeds.

sylvester (*Spiræa Aruncus. S. Humboldtii*). To 7 ft.: lvs. ovate to oblong-lanceolate, to 5 in. long, toothed. N. Amer., Eu., Asia.

ARUNDINARIA. *Gramineæ.* Large shrubby grasses differing from Bambusa in having 3 instead of 6 stamens and other technical characters of florets; native in N. Amer. and Asia. See *Bamboo.*

aristata: *Thamnocalamus aristatus.*

aureo-striata: *Sasa aureo-striata.*

auricoma: *Sasa auricoma.*

chrysantha: *Sasa chrysantha.*

debilis. To 10 ft., much branched: lvs. to 3 in. long and ⅓ in. across, nearly glabrous. Ceylon.

erecta: *Thamnocalamus Hindsii.*

falcata (*Bambusa falcata*). To 20 ft., sts. yellow-green: lvs. to 6 in. long and ½ in. wide, sheaths ciliate at apex. Himalayas.

Falconeri: *Thamnocalamus Falconeri.*

fastuosa (*A. Narihira. Bambusa fastuosa*). To 40 ft., sts. hollow, marked with purplish-brown: lvs. to 7 in. long and 1 in. wide, shining above, glaucous beneath, slightly pubescent. Japan.

Fortunei: *Sasa variegata.*

gracilis: *Sasa humilis.*

Hindsii: *Thamnocalamus Hindsii.*

Hookeriana. To 30 ft., glaucous: lvs. to 6 in. long and ¾ in. wide, glabrous, rough on edges. Himalayas.

humilis: *Sasa humilis.*

japonica: *Sasa japonica.*

jaunsarensis. To 15 ft., sts. with yellow scales at base: lvs. to 6 in. long and ¾ in. wide, rough on edges. Himalayas.

macrosperma. Southern Cane. Cane Reed. To 25 ft.: lvs. to 1 ft. long and 1¼ in. wide, finely toothed, glabrous or pubescent. Va. to Fla. and La., in swamps and by rivers.

marmorea (*Bambusa marmorea*). To 3 ft. or more, sheaths marbled with purple: lvs. to 5 in. long and ¾ in. wide, toothed, bright green. Japan.

Maximowiczii: *A. Simoni* var. *Chino.*

Metake: *Sasa japonica.*

Murielæ. To 12 ft., sts. yellow: lvs. to 5 in. long and ½ in. wide, long-bristly-acuminate, rough above, China.

Narihira: *A. fastuosa.*

nitida. To 20 ft., st.-sheaths purplish: lvs. to 3 in. long and ½ in. wide, glaucous beneath. China.—The hardiest of the arundinarias.

nobilis: *Thamnocalamus Falconeri.*

palmata: *Sasa senanensis* var. *nebulosa.*

pumila: *Sasa pumila.*

pygmæa: *Sasa pygmæa.*

quadrangularis: *Bambusa angulata.*

Ragamowski: *Sasa tessellata.*

Simoni (*Bambusa Simoni*). To 25 ft.: lvs. to 1 ft. long and 1 in. wide, often striped with white. China, Japan. Var. **Chino** (*A. Maximowiczii, Bambusa Laydeckeri*) is shorter with smaller lvs. mottled with yellow. Var. **striata** has lvs. striped white.

tecta. Similar to *A. macrosperma* and often treated as a variety but smaller, to 12 ft. high. Md. and Ind. to Tex., in low grounds and swamps.

tessellata: *Sasa tessellata.*

Veitchii: *Sasa Veitchii.*

ARUNDO. *Gramineæ.* Very tall per. grasses with large flat lvs. and spikelets borne in large terminal plume-like close panicles; native in warm parts of the Old World and planted for bold effects. See *Grasses.*

Donax. Giant Reed. To 20 ft., sts. or canes rather woody: lvs. to 2 ft. long and 3 in. wide: spikelets hairy, on ascending branches in erect panicles to 2 ft. high. Medit. region; more or less escaped in warm countries, and not hardy in the northern states. Var. **versicolor** (var. *variegata*) has yellowish- or white-striped lvs.

ASARUM. Wild Ginger. *Aristolochiaceæ.* Stemless per. herbs with long-stalked heart-shaped lvs. and large purplish or brown fls. borne singly near surface of ground; native in north temp. zone and sometimes transplanted to woodsy places from the wild. They require moist rich soil.

canadense. Lvs. 2, to 7 in. across, on stalks to 1 ft. long: fls. brownish-purple, 1 in. across, Apr.–May. N. B. to N. C. and Mo.

caudatum. Lvs. 2, to 6 in. across, on stalks to 7 in. long: fls. brownish-purple, with lobes prolonged into tails to 2 in. long, June. B. C. to Calif.

europæum. Lvs. 2, to 3 in. across, on stalks to 5 in. long: fls. greenish-purple or brown, ½ in. long. Eu.

Hartwegii. Lvs. to 5 in. across, on stalks to 8 in. long, mottled with white: fls. brownish-purple, ½ in. across, with lobes prolonged into tails to 2½ in. long. Ore., Calif.

Lemmoni. Lvs. 3 in. across: fls. brownish-purple, ⅓ in. across. Calif.

Shuttleworthii (*Hexastylis Shuttleworthii*). Lvs. 1–2, to 3 in. across, on stalks to 8 in. long, usually mottled: fls. mottled violet within, to 2 in. long, May–July. Va. to Ga. and Ala.

virginica (*Hexastylis virginica*). Lvs. 1–3, to 3 in. across, on stalks to 7 in. long, usually mottled: fls. purple, to ⅔ in. long, May–June. Va. to S. C. and Tenn.

ASCARINA. *Chloranthaceæ.* Aromatic shrubs and trees native in New Zeal. and the Pacific Isls., having opposite lvs., minute unisexual fls. in spikes, and fr. a drupe; sometimes grown in Calif.

lucida. To 25 ft.: lvs. oblong, to 2 in. long, coarsely toothed, glossy dark green above: spikes branched and drooping. New Zeal.

ASCENDING: in an upward direction but not truly erect; produced somewhat obliquely or indirectly upward.

ASCLEPIADACEÆ. MILKWEED FAMILY. About 220 genera of herbs, shrubs, frequently vines, widely distributed over the earth, particularly in the tropics, mostly with milky juice, opposite or whorled lvs., regular fls. commonly bearing a curious internal crown, anthers adhering to the stigma and the pollen united in masses called pollinia, monadelphous stamens, and fr. of 2 follicles with the seeds usually bearing long tufts of hair; many have medicinal and poisonous properties and some are grown for ornament, as Araujia, Asclepias, Asclepiodora, Ceropegia, Chlorocodon, Cryptolepis, Cryptostegia, Cynanchum, Duvalia, Echidnopsis, Gomphocarpus, Hoya, Huernia, Marsdenia, Periploca, Philibertia, Stapelia, Stephanotis, Vincetoxicum.

ASCLEPIAS. MILKWEED. SILKWEED. *Asclepiadaceæ.* Per. summer- or autumn-blooming milky herbs with fls. in axillary or terminal umbels, the 5 parts of the corolla strongly reflexed, showing a crown of 5 horned hoods: fr. 1 or 2 soft follicles, containing seeds with long silk: mostly native in N. and S. Amer. and Afr.

Of easy cultivation in the wild-garden or border; many of them have attractive habit, showy flowers and ornamental pods. Propagated by division, and also by seeds.

Cornuti: *A. syriaca.*

curassavica. BLOOD-FLOWER. To 3 ft.: lvs. oblong: fls. with reddish-purple corolla and orange hoods. Trop. Amer.; nat. in S. U. S.

exaltata: name sometimes used for *A. phytolaccoides.*

Hallii. To 16 in.: lvs. lanceolate to ovate-lanceolate: fls. greenish tinged with purple. Colo.

incarnata. SWAMP M. To 4 ft.: lvs. oblong-lanceolate: fls. rose-purple, rarely white (var. alba), to ¼ in. across. Swamps, N. B. to La. and Colo. Var. **pulchra** (*A. pulchra*) has broader lvs. and is hairy.

mexicana. To 5 ft.: lvs. glabrous, whorled or opposite, linear to narrow-lanceolate, to 6 in. long: fls. greenish-white, sometimes tinged purple. Ore. to Mex.

phytolaccoides. To 6 ft.: lvs. oval to oblong: fls. greenish-purple with white or pink hoods. Me. to Ga. and Ark.

pulchra: *A. incarnata* var.

rubra. To 4 ft.: lvs. ovate to lanceolate: fls. purplish-red, to ½ in. across. N. J. to Fla. and Tex.

speciosa. To 2½ ft., white-tomentose: lvs. ovate or oval: fls. purple-green, with long hoods. Minn. to B. C. and Calif.

subulata. To 5 ft., with rush-like sts. leafless or with few thread-like lvs.: fls. yellowish-white. Desert regions of Nev., Calif., Lower Calif.

Sullivantii. To 4 ft.: lvs. thick, oblong to ovate-oblong: fls. purplish. Ont. to Minn. and Kans.

syriaca (*A. Cornuti*). To 5 ft.: lvs. oblong to ovate, pubescent beneath: fls. green or purplish. N. B. to N. C. and Kans.

tuberosa. BUTTERFLY-WEED. PLEURISY-ROOT. To 3 ft., rough-hairy: lvs. lanceolate or oblong: fls. orange. Me. to Fla. and Ariz.

verticillata. HORSETAIL M. To 2 ft.: lvs. narrowly linear, in 3's to 7's: fls. greenish-white. Me. to Fla. and N. Mex.

ASCLEPIODORA. *Asclepiadaceæ.* N. American per. herbs differing from Asclepias in the spreading corolla and the hoods with a crest instead of a horn; sometimes transplanted to the wild-garden.

decumbens. Sts. to 1½ ft. long, decumbent or ascending: lvs. lanceolate to linear, to 6 in. long, thick: fls. greenish with purplish hoods, in umbels 2 in. across. Ark. to N. Mex.

ASCOCENTRUM. *Orchidaceæ.* Short-stemmed epiphytes with many linear lvs. and fls. in many-fld. short-stalked racemes, the sepals and petals equal. See *Orchids* for cult.

miniatum (*Saccolabium miniatum*). Fls. orange-red, nearly 1 in. across, May–June. Borneo.

ASCOTAINIA. *Orchidaceæ.* Terrestrial orchids with 1-lvd. pseudobulbs and fls. in terminal racemes, the sepals and petals similar, the lip entire or 3-lobed and and with 3–5 keels. See *Orchids* for cult.

viridifusca (*Tainia viridifusca*). Lvs. about 16 in. long and 2 in. wide: fls. with olive-green sepals and petals and yellowish-white lip, the racemes to 3 ft. high, Feb.–Mar. Burma.

ASCYRUM. *Hypericaceæ.* Low herb-like shrubs with opposite entire lvs. and bright yellow 4-parted fls. in terminal few-fld. cymes; native in N. and Cent. Amer. and Himalayas; differs from Hypericum in 4 rather than 5 sepals in 2 unequal pairs and in the separate stamens. Hardy in the N. with winter protection. Propagated by division and seeds.

filicoides: listed name.

hypericoides. ST. ANDREWS CROSS. To 2½ ft., much branched and often decumbent: lvs. oblong to linear, to 1½ in. long: fls. ½ in. across. Mass. to Cent. Amer. and W. Indies.—Evergreen S. and useful in landscape work.

ASEXUAL: sexless; without sex, as in propagation by means of vegetative shoots rather than by seeds, also of flowers without stamens or pistils.

ASH: *Fraxinus.* Mountain-: *Sorbus.* Prickly-: *Zanthoxylum americanum.*

ASIMINA. *Annonaceæ.* N. American shrubs or small trees with alternate simple lvs., axillary nodding white or purplish fls., and fr. of 1 or more berries.

They thrive in rich moist soil. Propagated by seeds sown in autumn or stratified, by layers, and by root-cuttings. Only *A. triloba* is hardy North.

angustifolia. Shrub to 3 ft.: lvs. linear or oblanceolate, to 8 in. long: fls. white or yellowish, to 3 in. across: fr. to 2 in. long. Ga., Fla.

speciosa. Shrub to 4 ft.: lvs. oblong or obovate, to 6 in. long, tomentose on both sides: fls. yellowish-white, 3–4 in. across, before the lvs. Ga., Fla.

triloba. PAPAW. Deciduous tree to 30 ft.: lvs. obovate-oblong, to 1 ft. long, drooping: fls. purple, to 2 in. across, before the lvs.: fr. fleshy, 3–5 in. long, edible. N. Y. to Fla. and Tex.

ASOKA: *Saraca indica.*

ASPARAGUS. *Liliaceæ.* Per. herbs or woody vines and shrubs with fleshy, tuberous or cord-like roots, one a common garden vegetable and others grown for the ornamental green: lvs. reduced to scales, the branchlets (cladodes) narrow, green and leaf-like: fls. small and greenish: fr. a berry.

The decorative kinds are of easy culture but most of them are tender to frost. They are commonly grown under glass or other cover. Propagated by seed and division, and woody kinds also by cuttings. See *Semele;* also *Asparagus, Garden.*

asparagoides (*A. medeoloides. Myrsiphyllum asparagoides*). SMILAX A. SMILAX of florists. Branching vine: lvs. ovate, about 1 in. long: fls. 1–2 together, greenish-white: berries dark purple, ¼ in. across. S. Afr. Var. **myrtifolius**, BABY S., is a more graceful form with smaller lvs.

Cooperi. Vine to 60 ft.: lvs. very dark green, to ½ in. long, making fern-like sprays: fls. white: berries red, ¼ in. across. S. Afr.

Crawshawi: an unidentified trade name.

crispus (*A. decumbens*). Climbing or drooping, to 6 ft.: lvs. needle-like, to ⅝ in. long: fls. 1 or 2 together, white, fragrant: berries white or pink, ½ in. across. S. Afr.

decumbens: *A. crispus.*

drepanophyllus (*A. Duchesnei*). Climbing to 30 ft.: lvs. linear and sickle-shaped, to 3 in. long, forming fern-like fronds: fls. in erect racemes, greenish: berries scarlet, ½ in. across. Cent. Afr.

Duchesnei: *A. drepanophyllus.*

elongatus: *A. virgatus.*

falcatus. Climbing to 40 ft.: lvs. linear-lanceolate and sickle-shaped, to 3 in. long, dark green: fls. in racemes, white: berries brown. Trop. Asia and Afr.

laricinus. Shrub with woody much branched sts.: lvs. awl-shaped, to 1 in. long: fls. clustered: berries ⅙ in. across. S. Afr.

Lutzi: an unidentified trade name.

madagascariensis. Shrub to 1 ft.: lvs. lanceolate, ⅝ in. long, so arranged as to resemble a pinnate lf.: fls. creamy-white, 4 together: berries scarlet. Madagascar.

medeoloides: *A. asparagoides.*

myriocladus. Nearly erect shrub to 6 ft.: lvs. thread-like, ¼ in. long: fls. in racemes to 1 in. long. Natal.

myrtifolius: *A. asparagoides* var.

nanus: *A. plumosus* var.

officinalis: see *Asparagus, Garden.*

plumosus. FERN A. Tall climbing, the long fern-like strands cut for decoration: lvs. needle-like, to ¼ in. long, bright green: fls. whitish, 1–4 together: berries purple-black, ¼ in. across. S. Afr. Var. **comorensis** is a robust form. Var. **compactus** is dwarf as is also var. **nanus**, DWARF A. Var. **robustus** is a strong-growing sort. Var. **tenuissimus** has wiry sts.—Popular in its various forms.

retrofractus. Shrub to 6 ft., slightly climbing: lvs. thread-like, 1 in. long: fls. white, in umbels. S. Afr.

scandens. Climbing to 6 ft.: lvs. linear and curved, to ½ in. long: fls. greenish-white, nodding, 1–2 together: berries scarlet, ⅙ in. across. S. Afr. Var. **deflexus** is a smaller form with deflexed branches.

schoberioides. Erect, to 3 ft.: lvs. flat, 3-angled: berries red. China, Japan.

Siebertii: hort. name.

Sprengeri. Climbing to 6 ft.: lvs. linear, 1 in. long: fls. in racemes, pinkish, fragrant: berries bright red, ½ in. across. S. Afr. Var. **compactus** is a dwarf form and **variegatus** had variegated lvs.

tenuissimus: *A. plumosus* var.

tetragonus. Climbing to 20 ft., roots tuberous: lvs. 3–4-angled, to ⅝ in. long: fls. white or pink, in racemes to 3 in. long, fragrant. S. Afr.

verticillatus. Climbing to 15 ft., somewhat woody: lvs. thread-like, to 2 in. long: fls. 1–4 together: berries red, ¼ in. across. Persia to Siberia.

virgatus (*A. elongatus*). Erect, to 6 ft.: lvs. needle-like, to ¾ in. long, dark green: fls. greenish-white, solitary: berries orange-red, ⅙ in. across. S. Afr.

ASPARAGUS, GARDEN or ESCULENT (*Asparagus officinalis* var. *altilis*). A developed or ameliorated cultivated form of the native *Asparagus officinalis* of the seacoasts of Europe and Asia, hardy perennial, grown for its edible spring shoots; it has somewhat run wild near habitations in places; the indigenous plant in its native countries is short-branched and more or less prostrate at base whereas the domestic asparagus (var. *altilis*) is strongly erect, to 3 feet or more. The genus comprises also many ornamental subjects: see *Asparagus*, preceding this article.

The edible asparagus is a universal favorite in the spring and is extensively cultivated. A plantation should yield well for ten years or more, but this longevity is dependent on good land deeply and thoroughly prepared in the beginning, fertile and enriched every year with good manure or concentrated fertilizer or both. Thickly planted garden beds are likely to run out sooner by overcrowding, and also by lack of tillage and other care.

Asparagus is propagated only by seeds, which are sown in drills 12–20 inches apart depending on the value of land and the method of tillage; thin to 3 or 4 inches in the drill or row. Till frequently, to keep the plants vigorous and keep the bugs away. The following spring the plants may be set in the permanent plantation; that is, the plants are yearlings. Seedlings vary considerably, and only the strongest should be saved for planting. Varieties are several; but the size and vigor depend largely on land, tillage and general care. Colossal, Palmetto, Columbian, Barr, Eclipse are well-known kinds.

Plants are set permanently about 18–24 inches apart in rows 3 feet or more asunder; in field culture with horse tillage and particularly when plants are to be banked, the rows are often 8–10 feet apart; 4–5 feet is a good distance for most home places. Sometimes beds are planted much thicker, but very large succulent stalks are not to be expected. In the kitchen-garden a row at one side but where tillage may be given and 75 to 100 feet long should supply the usual family. The plants should be set deep, usually 6–8 or 10 inches in a furrow but not covered more than 2 or 3 inches at first; the furrow or trench is filled as the plants grow. Cutting should not be begun to any extent until the plants have grown two years. At three years the bed is usually ready for a full cutting. If a knife is used for cutting asparagus, make sure that it is given a slanting direction so that younger shoots beneath the surface will not be severed.

Keep the plantation free of weeds; till in early spring before the plants are up; till after cutting ceases and continue until the tops become too large. When growth is completed in autumn, cut down the plants and remove them to destroy the seeds and also the rust. The beetle is controlled by spraying with arsenicals after the cutting season is past; sometimes a row is allowed to grow to attract the beetles, on which they may be poisoned; hand-picking is practicable on small home plantations; let poultry run in the patch. The beetles hibernate in rubbish about the place.

Asparagus is blanched by hilling up or banking, much as is celery. The natural green shoots are of better quality. The tenderness is a question of fertile soil, rapid growth and frequent cutting.

ASPEN: *Populus.*

ASPERULA. WOODRUFF. *Rubiaceæ.* Herbs with square sts., whorled lvs. and small funnelform 4-lobed fls. in forking cymes in early summer; native in Eu., Asia and Australia.

Woodruffs are grown in borders or rock-gardens where they thrive in shady situations in moist soil, although *A. orientalis* does well in the open flower-garden. Propagated by seeds and by division of the roots and clumps.

azurea-setosa: *A. orientalis.*

cynanchica. Per. to 1 ft.: lvs. in 4's, linear, to ⅔ in. long: fls. white or pink, tube longer than lobes. Eu., Asia.

hexaphylla. Per. to 2 ft. or more: lvs. in 6's, linear: fls. white, tube three times as long as lobes. S. Eu.

lævigata. Per. to 1½ ft.: lvs. in 4's, oval: fls. white, very small. S. Eu.

odorata. SWEET W. Per. to 8 in., spreading, herbage fragrant: lvs. in 8's, lanceolate: fls. white. Eu., Asia.

orientalis (*A. azurea-setosa*). Ann. to 1 ft.: lvs. in 8's, lanceolate: fls. blue. Eu., Asia.—A good flower-garden plant.

tinctoria. DYERS W. Per. to 2 ft., with reddish roots: lvs. in 4's and 6's, linear: fls. white or reddish. Eu.

ASPHODEL: *Asphodelus;* also *Asphodeline lutea.*

ASPHODELINE. JACOBS-ROD. *Liliaceæ.* Herbs with fleshy roots, simple sts., and white or yellow fls. in dense long racemes.

Hardy and of easy cultivation in any soil, useful for border or wild-garden. Propagated by division, and by seeds when available.

Balansæ. To 2 ft.: lvs. all basal, linear, to 10 in. long: fls. white, about ½ in. long. Cilicia.

lutea (*Asphodelus luteus*). ASPHODEL of the ancients. To 4 ft., with leafy sts.: lvs. linear, to 1 ft. long: fls. yellow, fragrant, 1 in. long. Medit. region.

ASPHODELUS. ASPHODEL. *Liliaceæ.* Fleshy-rooted herbs with basal lvs. and white funnel-shaped fls. in racemes terminating leafless scapes.

Of easy culture in the open, in the border or wild-garden. Propagated by division.

albus. Per. to 4 ft.: lvs. 3-angled: fls. ¾ in. long. Medit. region.

luteus: *Asphodeline lutea.*

ramosus. Per. to 5 ft.: lvs. sword-shaped: fls. in a branching infl. Medit. region.

ASPIDISTRA. *Liliaceæ.* Per. herbs with thick roots, stiff and shining basal lvs., and dark bell-shaped fls. borne singly at surface of ground and obscured by foliage (and therefore not often observed).

Popular florists window-box and porch plants. They withstand hard usage, dull light and poor soil. Propagated by division in early spring.

elatior (*A. lurida*). Lvs. to 2½ ft., oblong-elliptic, to 4 in. across, evergreen: fls. purple-brown, 1 in. across. China. Var. **punctata** has larger fls. which are pale green spotted with purple inside. Var. **variegata** has lvs. striped green and white.

lurida: *A. elatior.*

ASPIDIUM: *Cyrtomium, Dryopteris, Polystichum.*

ASPIDOSPERMA. *Apocynaceæ.* Trees with hard wood, native in S. Amer. and W. Indies, having simple lvs., small fls. in many-fld. terminal panicles, and fr. of 2 roundish or oblong follicles; one species has been planted in S. Calif.

Quebracho-blanco. Tall tree with trunk to 3 ft. thick and white wood: lvs. oval-lanceolate, to 3 in. long and 1 in. wide, entire, leathery and shining: fls. white: fr. to 3 in. long. Argentina.

ASPLENIUM. SPLEENWORT. *Polypodiaceæ.* A large genus of ferns, some of them native in the N. and therefore hardy, but most cult. kinds are grown in the greenhouse, usually evergreen with simple, deeply cut or compound lvs.; sori attached to upper side of veinlets. Some of the species are now treated under Athyrium.

They require no special handling, but under glass should not be too much exposed to strong sunshine; if kept too wet they may lose color in the slow season. See *Ferns.*

acrostichoides: *Athyrium acrostichoides.*

angustifolium: *Athyrium angustifolium.*

Belangeri. Lvs. evergreen, long and narrow, to 1½ ft. long and 4 in. wide, 2-pinnate, segms. ¼ in. long, entire, often bulblets at the axils. Malaya.

bulbiferum. MOTHER S. Lvs. to 4 ft. long and 1 ft. broad, 2–3-pinnate, segms. to 1½ in. long, lobed or divided, with bulbs or plantlets on upper surface. New Zeal., Australia, Malaya. Var. **laxum** is smaller with finer foliage.

ebeneum: *A. platyneuron.*

Filix-femina: *Athyrium Filix-femina.*

gemmiferum. Lvs. to 2 ft. long and 8 in. wide, simply pinnate, segms. to 6 in. long, slightly toothed. Afr., Madagascar.

Goeringianum: *Athyrium Goeringianum.*

Hemionitis. Lvs. 6 in. long and wide, hastate, with 2 lateral lobes and triangular terminal lobe. Spain, Canary Isls.

lanceum *Diplazium lanceum.*

longissimum. Lvs. to 8 ft. long, simply pinnate, segms. to 4½ in. long, slightly toothed, rooting at tips, stalks blackish, to 1 ft. long. Malaya.

lucidum Lvs. leathery, to 3 ft. long and 14 in. wide, simply pinnate, segms. to 6 in. long, wavy-toothed, stalks grayish, scaly, to 1½ ft. long. New Zeal.

Nidus (*A. Nidus-Avis*). BIRDS-NEST-FERN. Lvs. simple, bright green, stiff, erect, to 4 ft. long and 8 in. wide, entire, wavy or slightly lobed. Asia, Polynesia.

Nidus-Avis: *A. Nidus.*

platyneuron (*A. ebeneum*). EBONY S. Hardy: lvs. to 15 in. long and 3 in. wide, pinnate, stalks purplish-brown. Vt. to Va. and Ala.

pycnocarpon: *Athyrium angustifolium.*

thelypteroides: *Athyrium acrostichoides.*

Trichomanes. MAIDENHAIR S. Hardy: lvs. evergreen, simply pinnate, clustered, to 8 in. long and ¾ in. wide, segms. about ½ in. long, slightly toothed. N. Amer., Eu., Asia.

viviparum. Lvs. to 2 ft. long and 8 in. wide, 2-pinnate, segms. about ¼ in. long, often bulb-bearing. Mauritius, Bourbon.

ASPRELLA HYSTRIX: *Hystrix patula.*

ASPRIS. *Gramineæ.* Small mostly ann. grasses of the Medit. region, with narrow lvs. and spikelets borne in loose panicles; one species is planted for ornament and use in dry bouquets. See *Grasses.*

capillaris (*Aira capillaris*). Ann. to 1½ ft.: lvs. hair-like: panicles with many spreading thread-like branches. Var. **pulchella** (*Aira pulchella, Agrostis pulchella*) has awned florets.

ASSONIA: *Dombeya.*

ASTARTEA. *Myrtaceæ.* Australian heath-like shrubs with small opposite lvs. and small pink or white fls. solitary in the axils; one species occasionally planted in S. Calif.

fascicularis. To 10 ft.: lvs. linear, ¼ in. long, sometimes clustered. W. Australia.

ASTELIA. *Liliaceæ.* Tufted per. herbs native in New Zeal., Australia and Pacific Isls., with linear mostly basal lvs. and small unisexual fls.; one species is grown in the open in S. Calif.

nervosa. Lvs. to 8 ft. long and 3 in. wide, leathery, many-nerved, margins recurved: fls. dark green, fragrant, to ½ in. across, in much branched panicles.

ASTER. STARWORT. MICHÆLMAS DAISY. *Compositæ.* Herbaceous leafy-stemmed perennials, rarely annuals, with alternate lvs. and fl.-heads usually clustered, sometimes solitary, blooming in summer and autumn; rays numerous, flattish, white, blue, red or purple; disk-fls. mostly yellow; pappus of bristles. Asters of many kinds are characteristic of the N. American autumnal flora. Some of them, as *A. novi-belgii*, have been much modified under cult. The species here listed are perennials.

Most perennial asters thrive best in a medium rich soil. The named garden forms are increased usually by division or cuttings as seeds do not reproduce true to type. The more common native asters may be propagated by seed sown in spring for bloom the following year, or by division in either autumn or spring. They are adapted to rear borders, for colonizing, and for bold clumps. The China aster of flower-gardens is a different plant: see *Callistephus.*

acris. To 3 ft., rough-hairy: lvs. linear, entire, to 1½ in. long: heads clustered, to 1¼ in. across; ray-fls. blue. S. Eu. Var. **nanus** is very dwarf, not over 15 in.

acuminatus. To 3 ft., slightly pubescent: lvs. broad-oblong, to 6 in. long, sharp-toothed: heads clustered, to 1½ in. across; ray-fls. white or purplish. Lab. to Ga.

alpinus. ROCK A. To 10 in., pubescent: lvs. spatulate to linear-lanceolate, to 2 in. long, entire: heads solitary, 1½ in. across; ray-fls. blue or violet. Mts. of Eu., Asia, W. N. Amer. Var. **albus** has white fls., **ruber** rosy-purple, **speciosus** heads to 4 in. across. Var. **superbus** is larger and more showy.

amelloides: *A. Amellus.*

Amellus (*A. amelloides. A. ibericus*). ITALIAN A. To 2 ft., rough-hairy: lvs. oblong or oblong-lanceolate, nearly entire: heads clustered, to 1¾ in. across; ray-fls. purple. Eu., Asia. Var. **bessarabicus** (*A. bessarabicus*) has larger deeper purple fls. Var. **elegans** is lower and free-flowering.

amethystinus. To 5 ft., rough-hairy: lvs. linear-lanceolate, to 2 in. long, entire: heads clustered, to 1 in. across; ray-fls. blue or violet. Vt. to Neb.

Andersoni. To 15 in.: lvs. mostly basal, linear, to 8 in. long, entire: heads solitary, to 2 in. across; ray-fls. purple or blue. Calif.

apricus. To 8 in., pubescent: lvs. oblong, to 2 in. long: heads usually solitary; ray-fls. purple. B. C. to Colo.

azureus. To 4 ft., rough-hairy: lvs. ovate to lanceolate, entire, to 6 in. long, the lower cordate and long-stalked: heads numerous, ½ in. across; ray-fls. bright blue. Ont. to Ga. and Tex.

Bellidiastrum (*Bellidiastrum Michelii*). To 1 ft.: lvs. in a basal rosette, toothed: heads single; ray-fls. white. S. Eu.

bessarabicus: *A. Amellus* var.

Bigelovii (*Machæranthera Bigelovii*). Bien. to 3 ft., pubescent: lvs. oblong or lanceolate, coarsely toothed: heads clustered, to 2½ in. across; ray-fls. violet. Colo. to Ariz.

brachystachys: a listed name.

brachytrichus. To 10 in.: lvs. obovate, to 2¼ in. long: heads solitary, to 2 in. across; ray-fls. violet. China.

cabulicus: *Microglossa albescens.*

cassiarabicus. To 2 ft., pubescent: lvs. ovate, toothed: heads clustered; ray-fls. pink. Russia.

caucasicus. To 2 ft.: lvs. ovate to oblong-lanceolate, to 2 in. long, slightly toothed: heads solitary, about 1½ in. across; ray-fls. purple. Caucasus.

Chapmani. To 3 ft., unbranched, glabrous: lvs. linear, to 1 ft. long, entire: heads solitary, to 1 in. across; ray-fls. violet. Fla.

cognatus. To 1½ ft., shrubby: lvs. elliptic or oblong, to 1¼ in. long, spiny-toothed: heads solitary, to 2 in. across; ray-fls. blue or violet. Desert, Calif.

cordifolius. BLUE WOOD A. To 5 ft., much branched: lvs. ovate to lanceolate, to 5 in. long, the basal cordate and long-stalked, pubescent: heads numerous, to ¾ in. across; ray-fls. violet or blue. N. S. to Ga. and Mo. Var. **versicolor**, with light pink fls., is listed.

corymbosus: *A. divaricatus.*

Curtisii. To 5 ft., glabrous: lvs. varying from linear to ovate, toothed: heads panicled, 1 in. across; ray-fls. violet-blue. N. C., Tenn. to Ga.

decurrens: *A. lævis.*

Delavayi. To 3 ft.: lvs. ovate-lanceolate, toothed: heads solitary, to 4 in. across; ray-fls. blue-purple; disk violet-brown. China.

delicata: hort. name.

diffusus: *A. lateriflorus.*

diplostephioides. To 3 ft., pubescent: lvs. lanceolate, to 3 in. long, entire: heads solitary, to 3 in. across; ray-fls. blue or pale purple. Himalayas.

divaricatus (*A. corymbosus*). WHITE WOOD A. To 2½ ft., glabrous: lvs. ovate-lanceolate, toothed, long-stalked: heads in corymbs, to 1 in. across; ray-fls. white. Que. to Ga. and Tenn.

dracunculoides (*Galatella dracunculoides*). Much branched, very leafy: lvs. linear-lanceolate: heads in corymbs; ray-fls. blue. S. Eu., W. Asia.

Drummondii. To 5 ft., pubescent: lvs. ovate or ovate-lanceolate, toothed, to 4 in. long, basal cordate: heads numerous, to ½ in. across; ray-fls. blue. Ohio to Minn. and Tex.

dumosus. To 3 ft.: lvs. linear or spatulate, to 3 in. long, entire: heads numerous, ½ in. across; ray-fls. blue to white. Mass. to Fla. and La.

Eatonii. To 3 ft.: lvs. linear, entire: heads numerous, ½ in. across; ray-fls. lavender to whitish. B. C. to Colo.

ericoides. HEATH A. To 3 ft.: lvs. spatulate to linear, to 3 in. long, toothed: heads numerous, ½ in. across; ray-fls. white or pinkish. Me. to Fla. and Mo. Var. **villosus** (*A. pilosus*) is pubescent.

Farreri. To 1½ ft., pubescent: lvs. linear or linear-lanceolate, to 6 in. long, entire: heads solitary, to 3 in. across; ray-fls. deep blue. Tibet.

floribundus: *A. novi-belgii.*

foliaceus. To 3 ft.: lvs. lanceolate, to 4 in. long, nearly entire: heads few, 1 in. across; ray-fls. violet. N. N. Amer.

formosissimus: hort. name.

Fremonti. To 1 ft.: lvs. oblanceolate, to 4 in. long, entire: heads in small corymbs; ray-fls. purple. B. C. to Colo.

Garibaldii is referred to *A. alpinus.*

grandiflorus. To 2½ ft., hairy, much branched: lvs. oblong to linear, to 2 in. long, entire: heads solitary, 2 in. across; ray-fls. deep violet. Va. to Fla.

Greatai. To 2½ ft., pubescent: lvs. obovate, to 8 in. long, toothed above middle: heads numerous; ray-fls. light purple. Calif.

Harrowianus. Shrub to 5 ft.: lvs. lanceolate, to 5 in. long, toothed: heads in corymbs; ray-fls. pale purplish-blue. China.

hesperius. To 3 ft., somewhat hairy: lvs. lanceolate, to 4 in. long, nearly entire: heads numerous; ray-fls. white or violet. Calif.

himalaicus. To 1½ ft., pubescent: lvs. obovate or oblong, to 2 in. long, entire or toothed: heads solitary, 1½ in. across; ray-fls. lilac-blue. Himalayas.

hybridus: hort. name of uncertain application.

ibericus: *A. Amellus.*

incisus: *Calimeris incisa.*

lævis (*A. decurrens*). To 4 ft., glabrous: lvs. ovate to lanceolate, to 5 in. long, entire or toothed: heads numerous, 1 in. across; ray-fls. blue or violet. Me. to La.—Modified in cult., and often grown in tropics.

lateriflorus (*A. diffusus*). To 5 ft.: lvs. ovate to linear-oblong, to 5 in. long, toothed: heads numerous, ⅓ in. across; ray-fls. white or pale purple. N. S. to N. C. and Tex. Var. **horizontalis** has long wide spreading branches.

likiangensis. Dwarf, glandular-hairy, to 9 in., bearing 1 head: lvs. mostly basal, lanceolate to ovate or obovate, to 1 in. or more long and ½ in. broad: head large, the rays blue-purple, about ¾ in. long. Yunnan, China.

lilacinus: hort. name of uncertain standing.

linariifolius (*Ionactis linariifolius*). To 2 ft., very leafy, hairy: lvs. linear, to 1½ in. long, entire, stiff: heads several, 1 in. across; ray-fls. violet or rarely white. Me. to Fla. and Tex.

Linosyris: *Linosyris vulgaris.*

Lipskyi. Differs from *A. subcæruleus* in the more robust habit and larger lilac fls. Tibet.

longifolius (*A. virgineus*). To 3 ft., much branched: lvs. lanceolate or linear-lanceolate, to 8 in. long, entire: heads numerous, 1 in. across; ray-fls. violet or pale purple. Lab. to Mont.

Maackii. To 2 ft., hairy: lvs. lanceolate, to 2½ in. long, nearly entire: heads solitary, large; ray-fls. bluish. Japan.

macrophyllus. To 3 ft., rough: lvs. cordate-ovate to oblong, to 10 in. long, toothed: heads numerous, about 1 in. across; ray-fls. lavender. Canada to Minn. and N. C.

Milesii: a listed name.

miser: a name of uncertain botanical standing.

multiflorus. To 7 ft., rough: lvs. linear or linear-oblong, to 1½ in. long, entire: heads crowded, ⅓ in. across; ray-fls. white. Me. to Ga. and Ariz.

nemoralis. To 2 ft., slender, st. puberulent: lvs. oblong-lanceolate or narrower, acute, to 3 in. long, dentate or entire, sessile: fls. violet or purplish, to 1½ in. across. Newf. to N. J. and west.

novæ-angliæ. New England A. To 5 ft., very leafy, hairy: lvs. lanceolate, to 5 in. long, entire: heads crowded, to 2 in. across; ray-fls. deep purple. Que. to S. C. and Colo. Var. **roseus** has rose fls.

novi-belgii (*A. floribundus*). New York A. To 3 ft., glabrous: lvs. oblong to linear-lanceolate, to 6 in. long, nearly entire: heads numerous, about 1 in. across; ray-fls. bright blue-violet. Newf. to Ga.—Many of the named hort. asters belong here, largely of European origin.

oblongifolius. To 2 ft. or more, pubescent, much branched: lvs. oblong to lanceolate, somewhat clasping, entire, acute, to 2 in. long: fls. violet to rose-pink. Pa. south and west.

paludosus. To 2½ ft., scarcely branched: lvs. linear, to 6 in. long, entire: heads few, to 2 in. across; ray-fls. deep violet. Swamps, N. C. to Fla. and Tex.

paniculatus. To 8 ft., much branched, nearly glabrous: lvs. lanceolate to linear, to 6 in. long, slightly toothed: heads numerous, ¾ in. across; ray-fls. white or tinged violet. N. B. to Mont. and Mo.

patens. To 3 ft., rough, branched: lvs. ovate-oblong, to 3 in. long, entire: heads solitary, 1 in. across; ray-fls. purplish-blue. Me. to Fla. and Tex.

Pattersoni (*Machæranthera Pattersonii*). To 8 in., bien., hairy: lvs. spatulate, to 2½ in. long, slightly toothed: heads solitary or few, 1 in. across; ray-fls. purple. Mts., Colo.

peregrinus. To 1½ ft.: lvs. oblong-lanceolate, to 2 in. long, entire or toothed: heads solitary, to 2 in. across; ray-fls. violet-purple. Alaska, N. Asia.

pilosus: *A. ericoides* var. *villosus.*

Porteri. To 1 ft., glabrous: lvs. linear or oblanceolate, to 4 in. long: heads numerous; ray-fls. white. Colo. Var. **superbus** is an improved form.

ptarmicoides. White Upland A. To 2 ft.: lvs. linear-lanceolate, to 6 in. long, nearly entire: heads corymbose, to 1 in. across; ray-fls. white. Mass. to Colo.

pulchellus: hort. name; perhaps *Erigeron pulchellus.*

puniceus. To 8 ft., with reddish hairy sts.: lvs. lanceolate, to 6 in. long, toothed or entire: heads numerous, to 1½ in. across; ray-fls. violet-purple to white. Swamps, Newf. to Minn. and Ga.

pyrenæus. To 1½ ft., rough-pubescent: lvs. oblong-lanceolate, toothed: heads solitary or few, 2½ in. across; ray-fls. lilac. S. Eu.

Radula. To 2 ft.: lvs. lanceolate, to 3 in. long, toothed: heads several, to 1½ in. across; ray-fls. violet. Swamps, Newf. to W. Va.

sagittifolius. To 5 ft.: lvs. ovate-lanceolate, to 6 in. long, toothed, the lower cordate or sagittate at base: heads crowded, ¾ in. across; ray-fls. light blue or purplish. N. B. to Ga. and Mo.

salicifolius. To 5 ft., much branched, glabrous: lvs. lanceolate or linear-lanceolate, to 4 in. long, entire or slightly toothed: heads numerous, 1 in. across; ray-fls. violet-purple to white. Me. to Fla. and Tex.

salviæfolius. Alpine: lvs. pubescent: fls. white, large, single. Japan.

Schreberi. To 3 ft.: lvs. cordate-triangular to lanceolate, to 7 in. long, toothed: heads corymbose, to 1 in. across; ray-fls. white. N. Y. to Mich. and Va.

sericeus. To 2 ft., much branched: lvs. oblong, to 1½ in. long, entire, silvery-pubescent: heads numerous, 1½ in. across; ray-fls. violet-blue. Ill. to Tex.

Shortii. To 4 ft.: lvs. cordate-ovate to lanceolate, to 6 in. long, nearly entire, pubescent beneath: heads numerous, 1 in. across; ray-fls. violet-bue. Pa. to Ga. and Tenn.

spectabilis. To 2 ft.: lvs. oval to linear-oblong, to 5 in. long, nearly entire: heads several, 1½ in. across; ray-fls. bright violet. Mass. to Del.

subcæruleus. To 1 ft., pubescent, unbranched: lvs. oblong, entire or toothed: heads solitary, to 2 in. across; ray-fls. pale blue. India.

tataricus. To 7 ft., hairy: lvs. lanceolate or ovate-lanceolate, the basal to 2 ft. long, entire: heads numerous, 1 in. or more across; ray-fls. blue or purple. Siberia.

tenuifolius. To 2 ft.: lvs. linear, to 6 in. long, entire: heads few, to 1 in. across; ray-fls. pale purple to white. Salt marshes, Mass. to Fla.

Thomsoni. To 3 ft., hairy: lvs. broad-ovate, to 4 in. long, coarsely toothed: heads few, to 2½ in. across; ray-fls. lilac. Himalayas.—Plants grown under this name may be forms of *A. novi-belgii.*

tortifolius. To 2 ft., shrubby, white-pubescent: lvs. linear to lanceolate, to 3 in. long, spiny-toothed: heads solitary, to 2¾ in. across; ray-fls. purple or violet. Desert, Calif., Utah.

Tradescanti. To 5 ft., much branched: lvs. linear-lanceolate or lanceolate, to 6 in. long, toothed or entire, glabrous: heads numerous, ½ in. across; ray-fls. white. Me. to Va. and Mo.

Tranchi: hort. name for a stout late purple-fld. plant.

tricephalus. Closely allied to *A. himalaicus* but taller and with red instead of white pappus. Himalayas.

trinervius. To 3 ft.: lvs. lanceolate-ovate, to 4 in. long, toothed, rough: heads corymbose, ½ in. across; ray-fls. blue or purple varying to white. Himalayas.

Tripolium. To 3 ft., glabrous: lvs. linear-lanceolate, entire: heads corymbose; ray-fls. blue. Eu.

turbinellus. Prairie A. To 3 ft., much branched: lvs. lanceolate, to 3 in. long, entire: heads usually solitary, 1 in. across; ray-fls. violet. Ill. to Neb. and La.

umbellatus (*Doellingeria umbellata*). To 8 ft.: lvs. lanceolate, to 6 in. long, entire: heads corymbose, ¾ in. across; ray-fls. white. Newf. to Ga. and Ia.

undulatus. To 3½ ft., rough-pubescent, much branched: lvs. ovate-cordate to lanceolate, to 6 in. long, entire or wavy-margined: heads numerous, ¾ in. across; ray-fls. pale blue or violet. N. B. to Fla. and La.

versicolor. To 3 ft., glabrous: lvs. oblong-lanceolate, slightly toothed: heads corymbose, ½ in. across; ray-fls. violet or white. Probably N. Amer.

vestitus. To 2 ft., densely tomentose: lvs. narrow-lanceolate, to 2 in. long: heads corymbose, small· ray-fls. white. Yunnan.

virgineus: *A. longifolius.*

yunnanensis. To 2½ ft., pubescent: lvs. obovate or lanceolate, to 8 in. long, slightly toothed: heads solitary or 2–3, to 2½ in. across; ray-fls. violet-blue. Yunnan.

ASTER, BEACH: *Erigeron glaucus.* China: *Callistephus.* Golden: *Chrysopsis.* Stokes: *Stokesia.* Tree: *Olearia.*

ASTILBE (*Hoteia*). *Saxifragaceæ.* Strong herbaceous perennials with 2–3-ternately compound lvs. having toothed or cut lfts. and bearing panicles of white or pink fls.; Cent. and E. Asia and E. U. S. Often confused with the herbaceous spirea group, especially Aruncus, but those plants have many stamens and several to many separate pistils while the astilbes have usually only 8–10 stamens, and 2–3 pistils distinct or variously united. There are many variables and hybrid astilbes offered by florists; these are sometimes forced under the name Spiræa.

Astilbes are of easy cultivation and grow best in rich soil with plenty of water. Propagated by division or by seeds. They may be grown in the open border or forced under glass. It requires from ten to fourteen weeks to bring them into bloom when forced and they will need abundant moisture.

Arendsii. A series of hybrids of *A. Davidii* with different species is in the trade under this collective name; fls. range in color from purplish to nearly white.

astilboides (*Spiræa astilboides*). To 3 ft.: lvs. distinctly 2–3-pinnate; lfts. ovate, rounded at base, to 2½ in. long, sharp-toothed, hairy: fls. white, crowded in dense spikes, forming a panicle; petals very narrow. Japan.

biternata (*A. decandra*). To 6 ft.: lvs. to 2 ft. across; lfts. ovate, cordate to rounded at base, sharp-serrate, to 5 in. long: fls. numerous, yellowish-white, the fertile ones with minute petals or none. Mts., Ky. and Va. to Ga.

chinensis. To 2 ft.: lfts. doubly toothed, longer and narrower than in *A. astilboides:* fls. white, in narrow branching panicles. China.

Davidii (*A. chinensis* var. *Davidii*). To 6 ft., hairy: primary divisions of lvs. pinnate, the lfts. elm-like, to 1½ in. long, coarsely toothed: fls. rose-pink with dark blue anthers, densely clustered in long narrow panicles to 2 ft. long. China.

decandra: *A. biternata.*

grandis. To 6 ft.: lvs. ternately pinnate or 3-pinnate; lfts. ovate, doubly toothed, to 4 in. long, somewhat hairy: fls. creamy-white, crowded in panicles to 3 ft. long, with spreading branches. Cent. China.

hybrida: a name of uncertain application for garden forms.

japonica. To 3 ft.: lvs. 2–3-ternate; lfts. narrow-to lanceolate-ovate, sharp-toothed, wedge-shaped at base: fls. small, white, in erect terminal and axillary panicles; petals broad and obtuse. Japan.

Lemoinei. A race of garden hybrids in which *A. astilboides* has entered, having feathery panicles of white pink-stamened fls.

lobata: see *Filipendula rubra.*

rivularis. To 5 ft., with creeping rhizome: lvs. 2-ternate; lfts. ovate, toothed, to 3 in. long: fls. yellowish-white, in large panicles, the divisions spike-like. Nepal, W. China.

rosea. Hybrid between *A. chinensis* and *A. japonica:* similar to *A. japonica* in habit but fls. pinkish. The best known forms are Peach Blossom with lighter pink fls., and Queen Alexandra with deeper pink fls.

rubella. Hybrid with *A. Davidii* parentage, having rose-colored fls.

simplicifolia. Not over 1 ft.: lvs. simple, ovate, deeply lobed or cut, 3 in. long: panicle slender, narrow, with star-like white fls. Japan.

Thunbergii. To 2 ft.: lvs. 2–3-pinnate; lfts. ovate, to 3½ in. long, toothed, hairy: fls. white often becoming pink, in spreading panicles. Japan.

Ulmaria: see *Filipendula Ulmaria.*

ASTRAGALUS. MILK VETCH. *Leguminosæ.* Herbs with alternate pinnate lvs. and purple, white or yellow papilionaceous fls. mostly in spikes or racemes; occasionally planted in the border or rock-garden for ornament. Propagated by seeds or division in spring.

alopecuroides. Per. to 5 ft., pubescent: lfts. 1 in. long: fls. yellow, in spikes. Siberia.

alpinus (*Tium alpinum*). Per. to 15 in., often decumbent: lfts. to ½ in. long: fls. violet, in short racemes. Mts. of N. Eu., Asia and N. Amer.

austrinus (*Hamosa austrina*). Ann. or bien. to 16 in., often decumbent: lfts. to ⅓ in. long: fls. purplish, in head-like racemes. Tex. to Mex.

bisulcatus (*Diholcos bisulcatus*). Per. to 2½ ft., often decumbent: lfts. to 1 in. long: fls. purple, in dense spike-like racemes. Sask. to Colo.

ceramicus (*A. pictus. Phaca picta*). Per. to 8 in., gray-pubescent: lfts. to ¾ in. long: fls. yellowish-white, in few-fld. racemes. Colo. to New Mex.

Cicer. Ann., procumbent, sts. to 1½ ft. long: lfts. to 1 in. long: fls. yellowish, in spikes. Eu.

Drummondii (*Tium Drummondii*). Per. to 2½ ft., pubescent: lfts. ½ in. long: fls. cream-colored, in racemes to 4 in. long. Sask. to Colo.

Echinus. Shrub, much branched and spiny: lfts. oblong-lanceolate, spiny: fls. in globose heads. Asia Minor.

falcatus. Per. to 2 ft.: lfts. elliptic-oblong: fls. greenish-yellow, in spikes. Siberia.

flexuosus (*Homalobus flexuosus*). Per. to 1½ ft., sts. flexuous or decumbent: lfts. to ½ in. long: fls. purple, in racemes. Plains Sask. to New Mex.

frigidus (*Phaca frigida*). Per. to 2 ft.: lfts. to 1 in. or more long: fls. yellowish-white, in short racemes. Eu.

goniatus. To 10 or 12 in., zigzag and more or less decumbent, from a cespitose rootstock: lfts. 15–21, linear-oblong to elliptic, sometimes retuse, about ⅓ in. long; stipules lanceolate: fls. purple, in a short spike. Minn. south and west.

hypoglottis. To 6 in., ascending, from a straggling rootstock: lfts. to 19 and more, oblong or narrower, ½ in. or less long, obtuse; stipules broad and connate: fls. blue-purple, in spikes 1 in. long. Eu.—The plant cult. under this name may be *A. goniatus.*

mexicanus (*Geoprumnon mexicanum*). Per., spreading or decumbent: lfts. to ½ in. long: fls. yellowish-white tipped with blue, in short racemes. Ill. to Tex.

pictus: *A. ceramicus.*

Shortianus (*Xylophacos Shortianus*). Per., st. to 4 in. long: lfts. to 1 in. long: fls. blue or violet, in short racemes. Neb. to Wyo. and Ariz.

utahensis (*Xylophacos utahensis*). Per., st. to 4 in. long: lfts. to ⅓ in. long: fls. violet or purple, in dense racemes. Mont., Wyo., Utah.

ASTRANTIA. MASTERWORT. *Umbelliferæ.* Herbs with palmately lobed or dissected lvs., indifferent small polygamous fls. in umbels which have leafy involucres, and nearly cylindrical frs.; a few species are sometimes planted in borders for variety. Propagated by seeds and division.

carniolica. Per., similar to *A. major* but only 1 ft. high and the bracts subtending the umbels much shorter than fls. Eu.

gracilis. Per. to 8 in.: lvs. 5-parted: fls. whitish, the umbels subtended by whitish bracts. Eu.

major. Per. to 3 ft.: lvs. mostly basal, with 3–5 deep toothed lobes: fls. pinkish, rose or white, the umbels subtended by showy bracts which are longer than fls. and are often tinged purplish. Eu.

ASTRAPÆA: *Dombeya.*

ASTROCARYUM. *Palmaceæ.* More than 30 species of strongly armed monœcious feather-palms from Mex. to Brazil, the infl.

among the lvs., acaulescent to rather tall trees, trunk solitary or plant soboliferous: lvs. with more or less spiny petiole and rachis; pinnæ acuminate or obliquely truncate, mostly plicate, white or much lighter colored underneath, margins aculeate: spadix rather closely or simply branched; staminate fls. in dense spikes at end of branches, pistillate few and below: fr. drupe-like, oblong, ovoid, obovoid or globose, often aculeate, 1-seeded. See *Palm.*

mexicanum. To 12 ft. or more, thickly covered with flat black spines: lvs. 4–6 ft. long, petiole and rachis spiny; pinnæ white underneath, acute but notched at apex, upper ones more or less confluent, margins aculeate: fr. fusiform, about 2 in. long, very spiny. Veracruz, Mex.—Probably planted in S. Fla.

ASTROPHYTUM. Star Cactus. *Cactaceæ.* A few small Mexican species with condensed, cylindric, globular or flattened body and a few prominent ribs or wings that often give it a star-like shape: spines weak or wanting: fls. large, reddish with yellow center, soon fading, borne on the top of the plant. Treatment as for Echinocactus. See *Cacti.*

capricorne (*Echinocactus capricornis*). Plant somewhat globose to nearly cylindric, to 8 and 10 in. high, ribs 7 or 8, spines several, to 2 in. long: fls. about 2½ in. long, spreading wide open, lemon-yellow at center and orange in bottom.

myriostigma (*Echinocactus myriostigma*). Bishops-Hood. Plant globose or cylindric, about 2 in. high, ribs mostly 5, spines absent: fls. about 2 in. long, outer segms. with brown tips.

ornatum (*Echinocactus ornatus*). Plant nearly globose to cylindric, to 1 ft. or more high, white-floccose, ribs 8, spines several or many and about 1 in. long and sharp: fls. lemon-yellow, to 3½ in. broad.

ASYSTASIA. *Acanthaceæ.* Herbs or shrubs native in tropics of Old World, with opposite entire lvs. and tubular 5-lobed fls. in terminal racemes, spikes or panicles; one species grown as a ground-cover in S. Fla. and the tropics.

bella: *Mackaya bella.*

coromandeliana (*A. gangetica*). Procumbent or clambering per. to 4 ft. and more: lvs. ovate, to 3 in. long: fls. purple to yellow or white, 1 in. or more long, in racemes to 6 in. long. Malaya to Afr.; nat. in W. Indies, clambering in bushes and on fences.

gangetica: *A. coromandeliana.*

ATALANTIA. *Rutaceæ.* Trees or shrubs native from India to Australia, sometimes grown as a proposed stock for citrus fruits and for interest, having simple lvs. and petioles jointed at base of lf., 3–5-celled ovary, and fr. resembling a small orange. For cult. see *Citrus Fruits.*

buxifolia: *Severinia buxifolia.*

citroides. Small spiny tree: lvs. oval, emarginate: fr. about ¾ in. across, with glandular skin and pulp-vesicles. Indo-China.

ATAMOSCO: *Zephyranthes.*

ATHAMANTA. *Umbelliferæ.* Per. herbs from the Medit. region and Asia: lvs. pinnately parted: fls. white, in umbels subtended by linear involucral bracts: frs. linear, cylindrical and hairy.

Matthioli. To 10 in.: lf.-segms. thread-like: rays of umbel 20–25, woolly. S. E. Eu.

ATHANASIA ANNUA: *Lonas inodora.*

ATHROTAXIS. *Pinaceæ.* Large densely branched evergreen trees, of 3 species in Tasmania, allied to Cryptomeria, with small scale-like or lanceolate lvs. and small woody globose cones. Sometimes grown in warm climates, as Calif.; cult. under *Conifers.*

cupressoides. Lvs. rhombic-ovate, to ⅙ in. long, obtuse: cones to ½ in. across.

laxifolia. Lvs. ovate- lanceolate, ¼ in. long, acute or obtuse: cones ¾ in. across.

selaginoides. Lvs. lanceolate, to ½ in. long, spiny-pointed: cones to 1 in. across.

ATHYRIUM. *Polypodiaceæ.* Foliage similar to that of Asplenium, with which genus they have been united, the distinguishing characteristic being in the shape and position of the fruit-dots; widely distributed, mostly in the tropics, a few cult. See *Ferns.*

acrostichoides (*A. thelypteroides. Asplenium acrostichoides* and *thelypteroides*). Lvs. to 3 ft. long, deeply bipinnatifid, segms. toothed, on long straw-colored stalks. N. S. to Ga. and Mo.

angustifolium (*A. pycnocarpon. Asplenium angustifolium* and *pycnocarpon*). Lvs. to 2½ ft. long, simply pinnate, the segms. to 5 in. long, nearly entire. Que. to Ga. and Mo.

cyclosorum: *A. Filix-femina.*

Filix-femina (*A. cyclosorum. Asplenium Filix-femina*). Lady-Fern. Hardy, bright green: lvs. to 3 ft. long, bipinnate, segms, deeply toothed or cut. Eu., Asia, W. N. Amer.—The E. American plants represent two species or varieties (*A. angustum* and *A. asplenioides*) differing in technical characters. Some of the hort. vars. derived from the European type are **Craigii,** dwarf and crested, **crispum, Frizelliæ, grandiceps, laciniatum, latifolium, multifidum, plumosum, pulcherrimum, setigerum, Victoriæ** with pinnæ forked to base and crested at tips.

Goeringianum (*Asplenium Goeringianum*). Hardy: lvs. deciduous, usually drooping, to 1½ ft. long, pinnate, the segms, toothed or cut. Japan. Var. **pictum** has stalks purplish, lvs. with central gray band.

pycnocarpon: *A. angustifolium.*

thelypteroides: *A. acrostichoides.*

ATRAGENE AMERICANA: *Clematis verticillaris.*

ATRAPHAXIS. *Polygonaceæ.* Deciduous subshrubs with small lvs., white or pinkish fls. in terminal racemes, and fr. an achene; native in Asia, Greece, N. Afr.

They thrive on rather dry soil in sunny positions. Propagated by seeds in spring, by layers, and by cuttings of young wood in early summer under glass.

frutescens (*A. lanceolata*). To 3 ft.: lvs. oblong to lanceolate, to 1¼ in. long, grayish-green: fls. whitish, in racemes to 3 in. long, Aug.–Sept. S. Russia to Cent. Asia; hardy far N.

lanceolata: *A. frutescens.*

ATRIPLEX. Saltbush. *Chenopodiaceæ.* Mealy or scurfy herbs or shrubs with alternate or opposite lvs. and small greenish unisexual fls. in clusters; often native in salty situations.

One species, the orach, is grown for greens. Seeds are sown in drills in early spring and the seedlings thinned out in the row. Others are grown for ornament and as forage plants in desert regions.

Breweri. Shrub to 6 ft.: lvs. ovate-oblong, silvery-gray, to 1½ in. long. S. Calif.—Planted for hedges.

Halimus. Shrub to 6 ft.: lvs. broad-ovate or ovate-oblong, to 2½ in. long, silvery. S. Eu.

hortensis. Orach. Ann. to 6 ft.: lvs, triangular-ovate or arrow-shaped, the margins toothed or wavy, varying in color from pale yellowish-green to dark red. Asia.

lentiformis. Quail-Bush. Shrub to 10 ft.: lvs. ovate or arrow-shaped, silvery, to 1½ in. long. Calif., Ariz.

semibaccata. Diffuse or spreading grayish per. to 3 ft.: lvs. oblong, to 2 in. long, toothed or entire. Australia; nat. in Calif. and Ariz.—Forage plant.

ATROPA. *Solanaceæ.* A few Old World herbs, one economically important as the source of atropine and other drugs: lvs. alternate, entire: fls. bell- or funnel-shaped: berries purple, poisonous, in an enlarged calyx.

Belladonna. BELLADONNA. Per. to 3 ft.: lvs. ovate, to 6 in. long: fls. blue-purple or dull red, about 1 in. long, solitary or in pairs, nodding, axillary: berry nearly globular, ½ in. long, shining black. Eu., Asia.

ATTALEA. *Palmaceæ.* Unarmed feather-palms, probably 25 species Mex. to Brazil, monœcious or diœcious, trunk (if any) single and usually very large, ringed, sometimes lofty: lvs. long and heavy, gracefully outcurving at the end, pinnæ often standing edgewise: spadices erect among the lvs., on long peduncles, the 2 spathe-lvs. usually strong and durable; when monœcious, the staminate fls. on upper part of branches; stamens usually 10–24, large: fr. nut-like, to 3½ in. long, bearing a prominent beak, the covering fibrous. Palms sometimes planted as Attalea may belong to the related genus Scheelea of the Amer. tropics, which differs in having 6 stamens and other technical differences. For cult. see *Palm.*

Cohune. Ponderous palm reaching 50 ft. and more: lvs. often 20 ft. and more long, with very many long stiffish more or less conduplicate pinnæ: spadix 4–6 ft. long: fr. about 3 in. long, ovoid-oblong. Mex., Cent. Amer.; stands in the open in S. Fla.

gomphococca. To 30 ft.: lvs. 6–9 ft. long; pinnæ very many and narrow, pale underneath; petiole very short and fibrous at base. Costa Rica.

AUBRIETA. *Cruciferæ.* Choice little mat-forming perennials prized for the abundant bright purple or lilac spring bloom: pods or silicles short-oblong to globose. The several forms commonly known in cult. are color-races or varieties of **A. deltoidea,** which is native in Italy and Greece to Asia Minor. Named varieties are *Bouganvillei, Campbelli, Eyrei, græca, Hendersonii, hybrida, Leichtlini, Moerheimi, olympica, purpurea.* The fl.-sts. rise 2 in. to 10 or 12 in. The attractive deltoid or rhomboidal foliage covers spaces well between rocks and along borders. Propagation is by seeds, sown a season in advance of blooming, by division of the mats or clumps, and by layers of the trailing shoots. Aubrietas thrive well in usual half-shady exposures. —The name was originally spelled *Aubrieta,* not *Aubrietia.*

AUCUBA. *Cornaceæ.* Evergreen shrubs native in Asia, with opposite simple lvs., small purple diœcious fls. in terminal panicles, and fr. a berry-like drupe. The name is sometimes but was not originally spelled Aukuba.

Aucubas are grown in a cool greenhouse and out-of-doors in mild climates for the ornamental foliage. They thrive in a partially shaded position in moist well-drained soil. Propagated by cuttings of half-ripened wood, seeds, or the varieties by grafting.

crotonifolia. Lvs. croton-like, green spotted with white. Probably a var. of *A. japonica.*

himalaica. To 15 ft.: lvs. lanceolate or broader, to 8 in. long, finely toothed: fr. orange to scarlet. Himalayas; to be planted only far S.

japonica. To 15 ft.: lvs. dark green and shining, ovate or oblong, to 7 in. long, coarsely toothed above middle: fr. scarlet, rarely yellow or white. Himalayas to Japan; hardy in D. C. Var. **variegata** (var. *maculata*), GOLD-DUST TREE, has yellow-spotted lvs. Var. **latimaculata** (var. *aureo-maculata*) has a large yellow blotch in center of lf. Var. **dentata** has smaller coarsely toothed lvs. Var. **longifolia** (var. *angustifolia*), narrow lvs. to 5 in. long. Var. **macrophylla,** large broad lvs.

serratifolia is a form of *A. japonica.*

AUDIBERTIA (*Ramona*). *Labiatæ.* Herbs or subshrubs grown for ornament and for bees: per.: lvs. usually rugose and sage-like: fls. axillary or terminal, 2-lipped, differing from Salvia in the spathe-like calyx, blooming in spring and summer. They require the usual cult. for perennials.

grandiflora (*Salvia spathacea*). CRIMSON SAGE. Per. to 3 ft.: lvs. white-tomentose beneath: fls. to 1½ in. long, crimson, in dense clusters. Calif.

nivea (*Salvia leucophylla*). PURPLE SAGE. To 4 ft., the sts. woody, white-tomentose: fls. light purple, ½ in. long. Calif.

polystachya (*Salvia apiana*). WHITE SAGE. To 10 ft., shrubby, white-tomentose: fls. white, to ¾ in. long. Calif.—One of the shrubs called "greasewood."

stachyoides (*Salvia mellifera*). BLACK SAGE. Stiff and shrubby, 3 ft. high: lvs. green above, gray-tomentose beneath: fls. white or lilac-tinged, ½ in. long. Calif.—A bee plant.

AUDOUINIA. *Bruniaceæ.* One heath-like shrub in S. Afr., **A. capitata** (*Diosma capitata*), suitable for Calif. and under glass, with treatment as for Diosma: to 2 ft., branches erect and more or less whorled: lvs. small and sessile, linear, imbricate: fls. crimson, in long spike-like terminal crowded heads.

AULIZA: *Epidendrum ciliare.*

AUREOLARIA. *Scrophulariaceæ.* N. American herbs parasitic on the roots of Quercus, with entire or bipinnatifid lvs. and yellow fls. with spreading lobes, on axillary peduncles or in a terminal leafy raceme or panicle; sometimes transferred from the wild.

pedicularia (*Gerardia* and *Dasystoma pedicularia*). Ann. or bien. to 4 ft.: lvs. pinnatifid two-thirds to midrib: corolla to 1½ in. long, pubescent outside, with spreading lobes, Aug.–Sept. Me. to Fla. and Mo.

AURICLE: an ear-shaped part or appendage, as the projections at the base of some leaves and petals.

AURICULA. A favorite spring cool-season perennial of European fanciers, little grown in North America. It is *Primula Auricula* (which see), in many forms and colors, but some of the races may be of hybrid origin with other species. It is grown mostly in pots or boxes under frames; propagation is by seeds in general and for the production of new varieties, and by offsets or division for the perpetuation of particular varieties. Seeds sown in early spring should give blooming plants the following spring, but some of the seeds may not germinate until the second year. In the North plants may be carried over winter in a cold greenhouse.

AVENA. OATS. *Gramineæ.* Mostly ann. grasses, having flat lvs. and long-pointed mostly awned and hanging spikelets in loose panicles; native in temp. regions of the world and grown for the grain, forage, hay and occasionally for ornament. The panicles may hang in all directions (all-sided) or to one side only. They are sown in early spring or sometimes in autumn in mild climates. See *Grasses.*

barbata. Slender Wild Oat. Differing from *A. fatua* in the more slender panicles and in tecnhical characters of the florets. Eu.; nat. on Pacific Coast.

brevis. To 3 ft.: panicle one-sided; spikelets with 2 awns; oat short and broad. Eu.

elatior: *Arrhenatherum elatius.*

fatua. Wild Oat. To 4 ft., tufted: lvs. to 8 in. long and ⅓ in. wide: panicles to 1 ft. long, all-sided, the spikelets drooping and with awns to 1½ in. long. Eu., Asia; nat. in N. Amer.

flavescens: *Trisetum flavescens.*

nuda. Naked Oat. Differs from *A. sativa* in the grain separating from the hull; panicle close. Probably cultigen.

sativa. Common Oat. To 4 ft., tufted: lvs. to 1 ft. long and ½ in. wide: panicles to 1 ft. long, the branches all-sided or from one side in the forms known as Side Oats, awns to ¾ in. long or lacking; grain of fr. permanently inclosed in hull. Cultigen.

sterilis. Animated Oat. To 3 ft.: panicles to 1 ft. long, awns to 2 in. or more long and twisted, the florets moving by hygroscopic action. Medit. region.—Much of the seed planted under this name is *A. fatua.*

strigosa. Much like *A. sativa* but differing in technical floral characters: spikelets prickle-pointed. Eu.

AVENS: *Geum.*

AVERRHOA. *Oxalidaceæ.* Evergreen trees with alternate pinnate lvs., small fragrant fls., and large fleshy berry-like edible fr.; trop. Asia.

They can be grown only in regions free from frost, and thrive on deep rich soil in a moist climate. Propagated by seeds or by budding.

Bilimbi. Bilimbi. To 50 ft.: lfts. 24–45: fls. red-purple: fr. greenish-yellow, to 4 in. long, with 5 obscure angles. Known only in cult.

Carambola. Carambola. To 30 ft.: lfts. 5–9: fls. white marked with purple: fr. yellow or golden-brown, to 5 in. long, with deep ribs. Malayan region and spread in tropics.

AVIGNON BERRY: *Rhamnus infectoria.*

AVOCADO. The large pear-shaped or oblong or nearly globular fruit of *Persea americana* (which see), a tropical or subtropical American evergreen broad-leaved tree; other species may be involved in the origin of them.

The avocado has become of great importance in southern California and southern Florida as a market fruit and a special literature has developed. It is grown in orchard plantings, the trees standing 20–25 feet apart either way, on well-drained fertile open land. The tree reaches a height of 30 feet or more. Transplanting is commonly undertaken in spring and early summer, a ball of earth being removed with the tree; the plant is preferably banked in moist shavings in a lath house for at least two weeks, with daily syringing before being planted in the orchard. In two or three years most varieties begin to bear.

Named varieties are propagated on seedling avocado stocks by shield-budding in autumn or spring, the former perhaps preferable. The stock should be in active growth with the soil fairly wet. Skill is required in choosing budwood at just the proper stage of maturity so that the "eyes" will not fail. Rubber bands are employed to hold the bud in place, but most growers still use waxed cloth. The stock is cut back gradually, not all of it being removed until the bud has made a growth of 2 feet or so; the cut is then shellacked.

When packed for shipment the fruit is not wrapped in paper but is nested in excelsior in well-ventilated small crates. In California Fuerte (December to July) is the leading commercial variety. Nabal, Taft, Queen are excellent summer and autumn varieties. Yield varies widely from year to year, depending largely on weather conditions at blooming time which is March and April. Averaging over several years, 150 pounds to a tree is considered a conservative estimate for trees ten years old and over.

The avocado varieties are of several groups, as West Indian, Guatemalan, Mexican. The first comprises the tenderest varieties and can be grown only in the warmer parts of Florida. These kinds, as Trapp, Pollock, Simonds, ripen late summer to early winter. The Guatemalans, represented by Fuerte, Taft, Taylor, Wagner, are hardier and can be grown in central peninsular Florida; they ripen from early winter to spring. The Mexican group is about as hardy as the sweet orange, in the varieties Tarmon, Puebla, San Sebastian, Northrop, Gottfried; June to October.

AWL-SHAPED: narrow and sharp-pointed; gradually tapering from base to a slender or stiff point.

AWN: a bristle-like part or appendage.

AXIL: upper angle that a petiole or peduncle makes with the stem that bears it.

AXONOPUS. *Gramineæ.* Ann. and per. grasses of warm regions, having flat lvs. and small spikelets borne in narrow one-sided spike-like racemes; one species is grown in pastures in the S. See *Grasses.*

compressus (*Anastrophus compressus*). Carpet-Grass. Per. to 2 ft., stoloniferous: lvs. to 4 in. long and ¼ in. wide: racemes to 2 in. long, in clusters of 2–5 toward top of sts. Va. to La., trop. Amer.

AZADIRACHTA. *Meliaceæ.* Probably not planted here outside test grounds: see *Melia.*

AZALEA: *Rhododendron.* **Alpine-:** *Loiseleuria.*

AZALEASTRUM: *Rhododendron arborescens.*

AZARA. *Flacourtiaceæ.* Evergreen trees and shrubs native in S. Amer., with alternate simple lvs., small fragrant fls. in axillary racemes and clusters, and fr. a berry.

Grown for ornament in warm regions and sometimes under glass. Propagated by seeds or ripened cuttings.

celastrina. Much branched shrub to 9 ft.: lvs. round-oval, to 1½ in. long, slightly toothed, shining above: fls. golden-yellow, densely tomentose. Chile.

Gilliesii. To 15 ft.: lvs. broad-ovate, to 3 in. long, with coarse spiny teeth: fls. yellow. Chile.

integrifolia. To 20 ft.: lvs. obovate or oblong, to 1½ in. long, entire: fls. yellow, in racemes. Chile.

microphylla. To 12 ft.: lvs. obovate, to ¾ in. long: fls. greenish: fr. orange. Chile.

AZAROLE: *Cratægus Azarolus.*

AZOLLA. *Salviniaceæ.* Moss-like floating plants, with pinnately divided leaf-like sts. and minute lvs.; widely scattered.

caroliniana. Plants about 1 in. long, greenish or reddish. N. Amer., trop. Amer.—Sometimes grown on the surface of aquaria and greenhouse tanks.

B

BABIANA. *Iridaceæ.* Low cormous herbs from S. Afr., the st. bearing several plicate lvs. and lilac, yellow, pink or red fls. in terminal clusters or racemes, the perianth with slender tube and equal segms. Sometimes grown in pots under glass or in the open in mild climates for spring bloom. Propagated by cormels and seeds.

stricta. To 1 ft.: lvs. sword-shaped, hairy: fls. red or lilac, to 1½ in. long, the bracts hairy.

BABY BLUE-EYES: *Nemophila insignis.*

BABYS-BREATH: *Gypsophila paniculata.* **False:** *Galium Mollugo.*

BACCHARIS. *Compositæ.* Shrubs with small white or yellowish diœcious heads in corymbs or panicles; florets all tubular; pappus of the fr. snow-white and showy: lvs. alternate, sometimes evergreen.

The species are sometimes transferred to grounds for their more or less persistent foliage, or the profuse white or yellowish bloom; *B. halimifolia* is valuable for seashore planting. Some of them require well-drained soil and a sunny position, and others are marsh plants. Propagated easily both by seed and by cuttings rooted under glass.

angustifolia. To 8 ft.: lvs. linear, to 3 in. long, nearly entire, leathery. N. C. to Fla. and Tex., in brackish marshes.

Douglasii. To 5 ft., sticky: lvs. lanceolate, to 4 in. long, nearly entire. Calif., in lowlands.

genistelloides. To 2½ ft.: lvs. very small and bract-like or scale-like, borne on prominently winged leaf-like branches. Peru, Brazil.

glomeruliflora. To 10 ft.: lvs. spatulate, to 2 in. long, toothed above middle or entire, leathery and light green. N. C. to Fla., swamps and lowlands.

halimifolia. GROUNDSEL-BUSH. To 12 ft.: lvs. oblong or obovate, to 3 in. long, coarsely toothed, the upper entire. Mass. to Fla. and Tex., along the coast and in marshes.

pilularis. To 5 ft., evergreen: lvs. obovate, to 1 in. long, few-toothed or entire. Calif., Ore., on hills and dunes.

BACHELORS-BUTTON: *Centaurea Cyanus.*

BACTRIS. *Palmaceæ.* Feather-lvd. monœcious mostly gregarious palms of many species in trop. Amer., rarely planted and little known in the U. S.: mostly lowland and swamp plants, armed with spines and prickles: spadices among the lvs., short, covered by one of the spiny spathes; staminate fls. on upper part of branches; stamens 6–12: fr. globose and drupe-like, 1 in. more or less diam. For cult. see *Palm.*

Gasipaes: *Guilielma Gasipaes.*

major (*Pyrenoglyphis major*). Sts. in an attractive clump, to 15 ft., armed with rows of black spines, as are the petioles and rachises: lvs. 4–6 ft. long; pinnæ linear, about 30 pairs, 8–12 in. long, ½ in. or less broad, setose on margin: fr. about 1½ in. long, purplish-black. N. S. Amer.

BAEL FRUIT: *Ægle Marmelos.*

BAERIA. GOLDFIELDS. *Compositæ.* California, mostly annuals with opposite lvs. and many-fld. yellow heads of ray- and disk-fls.; pappus of scales or awns or lacking. Grown in the flower-garden for spring and summer bloom, and propagated by seeds.

aristata (*Actinolepis* and *B. coronaria. Hymenoxys californica. Shortia californica*). Sts. weak, to 10 in. long: lvs. 1–2-pinnate into linear segms.: heads ½ in. across.—Used for edgings and as an everlasting.

chrysostoma (*B. gracilis*). Much branched, 4–12 in. high: lvs. linear to thread-like, entire: heads to 1 in. across.

coronaria: *B. aristata.*

gracilis: *B. chrysostoma.*

macrantha. Sts. simple or nearly so, to 2 ft., from horizontal tuberous per. roots: lvs. linear, entire, to 5 in. or more long, ciliate and toothed: fls. to 1 in. across, slender-pedicelled. Calif.—Variable.

BAILLONIA. *Verbenaceæ.* Two S. American deciduous woody plants with opposite or whorled sessile lvs. and somewhat 2-lipped fls. in racemes or spikes, the corolla 5-lobed: fr. a drupe in the persisting calyx. Adapted to Calif. and under glass.

juncea (*Diostea juncea*). Small tree or shrub to 20 ft. with rush-like branches and small opposite remote dentate lvs.: fls. lilac, in short dense spikes, the corolla ¼–⅓ in. long. Chile, Peru.

BALAKA. *Palmaceæ.* Segregate from Ptychosperma and by many botanists retained in that genus: differs in the very broad or half-rhomboid pinnæ and not furrowed seed and albumen not ruminate; 2 species in Fiji; polygamo-diœcious small palms adapted to house cult. and probably in the open in S. Fla. For cult. see *Palm.*

perbrevis (*Kentia Kersteniana*). Interesting small unarmed palm with slender solitary ringed trunk and gracefully spreading and arching dark green lvs.: pinnæ 6–10 in. long, 2–3 in. broad at apex and thence narrowed to base (sometimes with very narrow ones intermixed), the end irregularly jagged and truncate or concave, with a projecting point at either side in young lvs. and the upper point often 2–3 in. long, with prominent midrib and thick margins and many intermediate veins; rachis somewhat scurfy.—*Kentia præmorsa* of the trade is probably this species.

Seemannii (*Ptychosperma Seemannii*). Very slender woods palm to 12 ft. and an in. or so diam., straight and ringed: lvs. to 4 ft. long; pinnæ or segms. broad and toothed-erose at apex and oblique, upper margin longer, about 9–14 in number: spadix below the lvs., with several slender branches, fls. distichous.

BALAUSTION. *Myrtaceæ.* One shrub native in W. Australia, with decumbent or prostrate sts. to 1 ft. long. **B. pulcherrimum.** Lvs. opposite, linear, to ½ in. long, keeled or 3-angled, stiff, entire: fls. red, solitary in axils, petals about ½ in. across.

BALISIER: *Heliconia Bihai.*

BALLOON-BERRY: see *Rubus illecebrosus.* **-Flower:** *Platycodon grandiflorum.* **-Vine:** *Cardiospermum Halicacabum.*

BALLOTA. *Labiatæ.* Pubescent per. herbs or subshrubs with toothed lvs. and small 2-lipped fls. in axillary clusters; native in the Old World and sometimes planted for ornament. Of simple requirements.

fœtida. Similar to *B. nigra* and perhaps a form of it, very ill-scented. Medit. region.

nigra. Black Hoarhound. To 3 ft.: lvs. ovate, to 2 in. long: fls. reddish-purple or whitish, to ¾ in. long. Eu.; nat. in E. N. Amer.

BALM: *Melissa.* **Bee-:** *Monarda didyma.* **Canary-:** *Cedronella canariensis.* **Field-:** *Nepeta hederacea.* **Fragrant-:** *Monarda didyma.* **Horse-:** *Collinsonia.* **Molucca-:** *Molucella lævis.* **-of-Gilead:** *Populus candicans.*

BALSA: *Ochroma*; see under *Bombacaceæ.*

BALSAM, Garden: *Impatiens Balsamina.* **-of-Peru:** *Myroxylon Pereiræ.* **-Root:** *Balsamorhiza.* **-Tree:** *Myroxylon.*

BALSAMINACEÆ. Balsam Family. Two genera; one widely distributed, of ann. and per. succulent herbs with simple lvs., very irregular bisexual fls. having 3 sepals one of which is large and petal-like, 5 unequal petals or 2 pairs united forming 3 petals, 5 stamens, 5-celled ovary, and fr. a caps. or berry. The genus Impatiens is grown for ornament, the other genus, Hydrocera, with a single species from Ceylon to Java, not being in cult.

BALSAMOCITRUS. *Rutaceæ.* A few African usually spiny trees with mostly 3-foliolate lvs., sometimes grown for interest and as possible stocks for citrus fruits: stamens 10–20: fr. large and hard-shelled and often persistent. **B. Dawei** reaches 50–60 ft.: mature lvs. with 3 lance-ovate stalked lfts.: fr. 4–6 in. diam., globose or nearly so, 8-celled, dropping from the pedicel when ripe.

BALSAMORHIZA. Balsam-Root. *Compositæ.* Low per. herbs with thick roots, large mostly basal lvs. and few or solitary showy yellow heads of ray- and disk-fls.; pappus none; native in W. Amer. on mts., foot-hills and sandy regions, and sometimes planted for ornament; spring and summer bloomers.

hirsuta. To 2 ft., hairy: lvs. pinnately divided into toothed or cut segms.: heads to 1¾ in. across. B. C. to Calif. and Utah.

macrophylla. To 2 ft., hairy: lvs. pinnately divided into entire segms.: heads to 3½ in. across. Utah, Wyo.

sagittata. To 2 ft.: lvs. cordate to sagittate, to 8 in. long, nearly entire, white-tomentose: heads 2 in. or more across. B. C. to Calif. and Colo.

BAMBOO. *Gramineæ.* Various giant long-lived woody grasses, mostly of the genera Arundinaria, Bambusa, Cephalostachyum, Chusquea, Dendrocalamus, Phyllostachys, Sasa, Thamnocalamus, as known in this country. The species of these genera are mostly Asian, but some of the Arundinarias are plants of the western hemisphere, two of them being native as far north as Missouri and Maryland. A few of them, as Chusqueas, are climbers.

The bamboos are adapted only to the southern parts of the country, although certain small kinds are hardy as far as Philadelphia or even northward. They usually do not produce seed in this country, and propagation is by division of the clumps and cuttings of the stolons. Bamboos require fertile soil and a uniform supply of clean underground water, and some of them thrive along water-courses. With age and thorough establishing of the roots, the clumps become conspicuous or even commanding objects. The larger kinds make good shelter-belts and groves.

BAMBUSA. Bamboo. *Gramineæ.* Tall woody grasses, sometimes climbing, with cylindrical hollow sts., persistent lf.-sheaths, and spikelets borne in panicles, stamens 6; native mostly in tropics of Old World and not hardy in northern states. See *Bamboo.*

Alphonse Karri: *B. nana* var.

angulata (*B.* and *Arundunaria quadrangularis*). To 3 ft., st. 4-angled: lvs. to 7 in. long and 1 in. wide, hairy beneath. China.

angustifolia: *Sasa disticha.*

argenteo-striata: *Sasa argenteo-striata.*

arundinacea. To 100 ft., culms yellow, branches flexuose and spiny: lvs. to 8 in. long and ½ in. wide, nearly glabrous: infl. a large panicle produced only once after which the plant dies. India.

aurea: *Phyllostachys aurea.*

aureo-striata: *Sasa aureo-striata.*

Castillonis: *Phyllostachys reticulata* var.

chrysantha: *Sasa chrysantha.*

disticha: *Sasa disticha.*

falcata: *Arundinaria falcata.*

fastuosa: *Arundinaria fastuosa.*

flexuosa: *Phyllostachys flexuosa.*

Fortunei aurea: *Sasa auricoma.*

gracilis: *Thamnocalamus Hindsii.*

Henonis: *Phyllostachys puberula.*

japonica: *Sasa japonica.*

kumasaca: *Phyllostachys kumasasa.*

Laydeckeri: *Arundinaria Simoni* var. *Chino.*

marmorea: *Arundinaria marmorea.*

Metake: *Sasa japonica.*

mitis: *Phyllostachys mitis.*

nana. To 10 ft., sts. yellow: lvs. to 3 in. long and ¼ in. wide, rough on edges, glaucous-blue. China, Japan. Var. **Alphonse Karri** (*B. Alphonse Karri*) has sts. variegated yellow and green, lvs. mottled rose and green. Var. **variegata** (*B. vittata-argentea*) has lvs. mottled with silvery-white.—Much of the material cult. as *B. nana* is *Sasa disticha.*

nigra: *Phyllostachys nigra.*

nutans. To 45 ft., the culms glossy-green: lvs. to 1 ft. long and 1 in. wide, rough above and on edges, glabrous or hairy beneath. India.

palmata: *Sasa senanensis* var. *nebulosa.*

quadrangularis: *B. angulata.*

Ragamowskii: *Sasa tessellata.*

Simoni: *Arundinaria Simoni.*

striata: *Phyllostachys sulphurea.*

sulphurea: *Phyllostachys sulphurea.*

tessellata: *Sasa tessellata.*

Thouarsii: *B. vulgaris.*

Tulda. To 70 ft., the culms gray-green: lvs. to 13 in. long and 1½ in. wide, rough above and on edges, paler and usually hairy beneath. India.

Veitchii: *Sasa Veitchii.*

verticillata: a name of doubtful botanical application.

Vilmorini: *Sasa disticha.*

viminalis: *Phyllostachys kumasasa.*

violescens: *Phyllostachys violescens.*

viridi-glaucescens: *Phyllostachys viridi-glaucescens.*

viridi-striata: *Sasa auricoma.*

vittata-argentea: *B. nana* var. *variegata.*

vulgaris (*B. Thouarsii*). Feathery B. To 50 ft., with yellow longitudinally banded sts.: lvs. to 10 in. long and 1½ in. wide, glabrous. Java and perhaps elsewhere.

BANANA. A tropical fruit extensively grown for local use and for export to temperate regions. It is a perennial herb but the stem and leaf-sheaths produce a trunk-like structure and the plant may attain a height of 20–30 feet with a crown of big long leaves and a heavy cluster of fruits. The common species is of two main races (sometimes regarded as two species), *Musa paradisiaca*, the plantain of which the fruit is edible when cooked, and var. *sapientum*, the true banana which is edible raw at maturity. Another species is the dwarf or Chinese banana, *Musa Cavendishii*, which may be grown commercially in warm-temperate climates, as in Bermuda and the Canaries. See *Musa*.

The banana bears once and then the main stalk or trunk dies or becomes weak; in the meantime suckers (one or more) have arisen from the crown to continue the fruiting. A vigorous sprout or new trunk should bear in ten or twelve months (or later than that if the plant is grown for curiosity under cover). A plantation continues to bear for several years if diseases, insects and soil defects do not intervene.

Propagation is by means of suckers inasmuch as commercial bananas are seedless. Dwarf bananas (*M. Cavendishii*) may be set as close as 8 or 10 feet either way, but the ordinary large kinds should stand 14 to 20 feet apart in commercial plantations. The banana requires moist deep and fertile soil but well drained, and protection from wind and full burning sun. Surplus suckers are removed to increase the vigor of the bearing stands.

Within the continental United States the banana is infrequently a commercial fruit except the dwarf Chinese, although it is commonly planted for home use, ornament and interest in Florida, along the Gulf Coast and elsewhere. The fruit is destroyed by frost, but new shoots arise from the crowns if the freezing is not too severe.

BANANA-SHRUB: *Michelia fuscata.*

BANEBERRY: *Actæa.*

BANGALAY: *Eucalyptus botryoides.*

BANKSIA. *Proteaceæ.* Australian evergreen trees or shrubs with alternate lvs. and yellowish fls. borne in pairs in dense terminal spikes becoming woody and cone-like in fr.; sometimes grown in S. U. S. Propagated by cuttings under a bell-jar or with difficulty by seeds. See also *Pimelea.*

Baxteri. Tall shrub: lvs. to 4 in. long, divided to midrib into triangular lobes 1 in. long and ¾ in. wide at base, pale beneath: spikes globular, to 3 in. across. W. Australia.

Caleyi. Low shrub: lvs. oblong-lanceolate, to 6 in. long, prickly-toothed or cut: spikes nearly globular, to 3 in. long. W. Australia.

coccinea. Shrub to 15 ft.: lvs. obovate to orbicular, to 2½ in. long, stiff, prickly-toothed: spikes globular, 2 in. across. W. Australia.

collina. Shrub to 12 ft.: lvs. linear, to 3 in. or more long, sharply toothed, white-tomentose beneath: spikes to 6 in. long.

ericæfolia. Shrub or tree to 14 ft.: lvs. narrowly linear, about ½ in. long, with entire revolute margins, notched or truncate at end: spikes to 10 in. long. New S. Wales.

grandis. Tree to 40 ft.: lvs. to 1 ft. long, divided to midrib into triangular lobes to 2 in. long and 1 in. wide at base, pale and tomentose beneath: spikes to 1 ft. long. W. Australia.

integrifolia. Tree to 30 ft.: lvs. scattered, oblong to lanceolate, to 8 in. long and 1 in. wide, entire or sometimes toothed, white-tomentose beneath: spikes to 6 in. long.

littoralis. Tree to 40 ft.: lvs. linear, to 8 in. long, usually toothed, white-tomentose beneath: spikes to 10 in. long. W. Australia.

marginata. Shrub to 15 ft.: lvs. oblong-lanceolate, to 2 in. long, usually entire with recurved margins, white beneath: spikes to 3 in. long.

Menziesii. Tree to 40 ft.: lvs. to 1 ft. long and 1 in. wide, truncate, rusty-tomentose beneath: spikes to 5 in. long. W. Australia.

nutans. Shrub: lvs. narrow-linear, to 1 in. long, with entire revolute margins, glabrous: spikes to 2 in. long, sometimes nodding. W. Australia.

occidentalis. Shrub to 5 ft.: lvs. linear, to 4 in. long, notched or toothed at end, margins recurved, white beneath: spikes to 6 in. long. W. Australia.

pulchella. Shrub: lvs. linear, to ½ in. long, with entire revolute margins: spikes to 1½ in. long. W. Australia.

quercifolia. Shrub to 6 ft., glabrous: lvs. oblong, to 4 in. long, truncate, deeply toothed or cut: spikes to 4 in. long. W. Australia.

repens. Prostrate shrub: lvs. to 1 ft. long, long-stalked, deeply pinnatifid, thick and stiff: spikes to 4 in. long. W. Australia.

serrata. Tree to 20 ft.: lvs. oblong-lanceolate, to 6 in. long and 1 in. wide, deeply toothed, tomentose beneath, leathery: spikes to 6 in. long.

sphærocarpa. Shrub to 4 ft., tomentose: lvs. linear, 1–3 in. long, with entire revolute margins: spikes globular, to 3 in. across. W. Australia.

verticillata. Small tree: lvs. in whorls, oblong-lanceolate, to 3 in. long, margins recurved, white beneath: spikes to 8 in. long. W. Australia.

BANYAN: *Ficus benghalensis.*

BAOBAB: *Adansonia digitata.*

BAPHIA (*Bracteolaria*). *Leguminosæ.* Thirty or more simple-lvd. African trees and shrubs, one of which is intro. for ornament in S. Fla.: fls. papilionaceous, in panicles or axillary racemes: pod linear-lanceolate, flattened, narrowed to apex. **B. racemosa**, CAMWOOD, is a shrub, with oblong-lanceolate pointed entire lvs. to 2½ in. long: fls. white with purplish veins, the standard nearly ½ in. across, in short panicled leafy clusters: pods 2 in. long. Trop. and S. Afr.

BAPTISIA. FALSE OR WILD INDIGO. *Leguminosæ.* Per. herbs with mostly digitate lvs. of 3 lfts., papilionaceous fls. in racemes, and short inflated pods; native in E. N. Amer. in dry lands, adapted to borders and wild-gardens. Propagated by division or seeds.

australis. To 6 ft.: lfts. to 2½ in. long; fls. indigo-blue, in summer. Pa. to Ga. and Tex.

bracteata. To 2 ft.: lfts. to 4 in. long: fls. cream-colored, in spring. Ga.

leucantha. To 4 ft.: lfts. to 2 in. long: fls. white, June–July. Ont. to Fla. and Tex.

leucophæa. To 2½ ft.: lfts. to 4 in. long: fls. white or cream-colored, in spring. Mich. to Tex.

perfoliata. To 3 ft.: lvs. simple, orbicular, to 2 in. long, perfoliate: fls. yellow, in spring. Ga., S. C.

tinctoria. To 4 ft.: lfts. to 1 in. long: fls. bright yellow, in summer. Me. to Fla. and La.

BARBADOS FLOWER-FENCE: *Poinciana pulcherrima.* -Nut: *Jatropha Curcas.* Pride: *Poinciana pulcherrima.*

BARBAREA (*Campe*). WINTER-CRESS. UPLAND-CRESS. *Cruciferæ.* A few biennials and perennials in temp. regions, some of them becoming field and roadside weeds, a few kinds more or less grown as edible cress, and sometimes for ornament: they are erect branching herbs with small yellow fls. in terminal racemes, elongated erect or spreading pods or siliques, and pinnatifid or lyrate lvs. See *Cress.*

præcox: *B. verna.*

rupicola. Per., forming mats or sods: st. to 1 ft.: radical lvs. with large cordate terminal segm. or part, cauline pinnatifid: fls. large, the pedicels longer than sepals. Corsica, Sardinia.—Grown for ornament.

verna (*B. præcox*). EARLY or BELLE ISLE CRESS. Bien., probably sometimes per., to 2 ft.: lvs. irregularly pinnatifid, the segms. of the radical ones mostly 4–8 pairs: pod at maturity 1½ in. or more long, sharply 4-angled, on pedicel nearly or quite as thick as itself, the beak or point short and thick. Eu.; sometimes run wild.—Blooms in very early spring.

vulgaris. Per. or perhaps bien. to 2 ft.: lvs. with 1–3 pairs of segms.: pod 1 in. or less long, obtusely angled, on relatively thin pedicels, the beak commonly very thin. Eu.; extensively nat. in N. Amer.—Blooms later. Double-fld. and variegated-lvd. forms are known.

BARBERRY: *Berberis.* **Holly:** *Mahonia Aquifolium.*

BARKERIA: *Epidendrum.*

BARKLYA. *Leguminosæ.* One tree to 60 ft. native of Queensland and intro. in S. Calif. **B. syringifolia.** Lvs. simple, broad-cordate, to 4 in. long: fls. golden-yellow, small, regular, in dense racemes to 9 in. long forming terminal panicles.

BARLERIA. *Acanthaceæ.* Herbs or shrubs with opposite entire lvs. and funnelform 5-lobed fls. solitary or in spikes or heads, with large often showy bracts; native in Old World tropics and grown under glass or in the open in warm climates. Propagated by cuttings of young wood over heat.

cærulea. To 4 ft.: lvs. ovate, to 6 in. and more long: fls. blue, to 2 in. long, in dense spikes to 3 in. long; bracts veiny, large, entire. India.

cristata. To 3 ft.: lvs. oval, to 3½ in. long: fls. blue, 2 in. long, in dense spikes; bracts with long spiny teeth. India.

BARLEY: *Hordeum vulgare.*

BAROSMA. *Rutaceæ.* S. African heath-like shrubs with mostly opposite leathery lvs. and 5-parted fls. solitary or clustered; one species intro. in S. Calif. Propagated by cuttings of mature wood.

ovata. To 2 ft., much branched: lvs. ovate or obovate, to ½ in. long, shining: fls. white, ⅙ in. long, solitary.

BARRINGTONIA. *Lecythidaceæ.* Evergreen trees of the Old World tropics, having large lvs. crowded at ends of branches and white or reddish fls. with many protruding stamens, borne in spikes or racemes; the following planted in tropics and intro. in S. Calif.

speciosa. To 50 ft.: lvs. obovate, to 15 in. long, entire, shining: fls. with white petals 2 in. long and longer purplish stamens: fr. 4-angled, 3 in. across, with 1 large seed, style and calyx-lobes persistent. India.

BARTONIA AUREA: *Mentzelia Lindleyi.*

BARYXYLUM: *Peltophorum.*

BASELLA. MALABAR-NIGHTSHADE. *Basellaceæ.* Two Asian twining herbaceous vines with fleshy ovate to ovate-lanceolate lvs. and small inconspicuous fls. in clusters on long thickened stalks; grown as pot-herbs in trop. regions. In the N. seeds must be started indoors under heat.

alba. Lvs. longer than broad: fls. whitish.

rubra. Lvs. about as broad as long: fls. reddish.

BASELLACEÆ. BASELLA FAMILY. Five genera of climbing or decumbent perennials from trop. Amer. and Asia, somewhat allied to the chenopods, having alternate fleshy lvs. and small regular bisexual fls. with 2 sepals, 5 petals and stamens, superior 1-celled ovary, and fr. inclosed by the corolla. Basella and Ullucus are sometimes grown for food and Boussingaultia for ornament.

BASIL: *Ocimum.*

BASKET-FLOWER: *Centaurea americana, Hymenocallis calathina.*

BASKET-OF-GOLD: *Alyssum saxatile.*

BASKET PLANTS are those of a more or less viney or trailing or diffuse habit that make a good appearance in hanging baskets and pots and that are of simple cultural requirements. The term is employed for those subjects customarily grown on porches and in windows rather than regularly in greenhouses. Some of them are annuals of simple culture. Others are perennials propagated by means of cuttings, as ivy (Hedera), vinca, strawberry geranium, nasturtium, senecio, glechoma. Sometimes oxalis and spring bulbs are included. Basket plants do not constitute a cultural group, and need not be further considered separately. In growing basket plants one must be sure that caution is taken against excessive drying out.

BASSWOOD: *Tilia.*

BAST, CUBAN: *Hibiscus elatus.*

BATEMANNIA: *Huntleya Burtii.*

BATOCYDIA UNGUIS: *Doxantha Unguis-cati.*

BATODENDRON: *Vaccinium arboreum.*

BATRACHIUM: see *Ranunculus.*

BAUERA. *Saxifragaceæ.* Evergreen shrubs of Australia and Tasmania, often somewhat heath-like in foliage, with opposite 3-parted lvs. and white, pink or purple fls. solitary in the axils or clustered at ends of sts.

One attractive species is grown in the cool greenhouse and blooms throughout winter and spring. Propagated by cuttings of half-ripened wood in spring.

rubioides. To 6 ft. or more, often prostrate: lfts. oblong or lanceolate, to ½ in. long, toothed: fls. pink or white, ½ in. across.

BAUHINIA. *Leguminosæ.* Trop. trees or shrubs, often climbing, with simple lvs. which are usually 2-lobed or -parted, fls. in terminal or axillary cymes, and long flat pods; grown for ornament in warm countries. Propagated by seeds, suckers, and cuttings over heat.

aculeata (*B. Ungula*). Tree-like shrub with spine-like stipules: lvs. glabrous, subcordate at base, the 2 lobes ovate and 3-nerved and parted about one-fourth the way down: petals lanceolate and crenate, stamens 9 or 10: pod narrow, flat. Colombia.

acuminata. Shrub to 6 ft.: lvs. lobed less than half way: fls. white, in racemes: pod to 5 in. long. India, Malaya, China.

alba: *B. variegata* var. *candida.*

candicans: probably *B. candida* is meant (*corniculata*). See also *B. variegata* var. *candida.*

candida: *B. corniculata, B. variegata* var.

corniculata. Erect shrub: lvs. lobed nearly one-half depth of lf., lobes obtuse: fls. white, 2½–3 in. long, with narrow long-clawed petals and prominent colored stamens. Brazil, Paraguay.—The plant grown in Calif. as *B. candida* apparently belongs here.

corymbosa. Climbing: lvs. lobed nearly to middle: fls. pinkish, in loose racemes. E. Asia.

forficata. Shrub or small tree: lvs. forked into long narrow lobes: fls. white or cream-colored, 1–3 in the axils, with long narrow petals: pods to 10 in. Brazil.

Galpini. Shrub to 10 ft., half-climbing: lvs. 2-lobed: fls. brick-red, in few-fld. racemes: pods to 5 in. long. S. and trop. Afr.

grandiflora: a name often applied to *B. variegata.*

Kappleri: *B. monandra.*

mexicana. PATA-VACA. Large shrub or small tree: lvs. forked one-half-way down, lobes spreading and acute: fls. small, in clusters, petals white, stamens very long. Mex.

monandra (*B. Kappleri*). BUTTERFLY-FLOWER. JERUSALEM DATE. Shrub or small tree: lvs. broadly lobed about one-third their length: fls. pink with purple markings, in terminal racemes, having only 1 fertile stamen: pods to 9 in. long. Probably Guiana.

picta. Erect: lvs. roundish-elliptic, the lobes nearly ovate and acutish: fls. white, in terminal racemes, petals oblong. Colombia.

purpurea (*B. triandra*). Tree: lvs. broadly lobed about one-third their length: fls. red or white, with long narrow petals. India, China.—Name sometimes erroneously applied to *B. variegata.*

racemosa. Small bush-like tree with hanging branches: lvs. rather small, broader than long, with short very obtuse lobes: fls. yellow, small, in loose racemes. India.

tomentosa. ST.-THOMAS-TREE. Shrub to 15 ft.: lvs. small, broadly lobed to one- or two-thirds their length: fls. yellow with a red or chocolate blotch on one petal, 1–3 in the axils: pods to 5 in. long. India, China, Afr.

triandra: *B. purpurea.*

Ungula: *B. aculeata.*

Vahlii. MALU CREEPER. Tall climber: lvs. very large, broadly lobed to one-third or one-fourth their length: fls. white becoming yellowish. in many-fld. terminal clusters: pods to 1 ft. long. Himalayas.

variegata. MOUNTAIN EBONY. ORCHID-TREE. Tree: lvs. broadly lobed to about one-third their length: fls. lavender to purple, with broad petals, few together in the axils: pods to 1 ft. long. India, China. Much planted in S. Fla. Var. **candida** (*B. alba*) has white fls.

BAYBERRY: *Myrica.*

BAY, BULL: *Magnolia grandiflora, Persea Borbonia.* **Loblolly:** *Gordonia Lasianthus.* **Red:** *Persea Borbonia* and *pubescens.* **Rose:** *Rhododendron.* **-Rum-Tree:** *Pimenta acris.* **Sweet:** *Laurus, Magnolia virginiana.*

BEAD-PLANT: *Nertera depressa.*

BEAD-TREE: *Adenanthera, Melia.*

BEAM-TREE, WHITE: *Sorbus Aria.*

BEAN. Various species of Phaseolus are commonly known as beans, as: common field, kidney or snap bean, *Phaseolus vulgaris;* lima bean, *P. limensis;* sieva or civet bean, *P. lunatus;* these species are annual twiners, but with bush or dwarf varieties. White Dutch Runner and Scarlet Runner, *P. coccineus,* are perennial but grown as annuals, also twiners with bush forms. All these plants are tender, to be planted only after the weather is warm and settled. Broad, Windsor or horse bean, *Vicia Faba,* is a stiffly erect hardy annual grown in North America mostly in Canada, and especially in the maritime districts; it does not thrive in hot dry summers. Other kinds of beans are grown for ornament, for forage and special purposes. See *Dolichos, Glycine, Phaseolus, Vigna.*

The present statements about culture of beans apply to the phaseolus kinds mentioned above. In respect to their uses, they may be divided into three categories; viz., those used as string or snap beans, the entire pod being eaten; those used as shell beans, the full-size but immature beans being shelled from the pod and cooked; dry beans, or those eaten in their dry or winter condition. The same variety of bean may be used for all of these three purposes at different stages of its development, but there are varieties better suited to one purpose than the other.

Beans will grow in most soils, but the best results may be expected in ground well enriched and in good physical condition. From the 5th to the 10th of May in the latitude of central New York, it will be safe to plant beans for an early crop. No vegetable seed decays quicker than beans, and the delay caused by waiting for the ground to become warm and free from excessive moisture will be more than made up by the rapidity of growth when finally they are planted. The beans may be dropped 2 inches deep in shallow drills, the seeds to lie 3 inches apart. Cover to the surface of the soil, and if the ground be dry, firm it with the foot or the back of the hoe. For the bush varieties, allow 2 feet between the drill-rows. Pole beans are given more room, and support must be provided. The bush varieties may be planted at intervals of two weeks from the first planting until the 10th of August. Each planting may be on ground previously occupied by some early-maturing crop. Thus, the first to third plantings may be on ground from which has been harvested a crop of spinach, early radish or lettuce; after that, on ground where early peas have been grown; and the later sowings where beets or early potatoes have grown. String beans for canning are commonly taken from the last crop. One quart of seed will plant about 100 feet of drill.

Limas are the richest of beans, but they often fail to mature in the northern states. The land should not be very rich in nitrogen (or stable manure), else the plants will run too much to vine and be too late. Choose a fertile sandy or gravelly soil with warm exposure, use some soluble commercial fertilizer to start them off, and give them the best of culture. Aim to have the pods set before the droughts of midsummer come. The pole limas are commonly planted in hills that are 2 to 4 feet apart in the rows; 1 quart of beans plants about 100 hills. Good trellises for beans are made by strong twine stretched between two horizontal wires, one of which is drawn a foot above the ground and the other 6 or 7 feet high; but in the end, good chicken-wire screen, stored in winter, is best. Dwarf limas are more desirable for small gardens than the pole varieties, as they may be planted much closer, the bother of procuring poles and twine is avoided, and the garden will have a more sightly appearance; they are grown in rows that are about 2½ feet apart. But the dwarf limas and pole limas require a longer season than the common garden bush beans, and usually only one planting is made.

Beans are attacked by a good number of diseases and insects, for the control of which the grower should consult the latest bulletins and books.

BEAN: *Phaseolus.* **Asparagus:** *Vigna sesquipedalis.* **Black:** *Castanospermum australe.* **Broad:** *Vicia Faba.* **Castor-:** *Ricinus communis.* **Goa:** *Psophocarpus tetragonolobus.* **Horse:** *Vicia Faba.* **Hyacinth:** *Dolichos Lablab.* **Indian-:** *Catalpa bignonioides.* **Jack:** *Canavalia ensiformis.* **Lyon:** *Stizolobium niveum.* **Mescal:** *Sophora secundiflora.* **Potato:** *Apios tuberosa.* **Screw:** *Strombocarpa odorata.* **Soy:** see *Soybean.* **Sword:** *Canavalia gladiata.* **-Tree:** *Laburnum anagyroides.* **Velvet:** *Stizolobium.* **Wild:** *Apios tuberosa.* **Yam:** *Pachyrhizus.* **Yard-long:** *Vigna sesquipedalis.* **Yokohoma:** *Stizolobium Hasjoo.*

BEARBERRY: *Arctostaphylos, Arctous.*

BEARD: a long awn or bristle-like hair, particularly when in tufts.

BEARD-TONGUE: *Penstemon.*

BEARS-BREECH: *Acanthus.*

BEARS-TAIL, CRETAN: *Celsia Arcturus.*

BEAUCARNEA. *Liliaceæ.* Tree-like plants in dry regions of Tex. and Mex. with tall trunks somewhat swollen at base, long linear stiff lvs. and small whitish fls. in panicles; sometimes retained in the genus Nolina; suitable for outdoor planting in warm dry regions. Cult. as for *Yucca.*

recurvata (*Nolina tuberculata*). To 30 ft.: lvs. to 6 ft. long and ¾ in. wide, recurving. Mex.

BEAUFORTIA. *Myrtaceæ.* Stiff heath-like shrubs of W. Australia, with small opposite lvs. and mostly red sessile fls. in dense heads or short spikes; one species intro. in S. Calif. Propagated by cuttings of hardening shoots under glass.

purpurea. Small shrub: lvs. ovate- to linear-lanceolate, to ⅙ in. long: fls. small, in dense heads, stamens purple.

BEAUMONTIA. *Apocynaceæ.* A few woody vines from Java to E. India, with opposite lvs., very large showy funnelform fls. in terminal cymes, leafy lobed calyx, and long cylindrical fr.

One is grown in greenhouses in rich loamy soil; it should not be planted in pots; also planted out-of-doors in the South. Propagated by cuttings.

grandiflora. HERALDS-TRUMPET. Lvs. oval or obovate, to 8 in. long: fls. white, trumpet-shaped, to 5 in. long and as broad, fragrant, spring-blooming. Himalayas.

BEAUTY-BERRY: *Callicarpa.*

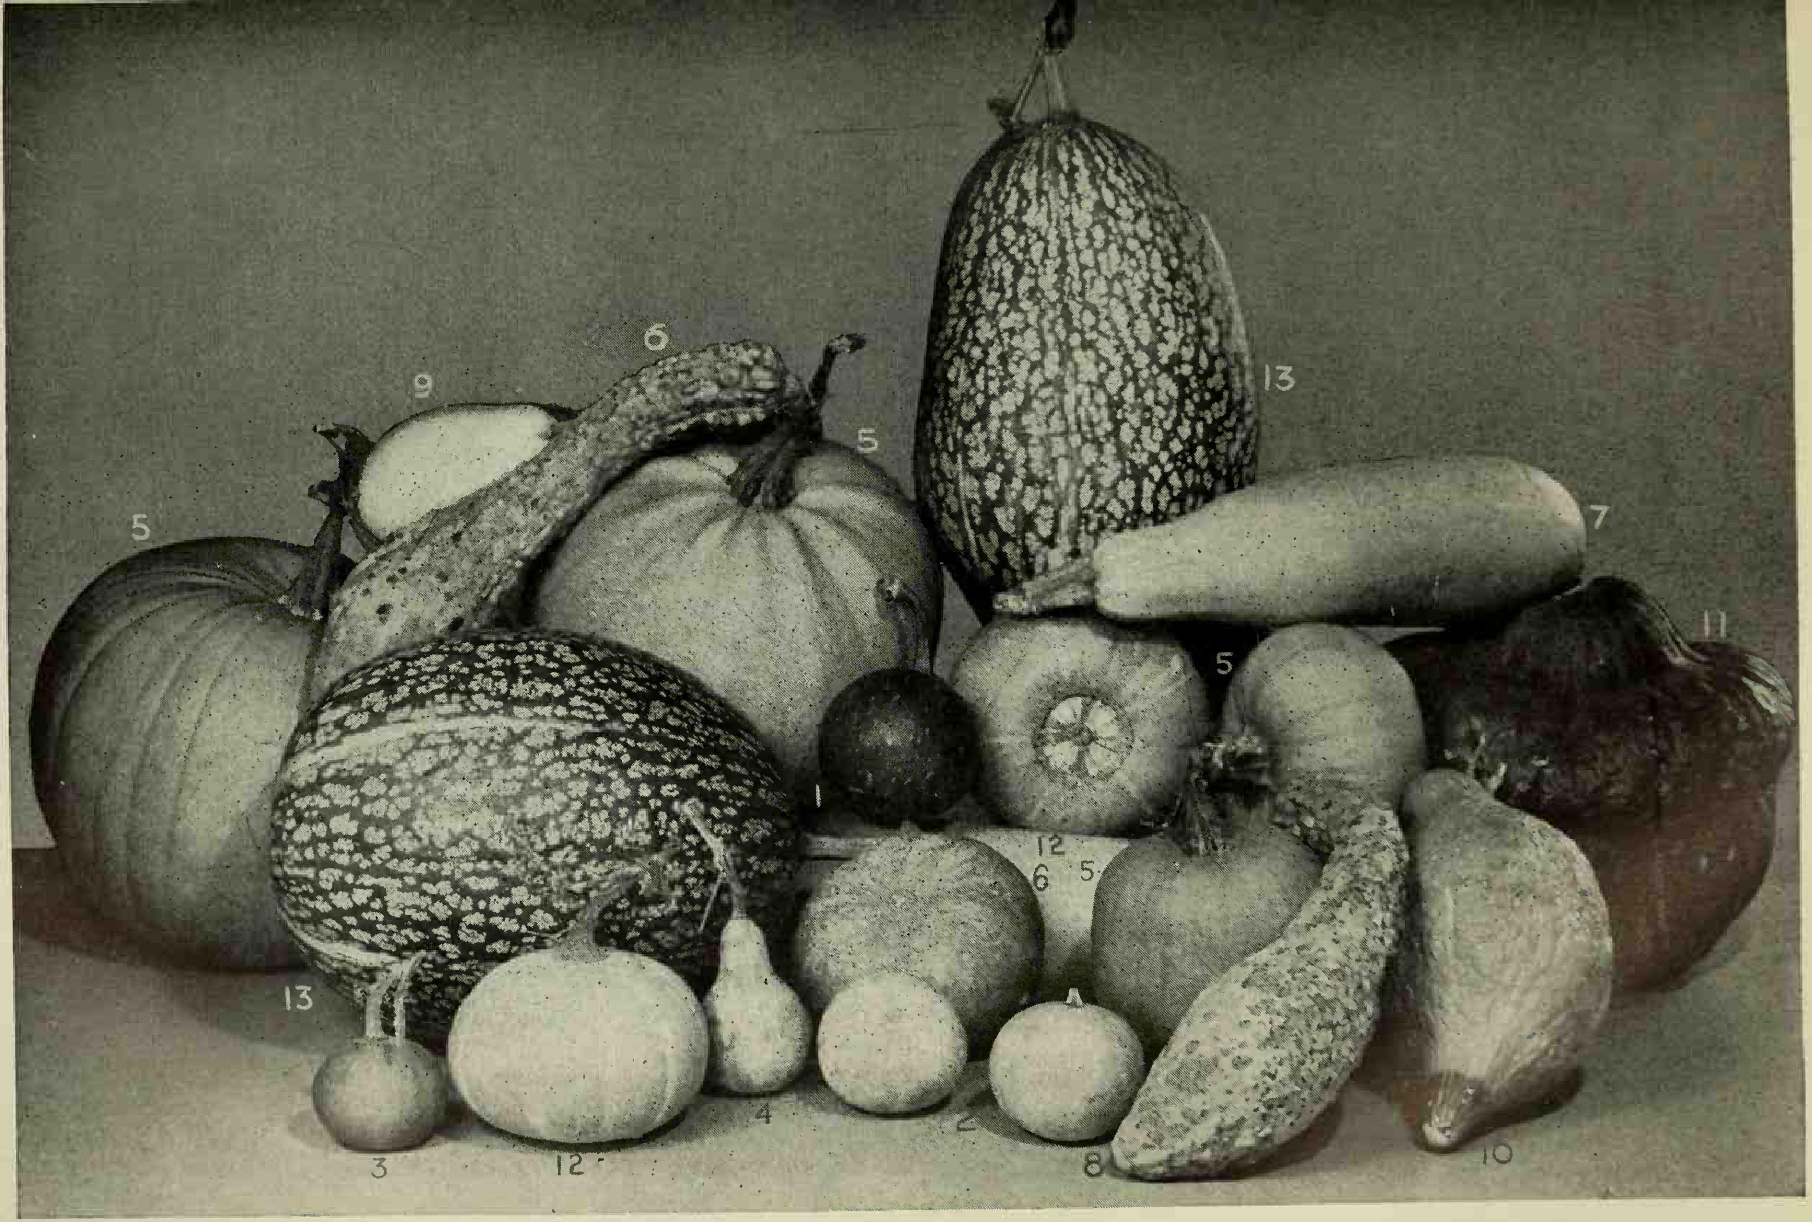
BEAUTY-BUSH: *Kolkwitzia amabilis.*

BEDDING is a more or less technical term to denote the growing of plants in beds or masses in distinction from placing them singly or in lines or "hills." It is commonly employed to designate the close massing of plants in the open ground for the making of striking displays of color or leafage; it is ordinarily a more or less temporary recourse for spring, summer or autumn show, although the name is sometimes given to assembled effects of perennials as of grasses and even of low evergreens. Sometimes the bed is of short duration even though the plants are perennial, as with the spring bulbs. It is evident that for temporary or seasonal effects the site must be well chosen and the ground carefully prepared so that results are obtained speedily and at the desired date.

In spring bedding the plants are commonly tulips, hyacinths, crocuses or other early-flowering bulbous plants. In this case, the ground is usually occupied later in the season by other plants. These later may be annuals, the seeds of which are sown amongst the bulbs as soon as the season is far enough advanced; or the annuals may be started in boxes and the plants transplanted amongst the bulbs as soon as the weather is fit. Heavy early over-planting of this kind, however, is likely to weaken the bulbs or prevent their proper maturation.

Summer bedding is often made with perennial plants carried over from the preceding year, or better, propagated for that particular purpose in February and March. Such plants as geranium, coleus, alyssum, scarlet salvia, ageratum and heliotrope may be grown for these beds. It is a common practice to use geranium plants which are in bloom in winter for bedding out in the summer, but such plants are tall and ungainly in form and have expended the greater part of their energies. It is better to propagate new plants by taking cuttings or slips late in the winter and setting out young, fresh, vigorous subjects. Many of the low-growing and compact continuous-flowering annuals are also excellent for summer bedding effects.

Bedding of another type attempts to make patterns or designs; it is carpet-bedding. Comparatively few subjects are adapted to this purpose, for the plants must be such as will stand shearing and have very strong and constant colors of foliage. The most popular bedding plants are coleus (particularly the yellow Golden Bedder), achyranthes, alternanthera, *Centaurea gymnocarpa,* and such succulent plants as the houseleeks. Some of the annual flowers may also be used for strong color effects, as *Lobelia Erinus* and sweet alyssum. Ordinarily the making of carpet-beds should be left to professional gardeners, since it requires much skill and care to make and keep the beds in perfect condition; and a ragged or imperfect carpet-bed is worse than no bed at all. Carpet-beds are really curiosities, and they have no more legitimate place in the general pictorial landscape design area than painted stones or sheared evergreens. Therefore, they should be placed by themselves at one side, where they do not interfere with the general design of the place.



III. Cucurbits, — Gourds, Pumpkins, Squashes. — 1, The native wild Okeechobee gourd, of the Florida Everglades, *Cucurbita okeechobeensis.* 2, The native wild gourd of Texas, *Cucurbita texana.* 3–8, forms of *Cucurbita Pepo*: 3 Orange gourd, 4 Pear gourd, 5 right field pumpkins, 6 below left striped gourd, 7 a white bush type, 8 summer crookneck. 9, Cushaw *Cucurbita moschata.* 10–12, *Cucurbita maxima*: 10 Golden Hubbard squash, 11 Bay State squash, 12 above Small Chinese squash. 13, Malabar gourd, *Cucurbita ficifolia*

In public parks they make a very useful attraction when set off by themselves, the same as topiary work or other specialties.

Bold subtropical effects can be produced by planting in the open such subjects as palms, bananas, crotons, araucarias, caladiums and cannas as well as by castor-beans and other quick growers. Plants like bananas and palms, which are kept normally in pots, would better be left in the pots and plunged to the rims rather than turned out directly into the ground. To attain quick and continuous effects, it is advisable to set the plants rather close. As these plants are likely to be injured by strong winds, it is well to have subtropical beds in a somewhat protected place. Care must be taken to provide good water supply, for the effects are conditioned largely on luxurious growth and clean foliage.

BEDSTRAW: *Galium.*

BEECH: *Fagus.* **Australian:** *Eucalyptus polyanthemos.* **Blue:** *Carpinus caroliniana.*

BEEFWOOD: *Casuarina.*

BEET: *Beta.*

BEFARIA (*Bejaria*). *Ericaceæ.* Evergreen shrubs with alternate entire lvs. and white, yellow or red fls. in terminal racemes or corymbs; native Fla., Mex., S. Amer. and one species sometimes planted in Fla.

racemosa. TAR-FLOWER. To 6 ft.: lvs. oval or oblong, to 2 in. long, leathery: fls. white, 2 in. across, in showy racemes to 8 in. long. S. Ga., Fla., in sandy soil and low places.

BEGGARWEED: *Desmodium purpureum.*

BEGONIA. *Begoniaceæ.* A great trop. genus, around the world, comprising subjects ornamental for foliage, habit and bloom: sappy or succulent herbs or herb-like shrubs; a few of them are annuals: lvs. alternate, often large and colored or illustrated, usually oblique or lop-sided: fls. monœcious, white, pink, red, yellow, the ovary inferior and usually similarly colored. Begonias have given rise, under cult., to numberless forms and hybrids and many of them bear Latin names as if they were species, thus adding to the confusion of the nomenclature. Present-day florists begonias are mostly of the *B. semperflorens* relationship. The following species are per. unless otherwise stated.

Begonias are all tender plants, impatient also of dry and droughty conditions. They are glasshouse or lathhouse or window-garden subjects, requiring protection from burning sun, although many of the kinds are useful for bedding-out in protected areas. Three main horticultural classes may be recognized: the fibrous-rooted (or rootstock very small, if any), mostly tall and branching; the rhizomatous, with the stems or rootstocks running on the surface of the ground and the plants usually without erect branching stems, comprising species with conspicuously heavy ornamental foliage; the tuberous-rooted. *B. socotrana* is bulbous. The lines between these divisions are often more or less indefinite. The stem-bearing fibrous-rooted kinds grow readily from cuttings of the firm half-ripened wood, and rhizomatous species by division of the rootstocks. All the species are readily raised from seeds under cover; the heavy-leaved kinds propagate from leaf-cuttings, as the rex varieties. The tuberous kinds, which are summer bloomers, are grown mostly from seeds although the tuber may be divided; the tubers rest in winter. Tubers usually produce their best bloom two years or seasons from seed, although they may be dried off when flowers are past and growth is fully mature and used over again for several years. Seeds of begonias are small and they must be covered lightly and always treated with care in a protected seed-bed. The fibrous-rooted branching kinds contain the winter bloomers although many of them also bear colored and attractive leaves; it is well to keep fresh plants of them coming on each year.

acuminata: *B. acutifolia.*

acutifolia (*B. acuminata*). Fibrous: subshrubby to 3 or 4 ft.: lvs. oblong to ovate-acuminate, 2–3 in. long, serrate: fls. white, about 1 in. across, 3–5 on a peduncle. Jamaica.

alba perfecta: trade name for a tall fibrous-rooted plant with white fls.

alba scandens: see *B. scandens.*

albo-picta. Fibrous: shrubby, branched, compact: lvs. elliptic-lanceolate, not large, glossy-green and silvery-spotted: fls. rather small, greenish-white. Brazil.

angularis (*B. zebrina*). Fibrous: plant smooth, shrubby, to 8 ft.: lvs. long ovate-acuminate, green and glossy above with white veins, tinged reddish underneath: fls. white, ⅔ in. across, in large clusters. Brazil.

argenteo-guttata. Fibrous: strong and branching, 2–4 ft., glabrous: lvs. ovate-acuminate, 4–6 in. long, angled or toothed, white-speckled: fls. white tinged pink, in axillary clusters. Cultigen; supposed hybrid.

argyrostigma: *B. maculata.*

ascotiensis. Fibrous: lvs. ovate, 2 in. long, dentate, brown with green margin: fls. bright red, long-peduncled. Cultigen; supposed to be *B. fuchsioides* × *B. semperflorens.*

boliviensis. Tuberous: st. 2–3 ft. high, somewhat hairy, becoming more or less drooping: lvs. lanceolate to narrow-ovate, acuminate, serrate, 3–5 in. long: fls. cinnabar-scarlet, fuchsia-like. Bolivia.—Has entered into some of the garden tuberous begonias (*B. tuberhybrida*).

Bowringiana: *B. laciniata.*

Bunchii: see *B. Feastii.*

carminata. Fibrous: rather tall, branching: lvs. ovate-acuminate, deeply toothed but not lobed, green: fls. in hanging clusters, rose-scarlet. Recorded as a cross between *B. coccinea* and *B. Dregei.*

caroliniæfolia. Fibrous: st. thick and fleshy: lvs. palmate, divided into 6–8 long ovate stalked lfts.: fls. small and pink, on long peduncles. Mex.

Carrierei: derivative from *B. semperflorens.*

Clarkei. Tuberous: st. erect to 2 ft., fleshy, puberulent: lvs. cordate-ovate, serrate: fls. large and bright red, in pendulous racemes. Bolivia at high altitudes.—Has contributed to the race of hort. tuberous begonias (*B. tuberhybrida*).

coccinea (*B. rubra*). Fibrous: sts. glabrous, becoming 3–4 ft., branching: lvs. thick, oblong to ovate, 4–6 in. long, reddish underneath: fls. large, wax-like and coral-red, in drooping clusters. Brazil.—Has given rise by variation and hybridization to many good forms, as Lucerna, President Carnot.

conchæfolia (*B. Warscewiczii*). Rhizomatous: lvs. ovate-cordate, 4–6 in. long, basal lobes overlapping, reddish and hairy underneath: fls. pink to nearly white, fragrant, on long peduncles. Cent. Amer.

corallina. Fibrous: related to *B. maculata* or a form of it, very free-flowering; 8–10 ft., needing support: lvs. cordate-lanceolate, glossy-green: fls. coral-red, in drooping long clusters. Cultigen.—The name is also applied to a form of *B. coccinea.*

crispa: *B. manicata* var.; also a form of tuberous begonia.

cypræa: a form of *B. metallica.*

Davisii. Tuberous, acaulescent: lvs. ovate-cordate, thin-hairy, red underneath: fls. bright red, as well as peduncles. Peru.—Has contributed to the garden tuberous begonias (*B. tuberhybrida*).

decora: hort. name for a tall fibrous-rooted begonia, with white odorous fls.

diadema. Fibrous: sts. 2 ft., fleshy: lvs. deeply parted, maple-like, dentate, green blotched white: fls. very small, pink. Borneo.

dichotoma. Fibrous: upright, 2–3 ft., glabrous, st. thick: lvs. nearly orbicular to ovate, 3–12 in. long, serrulate and angled, bright green: fls. white, small, in long-peduncled clusters. Venezuela.

Digwilliana. Fibrous: nearly or quite erect, of intermediate stature: lvs. elliptic, 2–4 in. long, serrate, dark rich green: fls. rosy-scarlet, drooping. Cultigen; probably a hybrid from *B. fuchsioides*.

domingensis. Subshrubby but low, with hard glabrous branches and hairy branchlets: lvs. small, ovate-acute, somewhat cordate and lobed, 1 in. or so long, glabrous above and hairy on nerves underneath: fls. white, small, in close cymes. Hispaniola.

Dregei. Tuberous or semi-tuberous: sts. ann. from the tuber, succulent, red, 1–3 ft.: lvs. ovate or rhombic, about 3 in. long, angled and more or less lobed, red-ribbed underneath: fls. few and white, on axillary peduncles. S. Afr. Var. **Macbethii** (*B. Macbethii*) is mostly smaller and more slender, 1–1½ ft. high: lvs. smaller, deeply notched-lobed: fls. smaller. Probably a cultigen.

Duchartrei. Fibrous: st. branched and hairy, 2–3 ft. and more: lvs. ovate-lanceolate, long-acuminate, 5–8 in. long, dentate, reddish underneath: fls. large, waxy-white and with red hairs, in long-stemmed compact clusters. Cultigen; apparently hybrid from *B. Scharffiana*.

Erfordii. Fibrous: dwarf and bushy, to 1½ ft.: fls. rose-carmine. Hybrid of *B. Schmidtiana* and a form of *B. semperflorens*.

Evansiana. Tuberous: glabrous, branching, sts. to 2 ft., deciduous: lvs. ovate, acute and subcordate, lobed and denticulate, red underneath: fls. large, flesh-color. China, Japan.—Stands some frost; propagates by axillary bulblets.

Feastii. Rhizomatous: lvs. nearly orbicular, thick, red underneath, hairy on edges: fls. light pink, long-peduncled. Hybrid of *B. manicata* and *B. hydrocotylifolia*.—A form with lf.-margins crested and frilled is *B. Bunchii*.

fimbriata: reported as a tuberous begonia with fringed petals.

floribunda: *B. multiflora*.

foliosa. Fibrous: small smooth semi-shrubby very leafy plant to 1½ ft.: lvs. about ½ in. long, distichous on short shaggy branchlets, notch-lobed: fls. 1–3 together on slender axillary peduncles, white tinged rose, about ½ in. across. Colombia.—Good basket and conservatory plant.

Franconis. Ann., pubescent, erect, to 6 in.: lvs. small, unequally ovate, subcordate, to 2 in. long, crenate and ciliate, 7-nerved: fls. white or pinkish, axillary and few. Mex.

Frœbelii. Tuberous: lvs. cordate-acuminate, with fleshy purplish hairs: fls. bright scarlet, large, in tall branching drooping clusters (see *B. tuberhybrida*). Ecuador.

fuchsioides. Fibrous but with very short rootstock: st. slender, 2–3 ft., branchlets shaggy: lvs. ovate and lop-sided, to 1½ in. long, serrulate: fls. fuchsia-like, scarlet, ½–¾ in. across. Mex.—Good conservatory plant.

gigantea: *B. semperflorens* var. Another *B. gigantea* is a rhizomatous plant, probably of garden origin, with st. 2–3 ft. high: lvs. long-acuminate, to 1 ft. long: fls. many and small, white or pale pink.

Gilsoni. Fibrous: st. shrubby, to 2 ft., more or less procumbent: lvs. large, lobed, pointed and somewhat fluted, dark green: fls. double or crested, light pink, on long erect peduncles. Cultigen.

glandulifera. To 2 ft., with a fleshy creeping rooting st.: lvs. obliquely cordate-ovate, to 6 in. long, serrulate, sparsely hairy underneath and on margins: fls. white, in long-stalked open clusters. W. Indies.

glaucophylla. Rhizomatous: sts. glabrous, long and drooping or climbing on rafters: lvs. ovate and wavy, 3 in. long, glaucous, white-spotted above, purple underneath: fls. brick-red, to 1 in. across, in clusters. Brazil.—Sometimes erroneously called *B. scandens*.

gracilis. Tuberous: st. erect, mostly unbranched, smooth: lvs. heart-shaped, lobed and denticulate: fls. pink, in summer, on short axillary peduncles: bulblets in the lf.-axils may be used for propagation. Mex.

Gregoriana: a listed name.

gunneræfolia. Fibrous: tree-like but little if at all branched, sts. scaly and more or less woolly: lvs. large, to 16 in. across, nearly orbicular, dentate-notched or with small angle-lobes: fls. very small, whitish, in axillary clusters. Colombia.

Haageana. Fibrous: plant red-hairy, st. shrubby, 2–4 ft.: lvs. ovate-cordate, to 10 in. long, wavy, nerves red above: fls. rose-pink, in large hanging showy clusters. Brazil.—See *B. Scharffiana*.

heracleifolia. Rhizomatous, hairy: lvs. long-stalked, orbicular, to 1 ft. or more across, with 5–9 deep narrow dentate lobes that extend to the middle of the blade or beyond: fls. white or rose, small, to 1 in. across, on peduncles 2–4 ft. high. Mex.

humilis. Ann. to 15 in., erect and branching: lvs. thin, narrow-ovate and pointed, 2 in. long, oblique and subcordate, sparsely hairy, dentate and serrulate: fls. white, small, in open long-stalked clusters. Trinidad.

hydrocotylifolia. Rhizomatous, hairy: lvs. roundish-cordate, repand and not lobed, short-stalked: fls. rose-colored, small but many, on peduncle to 1½ ft. high. Mex.

illustrata: trade name for a rhizomatous plant with round unlobed lvs. and sunken green markings along veins: probably a form of *B. imperialis*.

imperialis. Rhizomatous very hairy condensed low plant: lvs. cordate-ovate, 2–6 in. long, serrulate, green above and lighter along the veins, brown-green underneath: fls. white, about ½ in. across, on scapes or peduncles not exceeding the foliage. Mex.—Commonly grown as Otto Foerster. In var. **smaragdina** the lvs. are wholly bright green.

incana (*B. peltata* of cult.). Fibrous, scurfy-tomentose on stalks and foliage: st. 1–2 ft. tall and mostly simple: lvs. broad-ovate to nearly orbicular, peltate, 4–9 in. long, entire or repand: fls. white, 1 in. across, in clusters on long peduncles. Brazil.

incarnata. Fibrous: st. branching, erect, 2–3 ft.: lvs. oblong to ovate, 4–10 in. long and long-pointed, notched and semi-lobed, reddish-green underneath, often more or less spotted or feathered above: fls. rose-colored, to 1½ in. across, in hanging clusters. Mex.

Ingramii. Fibrous: to 3 ft., with horizontal blooming side branches: lvs. small, lance-ovate, serrate, green, tinted red in the sun: fls. rose, large for the group, as the plant is a hybrid of *B. nitida* and *B. fuchsioides*; free-blooming.

laciniata (*B. Bowringiana*). Fibrous: sts. to 2 ft.: lvs. broad cordate-ovate, 5–8 in. long, glabrous or nearly so except on edges, angled to sharp-lobed to laciniate, purplish-black above and broad green band between margin and rib: fls. white, about 2 in. across, few on a long peduncle. China.

Lesoudsii: reported as a form of Rex begonia.

Lindleyana. Erect, st. fleshy, red-hairy: lvs. ovate-acute, peltate, to 6 in. long, toothed and somewhat lobed: fls. in branching clusters, white. Guatemala.

Lloydii. Tuberous: drooping habit: fls. single and double, white and colored. Hort. name.

lobata. Fibrous: lvs. pointed, spotted: fls. white. Hort. name.

Lucerna: form of *B. coccinea*, or hybrid, with white-spotted foliage.

luxurians. Fibrous: sts., stalks and lvs. hairy: lvs. palmately compound, lfts. 7–17, lanceolate and serrate and 3–6 in. long and about 1 in. broad, upper surface reddish, under surface green: fls. small, cream-color, in long-peduncled clusters. Chile.

Macbethii: *B. Dregei* var.

macrophylla: *B. nelumbiifolia*.

maculata (*B. argyrostigma*). Fibrous, plant smooth: sts. branched, 2–5 or more ft.: lvs. oblong to oblong-ovate, thick, 4–8 in. long, obtuse or nearly so, undulate, green and with circular white dots above, red underneath: fls. pale rose to white, about 1 in. across, in hanging clusters. Brazil.

magnifica: hort. name for a form of *B. Rex-cultorum* as well as for one of the *B. semperflorens* type; the true *B. magnifica* of Colombia, a smooth and shining suffrutescent rhizomatous species, is probably not in cult. with us.

manicata. Rhizomatous: plant mostly glabrous except on lf.-margins and ribs: lvs. short-ovate, 4-8 in. long, fleshy, sinuate-dentate, shining green above, reddish underneath: fls. about ½ in. long, pink, the peduncles exceeding the foliage. Mex.—Runs into cristate and spotted forms under cult.; see also *B. Feastii*.

Margaritæ. Fibrous: sts. 1–2 ft. high, purple and hairy: lvs. ovate-acuminate, sinuate-dentate, green and purplish above, red underneath: fls. large, rose-colored, in clusters. Cultigen; *B. metallica* is said to be one parent.

Martiana: form of *B. gracilis.*

metallica. Fibrous: sts. erect and shaggy, to 4 ft.: lvs. ovate, to 6 in. long, angled or lobed, margins sinuate-serrate, green and metallic-tinted above, lighter underneath: fls. blush-white to light rose, to 1½ in. across, in peduncled clusters. Brazil.

multiflora (*B. floribunda*). Fibrous, tall, resistant: a form of *B. fuchsioides* or a derivative: fls. delicate pink.

narcissiflora: hort. name for a class of tuberous begonias with fls. shaped like a single daffodil, yellow, pink and red.

nelumbiifolia (*B. macrophylla*). Rhizomatous: lvs. round-ovate to nearly orbicular, to 18 in. long, peltate, not lobed, serrulate and ciliate, short-pointed, green both surfaces, mostly hairy on nerves: fls. white or pinkish, ½ in. or less across, on tall peduncle. Mex.

nigricans (*B. subpeltata nigricans* of hort. lists). Fibrous: erect, branched, 2–3 ft.: lvs, ovate, acuminate, to 9 in. long, angled-toothed, bristly-serrate, silvery-green and somewhat marked above with darker areas, red underneath, hairs often dark red: fls. rose, about 1 in. across, in peduncled clusters. Cultigen.

nitida. Fibrous, glabrous: sts. branched, 3–5 ft.: lvs. reniform-ovate, 4–6 in. long, crenate-dentate, green and glossy: fls. pink or rose, to 1½ in. across, in large peduncled clusters. Jamaica. Var. **odorata alba** has smaller sweet-scented fls.

odorata: *B. nitida* var.

olbia. Fibrous: st. short and erect, mostly branched: lvs. ovate, to 5 in. long, dentate and somewhat angle-lobed, hairy and bronzy-green and white-dotted above, red underneath: fls. white, in short drooping axillary clusters. Brazil.

palmaris. Fibrous: much like *B. olbia* but lvs. not spotted and reniform-ovate, to 10 in. long and usually with about 3 triangular-acute lobes: fls. white, with serrate petals, more or less hidden in the foliage. Brazil.

palmata: hort. name for a plant with cane-like growth and large palmate silver-striped lvs.

palmifolia: hort. name for a plant with large lobed green lvs. and white fls. in clusters.

Pearcei. Tuberous: sts. branched, 1 ft. high: lvs. broad-ovate and cordate, acuminate, toothed, glabrous and green above, tomentose and pale red underneath: fls. bright yellow, large, in axillary clusters. Bolivia.—It has intro. the yellow color into the hort. tuberous begonias (*B. tuberhybrida*).

peltata: *B. incana.*

phyllomaniaca. Fibrous: sts. erect, branching, producing, as do the lvs., many buds and leafy growths: lvs. narrowly cordate-ovate and long-acuminate, to 7 in. long, side-lobed and toothed, green both surfaces: fls. pale pink, ¾ in. across, in hanging clusters. Brazil.

picta: hort. name for a fibrous-rooted begonia with small narrow lvs. spotted white and white fls. (*picta alba*); *picta rosea* has rose-colored fls. and often spotted foliage: both are probably forms of *B. coccinea.*

prunifolia: hort. name for a plant of the *Scharffiana* type, with foliage plum-colored underneath: fibrous: sts. branched, hairy: lvs. to 6 in. long, oblique-ovate, red-hairy on veins underneath: fls. white, in large pendent clusters.

Rajah. Rhizomatous: lvs. angular-orbicular, papery, serrate, smooth above and with green ribs and brown-red intermediate areas, setose on veins underneath: fls. pink, small, on peduncles about as high as foliage. Malaya.

Rex. Rhizomatous: lvs. ovate, to 12 in. long, hanging on the hairy petiole, sinuate-dentate, reddish underneath and hairy on veins, metallic-green above with silvery zone about 1 in. wide midway between margin and outside of which is purplish: fls. pale rose, about 2 in. across, above the foliage. Assam.—Little known in hort.

Rex-cultorum. The Rex begonias of hort., with variously marked, blotched or marbled not lobed lvs. that are sometimes helix-like or spiralled in center. Derivatives from *B. Rex* through variation or hybridization.—Known sometimes as "beefsteak-geranium."

Richardsoni: hort. name for a small tuberous begonia, a form of *B. Dregei* with more deeply cut or laciniate lvs. than the var. *Macbethii*: fls. white.

ricinifolia. Hybrid derivative from *B. heracleifolia*: rhizomatous: lvs. orbicular in outline, to 1 ft. and more across, the lobes usually not extending more than about one-third the depth of the blade, bronzy-green: fls. rose-pink, to 1 in. across, on tall peduncles.

robusta: hort. name for a fibrous-rooted plant of intermediate growth, probably an offshoot of *B. fuchsioides*: sts. red, reproduced continuously from the root: lvs. oblong- acuminate, lop-sided, to 3 in. long, dentate, reddish: fls. pink to red, the staminate to 1½ in. or more across.

rosæflora. Tuberous: lvs. orbicular or reniform, 2–6 in. across, lobed, green but red-edged: fls. rose-red, 2 in. across. Peru, at high altitudes.—Has entered into the development of garden tuberous begonias (*B. tuberhybrida*).

Rossi: hort. name for a fibrous-rooted plant with bronzy foliage and light pink fls.

rubella: *B. rubellina.*

rubellina (*B. rubella* of hort. lists). Rhizomatous: lvs. broad-ovate, shallowly lobed and pointed, to 8 in. long, dull green sprinkled with dark brown spots, petiole shaggy: fls. pink, about 1 in. across, long-peduncled. Cultigen.

rubra: *B. coccinea.*

Sandersonii. Fibrous: st. glabrous, nearly or quite erect, the plant low and bushy: lvs. ovate-acuminate, to 3 or 4 in. long, doubly serrate, dark green: fls. bright scarlet, 1 in. or less long, drooping. Cultigen; probably a hybrid derivative from *B. fuchsioides.*

sanguinea. Fibrous: plant smooth and shining throughout, low, sts. several, 1½ ft. or more, red, leaf-bearing toward base: lvs. cordate-ovate, slightly peltate, to 6 in. long, entire, abruptly pointed, green above and blood-red underneath: fls. small, white, staminate to ¾ in. across, mostly above the foliage. Brazil.

scandens: a name commonly applied to the more scandent forms of *B. glaucophylla.* The true *B. scandens* has crenate-dentate lvs. and small white fls., from trop. Amer.; perhaps represented in the plant listed as *B. alba scandens.*

Scharffiana. Fibrous: plant 1–3 ft., robust, hairy: lvs. broad-ovate, to 8 in. long, pointed, olive-green above and bright red underneath: fls. large, waxy-white with conspicuous red hairs, in heavy long-peduncled clusters. Brazil.—The plant once prominently figured as *B. Scharffi* is *B. Haageana.*

Schmidtiana. Fibrous: plant usually 1 ft. or less high, sts. hairy and red-tinged: lvs. ovate- acuminate, to 3 in. long, angled or shallow-lobed, dentate, reddish underneath: fls. white tinted rose, small. Brazil.

Schnitzeri: hort. name for a low-branching semi-tuberous plant, perhaps a form of *B. Dregei*; fls. orange.

semperflorens. Fibrous: variable plant, glabrous and more or less succulent, sts. little branching, to 3 ft. high: lvs. ovate to oval, 2–4 in. across, finely serrulate and ciliate, glossy-green and commonly red-tinged on ribs: fls. rose-red to nearly white, 1 in. across, in axillary clusters. Brazil.—In its vars. and derivatives, some of them hybrids, this plant is the prevailing type of florists and bedding begonias; some of the well-known offshoots are Carrierei, Chatelaine, Cincinnati, Erfordii, Gigantea Rosea, Gloire de Louveciennes, Melior, Triomphe de Lorraine, Vernon. See also *B. socotrana.*

sempervirens: probably an error for *semperflorens.*

smaragdina: *B. imperialis* var.

Snitcheri: apparently a *B. Rex-cultorum* offshoot.

socotrana. Bulbous: sts. ann., erect, to 1 ft., somewhat branched: lvs. orbicular, to 6 or 7 in. across, centrally peltate, margins rolled or scalloped: fls. rose-pink, to 2 in. and more across, in a long-peduncled small forking cluster. Socotra, Indian Ocean.—It has entered into garden kinds, largely through hybridization with *B. semperflorens*, in such forms as Cincinnati, Gloire de Lorraine and Gloire de Sceaux.

speculata. Rhizomatous: lvs. broad-ovate to nearly orbicular, acuminate, to 8 in. across, triangular-lobed to one-quarter or one-half depth of blade, dull gray speckled gray above and reddish underneath: fls. pink-white, about 1 in. across, on long peduncle. Cultigen.

subpeltata: *B. nigricans.*

Sunderbruchii. Rhizomatous: a form of *B. heracleifolia* with palmate bronze-green lvs. bearing silver bands along the nerves and purple underneath: fls. pinkish.

Templinii. Recorded as sport from *B. phyllomaniaca*: lvs. with ruffled and fringed margins and blotched white, yellow and reddish: fls. pink.

Teuscheri. Fibrous: st. strong and erect, branched, to 6 ft. high: lvs. large and fleshy, ovate-lanceolate, serrate, bright green with grayish blotches or dots, red underneath: fls. large, bright red, in axillary clusters. Malaya.

Thurstonii. Fibrous: st. 2 ft. tall, smooth and glossy: lvs. orbicular-acuminate, red underneath: fls. pink, small, in erect clusters. Cultigen; reputed hybrid between *B. metallica* and *B. sanguinea.*

tuberhybrida: the hort. tuberous begonias, a class name, the plants of various habit and color of bloom, the issue of such species as *B. boliviensis, Clarkei, Davisii, Pearcei, rosæflora, Veitchii,* with perhaps *B. Frœbelii, gracilis* and others; some of them have low branching sts. and others only scapes.

ulmifolia. Fibrous: sts. branching, shaggy-hairy, to 3 ft.: lvs. ovate-oblong and elm-like, to 5 in. long, double-serrate, somewhat hairy: fls. small, white, ½ in. or more across, many in peduncled clusters. Colombia.

valida: a listed name.

Veitchii. Tuberous, one of the elements in the garden tuberous begonias (*B. tuberhybrida*): st. very short or practically none: lvs. nearly orbicular, lobed and cut, green: fls. cinnabar-red, 2½ in. across. Peru, high altitudes.

Verschaffeltiana (*Verschaffeltii*). Rhizomatous: lvs. very large, ovate-acuminate, lobed, green: fls. rose, in large clusters. Cultigen; reported hybrid of *B. manicata* and *B. caroliniæfolia.*

vitifolia. Fibrous: strong, to 4 ft.: lvs. large and grape-like, orbicular to reniform, lobed, serrate, pubescent, green above, rusty underneath: fls. small and white. Brazil.

Warscewiczii: *B. conchæfolia.*

weltoniensis. Tuberous or semi-tuberous: st. reddish, to 3 ft.: lvs. small, ovate-acuminate, to 2 in. across, dentate, green and smooth: fls. pink (white in var. *alba*), many on short peduncles. Cultigen; hybrid from *B. Dregei.*

Wettsteinii: hort. name for a fibrous-rooted begonia of intermediate stature, wavy green lvs. and bunches of brilliant red fls.

xanthina. Rhizomatous: habit of *B. Rex*: lvs. glossy-green above and purplish underneath: fls. bright yellow, tinged red outside, large. India.

zebrina: *B. angularis.*

BEGONIACEÆ. BEGONIA FAMILY. Some 500 species of per. and a few ann. herbs, sometimes shrub-like, mostly more or less succulent, affording many subjects prized for ornamental foliage and bloom. Some of them are somewhat tree-form although not many ft. high, others are lopping or scandent. Many of them are tuberous and not in foliage all the year. Nearly all the species are in the great genus Begonia. The other three genera (Begoniella, Hillebrandia, Symbegonia) are of very few species and not in general cult.

BEJARIA: *Befaria.*

BELAMCANDA. *Iridaceæ.* One Chinese and Japanese per. with stout rootstocks, often planted in gardens and of easy cult. in sunny locations in rich sandy loam; prized for its fls. and also for the ornamental black seeds. Propagated by seeds or division. **B. chinensis** (*Gemmingia chinensis. Pardanthus chinensis* and *sinensis*). BLACKBERRY-LILY. To 4 ft.: lvs. borne on st., to 10 in. long and 1 in. wide: fls. orange spotted with red, to 2 in. across: caps splitting in autumn, leaving a column of seeds resembling a blackberry. Nat. in U. S., and hardy N.

BELIS: *Cunninghamia.*

BELLADONNA: *Atropa Belladonna.*

BELLEVALIA: *Hyacinthus romanus.*

BELLFLOWER: *Campanula.* Chilean: *Lapageria rosea.* Giant: *Ostrowskia magnifica.*

BELLIDIASTRUM MICHELII: *Aster Bellidiastrum.*

BELLIS. *Compositæ.* Herbaceous annuals and perennials, growing in tufts or with branching sts.: lvs. alternate or all basal: heads solitary, the rays white or rose, disk-fls. yellow; pappus mostly lacking. Native in Eu. and the Medit. region.

English daisies are easily raised from seed sown in the spring for bloom the following year. The more special varieties are propagated by division in cool weather as the seeds do not reproduce true to type. The plants are favorites for edging and for colonizing in lawns; they should have fertile moist soil.

alpina: a synonym of *B. perennis.*

minutus: presumably *Bellium minutum.*

perennis. TRUE or ENGLISH DAISY. Per. to 6 in.: lvs. spatulate or obovate, in basal tufts: heads to 2 in. across, white or rose, in spring and early summer. W. Eu. A double form is var. **ranunculiflora.**

rotundifolia. Lvs. ovate or broader, often subcordate, long-stalked, coarsely toothed: heads to 1¼ in. across, with mostly white or in var. **cærulescens** blue rays. Algeria, Morocco.

BELLIUM. *Compositæ.* Small herbs with basal tufted lvs. and solitary heads of fls. with white rays and light yellow disk; pappus of bristles and scales; native in Medit. region and suitable for the rock-garden and similar places.

bellidioides. Ann. to 4 in., stoloniferous: lvs. spatulate.

minutum. Ann. to 3 in.: lvs. narrow-spatulate: heads ½ in. across.

BELLOTA: *Cryptocarya.*

BELL-VINE, PURPLE: *Rhodochiton volubile.*

BELLWORT: *Uvularia.*

BELOPERONE. *Acanthaceæ.* Trop. American herbs with opposite entire lvs. and tubular 2-lipped fls. in racemes or spikes with overlapping bracts; one species planted out in S. U. S. and also grown under glass as a pot-plant.

guttata. To 1½ ft.: lvs. ovate, to 2½ in. long, hairy: fls. white spotted with purple, 1¼ in. long, borne beneath broad reddish-brown imbricated showy bracts ¾ in. long, in dense spikes to 3½ in. long. Mex.

BELVEDERE: *Kochia scoparia.*

BENE: *Sesamum.*

BENINCASA. *Cucurbitaceæ.* Ann. hairy pumpkin-like tendriliferous vine grown, particularly by Chinese, for the large fr. which is used in the making of preserves and sweet pickles and said to be eaten raw in warm countries; probably only one species. Cult. as for pumpkin and squash.

cerifera: *B. hispida.*

hispida (*B. cerifera*). WAX or WHITE GOURD (of India). ZIT-KWA. TUNKA. CHINESE WATERMELON and PRESERVING MELON. Long-running vine: lvs. broadly cordate-ovate, angled or somewhat lobed and toothed: fls. yellow and veiny, corolla nearly rotate and to 3 in. across: fr. oblong to cylindrical, to 16 in. long, hairy and white-waxy, flesh white; seeds oblong-pointed, white, ⅓–½ in. long. E. Asia.

BENTHAMIA: *Cornus.*

BENZOIN. *Lauraceæ.* Aromatic trees and shrubs native in Asia and N. Amer., with alternate lvs., unisexual or bisexual little fls. in axillary clusters, and fr. a drupe. Propagated by seeds sown as soon as ripe, by layers, and by cuttings of green wood under glass.

æstivale (*B. odoriferum. Lindera Benzoin*). SPICE-BUSH. Deciduous shrub to 15 ft.: lvs. oblong-obovate, to 5 in. long, turning yellow in autumn: fls. before the lvs. in early spring, greenish-yellow, small: fr. scarlet. Moist places and lowlands, Me. to Fla. and Tex.

grandifolium. Evergreen shrub or tree to 60 ft.: lvs. oblanceolate, to 8 in. long, shining: fls. yellow: fr. black. China.

obtusilobum. Deciduous shrub or tree to 30 ft.: lvs. broad-ovate, to 5 in. long, entire or 3-lobed at apex: fls. yellow: fr. black. Japan, Korea, China.

odoriferum: *B. æstivale.*

BERBERIDACEÆ. BARBERRY FAMILY. Ten genera of herbs and shrubs mostly in the north temp. zone, having alternate lvs., bisexual fls. solitary or in racemes, with sepals and petals usually imbricated in 2 rows, stamens as many as petals, superior 1-celled ovary, and fr. a berry or pod. Among the ornamental genera are Aceranthus, Achlys, Berberis, Caulophyllum, Diphylleia, Epimedium, Jeffersonia, Mahoberberis, Mahonia, Nandina, Podophyllum, Vancouveria, all plants for outdoor use.

BERBERIDOPSIS. *Flacourtiaceæ.* One partially climbing shrub from Chile, grown out-of-doors in S. Calif. Propagated by seeds, cuttings of green wood in spring, or layers in autumn. **B. corallina.** Lvs. alternate, cordate-ovate, to 3 in. long, coarsely sharp-toothed: fls. crimson, ⅓ in. long, in terminal many-fld. racemes: fr. a berry.

BERBERIS. BARBERRY. *Berberidaceæ.* Spiny shrubs with yellow wood, simple deciduous or evergreen lvs., turning bright colors in autumn, yellow fls., and fr. a red, yellow or black berry; native in northern hemisphere and also S. Amer.; the deciduous species are mostly hardy in the northern and central states and in S. Ont.

Barberries are widely grown for hedges and as specimen bushes for their general beauty and for the attractive flowers in spring and the fruits in autumn and winter. The evergreen species are not hardy in the northern states. The evergreen kinds do best in moist well-drained light loam, but the deciduous species may have drier soils. They are all of easy cultivation. Propagated by seeds which should be separated from the pulp, sown in autumn and they should germinate the following spring; by layers, cuttings of young wood in early June planted in sand in a shaded hotbed, and rare kinds by grafting on common stocks; sometimes suckers may be removed from the parent plant.

aggregata (*B. Geraldii*). SALMON B. Deciduous, to 10 ft., spines 3-parted: lvs. to 1 in. long, sharp-toothed: fls. pale yellow, in sessile panicles to 1½ in. long: fr. red, pruinose. W. China. Var. **Prattii** (*B. Prattii*) has longer often entire lvs. and longer panicles. Var. **recurvata** has lvs. often entire and panicles to 4 in. long.

amurensis. Deciduous, to 10 ft., spines 3-parted: lvs. to 3 in. long, densely ciliate-toothed: fls. in drooping racemes to 4 in. long: fr. bright red. N. E. Asia. Var. **japonica** (*B. Regeliana, B. Hakodate*) has broader lvs. and shorter racemes. Japan, Korea.

Aquifolium: *Mahonia Aquifolium.*

aristata (*B. floribunda. B. petiolaris*). Deciduous, to 10 ft., spines simple or 3-parted: lvs. to 2¼ in. long, spiny-toothed or entire: fls. bright yellow, in racemes to 4 in. long: fr. red or purple, pruinose. Himalayas.

asiatica. HIMALAYAN B. Evergreen, to 10 ft., with small spines: lvs. to 3 in. long, toothed or entire, whitish beneath: fls. in racemes to 2 in. long: fr. purple. Himalayas; adaptable far S.

atrocarpa. Evergreen, to 6 ft.: lvs. narrow, to 3 in. long, coarsely spiny-toothed: fls. in clusters of 6–12: fr. jet-black. W. China.

Bealei: *Mahonia Bealei.*

Bergmanniæ. Evergreen, to 6 ft.: lvs. to 1½ in. long, coarsely toothed: fls. in clusters: fr. black, pruinose on reddish stalks. W. China. Var. **acanthophylla** has longer lvs.

brachybotrys: the plant in cult. under this name is probably a form of *B. vulgaris.*

brevipaniculata. Deciduous. to 6 ft., spines 3-parted: lvs. to 1¼ in. long, entire or nearly so, glaucous beneath: fls. pale yellow, in short panicles: fr. red, pruinose. W. China.

buxifolia (*B. dulcis*). MAGELLAN B. Evergreen, to 10 ft., spines 3-parted or simple: lvs. to 1 in. long, entire: fls. orange-yellow, solitary: fr. dark purple. Chile. Var. **nana** is dwarf and compact, and var. **pygmæa** dwarf, tufted, unarmed.

canadensis. ALLEGHENY B. Deciduous, to 6 ft., spines 3-parted: lvs. to 2 in. long, toothed, grayish-white beneath: fls. bright yellow, in racemes to 1¾ in. long: fr. scarlet. Va. to Ga. and Mo.

cerasina: a name of uncertain botanical standing.

chilensis. Spines brown, 3-parted: lvs. shorter than spines, stiff and thick, broad-obovate to obovate-cuneate, coarsely spiny-toothed, glaucous underneath: fls. many, in nodding racemes: fr. globose, black, pruinose. Chile.

chinensis (*B. sinensis* of some. *B. serotina. B. spathulata*). Deciduous, to 10 ft., spines simple or 3-parted: lvs. to 1½ in. long, nearly entire, pale beneath: fls. in racemes to 3 in. long: fr. dark red. Caucasus.

congestiflora var. **hakeoides**: *B. hakeoides.*

cretica. Deciduous, to 3 ft. or procumbent, spines 3-parted: lvs. about ¾ in. long, entire: fls. in short 2–7-fld. racemes: fr. purple-black. Greece; not hardy N.

Darwinii. Evergreen, to 10 ft., spines 3–7-parted: lvs. to 1 in. long, spiny-toothed, glossy dark green above, paler beneath: fls. orange-yellow, in drooping racemes to 4 in. long: fr. dark purple. Chile; adaptable only far S. and Calif.

diaphana. KANSU B. Deciduous, to 6 ft., spines simple or 3-parted: lvs. to 1¼ in. long, toothed or entire, glaucous beneath: fls. bright yellow, solitary or in clusters of 2–5: fr. red, slightly pruinose. W. China.

dictyophylla. CHALKLEAF B. Deciduous, to 6 ft., spines 3-parted: lvs. to 1 in. long, entire or toothed, white beneath: fls. pale yellow, solitary: fr. red. China.

dictyota: a form of *Mahonia Aquifolium.*

Dielsiana. Deciduous, to 10 ft., spines simple or 3-parted: lvs. to 2 in. long, entire or toothed: fls. in racemes to 3 in. long: fr. bright red. W. China.

dulcis: *B. buxifolia*; also a form of *B. vulgaris.*

elegans: *B. Lycium.*

elegantissima: listed name.

emarginata. Hybrid between *B. vulgaris* and *B. sibirica*, with fls. in dense racemes and deep red frs.

empetrifolia. CROW B. Evergreen, to 2 ft., branches often prostrate, spines simple or 3-parted: lvs. linear, to ¾ in. long, entire, spiny-pointed: fls. golden-yellow, solitary or in 2's: fr. bluish-black. Chile.

fascicularis: *Mahonia pinnata.*

Fendleri. Deciduous, to 4 or 5 ft., with red-brown branchlets: lvs. obovate to oblanceolate, acute, to 1½ in. long, sometimes spinulose: fls. yellow tinged red outside, 6–10 in slender racemes. Colo., New Mex.

floribunda: *B. aristata.*

formosiana: unidentified hort. name.

Fortunei: *Mahonia Fortunei.*

Fremontii: *Mahonia Fremontii.*

fuchsioides: hort. name, probably a form of *B. vulgaris.*

Gagnepainii. Evergreen, to 6 ft., spines 3-parted: lvs. narrow-lanceolate, to 4 in. long, spiny-toothed, pale beneath: fls. bright yellow, in clusters: fr. bluish-black, pruinose. W. China.

Geraldii: *B. aggregata.*

Gilgiana. Deciduous, to 6 ft., spines 3-parted: lvs. to about 2 in. long, toothed, pubescent: fls. bright yellow, in racemes to 1 in. and more long: fr. deep red. China.

globularis: hort. name, probably a form of *B. vulgaris.*

hakeoides (*B. congestiflora* var. *hakeoides*). CHILEAN B. Evergreen, to 12 ft., spines small: lvs. nearly orbicular, to 1 in. long, spiny-toothed: fls. in dense clusters: fr. bluish-black. Chile.

Hakodate: *B. amurensis* var. *japonica.*

heterophylla. Half-evergreen, to 5 ft., spines 3–7-parted: lvs. to 1 in. long, entire or with large spiny teeth: fls. solitary: fr. black, pruinose. Chile.

heteropoda. TURKESTAN B. Deciduous, to 6 ft., spines simple or 3-parted or wanting: lvs. to 2 in. long, entire or finely toothed, bluish-green: fls. orange-yellow, in short racemes, fragrant: fr. black, pruinose. Turkestan.

Hookeri. Evergreen: lvs. to 3 in. long, spiny-toothed, white beneath: fls. clustered: fr. black-purple. Himalayas. Var. **viridis** is listed.

ilicifolia. HOLLY B. Evergreen, to 8 ft.: lvs. to 2 in. long, spiny-toothed at apex: fls. orange-yellow, in short racemes. S. Chile.—The plant cult. as *B. ilicifolia* is usually *Mahoberberis Neuberti* var. *latifolia.*

insignis. Evergreen, to 6 ft., spines few: lvs. to 5 in. long, spiny-toothed, glossy: fls. golden-yellow, in clusters: fr. black. Himalayas; hardy only far S.

Jacquini: *B. vulgaris.*

japonica: *B. Thunbergii* or *Mahonia Bealei;* see also *Mahonia japonica.*

Julianæ. WINTERGREEN B. Evergreen, to 6 ft., spines 3-parted: lvs. to 3 in. long, spiny-toothed: fls. in clusters: fr. bluish-black, pruinose. China.

Knightii: *B. xanthoxylon.*

koreana. Deciduous, to 6 ft., spines mostly simple: lvs. to 3 in. long, toothed, pale beneath: fls. in racemes 1 in. and more long: fr. bright red. Korea.

latifolia: *Mahoberberis Neuberti* var. *latifolia.*

Lawsoniana: hort. name probably belonging to *B. stenophylla.*

laxiflora. Hybrid between *B. vulgaris* and probably *B. chinensis*, with fls. in racemes to 4 in. long.

Liechtensteinii: *B. Potanini.*

Lycium (*B. elegans*). Half-evergreen, to 10 ft., spines 3-parted: lvs. to 2 in. long, entire or toothed: fls. bright yellow, usually in racemes to 4 in. long: fr. purple, pruinose. Himalayas; adaptable only far S.

macracantha. Hybrid between *B. aristata* and *B. vulgaris:* to 10 ft. or more: lvs. mostly obovate, somewhat spinose-serrate: racemes with 10–20 fls.

nepalensis: *Mahonia nepalensis.*

nervosa: *Mahonia nervosa.*

Neuberti: *Mahoberberis Neuberti.*

Nevinii: *Mahonia Nevinii.*

orthobotrys. Similar to *B. vulgaris*, but the fls. somewhat corymbose and differing in technical characters. Persia.

parvifolia. Half-evergreen, low, spines 3-parted: lvs. to ½ in. long, spiny-toothed or entire, pale beneath: fls. in dense clusters: fr. red, pruinose. W. China.

petiolaris: *B. aristata.*

pinnata: *Mahonia pinnata.*

Poiretii. Deciduous, to 6 ft., spines simple, small: lvs. to 1½ in. long, entire, bright green above, pale beneath: fls. bright yellow, in racemes: fr. bright red. N. China, Siberia.

Potanini (*B. Liechtensteinii*). Deciduous, spines simple or 3-parted: lvs. to 2½ in. long, spiny-toothed, white beneath: fls. in racemes to 1½ in. long: fr. red. W. China.

Prattii: *B. aggregata* var.

pruinosa. Evergreen, to 10 ft., spines 3-parted: lvs. to 2 in. long, spiny-toothed, glossy dark green above, white beneath: fls. in clusters: fr. bluish-black, pruinose. China.

Regeliana: *B. amurensis* var. *japonica.*

repens: *Mahonia repens.*

replicata. Evergreen, branchlets yellowish: lvs. to 1¼ in. long, margins revolute: fr. scarlet, turning black. China.

Sargentiana. Evergreen, to 6 ft., spines 3-parted: lvs. to 4 in. long, spiny-toothed, pale beneath: fls. in clusters: fr. bluish-black. China.

serotina: *B. chinensis.*

sibirica. Deciduous, to 2 ft., spines 3–11-parted: lvs. to 1 in. long, spiny-toothed: fls. solitary or in 2's, nodding: fr. red. Siberia.

Sieboldii. Deciduous, to 5 ft., spines 3-parted: lvs. to 2½ in. long, ciliate-toothed: fls. pale yellow, in few-fld. racemes: fr. bright red. Japan.

sinensis: *B. chinensis, B. Thunbergii.*

spathulata: *B. chinensis.*

Stapfiana: *B. Wilsonæ* var.

stenophylla. Hybrid between *B. Darwinii* and *B. empetrifolia*: lvs. narrow-lanceolate, to 1 in. long, revolute at margins, dark green above, pale beneath: fls. golden-yellow, in clusters: fr. black, pruinose.

subcaulialata: *B. Wilsonæ* var.

Swaseyi: *Mahonia Swaseyi.*

Thunbergii (*B. japonica. B. sinensis* of some). JAPANESE B. Deciduous, to 8 ft., spines mostly simple: lvs. variable, to 1¼ in. long, entire: fls. solitary or in clusters: fr. bright red. Japan; hardy and popular. Var. **atropurpurea** has bronzy-red foliage. Var. **lutea** has yellow frs. Var. **Maximowiczii** has acute rather than obtuse lvs. Vars. **minor** and **nana** are low forms.

triacanthophora. Evergreen, to 5 ft.: lvs. narrow, to 2 in. long, toothed, glaucous beneath: fls. whitish, in clusters: fr. blue-black. China.

trifoliolata: *Mahonia trifoliolata.*

Vernæ. Deciduous, to 6 ft., spines simple: lvs. variable, to 1 in. long, entire: fls. in dense racemes to 1½ in. long: fr. red. China.

verruculosa. Evergreen, to 3 ft., spines 3-parted: lvs. to 1 in. long, spiny-toothed, margins revolute, glossy dark green above, glaucous beneath: fls. golden-yellow, solitary or in 2's: fr. black, pruinose. W. China.

virescens. Deciduous, to 10 ft., spines simple or 3-parted: lvs. to 1 in. long, toothed or entire, glaucous beneath: fls. pale yellow, in few-fld. racemes: fr. purple, pruinose. Himalayas.

vulgaris (*B. Jacquini*). EUROPEAN or COMMON B. Deciduous, to 8 ft., spines 3-parted: lvs. to 2 in. long: fls. in racemes to 2 in. long: fr. red or purple. Eu.; nat. in N. Amer.—A host of the wheat rust. Hort. vars. are: **alba**, fr. whitish; **albo-variegata**, lvs. variegated with white; **argenteo-marginata**, margins of lvs. white; **aureo-marginata**, margins of lvs. yellow; **atropurpurea** (var. *purpurea*), lvs. deep purple; **dulcis** (*B. dulcis*), fr. sweet; **lutea**, fr. bright yellow.

Wallichiana. Evergreen, to 10 ft.: lvs. to 4 in. long, spiny-toothed, pale beneath: fls. in clusters: fr. black. Himalayas.

Wilsonæ. Deciduous or half-evergreen, to 6 ft., spines 3-parted: lvs. to 1 in. long, entire, glaucous beneath: fls. golden-yellow, in dense clusters or panicles: fr. salmon-red. W. China. Var. **Stapfiana** (*B. Stapfiana*) has infl. of 4–7 fls. Var. **subcaulialata** (*B. subcaulialata*) has lvs. whitish beneath and sometimes with few teeth, and strongly angled branchlets.

xanthoxylon (*B. Knightii*). Evergreen, spines 3-parted: lvs. to 4 in. long, spiny-toothed: fls. in clusters: fr. black. Java; hardy only far S.

BERCHEMIA. *Rhamnaceæ.* Twining deciduous shrubs bearing alternate entire lvs. having conspicuous parallel veins, small fls. in terminal panicles, and drupaceous fr.

The species thrive in any soil but are not reliable far North. Propagated by seeds and root-cuttings in spring or by layers and cuttings of ripe wood in autumn.

racemosa. Lvs. ovate, subcordate at base, to 2½ in. long, somewhat glaucous underneath: fls. greenish, the panicles to 6 in. long: fr. red turning black, to ¼ in. long. Japan, Formosa.

scandens (*B. volubilis*). Supple-Jack. Climbing to 15 ft. or more: lvs. elliptic to oblong-ovate, rounded at base: fls. greenish-white, in panicles to 1½ in. long: fr. bluish-black. Low woods, Va. and Ky. to Fla. and Tex.

volubilis: *B. scandens*.

BERGAMOT: *Citrus Bergamia*. Wild: *Monarda fistulosa*.

BERGENIA (*Megasea*). *Saxifragaceæ*. Per. herbs with thick rootstocks from which the plants develop into large low clumps or colonies: lvs. large, thick, wavy, entire or toothed and with gland-bearing pits, the petioles sheathed at base: fls. large, pink or white, in spring, on scapes. The lvs. are ornamental and more or less evergreen. Cult. as for *Saxifraga*, the first two hardy N.

cordifolia (*Saxifraga cordifolia*). To 20 in.: lvs. fleshy, orbicular-cordate, margin wavy-toothed, smooth and shining: fls. clear rose, in dense nodding cymes, on thick shiny scapes, partly hidden in the lvs. Siberia. Var. **purpurea**, panicles taller, fls. deep reddish-purple.

crassifolia (*Saxifraga crassifolia*). To 20 in.: lvs. smooth and shining, obovate, slightly toothed or entire: fls. rose, lilac or purple, in dense panicles standing well above the lvs. Siberia, Mongolia. Var. **orbicularis** (*S. orbicularis*) has broad lvs. and rose fls.

ligulata (*Saxifraga ligulata*). To 1 ft.: lvs. obovate or orbicular, cordate at base, margins entire, ciliate: fls. white, rose or purplish, nodding, in racemes. Himalayas. Var. **Leichtlinii** has crimson lvs. and rose fls.

purpurascens (*Saxifraga purpurascens*). To 1 ft.: lvs. obovate or oblong, to 3 in. long, wavy-margined: fls. purple, nodding, in few-fld. panicles on purplish scapes. India.

Stracheyi (*Saxifraga Stracheyi*). To 1 ft.: lvs. obovate, margins ciliate: fls. pink or rose, in branching panicles. India.

BERGERANTHUS. *Aizoaceæ*. A few S. African plants formerly included in Mesembryanthemum (which see for cult.), nearly or quite stemless: lvs. standing cross-wise and more or less connate at base, somewhat glaucous and often dotted: fls. long-stalked; stigmas mostly 5. **B. multiceps** (*M. multiceps*) is a stemless and tufted per.: lvs. flat above and keeled underneath, to 1½ in. or more long, shining green: fls. yellow, 1–5 on a somewhat compressed scape.

BERGEROCACTUS. *Cactaceæ*. One species in extreme S. Calif. and Lower Calif., a segregate from Cereus: fls. with scale-bearing ovary: plant making colonies or patches, the branches cylindric or columnar, closely many-ribbed, with many yellow sharp spines: fls. small, pale yellow: roots somewhat tuberous. See *Cacti*. **B. Emoryi** (*Cereus* and *Echinocereus Emoryi*). Making large colonies or patches: branches or sts. erect, to 2 ft. and 2 in. or more diam.: fls. about ¾ in. long and broad, diurnal. Sometimes planted in gardens in its native regions and in the trade for that purpose.

BERLANDIERA. *Compositæ*. Per. hairy herbs with alternate lvs. and heads solitary or in corymbs, of yellow ray- and disk-fls.; pappus none or of awns; native in S. U. S. and Mex.; sometimes transferred to grounds. They bloom in spring and summer.

lyrata. To 8 in., white-pubescent: lvs. lyrate-pinnatifid: heads solitary, 1 in. across. Plains, Kans. to Mex.

BERRY: pulpy, indehiscent, few- or many-seeded fruit; technically, the pulpy fruit resulting from a single pistil, containing 1 or more seeds but no true stone. Botanically, fruits of eggplant, tomato, grape are berries, but in pomology the term is commonly restricted to the bush-fruits, as currant, gooseberry, cranberry; blackberry, raspberry, strawberry, are not true berries.

BERSEEM: *Trifolium alexandrinum*.

BERTEROA. *Cruciferæ*. A few species of ann. or per. herbs in Eu. and Asia, differing from Alyssum in the thick pods or silicles, and 2-cleft petals; one is sometimes grown in sunny places for ornament. **B. incana** (*Alyssum incanum*) is bien., strict, to 2 ft., grayish or hoary: lvs. oblong or lanceolate, to 2 in. long: fls. white, in terminal elongating racemes. Eu.; nat. in N. Amer.

BERTHOLLETIA. *Lecythidaceæ*. Large trop. American trees furnishing commercial Brazil- or Para-nuts, also called "Castanea," mostly the product of **B. excelsa**. To 100 ft.: lvs. oblong, leathery, to 2 ft. long, wavy-margined: fls. cream-colored, in spike-like racemes: fr. to 6 in. across, the dark brown walls thick and hard, containing 18–24 triangular nuts with single kernel. Brazil, Venezuela, Guiana.—Suited only for trop. climates, but small specimens are likely to be seen in collections of economic plants under glass. Propagated by seeds or layers.

BERTOLONIA. *Melastomaceæ*. Mostly Brazilian dwarf or creeping herbs with simple 3–9-nerved lvs., white, rose or purple fls. in racemes, and capsular fr.

Grown in greenhouses for the attractive foliage, which is purplish underneath and with various metallic colors above. They thrive in dense shade and a humid atmosphere. Propagated by cuttings over heat and by seeds.

maculata. Lvs. broadly ovate, hairy, velvety-green above, the veins bordered with purple or magenta band: fls. rose.

marmorata. Lvs. ovate-oblong, slightly hairy, streaked with white along veins: fls. purple. Var. **ænea** has coppery tinged lvs. only slightly spotted.

pubescens. Lvs. ovate, with long white hairs and chocolate-colored band down center. Ecuador.

Sanderiana: hort. name; probably a form of *B. maculata*.

BESSERA ELEGANS: see *Milla*.

BESSEYA: *Synthyris plantaginea*.

BETA. Beet. *Chenopodiaceæ*. Herbs with alternate lvs. and small greenish or reddish fls. in panicled spikes, one widely grown for the edible roots and lvs. **B. vulgaris**. Beet. Beet-Root. Sugar-Beet. Mangel. Bien. or ann. to 4 ft., with thick roots of various sizes, forms and colors, and ovate to oblong-ovate lvs. Cultigen. Var. **Cicla**, Leaf-Beet, has much larger lvs. and no fleshy root, in Swiss chard the midribs much enlarged. Grown as a pot-herb and sometimes for the ornamental colored foliage.

Beets are of easy cultivation in any good garden soil. Seeds may be sown early in spring and at intervals of a few weeks throughout the summer to insure a steady crop. For very early use seeds may be sown in boxes or hotbeds in February and March and transplanted to the open when frost is out of the ground. Beets sown in late summer may be dug before cold weather and stored in the cellar in barrels, packed in earth or sphagnum. The long-rooted varieties should be planted only in open well-tilled soil, else they will become misshapen.

BETONICA: *Stachys.*

BETONY: *Stachys.* **Wood-:** *Pedicularis.*

BETULA. Birch. *Betulaceæ.* Deciduous monœcious trees and shrubs native in the northern hemisphere, with alternate toothed lvs. and unisexual fls. borne in catkins, the staminate showing in autumn and remaining naked during the winter and opening in spring, the pistillate becoming cone-like with 3-lobed scales; cult. for ornament and for the timber which is used for making furniture and other articles. They inhabit lowlands, sandy or light-soil regions and mountains.

Birches are mostly short-lived trees suitable for northern climates. They thrive on moist sandy soil or some species in drier locations. Propagated by seeds sown at once or stratified, in sandy soil which is kept moist and shady. Seedlings should be transplanted when about one year old. Other methods of propagation are by layers, greenwood cuttings under glass, and grafting or budding or seedling stocks.

alba: the material cult. under this name may be either *B. pendula* or *B. pubescens.*

Bhojpattra: *B. utilis.*

costata. Tree to 100 ft., with flaking papery bark: lvs. ovate, to 3 in. long, long-acuminate: cones ellipsoid, ¾ in. long. N. E. Asia.

cylindrostachya. Tree to 60 ft.: lvs. ovate-oblong, to 6 in. long, slightly pubescent beneath: cones to 3½ in. long. Himalayas.

Ermani. Tree to 60 ft.: lvs. triangular-ovate, to 4 in. long: cones oblong, about 1 in. long. N. E. Asia, Japan.

excelsa: *B. lutea.*

fastigiata: *B. pendula* var.

fontinalis (*B. occidentalis*). Water B. Shrubby tree to 40 ft.: lvs. broad-ovate, to 2 in. long: cones about 1 in. long. Alaska to Ore. and Colo.

fruticosa. Shrub to 15 ft.: lvs. ovate, to 2 in. long: cones oblong-cylindric, to 1 in. long. N. E. Asia.

glandulosa. Shrub to 6 ft.: lvs. nearly orbicular to obovate, to 1 in. long, pale beneath: cones cylindric, to ¾ in. long. N. Amer.

laciniata: *B. pendula* var. *dalecarlica.*

lenta. Cherry or Sweet B. Tree to 75 ft.: lvs. oblong-ovate, to 5 in. long, when young silky-pubescent beneath: cones ovoid-oblong, to 1½ in. long. Me. to Ala., in moist woods.

lutea (*B. excelsa*). Yellow B. Tree to 90 ft., with flaking yellowish or silvery bark: lvs. ovate, to 5 in. long, glabrous or pubescent beneath: cones oblong, about 1 in. long. Newf. to Ga. and Tenn., mostly in moist woods.

macrophylla: *B. papyrifera* var. *grandis.*

Maximowicziana. Monarch B. Tree to 100 ft., the bark flaking: lvs. broad-ovate, to 6 in. long, heart-shaped at base: cones cylindric, to 3 in. long. Japan

nana. Spreading branching shrub to 2 ft.: lvs. orbicular, to ½ in. long, when young sticky and pubescent beneath: cones ½ in. or less long. N. Asia, N. Eu., Alaska.

nigra (*B. rubra*). River or Black B. Tree to 100 ft., with flaking papery bark: lvs. rhombic-ovate, to 3 in. long, whitish below: cones oblong-cylindric, 1½ in. long. Mass. to Fla. and Kans., by streams and in bottom-lands.

occidentalis: the trade name may refer either to *B. fontinalis* or to *B. papyrifera* var. *occidentalis.*

papyracea: *B. papyrifera.*

papyrifera (*B. papyracea*) Canoe or Paper B. Tree to 100 ft., with white exfoliating bark: lvs. ovate, to 4 in. long: cones cylindric, to 2 in. long. N. N. Amer., in light and rocky lands. Var. **grandis** (*B. macrophylla*) has large heart-shaped lvs. Var. **occidentalis** (var. *Lyalliana*) has orange or dark brown bark. B. C. to Mont.

pendula (*B. verrucosa*). European White B. Tree to 60 ft., with white bark peeling off in layers, the branches usually drooping: lvs. rhombic-ovate, to 2½ in. long: cones cylindric, about 1 in. long. Eu., Asia Minor. Some of the hort. vars. are: **dalecarlica** (*B. laciniata*), lvs. deeply lobed; **fastigiata**, of columnar habit; **gracilis** (*B. alba elegans laciniata*), branches drooping, lvs. finely dissected; **purpurea** (*B. alba atropurpurea*), lvs. purple; **tristis**, branches drooping and forming a round head; **Youngii**, head irregular, branches drooping and very slender.

populifolia. Gray B. Tree to 30 ft., with chalky bark: lvs. triangular-ovate, to 3 in. long, shining above: cones cylindric, about 1 in. long. N. S. to Del., on light lands. Var. **laciniata** has pinnately lobed lvs., **pendula** drooping branches, and **purpurea** purple young lvs.

pubescens. Tree to 60 ft., with white peeling bark: lvs. ovate, to 2 in. long, usually pubescent beneath: cones cylindric, 1 in. long. Eu., Siberia. Var. **urticifolia** (*B. urticifolia*) has lvs. coarsely toothed or lobed. Var. **variegata** has variegated foliage.

pumila. Shrub to 15 ft.: lvs. orbicular to obovate, about 1 in. long, when young densely pubescent beneath: cones cylindric-oblong, 1 in. long. Newf. to N. J. and Minn., in bogs.

rubra: *B. nigra.*

urticifolia: *B. pubescens* var.

utilis (*B. Bhojpattra*). Tree to 60 ft., with flaking dark brown bark: lvs. ovate, to 3 in. long, pubescent beneath: cones cylindric, 1 in. long. Himalayas.

verrucosa: *B. pendula.*

BETULACEÆ. Birch Family. Six genera of deciduous mostly monœcious trees and shrubs, in the north temp. zone, having alternate simple lvs., staminate fls. in long drooping catkins, pistillate in short catkins or clusters, 2–10 stamens in the axils of bracts, 2-celled ovary, and fr. a small nut-like body. The family furnishes many ornamental subjects, valuable timber, some edible nuts, bark used for making canoes and writing paper. Alnus, Betula, Carpinus, Corylus and Ostrya are best known to hort.

BIANCÆA: *Cæsalpinia.*

BICUCULLA: *Dicentra.*

BIDENS. Bur-Marigold. Stick-Tights. Tickseed. *Compositæ.* Herbaceous ann. and per. mostly weedy plants, with opposite toothed, cut or divided lvs. and solitary or clustered heads, the rays white or yellow when present, the disk yellow; pappus of stiff bristles. Some species are grown from seed for ornament in the flower-garden; they are closely allied to Cosmos. Native wild species are weedy, mostly in moist places.

atrosanguinea: *Cosmos diversifolius.*

dahlioides: *Cosmos diversifolius.*

ferulæfolia. Fern-leaved B. Ann., branching: lvs. 2-pinnate into narrow segms.: heads corymbose, less than 1 in. across; rays and disk bright yellow. Mex.

grandiflora. To 4 ft., somewhat glaucous, branched: lvs. pinnately divided into narrow segms.: heads golden-yellow. Mex.

humilis. Dwarf, almost procumbent: lvs. irregularly 2-pinnately 5-parted, segms. narrow: heads yellow, solitary. Ecuador.

trichosperma (*Coreopsis trichosperma*). Ann. or bien. to 5 ft.: lvs. pinnately cut into lanceolate or linear segms.: heads to 2½ in. across, rays golden-yellow. Mass. to Ga. and Ky.

BIENNIALS (abbreviated bien. in this book) are plants that live two years from seed, blooming only or mostly the second year. Some of the perennials are so short-lived that they become practically biennial in cultivation and may be so listed. Examples of plants that are actually or essentially biennial are common forms of red clover, parsnip, cabbage, foxglove, Canterbury bells, hollyhock, verbascums, snapdragon, pansy. Of most ornamental kinds, bloom may be obtained from seeds sown the previous midsummer, the seedlings being handled promptly to insure continuous growth. As a class, biennials require no special culture differing from that of other plants.

BIFRENARIA. *Orchidaceæ.* S. American epiphytes with pseudobulbs bearing 1 leathery lf. and fls. in racemes, the sepals and petals similar, the lip usually 3-lobed and with a callus or ridges; suited to a temperate or cool greenhouse. See *Orchids.*

atropurpurea. Pseudobulbs to 3 in. high, bearing a linear-lanceolate lf. to 10 in. long: fls. about 2 in. across, very fragrant, in 3–5-fld. racemes to 3 in. long, the sepals and petals wine-red with yellow center, the lip entire, whitish tinged with rose, with linear callus, June. Brazil.

aurantiaca (*Lindleyella aurantiaca*). Pseudobulbs to 2 in. high, bearing 1 plaited lf. to 6 in. long and 2 in. wide: fls. in 7–12-fld. racemes to 8 in. long, yellow spotted with purple, the lip spurred and with a lighter callus between the side lobes, Sept.–Oct. Trinidad, Guiana.

Harrisoniæ (*Lycaste Harrisoniæ*). Pseudobulbs to 3 in. high, bearing a narrow-elliptic lf. to 1 ft. long: fls. about 2¾ in. across, in short 2–3-fld. racemes, the sepals and petals yellowish tinged with red, the lip violet-red with yellow hairy callus, the base of the column prolonged into a spur-like part to 1½ in. long, Mar.–May. Brazil.

BIGNAY: *Antidesma Bunius.*

BIGNONIA. *Bignoniaceæ.* One evergreen climbing shrub with lvs. of 2 lfts. and a terminal tendril, funnelform fls. in axillary cymes, and linear flattened frs. The genus is variously understood, but is here considered to have only one species. It is grown as a wall cover in the S. and sometimes in the greenhouse. Propagated by cuttings, and by seeds when available.

æquinoctialis: *Cydista æquinoctialis.*

alliacea: *Adenocalymna alliaceum.*

argyreo-violescens. Hort. name for a foliage plant with ovate purple lvs. becoming variegated with white. —The genus is uncertain, but not a true Bignonia.

atropurpurea, atrosanguinea: *B. capreolata* var.

australis: *Pandorea pandorana.*

buccinatoria: *Phædranthus buccinatorius.*

capreolata (*Anisostichus* and *Doxantha capreolata*). Trumpet-Flower. Cross-Vine. Climbing to 50 ft.: lfts. ovate or oblong, to 6 in. long, entire: fls. yellow-red, paler within, 2 in. long: caps. to 7 in. long. Fields, Va. and Ill., to Fla. and La., but root-hardy farther N. Kinds with fls. in darker colors are known as *B. atropurpurea* and *B. atrosanguinea.*

Chamberlaynii: *Anemopægma Chamberlaynii.*

Cherere: *Phædranthus buccinatorius.*

chinensis: *Campsis chinensis.*

grandiflora: *Campsis chinensis.*

jasminoides: *Pandorea jasminoides.*

Mackenii: *Pandorea Ricasoliana.*

Princei: *Campsis hybrida.*

purpurea: *Clytostoma purpureum.*

radicans: *Campsis radicans.*

serratifolia: *Tabebuia serratifolia.*

speciosa: *Clytostoma callistegioides.*

stans: *Stenolobium stans.*

Tweediana: *Doxantha Unguis-cati.*

Unguis-cati: *Doxantha Unguis-cati.*

venusta: *Pyrostegia ignea.*

violacea. Lfts. oval, 4 in. long: fls. violet, 1 in. long, in terminal branched panicles. Bolivia.—Undoubtedly not a true Bignonia, but genus undetermined.

BIGNONIACEÆ. Bignonia Family. About 100 widely distributed genera of trees, shrubs, vines, and herbs, with mostly opposite simple or compound lvs. which are often even-pinnate, showy, more or less irregular gamopetalous fls. in racemes or panicles, having 5-lobed corolla-limb, 5 stamens of which 1 or 3 are sterile, superior 1–2-celled ovary, and fr. a long caps. or pod with winged seeds. Many genera are cult. for ornament, as Adenocalymna, Amphicome, Anemopægma, Bignonia, Campsidium, Campsis, Catalpa, Chilopsis, Clytostoma, Crescentia, Cydista, Delostoma, Distictis, Dolichandra, Doxantha, Eccremocarpus, Incarvillea, Jacaranda, Kigelia, Oroxylon, Pandorea, Parmentiera, Phædranthus, Pithecoctenium, Pyrostegia, Radermachia, Spathodea, Stenolobium, Tabebuia, Tecoma, Tecomaria. Most of the bignoniads are native in warm-temp. and trop. regions.

BIHAI: *Heliconia.*

BIKUKULLA: *Dicentra.*

BILIMBI: *Averrhoa Bilimbi.*

BILLARDIERA. *Pittosporaceæ.* Small Australian shrubs with twining branches, alternate lvs., and mostly yellow or purple fls. solitary or clustered; grown under glass or out-of-doors in mild climates. Propagated by cuttings under glass or by seeds.

longiflora. Lvs. varying from ovate to linear, to 1½ in. long, entire: fls. greenish-yellow or becoming purple, solitary, drooping: berries blue.

BILLBERGIA. *Bromeliaceæ.* Stemless epiphytic herbs native in trop. Amer., having stiff lvs. in rosettes or clusters, and showy mostly blue fls. in spikes or panicles; grown for ornament and as oddities under glass or as house-plants. For cult., see *Bromeliaceæ.*

Forgetiana. Lvs. green banded with white. Of uncertain botanical standing.

Liboniana. Lvs. to 2 ft. long and 1½ in. wide, with small spiny teeth: fls. in an erect simple spike on scapes to 1 ft. long, with red sepals and blue-tipped petals. Brazil.

Morelii. Lvs. to 2 ft. long and 2 in. wide, with small spiny teeth: fls. in drooping spikes on scapes to 1 ft. long, with long red bract-like lvs., red sepals and blue-tipped petals. Brazil.

nutans. Lvs. to 1½ ft. long and ½ in. wide, finely toothed: fls. few on scapes to 1 ft. long, drooping, with bright red bracts and green petals edged with blue. Brazil.—One of the commonest in cult.

pyramidalis (*B. thyrsoidea*). Lvs. to 3 ft. long and 2½ in. wide, finely spiny-toothed: fls. in dense spikes to 4 in. long, with bright red bracts and red petals tipped with violet. Brazil.

rhodocyanea: *Æchmea fasciata.*

Sanderiana. Lvs. leathery, about 1 ft. long, spiny-toothed: panicles loose, to 10 in. long, on nodding scapes; sepals tipped with blue; petals blue with yellowish-green claw; bracts rose. Brazil.

speciosa. Lvs. to 2 ft. long, spiny-toothed, striped on back: fls. pale green tipped with blue, bracts rose, in loose drooping clusters. Brazil.

thyrsoidea: *B. pyramidalis.*

zebrina. Lvs. to 3 ft. long and 3 in. wide, prickly-toothed, spotted and banded with white: fls. in spikes on drooping scapes shorter than lvs., with pink or salmon bracts and green or yellowish-green fls. Brazil.

BILTIA: *Rhododendron Vaseyi.*

BINDWEED: *Convolvulus.*

BIOTA: *Thuja orientalis.*

BIRCH: *Betula.*

BIRD-OF-PARADISE FLOWER: *Strelitzia.*

BIRDS-EYES: *Gilia tricolor.*

BIRTHWORT: *Aristolochia.*

BISCHOFIA. *Euphorbiaceæ.* One evergreen or somewhat deciduous tree native in trop. Asia, sometimes planted in extreme S. U. S. **B. javanica** (*B. trifoliata*). Toog. To 75 ft.: lvs. alternate, of 3 ovate-acuminate bronzy-green serrulate lfts. to 5 in. long: fls. small, greenish, diœcious, without petals, in many-fld. racemes not exceeding the lvs.: fr. berry-like, brown or reddish or blue-black, size of a pea.

BISCUTELLA. *Cruciferæ.* A few ann. and per. herbs of the Old World, one sometimes planted for ornament, interesting for the 2 circular winged lobes of the flat pods or silicles: radical lvs. large, entire, toothed or pinnatifid: sts. mostly slender-branching: fls. small, yellow. **B. lævigata** is per., to 2 ft., hairy in lower part: lvs. variable, the radical ones long-oblong and toothed and forming rosette: fls. in terminal racemes, in spring and summer: pods about ⅓ in. across. Cent. and S. Eu.

BISHOPS-CAP: *Mitella.*

BISHOPS-HOOD: *Astrophytum myriostigma.*

BISHOPS-WEED: *Ægopodium Podagraria.*

BISMARCKIA. *Palmaceæ.* Heavy diœcious fan-palm of Madagascar, allied to Latania and Hyphæne, known somewhat to cult.; from the former it differs in bearing staminate and pistillate fls. on similar spadices, and from Hyphæne in characters of fr. and seed and in the fact that the trunk is always columnar and unbranched: spadices among the lvs. **B. nobilis.** To 30 ft. (perhaps more), ringed with scars, bearing a heavy crown: lvs. 3 ft. or more across, regularly divided to middle or below into many bluish-green segms. deeply bifid at apex, filament in the sinus; petiole finely serrate-denticulate along the sharp edges: fr. in drooping clusters, about 1½ in. diam., drupe-like, peduncled, with a single walnut-like seed 1 in. diam.

BISTORTA: *Polygonum.*

BITTERNUT: *Carya cordiformis.*

BITTER-ROOT: *Lewisia rediviva.*

BITTER-SWEET: *Solanum Dulcamara.* **False:** *Celastrus scandens.*

BIXA. *Bixaceæ.* A trop. American tree much planted in the tropics for the annatto dye which is extracted from the pulp around the seeds. **B. Orellana.** Annatto. To 20 ft. or more: lvs. ovate, to 7 in. long: fls. pink or rose, to 2 in. across: fr. reddish-brown, to 2 in. long, covered with soft spines.—Propagated by seeds and cuttings. Grown in S. Fla. and southward.

BIXACEÆ. Bixa Family. Two genera of trees and shrubs having alternate simple lvs., regular bisexual fls. with 5 sepals and petals, numerous stamens, superior 1-celled ovary, and capsular fr.: native in the warm parts of Amer. and Australia. Bixa is cult. for the annatto dye. See Cochlospermaceæ.

BLACK-BEAD: *Pithecellobium Unguis-cati.*

BLACKBERRY. The American pomological blackberry is a native fruit, having been developed from indigenous species. The species of wild blackberry are more numerous than formerly supposed and their identities are not yet clearly understood, and the exact parentage of the named horticultural varieties is mostly yet obscure. See *Rubus.*

The culture of the blackberry is limited by the cold winters of the northern and plains states and by drought and dry heat in the Southwest. Elsewhere it is grown in some of its forms, although nowhere does it assume great commercial importance. Almost any good soil will grow blackberries provided it is well drained and retentive of moisture with a good humus content. The heavier clay loams are preferred.

Propagation of varieties is by suckers which come up from the roots, and for more rapid increase by root-cuttings. Roots are cut into sections 2–3 inches long, buried in soil to callus during the winter, and planted in the nursery row in early spring. Some of the trailing or lopping sorts root at the tips of the canes. Planting is performed in the very early spring either in rows 7–8 feet apart, plants 2–3 feet apart in the row, or in hills 7 x 7 or 8 x 8 feet on the square.

Clean cultivation is essential for successful culture of blackberries on a large scale. Home plantings may be heavily mulched to keep down the weeds and retain moisture. Suckers outside the row or hill must be destroyed or the planting will become a thicket. Blackberries respond to the application of manure or complete fertilizer on poor soils. Care should be taken not to stimulate the plants to over-vegetative growth.

Pruning consists in cutting out the fruiting canes soon after the fruit is picked and thinning out the new canes in the early spring to space them about a foot apart in the row, or 5–6 to the hill. The canes are biennial, growing from the ground one year and fruiting the next year. Canes may be shortened back if very tall. Trailing kinds must be trained on a trellis.

For home use fruit should become soft-ripe on the plants. For market the berries should be black but still firm. Picking is by hand, the berries usually falling into the same quart berry baskets in which the fruit is marketed.

A good yield is about 2,000–3,000 quarts to the acre.

In choosing varieties, adaptation to climate is important. Varieties of more than average hardiness are Eldorado, Ancient Briton, Snyder, Hardy, Taylor, Wachusett, Minnewaski, Erie, Mersereau. Varieties adapted to regions south of New York are Nanticoke, Rathbun, Agawam, Dorchester, Early King, Lawton. Varieties for the far Southwest are Dallas, McDonald, Haupt. Varieties for the Pacific Coast include Jordan, Kittatinny, Himalaya, Erie, Mammoth, Evergreen, Lawton, Crandall. Varieties specially resistant to rust are Eldorado, Snyder, Taylor, Erie.

Care should be taken to plant only disease-free plants. If rust is prevalent the only remedy is to plant rust-resistant varieties. The commercial grower should give particular attention to special pest and disease problems.

BLACKBUTT: *Eucalyptus pilularis.*

BLACK-EYED SUSAN: *Rudbeckia hirta, Thunbergia alata.*

BLACKTHORN: *Prunus spinosa.*

BLADDER-NUT: *Staphylea.*

BLADDER-POD: *Vesicaria.*

BLADDERWORT: *Utricularia.*

BLADE: the expanded part of a leaf or petal.

BLANDFORDIA. *Liliaceæ.* Australian fibrous-rooted herbs with lvs. mostly near base of st., large drooping 6-lobed fls. in terminal racemes, and capsular frs.; adapted to mild climates. Propagated by seeds and sparingly by division of roots.

nobilis. To 3 ft.: lvs. to 1½ ft. long and ⅙ in. wide: fls. brownish-red tipped with yellow, to 1¼ in. long. New S. Wales.

BLAZING STAR: *Chamælirium luteum, Liatris, Mentzelia lævicaulis.*

BLECHNUM. *Polypodiaceæ.* Rather coarse ferns, with compound or deeply cut lvs.; sori in a line close to midrib of segms.

A few species are cultivated in greenhouses. Propagated by spores except in the species that develop plantlets at the ends of the creeping rhizomes. They require a rather dry atmosphere but plenty of moisture at the root, and a temperature of 60–65°; good as specimen plants. See *Ferns.*

brasiliense. With scaly trunk to 3 ft. high: lvs. to 3 ft. long and 15 in. wide, deeply pinnatifid, segms. finely toothed. Brazil, Peru.

fluviatile (*Lomaria fluviatilis*). Lvs. to 2½ ft. long and 1½ in. wide, simply pinnate, segms. to ¾ in. long, wavy-margined, sterile and fertile different. New Zeal., Australia.

gibbum (*Lomaria gibba*). With trunk to 5 ft. high: lvs. to 3 ft. long and 1 ft. wide, deeply pinnatifid, segms. finely toothed, the sterile and fertile different. New Caledonia, Aneiteum in S. Pacific.

Moorei (*Lomaria ciliata*). Trunk 6 in. high: lvs. to 1 ft. long, simply pinnate, toothed or lobed, the sterile and fertile different, sts. blackish. New Caledonia.

occidentale. Trunkless: lvs. to 1½ ft. long, simply pinnate, segms. to 3 in. long, entire. Trop. Amer.

orientale. Trunk stout, erect: lvs. to 5 ft. long and 3 ft. broad, simply pinnate, segms. to 8 in. long. Australia, China, Himalayas.

serrulatum. Saw-Fern. Lvs. to 2 ft. long and 15 in. wide, simply pinnate, segms. finely toothed, linear-oblong. Swamps, Fla. to Brazil.

spicant (*Struthiopteris* and *Lomaria spicant*). Deer-Fern. Sterile lvs. in crown surrounding fertile lvs., evergreen, to 3½ ft. long, simply pinnate, segms. entire or slightly toothed. Alaska to Calif., Eu., Asia.

BLEEDING-HEART: *Dicentra spectabilis.*

BLEPHARIGLOTTIS: *Habenaria.*

BLETIA HYACINTHINA: *Bletilla striata.*

BLETILLA. *Orchidaceæ.* Terrestrial orchids with tuberous rhizomes, rather thin lvs. and fls. in terminal racemes, the sepals and petals similar, the lip free and 3-lobed; sometimes planted out-of-doors. See *Orchids.*

hyacinthina: *B. striata.*

striata (*Bletia* and *Bletilla hyacinthina*). To 2 ft.: lvs. 3–5: fls. purple, 1½ in. long, in 3–7-fld. racemes longer than lvs., June. China, Japan.

BLIGHIA. *Sapindaceæ.* One tree native in W. Afr. but now cult. and nat. widely in the tropics, producing edible frs. B. sapida (*Cupania sapida*). Akee. To 40 ft.: lvs. of 6–10 obovate-oblong lfts. to 6 in. long: fls. small, greenish-white, polygamous, in axillary racemes: fr. straw-colored to magenta-red, 3 in. long, splitting into 3 parts, with 3 shining seeds having a white fleshy edible aril at base.—Akees withstand a few degrees of frost when well established. They succeed on moist loamy soils. Propagated usually by seeds.

BLITUM: *Chenopodium capitatum.*

BLOOD-FLOWER: *Asclepias curassavica.*

BLOOD-LEAF: *Iresine.*

BLOODROOT: *Sanguinaria canadensis.*

BLOODWOOD: *Eucalyptus.* Tree: *Hæmatoxylum campechianum.*

BLOOMERIA. *Liliaceæ.* Herbs native in S. Calif., having corms, basal grass-like lvs., and yellow wheel-shaped fls. in umbels terminating the scapes.

Bloomerias withstand several degrees of frost. The plants thrive in sandy well-drained soil and sunny exposure. The corms should be dug after ripening and replanted in autumn; they are good summer bloomers, allied to Brodiæa. Propagated by seeds.

aurea: *B. crocea.*

crocea (*B. aurea*). Golden-Stars. To 1½ ft.: fls. orange-yellow striped with darker lines, ½ in. long.

BLUEBEARD: *Caryopteris.*

BLUEBELL: *Campanula rotundifolia.* California: *Phacelia Whitlavia.* Creeper, Australian: *Sollya heterophylla.* English: *Scilla nonscripta.* Spanish: *Scilla hispanica.*

BLUEBELLS: *Mertensia.*

BLUEBERRY. Certain North American Vacciniums are known as blueberry, but in horticultural practice the name is restricted mostly to *V. corybosum*, one of the highbush species. In recent years this blueberry has been greatly improved in productiveness and size of fruit; and the knowledge that it requires an acid soil has contributed to its introduction as one of the pomological products.

Common alkaline or neutral lands do not produce blueberries. An acid soil is essential, one composed of peat and sand but with good drainage and aeration. It is not necessary to plant in swamps; in fact, the plant does not thrive when the roots are permanently under water. The water-table should be at least one foot below the surface in the growing season. The permanent plantation is set about 8 feet apart each way. Surface tillage is advised. Plants begin to bear well in three or four years after setting and they should last a lifetime. They grow to a height of 6 to 8 feet. In home gardens it is advised that plants be set in ample holes or trenches about 1 foot deep in a mixture of four parts peat or half-rotted oak leaves to one part of sand; a similar mixture is used as a top-dressing in the plantation. Chemical fertilizers that leave an acid reaction in the soil may be applied, as sulfate of ammonia, acid phosphate, sulfate or muriate of potash.

Propagation of the blueberry is by dividing the clumps or rootstocks, by layering, by cuttings and by seeds, but the seeds do not reproduce the variety or strain. The home gardener, if he attempts blueberries at all, will probably purchase his plants.

BLUE-BLOSSOM: *Ceanothus thyrsiflorus.*

BLUE-BOTTLE: *Centaurea Cyanus.*

BLUE-CURLS: *Trichostema.*

BLUE-DICKS: *Brodiæa capitata.*

BLUE-EYED MARY: *Collinsia verna.*

BLUE-LIPS: *Collinsia grandiflora.*

BLUET, MOUNTAIN: *Centaurea montana.*

BLUETS: *Houstonia cærulea.*

BLUE-WEED: *Echium vulgare.*

BLUMENBACHIA (*Saloa*). *Loasaceæ.* Ann. herbs armed with stinging hairs, native of S. Amer., having opposite lobed lvs. and odd interesting fls. solitary in the axils: caps. opening at top. Propagated by seeds sown under glass and seedlings transplanted after danger of frost is over.

insignis. Ann. or grown as such, twining, the sts. to 2 ft. or more long: lvs. to 3 in. across, deeply palmately 5-lobed: fls. white, 1 in. across, hooded, with thick yellow scales spotted with red at base of petals. S. Amer.

lateritia: *Caiophora lateritia.*

BOCCONIA. *Papaveraceæ.* Trees, shrubs or per. herbs with yellowish juice, alternate mostly pinnately lobed or parted lvs. and small fls. without petals, borne in terminal branching panicles; native in Mex. and trop. Amer.; seldom planted in S. U. S.

cordata: *Macleaya cordata.*

frutescens. Shrub or tree to 25 ft.: lvs. to 16 in. long, pinnatifid: fls. purplish, the panicles 1 ft. or more long. Cent. Amer. to Peru, W. Indies.

japonica: *Macleaya cordata.*

microcarpa: *Macleaya microcarpa.*

BŒHMERIA. *Urticaceæ.* Herbs, shrubs or trees mostly native in warm countries, with alternate or opposite simple lvs. and very small unisexual fls. in clusters or spikes.

Grown under glass for the ornamental foliage or out-of-doors in the South, one species furnishing fiber. Propagated by division, or seeds when produced. Ramie is grown to some extent in southern United States; it requires fertile well-drained soil, and is easily grown. Some of the bœhmerias are weedy plants native in North America.

argentea. Lvs. alternate, to 1 ft. long and 7 in. wide, finely toothed, spotted above with silvery-gray, veined with red-brown below: fls. in branched drooping spikes to 10 in. long. Mex.

cylindrica. Per. to 3 ft.: lvs. to 3 in. long and 1½ in. wide, coarsely toothed: fls. in spikes to 1½ in. long. N. Amer., W. Indies.

macrophylla. Shrub or small tree: lvs. opposite, lanceolate, to 1 ft. long, finely toothed, usually pubescent beneath: fls. in drooping spikes to 1 ft. long. Himalayas.

nivea (*Urtica utilis*). RAMIE. CHINESE SILK-PLANT. Herb or shrub to 6 ft.: lvs. alternate, broad-ovate, to 6 in. long, coarsely toothed, white-tomentose beneath: fls. in panicles to 6 in. long. China, Japan, S. Asia.

platyphylla. Shrub to 10 ft.: lvs. opposite and alternate, broad-ovate, to 9 in. long, coarsely toothed, usually pubescent: fls. in long drooping spikes. Asia, Afr.—A variable poorly-defined species.

Urera: the plant cult. far S. under this name is probably the trop. American *Urera caracasana.*

BOGBEAN: *Menyanthes trifoliata.*

BOG PLANTS, in horticulture, differ from aquatics in the fact that they do not live permanently in deep water, but rather in wet places as about lakes and ponds and in swamps. Mostly they are native plants transferred to wet places in grounds, and sometimes colonized. For the most part they are easily grown if the natural habitat is understood and imitated. Commonly they are perennials and woody plants that take care of themselves when once established. Sedges, rushes, pickerel-weed, arrow-leaf, water plantain, spatterdock, are common bog and swamp plants, as well as some of the eupatoriums, loosestrifes and lythrum. Any region outside deserts and plains yields interesting material for the appreciative planter.

BOISDUVALIA. *Onagraceæ.* A few ann. herbs or many-stemmed little bushes, native Ore., Calif., and Pacific S. Amer., one of which may be grown in flower-garden or border in sunny situations; propagated by seeds.

densiflora (*Godetia* and *Œnothera densiflora*). Ann., erect, 1–5 ft., hairy: lvs. narrow-lanceolate, acute, denticulate: fls. light purple, small, ½ in. or less across, in close leafy axillary clusters that comprise a long interrupted terminal spike. Calif.

BOLBOXALIS: *Oxalis cernua.*

BOLDO: *Peumus Boldus.*

BOLDOA FRAGRANS: *Peumus Boldus.*

BOLLEA: *Zygopetalum.*

BOLLWILLERIA: *Sorbopyrus auricularis.*

BOLTONIA. *Compositæ.* Tall erect herbaceous aster-like perennials, glabrous: lvs. alternate and entire, usually becoming vertical by a twist at the base: heads with white, purplish or violet ray-fls. Native in U. S. and E. Asia, in moist places and on prairies.

Boltonias are often planted in the border or colonized: they are of the easiest culture. Propagated by division in the spring, also by seed. They resemble wild asters.

asteroides (*B. glastifolia*). To 8 ft.: lvs. lanceolate, to 5 in. long, sessile: heads ¾ in. across, rays white to violet and purple. Conn. to Fla. and La.

glastifolia: *B. asteroides.*

lævigata: hort. name; perhaps *B. asteroides.*

latisquama. Differs from *B. asteroides* in the larger heads 1 in. across, rays blue-violet, and in the involucral bracts. Mo. to Okla. Var. **nana** is 2–3 ft. tall with pinkish rays.

BOLUSANTHUS. *Leguminosæ.* One African tree sometimes planted in S. Calif. B. speciosus (*Lonchocarpus speciosus*). To 15 ft.: lvs. pinnate, the lfts. lanceolate: fls. papilionaceous, bright blue, in terminal often pendulous racemes: pods oblong-linear, flattened.

BOMAREA. *Amaryllidaceæ.* S. American twining herbs, with parallel-veined lvs. and tubular fls. borne in drooping umbels.

Bomareas may be grown out-of-doors in the South in partial shade or in a cool greenhouse. They require abundant water and liquid manure in the growing season. The roots may be left in the soil over winter, the tops being cut off. Propagated by division of the roots or by seeds over heat.

conferta: *B. patacocensis.*

multiflora. Lvs. oblong, to 4i n. long: fls. in dense many-fld. umbels, 1 in. long, the perianth-segms. nearly equal, outer tinged red, inner reddish-yellow spotted with brown. Colombia, Venezuela.

oligantha. Lvs. oblong, to 4 in. long: fls. to 1¼ in. long, the perianth-segms. equal, the outer red, the inner yellow spotted with reddish-brown. Peru.

patacocensis (*B. conferta*). Lvs. oblong-lanceolate, to 6 in. long: fls. bright red, the inner perianth-segms. to 2½ in. long and yellow-keeled. Andes of Ecuador and Colombia.

BOMBACACEÆ. Bombax Family. Trees of about 20 genera in the tropics, mostly American, differing in technical characters from Malvaceæ, with simple or palmately compound lvs., regular bisexual fls. having 5 sepals and petals, 5 to numerous stamens, superior 2–5-celled ovary, and dry or fleshy frs. some of which contain a woolly or cottony fiber. Only Adansonia, Bombax, Ceiba, Chorisia, Durio, and Pachira are cult. on our southern borders. The American genus Ochroma, supplying balsa wood, renowned for its lightness, belongs in this family; the species are probably not planted in the U. S.

BOMBAX. *Bombacaceæ.* Big trees with digitately compound lvs., large red fls. before the lvs., and capsular frs. woolly within and with woolly seeds; planted for ornament in the tropics and the lint in the pods sometimes used for fiber and the fleshy calyces eaten.

malabaricum. To 75 ft., spiny: lfts. 3–7, to 7 in. long: fls. to 4 in. long, clustered near ends of branches: fr. to 6 in. long. India to Malaya; planted in S. Fla.

BONAPARTEA HYSTRIX: *Agave stricta.*

BONAVIST: *Dolichos Lablab.*

BONESET: *Eupatorium.*

BONTIA. *Myoporaceæ.* One evergreen shrub or tree to 30 ft., native in W. Indies and N. S. Amer. and sometimes grown for ornament in our southernmost areas and in the tropics; much like Myoporum but fls. deeply 2-lipped. **B. daphnoides.** Lvs. oblong or lanceolate, to 4 in. long, willow-like: fls. yellow spotted with purple, ¾ in. long, 2-lipped, solitary or clustered: fr. yellow, pointed, ½ in. long.

BORAGE: *Borago.*

BORAGINACEÆ. Borage Family. Herbs, shrubs or trees, of about 85 or more genera of wide range, prevailingly with bristly hairs, having mostly alternate simple lvs. and bisexual regular fls. with 5-lobed calyx and corolla, 5 stamens, superior 2- or 4-celled ovary, and fr. commonly composed of 4 nutlets; in the herbaceous groups, the fls. are usually small but many or numerous and borne in one-sided scorpioid spikes or racemes; the colors in blue are likely to fade or change to pink; other colors abound, as yellow and orange, white, shades of red. The family furnishes medicinal plants and dyes, and also many ornamental subjects in the genera Adelocaryum, Anchusa, Arnebia, Borago, Brunnera, Cerinthe, Cordia, Cryptantha, Cynoglossum, Echium, Ehretia, Eritrichium, Euploca, Heliotropium, Lappula, Lindelofia, Lithodora, Lithospermum, Mertensia, Moltkia, Myosotidium, Myosotis, Omphalodes, Onosma, Onosmodium, Pentaglottis, Pulmonaria, Symphytum, Trachystemon.

BORAGO. Borage. *Boraginaceæ.* Hairy Medit. herbs with alternate simple lvs. and blue saucer-shaped fls. in open leafy cymes, throat filled by scales, stamens forming a cone; one or two grown in the flower-garden and *B. officinalis* sometimes as a pot-herb and for bees. Propagated by seeds sown in spring, by division or cuttings.

laxiflora. Decumbent per.: lvs. oblong or ovate: fls. pale blue, drooping, on long pedicels. Corsica.—Good for the rock-garden.

officinalis. Ann. to 2 ft.: lvs. oblong or ovate: fls. blue, purple or white. Eu., N. Afr.

orientale: *Trachystemon orientale.*

BORASSUS. *Palmaceæ.* Large heavy diœcious fan-palms of Asia and Afr., of 7 recognized species: trunk single and erect, unarmed: lvs. large and stiff, the petiole somewhat spiny-dentate on margins: infl. among the lvs.; staminate infl. long and much branched, the fls. under closely imbricated bracts in dense spikes 1 in. diam. and about 1 ft. long, the stamens 6; pistillate infl. smaller and little branched, the fls. fewer: fr. a large drupe-like body with 1–3 seeds, subtended by enlarged perianth-parts.

flabellifer. Palmyra Palm. To 100 ft. and trunk to 3 ft. diam., old lvs. hanging on young trees: lvs. to 10 ft. across, many-cleft, rigid: fr. 6–8 in. diam., depressed-globular, with fibrous pulp. India and Malaya.—Much planted in S. Asia for its many uses and products; intro. in S. Fla.

BORDER. A narrow planting along a boundary or division line (as a walk or road) or against a building or wall is known as a border, although the term is sometimes inaccurately employed for any long narrow or strip planting even though it has no relation to margins or confines. Ordinarily it is 5 feet or less broad so that it can be planted and tended from one side, but it may be broader if there is easy access from either side. A border is properly not only a place in which plants can be conveniently grown, but it has relation to the lay-out and subdivision of the home property. A good border, well placed for the growing of plants, provides an attractive receiving plot for accessions, and should afford a never-ending variety in bloom and vegetation.

The border receives different designations, depending on the kinds of plants; it may be a shrub border, a flower border, a hardy border for native and other hardy plants, a vine border. As a rule, the most effective planting is that which is thrown into masses, for one plant reinforces the other, and the flowers have a good setting or background. Very striking displays of foliage and flowers and plant forms can be made when massed. Plants are more easily grown when planted in a border, since the whole area can be kept cultivated with ease; and if a plant becomes weak or dies, its place is readily filled by the neighboring plants spreading into it. The border may be mixed, — that is, composed of a great variety of plants, — or it may be made up of one species in considerable quantity. In long and very striking borders, it is often best to have the background — that is, the back row — of one general type of plant in order to give continuity and strength to the whole group. In front of this a variety of plants may be set. Shrub borders are sometimes planted of one species only, for continuous or artistic effect.

For best results in border planting the land should be fertile. The whole area should be plowed or spaded. If the border is composed of shrubs, and is large, a horse cultivator may be run in and out between the plants for the first two or three years, since the shrubs will be set 2 to 4 feet apart. Ordinarily, however, the tillage is by hand tools. After the plants are once established and the border is filled, it is best to dig up as little as possible, for the digging disturbs the roots and breaks off the crowns. It is usually best to pull out the weeds and give the border a top-dressing each autumn of well-rotted manure. If the ground is not very rich, an application of ashes or some commercial fertilizer may be given from time to time. The border may be planted thick to allow the plants to run together, thereby giving one continuous effect. Most shrubs should be set 3 feet apart. Those as large as lilacs may go 4 feet and sometimes even more. Common herbaceous perennials, as bleeding-heart, delphiniums, hollyhock, and the like, should go 12 to 18 inches. On the front edge of the border is an excellent place for annual and tender flowering plants. These herbaceous plants may be planted far enough apart to allow of full development. Spring- and summer-flowering bulbs may find good conditions in a well-made border. Into the heavy borders about the boundaries of the place the autumn leaves will drift and afford an excellent mulch. If these borders are planted with shrubs, the leaves may be left there to decay, and not all be raked off in the spring.

BORECOLE: *Kale.*

BORONIA. *Rutaceæ.* Australian shrubs or subshrubs with simple or compound lvs., attractive fragrant purple, red or white fls., 4-parted ovary and 4 styles, and fr. of 2–4 carpels.

Grown in a cool greenhouse in well-drained soil and out-of-doors in California. Plants should be cut back after flowering to make bushy specimens, and should be replaced by new plants after two years. Propagated by seeds and cuttings of half-ripened wood.

alata. Mostly glabrous shrub, somewhat glaucous: lvs. of 7–11 obovate or oblong obtuse lfts., entire or crenate, to ½ in. long: fls. in terminal clusters, pink, fragrant, with very sharp petals, opening wide.

elatior. To 4 ft.: lvs. of 5–13 linear lfts.: fls. rose-red or purplish, nodding, about ¼ in. long, not wide-opening.

heterophylla. Glabrous tall shrub to 6 ft.: lvs. sometimes simple and linear, to 2 in. long, sometimes with 3 or 5 linear lfts.: fls. pink or scarlet, drooping, solitary on axillary whorled peduncles, to ½ in. diam., not opening widely.

megastigma. To 2 ft.: lvs. of 3–5 linear lfts.: fls. purple, yellow inside, rather open.

spathulata. Glabrous and glaucous undershrub: lvs. simple, spatulate to obovate or lanceolate, but broad-ovate on young branches, mostly obtuse, to about 1 in. long: fls. small, pink, in little terminal clusters.

viminea. Glabrous small shrub: lvs. simple, linear-lanceolate, to 1 in. long: fls. solitary, axillary and terminal, the petals to ¼ in. long.

BOSCIA UNDULATA: *Vepris lanceolata.*

BOSEA. *Amaranthaceæ.* Upright shrubs with alternate entire lvs., small fls. in terminal spikes or racemes, and ornamental crimson berries; native in Canary Isls., Cyprus and Himalayas. Hardy only in S. U. S. Propagated by seeds and cuttings.

Amherstiana (*Deeringia Amherstiana*). Lvs. ovate, to 7 in. long: fls. greenish, in terminal panicles: berries ⅙ in. across. Himalayas. Var. **variegata** is listed.

BOSSEKIA: *Rubus deliciosus.*

BOSSIÆA. *Leguminosæ.* Australian shrubs with simple mostly entire lvs., yellow, orange or red papilionaceous fls. solitary or in clusters, and flat pods; intro. in S. Calif.

Aquifolium. Lvs. opposite, broad-cordate, to ¾ in. across, prickly-toothed: fls. yellow, about ½ in. long, solitary.

biloba. To 1½ ft.: lvs. alternate, linear or broader, to 2 in. long, retuse or 2-lobed, margins revolute: fls. to ¾ in. long.

ornata. To 2 ft.: lvs. alternate, ovate to lanceolate, to 2 in. long: fls. to ¾ in. across, in clusters.

BOTANIC GARDEN. An institution for the maintenance of a growing collection of plants under scientific management and control for purposes of education and research, together with such libraries, herbaria, laboratories and museums as are essential to its particular undertakings. Each botanic garden naturally develops its own special field, depending on the personnel, location, extent, available funds, as well as on the terms of its charter. It may include greenhouses, test grounds, herbary, arboretum and other departments. It maintains a scientific as well as a plant-growing staff, and publication is one of its major modes of expression.

The botanic garden may be an independent institution, or it may be connected or affiliated with a college or university. If a department of an educational institution it may have close relation with the teaching program; but in any case it exists for scientific ends and is not to be restricted or diverted by other demands. It is not a landscape or ornamental garden although it may be artistic, nor an experiment station, nor yet a park with labels on the plants. The essential element is the intention of the enterprise, which is the acquisition and dissemination of botanical knowledge.

BOTHRIOCLINE: *Erlangea tomentosa.*

BO-TREE: *Ficus religiosa.*

BOTRYCHIUM. Grape-Fern. Moonwort. *Ophioglossaceæ.* Mostly somewhat fleshy ferns with short underground sts. each of which sends up a single petiole bearing a 1–3-pinnate lf. and an erect panicle of sessile sporanges arranged like grapes; native chiefly of temp. regions of both hemispheres, many in the U. S.; the species are confused, and they do not commonly appeal to the cultivator. See *Ferns.*

dissectum. Hardy, to 1½ ft.: lvs. to 6 in. across, ternately compound into finely dissected segms., evergreen. Me. to Va. and Ky. Var. **obliquum** (*B. obliquum, B. ternatum* var. *obliquum*) has lvs. ternately divided into toothed segms. to 1 in. long.

Lunaria. Hardy: lvs. solitary, clasping, to 1 ft. long, pinnate into lunate entire or toothed segms. N. N. Amer., Eu., Asia.

matricariæfolium (*B. ramosum*). Hardy: lvs. to 1 ft. long, sessile, 1–2-pinnate, segms. toothed or divided. N. Amer., Eu.

obliquum: *B. dissectum* var.

ramosum: *B. matricariæfolium.*

ternatum: the plant cult. under this name is *B. dissectum* var. *obliquum.*

virginianum. Rattlesnake-Fern. Hardy: lvs. to 2½ ft. long, broadly triangular, ternate, the segms. pinnate and much cut. N. Amer., Eu., Asia.

BOTTLE-BRUSH: *Callistemon, Melaleuca.*

BOTTLE-TREE: *Brachychiton.*

BOUGAINVILLEA: *Buginvillæa.*

BOUNCING BET: *Saponaria officinalis.*

BOUSSINGAULTIA. *Basellaceæ.* Trop. American per. vines with alternate fleshy lvs. and small fls. in spike-like racemes.

Grown for ornament out-of-doors in warm regions and under glass in cold regions; also root-hardy North. Propagated by seeds, division of roots and by tubercles produced in leaf-axils.

baselloides. Madeira-Vine. Mignonnette-Vine. Tall vigorous twiner: lvs. ovate, to 3 in. long: fls. white, fragrant, the racemes sometimes 1 ft. long, in late summer or autumn.

BOUVARDIA. *Rubiaceæ.* Mostly shrubs native in Mex. and Cent. Amer., with opposite or whorled lvs., tubular 4-lobed red, yellow or white fls. in terminal cymes, sometimes solitary, and capsular fr.

Bouvardias are grown in the greenhouse and were once very popular. Many of the old florists kinds are supposed to be hybrids. They thrive in a temperature of about 55° in rich soil with abundant water. Propagated by root-cuttings and cuttings of fresh shoots taken with a heel and placed over bottom heat.

Humboldti. Lvs. opposite, ovate: fls. white, fragrant, to 2½ in. long and 1¼ in. across. Hort. form.

leiantha. Lvs. in whorls of 3–5, ovate, to 3 in. long, pubescent beneath: fls. deep red, ½ in. long, glabrous outside. Mex. to Costa Rica.

longiflora. To 5 ft.: lvs. opposite, ovate or lanceolate, to 2 in. long: fls. white, to 3½ in. long, glabrous outside, solitary. Mex.

ternifolia (*B. triphylla*). To 6 ft.: lvs. in 3's and 4's, lanceolate to ovate: fls. red, to 1¼ in. long, pubescent outside. Mex., W. Tex.

triphylla: *B. ternifolia.*

BOWER-PLANT: *Pandorea jasminoides.*

BOWIEA: *Schizobasopsis.*

BOWKERIA. *Scrophulariaceæ.* S. African shrubs or trees with lvs. usually in 3's and 2-lipped fls.; may be grown in S. Calif.

Gerrardiana. Shrub to 10 ft.: lvs. oval-lanceolate, to 6 in. long, finely toothed, paler beneath: fls. white, upper lip to ½ in. long and ⅔ in. broad.

triphylla. Very similar to the above but differing in the narrow upper lip of corolla.

BOX: *Buxus, Eucalyptus.* **Brisbane:** *Tristania conferta.* **-Elder:** *Acer Negundo.* **-Thorn:** *Lycium.* **Victorian:** *Pittosporum undulatum.*

BOYKINIA (*Therofon*). *Saxifragaceæ.* Per. American herbs with creeping rootstocks, alternate broad lvs. and white fls. in cymes or panicles; useful in the wild- or rock-garden; native mostly in woods and mts.

elata (*B. occidentalis*). To 2 ft.: lvs. 1–4 in. across, deeply lobed and toothed: petals much longer than calyx-lobes. Calif.

major. To 3 ft.: lvs. 4–8 in. across, cut and toothed: petals slightly longer than calyx-lobes. Ore., Calif.

occidentalis: *B. elata.*

rotundifolia. To 2 ft.: lvs. 2–7 in. across, shallowly lobed and toothed: petals only slighty longer than calyx-lobes. Calif.

tellimoides (*Saxifraga tellimoides*). To 3 ft.: lvs. to 5 in. across, 7–9-lobed: fls. greenish, petals twice or more longer than calyx-lobes. Japan.

BRACHYCHITON. Bottle-Tree. *Sterculiaceæ.* Australian trees sometimes with swollen trunk, bearing alternate entire or palmately lobed lvs., unisexual or polygamous fls. without petals but the calyx mostly corolla-like and bell-shaped, commonly in axillary panicles, and fr. a woody follicle, tardily dehiscing; planted for ornament in southern regions, and particularly in Calif. Propagated by seeds and cuttings of ripened wood.

acerifolium (*Sterculia acerifolia*). Flame-Tree. To 60 ft.: lvs. deeply 5–7-lobed, to 10 in. across, shining: fls. bright scarlet: fr. black, to 4 in. long.

Bidwilli (*Sterculia Bidwilli*). Shrub or tree, tomentose: lvs. deeply 3-lobed: fls. red.

discolor (*Sterculia discolor*). Lvs. irregularly 5–7-lobed or angled, white-tomentose beneath, to 6 in. across: fls. livid: fr. to 6 in. long, densely rusty-tomentose.

luridum (*Sterculia lurida*). Lvs. palmately 5–7-lobed, pubescent on both sides: fls. livid and variegated: fr. to 6 in. long. tomentose.

populneum (*Sterculia diversifolia*). Kurrajong. To 60 ft.: lvs. ovate and entire or 3-5-lobed, to 3 in. long, shining: fls. yellowish-white, reddish inside: fr. to 3 in. long. Var. **occidentalis** (*Sterculia Gregorii*) has deeply 3-lobed lvs. and salmon-pink fls.

rupestris (*Sterculia rupestris*). Tree with swelling trunk often contracted at top and bottom: lvs. oblong-linear, entire, to 6 in. long, or digitately compound into 5–9 linear-lanceolate lfts.: fls. tomentose: fr. 1 in. long.

BRACHYCOME. *Compositæ.* Herbaceous annuals and perennials with simple or branching sts., basal or alternate lvs., entire or more or less pinnately cut: heads solitary or loosely clustered at ends of branches; ray-fls. white, blue or lilac; pappus of bristles or scales or lacking. Of easy cult. in the flower-garden. Propagated by seeds.

iberidifolia. Swan River Daisy. Ann., branching, to 1½ ft.: lvs. alternate, pinnate into narrow segms.: heads 1 in. across, blue, rose or white. Australia.—A good edging and border ann.

BRACHYGLOTTIS. *Compositæ.* New Zealand shrubs or small trees with large lobed lvs. and small heads borne in terminal branched panicles, with ray- and disk-fls.; pappus bristly. Grown out-of-doors in S. Calif.

Rangiora. To 14 ft.: lvs. to 15 in. long, sinuate, white-tomentose beneath, glossy above: heads ⅛ in. long, involucral bracts purplish.

repanda. To 20 ft.: lvs. to 1 ft. long, sinuate, white-tomentose beneath, dull above: heads ⅙ in. long, involucral bracts white, shining. Var. **variegata** is listed.

BRACHYPODIUM. *Gramineæ.* Slender ann. or per. grasses mostly of the north temp. zone, having many-fld. flattened spikelets borne in spike-like racemes; a few sometimes grown for ornament. See *Grasses.*

distachyon. Ann. to 1½ ft.: lvs. to 4 in. long and ⅙ in. wide, slightly hairy: racemes to 3 in. long, awns to ¾ in. long. Medit. region, S. Afr.

gracile: *B. sylvaticum.*

sylvaticum (*B. gracile*). Per. to 4 ft.: lvs. to ⅔ in. across, flaccid, hairy: racemes nodding, to 6 in. long, awns to ⅓ in. long. Medit. region, Asia.

BRACHYSEMA. *Leguminosæ.* Australian shrubs with simple lvs., mostly red papilionaceous fls. solitary or clustered, and swollen pods; cult. out-of-doors in S. Calif.

acuminatum. Subshrub, often spreading: lvs. opposite, oval-elliptic, silvery-canescent beneath.

lanceolatum. To 3 ft.: lvs. usually opposite, lanceolate, to 4 in. long, silvery-canescent beneath: pods about ½ in. long.

BRACKEN: *Pteridium.*

BRACT: a much-reduced leaf, particularly the small or scale-like leaves in a flower-cluster or associated with the flowers and on the upper part of flowering stems.

BRACTEOLARIA: *Baphia.*

BRACTLET: bract borne on a secondary axis, as on the pedicel or even on a petiole.

BRADBURYA: *Centrosema.*

BRAHEA. *Palmaceæ.* As now understood Brahea has 3 species in Mex. and 1 in El Salvador: they are hermaphrodite fan-palms of middle size, unarmed except perhaps on petioles, with solitary trunk bearing remains of old lf.-bases above, more or less ringed below, spadices among the lvs. and commonly exceeding them, diffusely short-branched, the branches not subtended by spathes; fls. sessile on the tomentose or pubescent branchlets; stamens 6, filaments united in tube: fr. oblong-elliptic, ½ in. or less long. The Braheas are more or less planted in S. Calif. For cult. see *Palm.*

armata: *Erythea armata.*

calcarea. Trunk bearing old lvs. or becoming naked, to 20 ft.: lvs. to 3 ft. and more across making a heavy rather dense crown, shining green above and glaucescent underneath, divided to about the middle into some 80 narrow eventually drooping very long- and narrow-pointed deeply bifid segms., filaments few; petiole unarmed, slender, about equalling or exceeding the blade: branchlets of spadix filiform and pubescent, the fls. solitary: fr. ovoid, about ½ in. long; seed adherent to the endocarp. Mex., near Veracruz.

dulcis. Trunk stout, to 20 ft., bearing scars of old lvs. or at top covered with old lvs., naked at base: lvs. 4–5 ft. lengthwise, green, divided to middle or beyond into about 60 rather broad long-pointed and deeply bifid long-hanging segms., the filaments few; petiole rather slender, coarsely retrorse-spiny: spadix to 5 or 7 ft. long, pendulous; fls. partly immersed, the branchlets terete and thick and densely tomentose: fr. oblong-ellipsoid, about ½ in. long, yellow and succulent; seed free from endocarp. Mex.

edulis: *Erythea edulis.*

filamentosa, filifera: *Washingtonia filifera.*

glauca: *Erythea armata.*

Pimo. Trunk 10–12 ft.: lvs. 2 ft. or so long, dull green but paler underneath and scurfy on ribs, divided less than half the depth into 40–50 rather firm shortly bifid segms., filaments few; petiole very slender, scurfy, with many small deflexed spine-teeth: spadix about 1½ ft. long, the branchlets filiform and somewhat tomentose; fls. glomerate. Mex.—Insufficiently known.

BRAKE: *Pteridium, Pteris.* **Cliff-:** *Pellæa.* **Rock-:** *Cryptogramma.*

BRAMBLES: *Rubus.*

BRASENIA. *Nymphæaceæ* (or *Cabombacaceæ*). One aquatic herb, often in deep water, native in N. Amer., Asia, Afr. and Australia, grown sometimes in ponds. Propagated by seed or division of roots. **B. Schreberi** (*B. peltata. B. purpurea*). WATER-SHIELD. Lvs. floating, to 4 in. long and 2 in. wide, peltate, submerged parts coated with thick transparent jelly: fls. purple, ½ in. across, on long axillary peduncles: fr. ⅓ in. long, of separate carpels.

BRASSAVOLA. *Orchidaceæ.* Trop. American epiphytes having pseudobulbs, fleshy lvs. and fls. solitary or in short racemes, the sepals and petals small and spreading, the lip entire and attached to column at base. For cult. see *Orchids.*

cucullata. Pseudobulbs 6 in. high, bearing a lf. to 8 in. long: fls. usually solitary, the sepals and petals white with rosy tips, the lip white toothed on edges, with long point, Oct.–Dec. W. Indies, Venezuela, Guatemala.

Digbyana (*Lælia Digbyana*). Pseudobulbs 6 in. high, bearing a lf. to 8 in. long: fls. solitary, fragrant, to 5 in. across, greenish-white, the lip deeply fringed on margins, May–Aug. Honduras, Mex.

glauca (*Lælia glauca*). Similar to the above but with fls. bright olive- or whitish-green and shortly fringed lip, Feb.–Mar. Mex., Guatemala.

BRASSIA. *Orchidaceæ.* Epiphytes native in trop. Amer., having pseudobulbs bearing 1 or 2 lvs. and fls. in racemes, the sepals and petals narrow and long-pointed, often tail-like, the lip entire and shorter than the sepals; grown in an intermediate temperature. See *Orchids.*

brachiata. Pseudobulbs to 5 in. high, bearing 2 linear-lanceolate lvs. to 1 ft. long: scapes to 3 ft. long, bearing a 7–10-fld. raceme; sepals about 8 in. long, yellowish-white marked with brown below, the petals about half as long; lip light yellow marked with green, July–Oct. Guatemala.

Lawrenceana. Pseudobulbs about 5 in. long, bearing 2 lanceolate lvs. to 1 ft. long: scapes to 2 ft. long; sepals and petals bright yellow spotted with brown, the former about 3 in. long, the lip bright yellow, May–June. Brazil.

longissima (*B. Lawrenceana* var. *longissima*). Pseudobulbs to 3 in. high, bearing 1 or 2 lvs. to 1 ft. long and 2 in. wide: scapes to 2 ft. long, with a 10–15-fld. raceme; sepals and petals golden-yellow spotted with brown at base, the lateral sepals to 10 in. long; lip white spotted with red-brown, June. Costa Rica.

verrucosa. Pseudobulbs to 4 in. long, bearing 2 linear lvs. to 1 ft. long: scapes to 2½ ft. long, with 6–13-fld. racemes; sepals and petals green spotted at base with brown, the former to 4 in. long; lip white spotted with dark green below, Apr.–June. Mex., Guatemala.

BRASSICA (incl. *Sinapis*). COLES. MUSTARDS. *Cruciferæ.* Mostly ann. and bien. herbs, sometimes per., yielding many edible plants: see *Broccoli, Brussels Sprouts, Cabbage, Cauliflower, Collards, Kale* (Borecole), *Kohlrabi, Mustard, Pe-tsai, Rape, Rutabaga, Turnip.* The species are probably 50 or more, original in the Old World, but the nativity of many of them is unknown; some of them are widespread weeds. They are erect tall branched and for the most part glabrous often glaucous plants with variously pinnatifid or lyrate or strongly toothed lower lvs., yellow or yellowish-white or sometimes white fls. in terminal racemes in spring and summer, pods or siliques elongated. The cult. is simple; they are essentially cool-season subjects.

acephala: *B. oleracea* var.

alba (*Sinapis alba*). WHITE MUSTARD. Ann. to 4 ft., sparsely hairy: lvs. oval to obovate, deeply divided on sides: fls. yellow, about ½ in. long: pod to 1½ in. long, spreading, lower part seed-bearing and nodulose, beak flat.

alboglabra. Ann., perhaps sometimes living over winter, glabrous and very glaucous, to 3 ft.: lvs. thick, lower ones oval, sinuate, to 10 in. long, auricled or lobed at base of blade, long-stalked, upper st.-lvs. long-oblong and petioled or not clasping: fls. white, large, cabbage-like: pod 2–3 in. long. Probably from Orient, there grown as pot-herb.

arvensis (*Sinapis arvensis*). CHARLOCK. Widespread weed in grain fields and waste places, the seed perhaps sometimes employed in the making of table mustard: ann. to 3 ft. or more, green, commonly hispid toward base and sometimes above: lvs. ovate to oblong-ovate, variously lobed or lyrate, not clasping: fls. small, yellow: pod about ¾ in. or less long, nodulose, beak often ½ in. or more long.

botrytis: *B. oleracea* var.

bullata: form of *B. oleracea* var. *capitata*.

campestris. Ann., in grain fields eastward and a great weed on Pacific Coast, glaucous all over, 2–6 ft.: lvs. clasping, the lower ones variously lyrate-lobed: fls. small, bright yellow: pod 2–3 in. long.

capitata: *B. oleracea* var.

cauliflora: *B. oleracea* var. *botrytis*.

caulorapa. KOHLRABI. Low bien., glabrous and glaucous: st. swelling just above ground into the "turnip" or edible part: lvs. rather small, 10 in. or less long, with oval dentate blade and long petiole: fls. cream-yellow: pod 2–3 in. long, with short thick beak.

chinensis. PAK-CHOI. Ann. or bien., glabrous, somewhat glaucous at maturity: lower lvs. shining green making a rather compact crown or cluster to 20 in. high but not a head, obovate and entire or nearly so, the petiole white and narrowly winged or margined but not jagged; st.-lvs. clasping: fls. pale yellow, ¾ in. long: pod to 2½ in. long. Grown as pot-herb.

gemmifera: *B. oleracea* var.

japonica: *B. juncea* var. *crispifolia*.

juncea (*Sinapis juncea. B. rugosa*). LEAF-MUSTARD. Ann., green but st. sometimes slightly glaucous, to 4 ft.: lower lvs. oval to obovate, rather thin, lyrate-lobed or divided, with toothed or scalloped edges; st.-lvs. narrowed at base but not clasping: fls. bright yellow: pod to 1½ in. long. The commonest form of leaf-mustard for greens, often in the var. **crispifolia** (*B. japonica* of hort. but not botanically) known as Southern Curled. Sometimes run wild.

Napobrassica. RUTABAGA. Bien., very glaucous and thick-lvd., glabrous, the underground tuber with solid yellow or white flesh and with long neck or crown and often withstanding winter in the N.: lvs. large and long, lyrate-pinnatifid, those on st. with clasping base: fls. light yellow to whitish-yellow: pods much spreading on stout pedicels, the beak stout and short. Var. **solidifolia** has long not-lobed radical lvs.

Napus. RAPE. COLZA. Ann., but late-sown plants pass the winter and bloom following spring, making thin tap-root: otherwise much like *B. Napobrassica* except that the pods are ascending on rather thin pedicels and the beak is slender and commonly ½ in. or more long.

narinosa. Stout low glabrous not glaucous bien., bearing short clusters of orbicular-ovate small puckered mostly entire lower lvs. with broad whitened petioles; st.-lvs. very broad and clasping, entire: fls. yellow: pod very thick and relatively short, ¾ in. or less long and one-half or one-third as broad, the beak very short and stout. Grown for pot-herb by Chinese.

nigra (*Sinapis nigra*). BLACK MUSTARD. Tall ann. to 6 ft. and more, mostly hispid-hairy at least below, little it at all glaucous: lvs. pinnatifid or lobed, terminal part large, petioled, dentate: fls. yellow, in many short racemes: pods 1 in. or less long, 4-sided, appressed to rachis. A widespread weed, and as a cult. plant the main source of table mustard.

oleracea. Thick-lvd. glaucous per. (probably also bien.) on coasts of W. England, represented in cult. by many races: lower lvs. to 20 in. long, oblong or obovate, lobed at base; st.-lvs. narrow, long, sometimes clasping: fls. whitish-yellow or cream-yellow, large, to 1 in. long: pods to 4 in. long, spreading. Not in cult. except now and then in test grounds. Var. **acephala** (*B. acephala*) comprises forms without heads or dense rosettes: KALE or BORECOLE, COW-CABBAGE. Var. **botrytis** (*B. botrytis*) has whitish heads formed of thickened transformed fl.-clusters: CAULIFLOWER, BROCCOLI. Var. **capitata** (*B. capitata*) has one dense head of consolidated lvs.: CABBAGE (one form being Savoy, sometimes known as var. *bullata* or *B. bullata*). Var. **gemmifera** (*B. gemmifera*) has small compact buds or heads in lf.-axils long the st.: BRUSSELS SPROUTS, known commonly as "SPROUTS." Var. **italica** with thickened fl.-branches not condensed into a solid head: SPROUTING, BRANCHING or ASPARAGUS BROCCOLI. VAR. **Tronchuda**; a low cabbage-like plant without head and with broad midribs: PORTUGUESE CABBAGE or KALE.

parachinensis. FALSE PAK-CHOI. Like *B. chinensis* but with radical lvs. more orbicular and petiole not margined, st.-lvs. narrowed to base and not clasping. Grown by Chinese as pot-herb.

pekinensis (*B. Pe-Tsai*). PE-TSAI (which see). CELERY CABBAGE. Ann. with green soft foliage, glabrous or essentially so: basal lvs. large and very broad, with undulate or obscurely toothed margins, the petiole broad, flat and with jagged wings; st.-lvs. either stalked or clasping: fls. light yellow: pod to 2½ in. long. Grown as a cool-season vegetable, the lvs. forming a more or less solid attractive head.

Pe-Tsai: *B. pekinensis*.

Rapa. TURNIP. Green-lvd bien., with white- or yellow-fleshed flat or globular tuber not bearing a long neck or crown and that does not withstand the winter in the N.: lvs. soft but hispid, to 20 in. long lyrate-pinnatifid; st.-lvs. clasping: fls. yellow: pods 2½ in. long or less. Var. **lorifolia**, STRAP-LEAVED T., has radical lvs. nearly or quite unlobed. Var. **septiceps.** SEVEN-TOP T. A race with thick not tuberous root that passes the winter and sends up several shoots that are used for food. Sometimes sold as "Italian kale."

rugosa: *B. juncea*.

BRASSOCATTLÆLIA. *Orchidaceæ.* Trigeneric hybrids between the genera Brassavola, Lælia and Cattleya.

Mackayi (*B. Digbyana* × *L.-C. elegans*).

BRASSOCATTLEYA. *Orchidaceæ.* A group comprising hybrids between the genera Brassavola and Cattleya.

Fournieræ (*B. Digbyana* × *C. labiata*).
heatonensis (*B. Digbyana* × *C. Hardyana*).
Holfordii (*B. Digbyana* × *C. Forbesii*).
Hyeæ (*B. Digbyana* × *C. Harrisoniana*).
langleyensis (*B. Digbyana* × *C. Schroederiana*).
Leemanniæ (*B. Digbyana* × *C. Dowiana*).
Mariæ (*B. Digbyana* × *C. Warneri*).
Maronæ (*B. Digbyana* × *C. Warscewczii*).
Maroni (*B. Digbyana* × *C. Mendelii*).
Sedeni (*B. Digbyana* × *C. Trianæi*).
Thorntonii (*B. Digbyana* × *C. Gaskelliana*).
Veitchii (*B. Digbyana* × *C. Mossiæ*).

BRASSOLÆLIA. *Orchidaceæ.* A series of hybrids between Brassavola and Lælia.

Gratrixiæ (*B. Digbyana* × *L. cinnabarina*).
Jessopi (*B. Digbyana* × *L. xanthina*).
Veitchii (*B. Digbyana* × *L. purpurata*).

BRAUNERIA: *Echinacea*.

BRAZIL-NUT: *Bertholletia.*

BRAZIL-WOOD: *Cæsalpinia echinata.*

BREADFRUIT. The great rough syncarp of *Artocarpus communis*, native probably in the Malayan Archipelago and now widely dispersed in the torrid zone; it is cooked for eating. The tree is large and heavy-leaved. The fruit is borne on small branches; it is commonly 4–8 inches in diameter when full grown, spherical or short-oblong. The tree is sometimes seen in economic collections under glass and may be set out in the open in the warmest parts of the continental United States, but its real culture is confined to low moist regions in the tropics. The usual breadfruit is seedless and is propagated by means of suckers and root-cuttings. The seed-bearing form, usually called breadnut, may be raised from seeds; this is grown for the seeds which are roasted or boiled.

BREADNUT: *Brosimum Alicastrum;* see *Breadfruit.*

BREADROOT, INDIAN: *Psoralea esculenta.*

BREVOORTIA. *Liliaceæ.* One California cormous herb, grown in shady well-drained locations. **B. Ida-Maia** (*Brodiæa coccinea*). Floral Fire-Cracker. To 3 ft.: lvs. basal, linear: fls. tubular, scarlet tipped with green, 1½ in. long, nodding in umbels terminating the scape.

BREYNIA. *Euphorbiaceæ.* Shrubs or trees with alternate simple lvs., monœcious apetalous fls. usually solitary in the axils, and fr. a berry; native in Old World tropics. Grown for ornament and hedges in the warmest parts of the country and in greenhouses in the N. Propagated by cuttings of green wood and roots.

nivosa (*Phyllanthus nivosus*). Snow-Bush. Loose-growing shrub, 3–4 ft.: lvs. oval, to 2 in. long, mottled or speckled green and white: fls. small and greenish. S. Sea Isls.; more or less run wild in Fla. and tropics. Var. **atropurpurea** (var. *purpurea*) has dark purple lvs. and var. **roseo-picta** has lvs. mottled with pink and red.

BRICKELLIA (*Coleosanthus*). *Compositæ.* American herbs or shrubs with alternate or opposite lvs. and heads in panicles or cymes, of white, yellowish or pink disk-fls.; pappus bristly; achenes 10-ribbed. One species is grown in the border where it thrives in moist shady locations. Propagated by cuttings over heat.

grandiflora. Tassel-Flower. Per. to 3 ft.: lvs. triangular-ovate, to 4 in. long, toothed: heads about ½ in. across, yellowish-white. W. N. Amer., in mts.

BRIDAL WREATH: *Spiræa prunifolia* and *trichocarpa;* see also *Francoa ramosa.*

BRIDGESIA: *Ercilla spicata.*

BRISTLY: bearing stiff strong hairs or bristles.

BRITTONASTRUM. *Labiatæ.* Per. herbs native in Ariz. and Mex., with toothed opposite lvs. and white, red or purple 2-lipped fls. in whorls in terminal spikes, stamens exserted; sometimes grown in the herb-garden but not hardy in the N. Propagated by division.

canum (*Cedronella* and *Agastache cana*). To 3 ft., woody, hoary: lvs. ovate, to 1½ in. long: fls. pink, 1 in. long.

mexicanum (*Cedronella mexicana. Gardoquia betonicoides*, but the plant sold under this name may not be correct). To 3 ft., with creeping roots: lvs. ovate-lanceolate, to 2½ in. long: fls. pink, 1 in. long.

BRIZA. Quaking-Grass. *Gramineæ.* Small ann. and per. grasses having many-fld. flattened nodding spikelets borne in panicles with hair-like branchlets; native in Old World and S. Amer., a few grown for ornament.

compacta: hort. name.

geniculata: *Eragrostis obtusa.*

gracilis: *B. minor.*

maxima. Ann. to 2 ft.: lvs. to 6 in. long and ¼ in. wide: spikelets ovate, ½ in. or more long, often bronzy, in panicles to 3 in. long, decorative. Medit. region.

media. Per. to 2 ft.: lvs. to 3 in. long and ⅙ in. wide: spikelets ovate, to ¼ in. long, often purplish, in panicles to 10 in. long. Eu., Asia; nat. in N. Amer.

minor (*B. gracilis*). Ann. to 1½ ft.: lvs. to 5 in. long and ⅓ in. wide: spikelets triangular, to ⅙ in. long, in panicles to 5 in. long. Eu.; nat. in N. Amer.

BRIZOPYRUM: *Demazeria sicula.*

BROCCOLI (*Brassica oleracea* var. *botrytis*). A form or race of the cauliflower tribe, requiring a long season and usually coming to best results (where the climate allows) if the plants are allowed to stand over winter and to make their heads in spring, which will be one year from seed-sowing. The leafage of the plant is likely to be more erect than in the cauliflower and the leaves narrow and long. A related plant, not making a large single white head but a loose more or less leafy panicle of edible flower shoots, is the asparagus or sprouting broccoli (*B. oleracea* var. *italica*). For culture of broccoli, see *Cauliflower.*

BRODIÆA. *Liliaceæ.* Cormous herbs mostly native in W. N. Amer., in fields and on hills and mountains, with few basal grass-like lvs. and funnel-shaped or campanulate fls. in loose umbels terminating the slender scapes.

Brodiæas are hardy in the Pacific and southern states and useful in borders; also sometimes grown in pots; spring and summer bloomers. They thrive on any soil that is not wet or heavily manured. Propagated by seeds or offsets if produced.

Bridgesii. To 9 in.: fls. pale lilac, about 1½ in. long, fertile stamens 6. Calif., Ore.

californica. To 1 ft.: fls. violet-purple, to 1½ in. long, fertile stamens 3. Calif.

candida. Similar to *B. laxa* but with white or pale blue fls. Calif.

capitata (*Dichelostemma capitatum*). Blue-Dicks. To 2 ft.: fls. blue, ⅔ in. long, in head-like umbels, fertile stamens 6. S. Ore. to Lower Calif.

coccinea: *Brevoortia Ida-Maia.*

congesta: *B. pulchella.*

coronaria (*B. grandiflora*). To 1½ ft.: fls. violet-purple, to 1¾ in. long, fertile stamens 3. B. C. to Calif.

crocea. To 1 ft.: fls. bright yellow, ¾ in. long, fertile stamens 6. Calif.

Douglasii (*Triteleia grandiflora*). To 2 ft.: fls. blue, to 1 in. long. B. C. to Ore. and Mont.

grandiflora: *B. coronaria.*

Hendersonii. Similar to *B. Bridgesii* but with yellow fls. having purple band down center. Ore.

ixioides (*Calliprora ixioides*). Pretty Face. To 1½ ft.: fls. salmon-yellow veined with dark purple, ¾ in. long, fertile stamens 6. Ore to S. Calif. Var. **splendens** has large bright yellow fls.

lactea (*Hesperoscordum hyacinthinum*). Wild-Hyacinth. To 1½ ft.: fls. white or lilac, ½ in. long, fertile stamens 6. B. C. to Calif.

laxa (*Triteleia laxa*). Grass-Nut. Triplet-Lily. To 2 ft.: fls. purple or rarely white, to 1¾ in. long, fertile stamens 6. Calif.

minor (*B. Purdyi. Hookera minor*). To 10 in.: fls. violet-purple, 1 in. long, fertile stamens 3. Calif.

multiflora. To 2 ft.: fls. light purple, ¾ in. long, in head-like umbels, fertile stamens 3. Calif., Ore.

peduncularis (*Triteleia peduncularis*) To 3 ft.: fls. violet-purple or white, ¾ in. long, fertile stamens 6. Calif.

pulchella (*B. congesta. Dichelostemma pulchellum*). To 3 ft.: fls. violet-purple, ¾ in. long, in head-like clusters, fertile stamens 3. Wash. to Calif.

Purdyi: *B. minor.*

stellaris (*Hookera stellaris*). To 6 in.: fls. violet-purple, ¾ in. long, fertile stamens 3. Calif.

terrestris. Very low, the mostly large umbel at or near the ground: fls. purple, wide open, ¾ in. long. Calif.

uniflora (*Milla uniflora. Triteleia uniflora. Leucocoryne uniflora*). Spring Star-Flower. To 8 in., with onion-like odor: fls. white tinged with blue, solitary, 1 in. long. Argentina. Var. **cærulea** has porcelain-blue fls. and **violacea** violet fls.

volubilis (*Dichelostemma* and *Stropholirion californicum*). Snake-Lily. To 3 ft. or twining to 8 ft.: fls. rose or pink, ⅔ in. long, fertile stamens 3. Calif.

BROMELIA. *Bromeliaceæ.* Trop. American terrestrial herbs with stiff spiny-margined lvs. in basal rosettes, and fls. in heads or panicles; planted in the tropics and sometimes in greenhouses. See *Bromeliaceæ.*

Pinguin. Pinguin. Lvs. to 6 ft. long and 1½ in. wide, light green, with hooked prickles: fls. white or pinkish, in mealy panicles shorter than lvs. W. Indies, S. Amer.

BROMELIACEÆ. Bromeliads. Bromelia or Pineapple Family. American herbs or subshrubs, of tropics or warm countries, mostly epiphytic, of about 40 genera, with usually long stiff lvs. often in rosettes, regular bisexual fls. in spikes, heads or branching panicles often with showy colored bracts and sometimes with ornamental fls., having 6 perianth-parts in 2 series, 6 stamens, 3-celled ovary and fr. a berry or caps. Several genera are grown for ornament, mostly under glass, and the pineapple for food, such as Æchmea, Ananas, Aregelia, Billbergia, Bromelia, Canistrum, Cryptanthus, Dyckia, Greigia, Guzmania, Nidularium, Pitcairnia, Puya, Rhodostachys, Tillandsia, Vriesia. Distinctions between the genera are mostly technically botanical and cannot be detailed here.

Many of the bromeliads, in several genera, make showy and effective greenhouse and conservatory subjects. Although many of the cultivated kinds are variously epiphytic in their native habitats, they are usually grown in pots, wire baskets or wooden cribs, in a soil of fibrous material. Growth is mostly in summer, when plenty of water should be supplied; bloom is usually best in the following late winter to early summer. The spikes of showy bracts and often of colored flowers make the plants unusually attractive. Most bromeliads require a night temperature in the winter of 50–75°, and plenty of light and sunshine. In winter only a light sprinkling over the foliage is necessary. Propagated by suckers or sprouts from the base of the old plants.

BROMUS. Brome-Grass. *Gramineæ.* Ann. and per. grasses with flat lvs. and usually drooping spikelets in open terminal panicles; mostly natives of the north temp. zone, some kinds grown for forage and others for the flower-garden. See *Grasses.*

brizæformis. Quake-Grass. Ann. to 2 ft.: lvs. to 8 in. long and ¼ in. wide: spikelets ovate-oblong, flattened, to 1 in. long, awnless, in panicles to 8 in. long, the branches nodding. N. Eu., Asia; nat. in N. Amer.—Useful in dry bouquets.

erectus. Per. to 3 ft.: lvs. to 1 ft. long and ⅙ in. wide: spikelets to 1½ in. long, awned, in panicles to 7 in. long, the branches erect. Eu.; nat. in E. N. Amer.

inermis. Hungarian or Awnless B. Per. to 4 ft.: lvs. to 1 ft. long and ¼ in. wide: spikelets oblong, to 1 in. long, awnless, in panicles to 10 in. long, the branches ascending. Eu.; grown in pastures and sometimes escaped.

intermedius (*Serrafalcus Hughi*). Ann. or bien. to 1½ ft.: spikelets 1 in. long, greenish or yellowish, in panicles to 4 in. long. Medit. region.

japonicus (*B. patulus*). Ann. to 2 ft.: lvs. to 8 in. long and ¼ in. wide: spikelets lanceolate, to 1 in. long, awned, in panicles to 8 in. long, the branches nodding. Eu., Asia; sparingly nat. in N. Amer.

macrostachys. Ann. to 2 ft.: lvs. to 6 in. long and ¼ in. wide: spikelets to 1½ in. long, flattened, with awns to ¾ in. long, in panicles to 4 in. long, the branches erect. Eu., W. Asia.—Grown for ornament. Var. **lanuginosus** has lvs. and spikelets pubescent.

madritensis. Ann. to 2½ ft.: lvs. to 8 in. long and ¼ in. wide: spikelets to 2 in. long, with awns to ¾ in. long, in dense panicles to 6 in. long, the branches erect. Eu.; escaped in N. Amer.—Grown for ornament.

patulus: *B. japonicus.*

pendulinus. Per. to 3 ft.: lvs. to 6 in. long and ⅙ in. wide: spikelets to ¾ in. long, awned, in panicles to 6 in. long. Mex.

unioloides (*Ceratochloa pendula*). Rescue-Grass. Ann. or bien. to 3 ft.: lvs. to 1 ft. long and ⅓ in. wide: spikelets to 1 in. long, much flattened, awnless, in panicles to 10 in. long, the branches ascending. S. U. S. to S. Amer.—Grown for forage in the S.

BROOKLIME, EUROPEAN: *Veronica Beccabunga.*

BROOM: *Cytisus, Genista, Spartium.* **Butchers:** *Ruscus aculeatus.* **Climbing Butchers:** *Semele androgyna.*

BROSIMUM. *Moraceæ.* Trop. American milky-juiced trees with alternate entire leathery lvs., staminate fls. of a single stamen, pistillate fls. and frs. immersed in the fleshy receptacle; grown in trop. regions for the nuts, and for the lvs. which are used for fodder. Propagated by cuttings over heat.

Alicastrum. Breadnut. To 100 ft.: lvs. oblong, to 7 in. long and 2½ in. wide: fr. globose, about 1 in. across, yellow, with a single large seed which is eaten and roasted. Mex., Cent. Amer., W. Indies.

BROUGHTONIA. *Orchidaceæ.* A small genus of W. Indian epiphytic orchids of which one is sometimes cult. under glass. B. sanguinea. Pseudobulbs 2 in. long, bearing 2–4 leathery lvs. about 2 in. long: scapes to 1½ ft. tall, bearing racemes of crimson-purple fls. about 1½ in. across, May–June. Cuba, Jamaica.

BROUSSONETIA. Paper-Mulberry. *Moraceæ.* Deciduous trees or shrubs with milky juice, alternate toothed often lobed lvs., staminate fls. in drooping catkins, pistillate in globose heads, and fr. a small syncarp composed of orange-red drupelets; native in E. Asia, where the bark is used for making paper.

Propagated by seeds, suckers, cuttings of green or ripe wood in a cool greenhouse, root-cuttings over slight heat, and by layers. Varieties may also be grafted in spring in the greenhouse on roots of the type or budded in summer.

papyrifera (*Papyrius papyrifera*). To 50 ft.: lvs. ovate, to 8 in. long, usually deeply lobed, grayish-pubescent beneath: syncarp tomentose, ¾ in. across. China, Japan; much planted as a street tree and nat. N. Y. to Fla. and Mo. Var. **laciniata,** lvs, finely dissected. Var. **leucocarpa,** fr. white. Var. **variegata,** lvs. variegated white or yellow. Hardy in central states, and farther north in protected places.

secundiflora: *Sophora secundiflora.*

BROWALLIA. *Solanaceæ.* Annuals grown in the garden or greenhouse for the blue, violet or white tubular fls. with spreading 5-lobed limb, which are solitary and axillary or in more or less one-sided racemes; lvs. usually simple; native in trop. Amer. and of the simplest cult.

americana (*B. demissa. B. elata*). To 2 ft., glabrous or somewhat pubescent, not viscid: lvs. ovate, to 2½ in. long: fls. blue or violet, tube ½ in. long and limb ½ in. across, segms. 2-lobed, calyx hairy. Trop. Amer. Var. **alba** has white fls. and **nana** is dwarf.

Czerwiakowskii: *B. viscosa.*

demissa: *B. americana.*

elata: *B. americana.*

grandiflora (*B. Roezlii*). Similar to *B. americana,* with white or pale blue broader fls. and glabrous calyx. Peru.

Jamesonii: *Streptosolen Jamesonii.*

major: *B. speciosa.*

pulchella: *B. viscosa.*

Roezlii: *B. grandiflora.*

speciosa (*B. major*). To 5 ft., shrubby at base: lvs. ovate: fls. with tube 1 in. long, limb dark purple, pale lilac beneath, varying to blue, violet and white, to 2 in. across, segms, entire. Colombia.

viscosa (*B. Czerwiakowskii. B. pulchella*). To 1 ft., sticky-hairy, at least on young parts: lvs. ovate: fls. dark blue with white eye, or white, to ¾ in. long, the segms. short and 2-lobed. S. Amer.—Some of the stock otherwise named belongs here.

BROWNEA (*Hermesias*). *Leguminosæ.* Small trees native in trop. Amer., with leathery pinnate lvs. and very showy red fls. in racemes or dense heads; sometimes planted in the warmest parts of the country.

capitella. Lfts. 9 in. or more long, long-acuminate: fls. in dense heads about 11 in. across, the stamens long-exserted. Venezuela.

grandiceps. Lfts. about 7 in. long, caudate: fls. in dense heads about 9 in. across. S. Amer.

latifolia. Lfts. to 4 in. long and 2 in. wide, pointed: heads small, stamens slightly protuding. Trinidad, Venezuela.

macrophylla. Partially climbing shrub to 18 ft.: lfts. tomentose beneath: heads to 6 in. across, borne near base of trunk. Panama, Colombia.

Rosa-de-monte (*B. rosea*). Lfts. 3–4 in. long, abruptly acuminate: fls. in heads. S. Amer.

rosea: *B. Rosa-de-monte.*

BROWN-EYED SUSAN: *Rudbeckia triloba.*

BRUCKENTHALIA. *Ericaceæ.* One evergreen heath-like shrub to 10 in. high, adapted to the rock-garden and hardy N. Propagated by seeds and cuttings. **B. spiculifolia.** Spike-Heath. Lvs. crowded, linear, about 15 in. long: fls. pink, very small, bell-shaped, in racemes to ¾ in. long, the style exserted, in summer. S. Eu., Asia Minor.

BRUGMANSIA: *Datura.*

BRUNELLA: *Prunella.*

BRUNFELSIA (*Franciscea*). *Solanaceæ.* Shrubs and trees usually winter blooming, with mostly large showy often fragrant funnel-shaped fls. in loose or dense terminal cymes or sometimes solitary: lvs. alternate, simple and entire. Native in trop. Amer., a few grown in conservatories and in the open in Fla. and S. Calif. Linnæus, in 1753, spelled the name Brunsfelsia, but in Genera, 1754, Brunfelsia, apparently a correction.

Brunfelsias need a rich loose compost and liberal feeding during their growing season, blooming best if pot-bound. They should have a night temperature of 50°. Propagated by cuttings from the new growth in spring or in autumn from pieces of ripened wood.

americana. Lady-of-the-Night. Shrub to 8 ft.: lvs. oval to obovate, to 4 in. long: fls. white fading to yellow, mostly solitary, the slender tube to 4 in. long and limb to 2 in. across, very fragrant at night; calyx short: fr. a yellow berry ¾ in. diam. W. Indies.

calycina. Erect or spreading: lvs. ovate-oblong, to 4 in. long, dark green above, lighter below: fls. rich dark purple, limb 2 in. across, in few-fld. mostly terminal cymes; calyx with tube to 1 in. long, half or more length of corolla-tube. Brazil. Var. **eximia,** fls. rich purple soon fading to almost pure white. Var. **floribunda** (*B. floribunda*), dwarf, fls. rich violet with small white eye. Var. **macrantha** (*B. grandiflora, B. macrantha*), lvs. rich dark green, to 8 in. long, fls. rich deep purple with lavender-blue ring around white eye at mouth of tube. Peru.

capitata. Shrub: lvs. obovate-oblong, to 9 in. long: fls. in many-fld. cymes, corolla-tube slightly longer than calyx which is 1 in. long. Brazil.

floribunda: *B. calycina* var.

grandiflora: *B. calycina* var. *macrantha.*

Hopeana. Slender branching shrub: lvs. lanceolate-oblong, to 3 in. long, rich dark green: fls. small, solitary or in pairs along the leafy growths, limb light violet-blue changing to nearly white, tube nearly white, 1 in. long; calyx ¾ in. long. Brazil, W. Indies.

latifolia. Rather dwarf: lvs. oval, to 4 in. long: fls. nearly white to lavender and purple with lighter center, solitary or in few-fld. clusters, tube 1 in. long, limb 1½ in. across; calyx short. Trop. Amer.

macrantha: *B. calycina* var.

macrophylla. Shrub: lvs. oblong, to 9 in. or more long: fls. in loose many-fld. cymes, corolla-tube twice as long as calyx. Brazil.

BRUNIACEÆ. Brunia Family. About a dozen genera of heath-like subshrubs, mostly in S. Afr. but extending to S. Australia, placed in the sequence near Hamamelidaceæ and Saxifragaceæ. The family is characterized by small bisexual and regular fls., with the parts mostly 4 or 5, and a dry fr. with commonly 2 parts. Only Audounia appears to be cult. in N. Amer., and this is likely to be listed under Diosma, one of the Rutaceæ.

BRUNNERA. *Boraginaceæ.* A small herbaceous genus of W. Siberia and E. Medit. region, usually referred to Anchusa, but of different habit, broad netted-veined lvs. and naked infl.

macrophylla (*Anchusa myosotidiflora*). Per. to 1½ ft.: lvs. ovate, heart-shaped at base: fls. blue, ¼ in. across, in summer. Siberia, Caucasus.

BRUNSDONNA. Hybrids between *Amaryllis Belladonna* and *Brunsvigia Josephinæ.* Such hybrids have been produced crossing either way, those with Amaryllis seed parent apparently being more satisfactory horticulturally.

BRUNSVIGIA. *Amaryllidaceæ.* S. African summer- and autumn-flowering bulbs having basal lvs. and red or pink funnelform fls. in umbels terminating the scape.

Brunsvigias require rich sandy soil together with heat and sunlight. After flowering the bulbs should be rested. Propagated by offsets.

Josephinæ (*Amaryllis Josephinæ*). JOSEPHINES-LILY. To 1½ ft.: lvs. to 3 ft. long and 2 in. wide, ribbed: fls. bright red, 3 in. long, the tube about ½ in. long.

BRUSSELS SPROUTS (*Brassica oleracea* var. *gemmifera*). Biennial, the first year from seed producing little heads or "sprouts" in the leaf-axils, and the second year bearing seeds. The culture is essentially that for kale except that it is always a fall crop, the seed being sown in spring in a seed-bed and the younglings transplanted in late spring or summer, 18–30 inches apart in rows for the large kinds with sufficient space between (say 3 feet) to allow of pleasant tillage; dwarf varieties may be grown with less space. The "sprouts" attain a diameter of 1 or 2 inches; they are gathered as they mature from the bottom upwards, and a good plant should yield about one quart. As the sprouts attain form and considerable size, the subtending leaf is removed, the terminal crown of foliage maintaining the vigor of the plant. The crop is desired after frosty weather comes. The little sprouts or buttons are amongst the most delicate products of the cabbage tribes; they are best when not too large, say an inch or even less in diameter. The insects and diseases are those of the cabbage.

BRYANTHUS: *Phyllodoce Breweri.*

BRYONIA. BRYONY. *Cucurbitaceæ.* Herbs with per. more or less fleshy or tuberous root, mostly diœcious, one of them seldom grown in this country as an ornamental or arbor vine: fls. not large, the staminate in racemes, the pistillate few or solitary in axils: species 7 or more, in temp. Eu. and W. Asia.

dioica. To 10 or 12 ft., from fleshy tuber or strands: lvs. palmately 5-lobed, rough: fls. greenish, to ¾ in. across: fr. a smooth red berry ¼ in. diam. Eu., W. Asia, N. Afr.

BRYONOPSIS. *Cucurbitaceæ.* Two ann. tendril-climbing herbs, Asia, Afr. and Pacific Isls., one of which may be grown as an ornamental vine: plant monœcious: fls. small and greenish, fascicled and mostly in the axils.

laciniosa. Sts. slender, glabrous, tall-climbing: lvs. deeply 3–5-lobed, with obtuse sinuses: fr. yellow-green to reddish and striate, nearly ¾ in. diam.

BRYONY: *Bryonia.* **Black**: *Tamus communis.*

BRYOPHYLLUM. *Crassulaceæ.* Old World trop. fleshy perennials with opposite simple or pinnate lvs. and nodding or hanging fls. in large cymes or panicles, the corolla-tube included in a much-inflated calyx.

They are of simple culture but do not withstand frost. Propagated by stem-cuttings and seeds but more readily by placing a leaf on wet sand in a warm light propagating frame or even laying it on the ground; from the notches of the leaf young plants will grow and these may be potted when of sufficient size.

calycinum: *B. pinnatum.*

crenatum. To 3 ft.: lvs. ovate, to 3 in. long, coarsely toothed: fls. with pink inflated calyx and red corolla ¾ in. long. Madagascar.—It has been mistakenly written *cruentum*.

pinnatum (*B. calycinum*). AIR-PLANT. LIFE-PLANT. FLOPPERS. To 6 ft.: lvs. of 3–5 oval or oblong lfts. to 5 in. long: fls. with greenish- or yellowish-white purple-tinted inflated calyx and reddish corolla to 3 in. long. Probably E. India but run wild in warm regions.

BUCARE: *Erythrina Poeppigiana.*

BUCHU: *Diosma ericoides.*

BUCKBEAN: *Menyanthes trifoliata.*

BUCKBERRY: *Gaylussacia ursina.*

BUCKEYE: *Æsculus, Ungnadia.*

BUCKLEYA. *Santalaceæ.* Deciduous parasitic shrubs with opposite entire lvs., staminate fls. in umbels, pistillate solitary, and drupaceous frs.; 3 species in China, Japan, and N. Amer.

As the cultivated species is parasitic on the roots of Tsuga, seeds must be sown in a pot with the host plant and set out with the hemlock. Hardy in New England.

distichophylla. To 12 ft.: lvs. ovate to ovate-lanceolate, to 2½ in. long, sessile: fls. greenish, small: fr. yellowish-green, about ½ in. long. N. C., Tenn.—A graceful shrub.

BUCKTHORN: *Rhamnus.* **False**: *Bumelia lanuginosa.* **Sea-**: *Hippophaë.*

BUCKWHEAT: *Fagopyrum.* **-Tree**: *Cliftonia monophylla.* **Wild**: *Eriogonum fasciculatum.*

BUDDING: see *Graftage.*

BUDDLEJA (*Buddleia*) BUTTERFLY-BUSH. *Loganiaceæ.* Shrubs or rarely herbs, deciduous or evergreen, bearing stellate, glandular or scaly pubescence, with mostly opposite lanceolate lvs., 4-lobed fls. in heads, panicles or spikes, and fr. a 2-valved caps.; several showy species are grown for ornament.—Spelled *Buddleja* by Linnæus, but the *i* and *j* have the same phonetic value.

Even when buddlejas are not hardy North, the roots may survive with winter protection; but some of the species stand the winter in New York. They thrive in sunny locations in rich well-drained soil. Propagated by seeds sown over heat in spring, by cuttings of green wood, and by cuttings of ripe wood kept over winter in a frost-proof room.

alternifolia. To 12 ft. or more, branches drooping or arching: lvs. alternate, to 4 in. long, gray-tomentose beneath: fls. lilac-purple, in dense clusters to ¾ in. long, June. China.

amplissima: hort. name.

asiatica. Lvs. to 8 in. long, entire or fine-toothed, white- or yellow-tomentose beneath: fls. white, fragrant, in drooping spikes to 9 in. long, in winter and spring. China to India.—Grown under glass; in the open adaptable only in southernmost parts.

caryopteridifolia. To 6 ft.: lvs. ovate to oblong, to 2½ in. long, with large irregular teeth, tomentose: fls. lavender, in narrow panicles to 3 in. long. China; not hardy N. but in Calif.

Colvilei. To 30 ft.: lvs. to 7 in. long, toothed, pubescent: fls. purple or crimson with white eye, in drooping panicles to 1½ ft. long. Himalayas; to be grown far S.

curviflora: *B. japonica.*

Davidi (*B. variabilis*). SUMMER LILAC. To 15 ft.: lvs. to 10 in. long, finely toothed, dark green above, white-tomentose beneath: fls. lilac with orange eye, fragrant, in spikes to 10 in. long, in late summer. China.—One of the hardiest and probably commonest. Var. **magnifica** has larger rose-purple fls. in dense spikes. Var. **nanhoensis** grows to 5 ft. high with lvs. to 4½ in. long. Var. **superba** resembles *magnifica* but has larger panicles. Var. **Veitchiana** bears mauve-colored fls. in large dense spikes. Var. **Wilsoni** has rose-lilac fls. in drooping spikes to 2 ft. long.

Farquharii. Hybrid between *B. officinalis* and *B. asiatica*: lvs. yellow-tomentose beneath: fls. pale pink, in spikes; adaptable S.

globosa. To 15 ft.: lvs. to 10 in. long, wavy-toothed, yellow-tomentose beneath, wrinkled above: fls. orange, fragrant, in dense long-stalked heads ¾ in. across, June. Peru; planted in Calif.

intermedia. Hybrid between *B. Lindleyana* and *B. japonica*: lvs. to 6 in. long: fls. violet, in drooping panicles to 8 in. long. Var. **insignis** has rosy-violet fls. in erect spikes.

japonica (*B. curviflora*). To 6 ft., with 4-winged branchlets: lvs. to 8 in. long, slightly toothed, tomentose beneath when young: fls. lilac, in drooping panicles to 8 in. long, in summer. Japan.

Lindleyana. To 6 ft., with 4-angled branchlets: lvs. to 4 in. long, slightly toothed, nearly glabrous beneath: fls. purplish-violet, in erect spikes to 8 in. long, in summer. China; not hardy N.

madagascariensis. To 20 ft.: lvs. to 5 in. long, dark green above, white- or yellow-tomentose beneath: fls. orange, in panicles, in winter. Madagascar; stands in Calif. and other mild climates.

nanhoensis: *B. Davidi* var.

nivea. To 10 ft.: lvs. to 10 in. long, coarsely toothed, dark green above, white-tomentose beneath: fls. lilac or purple, in dense spikes to 6 in. long, corolla tomentose outside, in late summer. China. Var. **yunnanensis** has lvs. pubescent above and yellow-tomentose beneath.

officinalis. To 10 ft.: lvs. to 6 in. long, entire or fine-toothed, gray-pubescent above, white- or yellow-tomentose beneath: fls. lilac with orange eye, fragrant, in panicles 6 in. long, in winter and spring. China; adapted only far S.

paniculata. To 15 ft.: lvs. to 5 in. long, coarsely toothed, pubescent above, white or yellow-tomentose beneath: fls. lilac with white eye, fragrant, in panicles to 4 in. long, in summer. Himalayas.

salvifolia. To 10 ft.: lvs. to 6 in. long, finely toothed, rusty-tomentose beneath, pubescent above: fls. yellowish-white with orange throat. in panicles to 6 in. long. Trop. and S. Afr.

variabilis: *B. Davidi.*

BUFFALO-BERRY: *Shepherdia argentea.*

BUGBANE: *Cimicifuga.*

BUGINVILLÆA (see page 8). *Nyctaginaceæ.* The cult. kinds grown as woody vines but may be trained as standards, in the open far S. and in greenhouses N.: lvs. simple, alternate, ovate to elliptic-lanceolate, commonly entire: fls. inconspicuous, inclosed by showy mauve, magenta, purple or red corolla-like bracts: native in S. Amer. Many forms bear Latin names as though they were species.

Of easy cultivation in any soil, thriving best in full sunshine; in the North grown as pot-plants in a cool greenhouse. Propagated by cuttings, some kinds more easily than others.

brasiliensis: *B. spectabilis.*

glabra. Glabrous or nearly so: lvs. slender-pointed and with narrow base: bracts purple or magenta, running into lighter shades. Brazil. Var. **Cypheri** is larger with deep rose bracts. Var. **Sanderiana**, PAPER-FLOWER, is a floriferous form. Var. **variegata** has lvs. variegated with white.

Harrisii. Lvs. dark green marbled with creamy-white; probably a form of *B glabra.*

spectabilis (*B. brasiliensis*). More or less pubescent or tomentose: lvs. short- or blunt-pointed and broad at base: bracts in shades of red. Brazil. Var. **Crimson Lake** has bright crimson bracts, and var. **lateritia** brick-red bracts. Yellow bracts are reported.

BUGLE-WEED: *Ajuga.*

BUGLOSS: *Anchusa.* Vipers-: *Echium.*

BULBINE. *Liliaceæ.* Herbs from Australia and Afr., having bulbs or tuberous roots, linear or lanceolate lvs., and usually yellow fls. in racemes; seldom grown under glass or in the open in warm regions; bloom in spring and summer.

alooides. Stemless per. with tuberous rootstock: lvs. to 9 in. long: fls. bright yellow, ¼ in. long, in racemes to 1 ft. long. S. Afr.

annua. Stemless ann. without rootstock or bulb: lvs. to 1 ft. long: fls. bright yellow, ¼ in. long, in racemes to 6 in. long on scapes. S. Afr.

BULBINELLA. *Liliaceæ.* Per. herbs with fleshy tuberous roots, linear basal lvs. and yellow or white fls. in a dense raceme terminating the naked scape; native in S. Afr. and New Zeal. Grown in the border where they do best in rich moist soil; useful in warm regions. Propagated by division or seed.

Hookeri (*Chrysobactron Hookeri*). To 3 ft.: fls. bright yellow, ⅓ in. across, in racemes to 10 in. long. New Zeal.

BULBOCODIUM. *Liliaceæ.* One crocus-like cormous herb native in Eu. and Asia. **B. vernum.** Lvs. radical, narrow: fls. violet-purple, funnelform, 1–3 from each bulb and borne close to the ground in very early spring in advance of full leafage, the narrow segms. 2 in. long. For cult. see *Crocus.*

BULBOPHYLLUM. *Orchidaceæ.* Epiphytes having pseudobulbs which bear 1 or 2 lvs. and from the base the scape with a raceme of fls. or sometimes fls. solitary, having petals smaller than the sepals and a fleshy strap-shaped lip; grown in a warm greenhouse. See *Orchids.*

appendiculatum (*Cirrhopetalum appendiculatum*). Fls. about 8 in. long, solitary, with petals and dorsal sepal white lined with purple and tipped with purple fringe, and thick bright purple lip. E. Indies.

barbigerum. Pseudobulbs 1 in. long, with 1 lf. to 3 in. long and 1 in. wide: fls. in 8–14-fld. racemes to 6 in. long, the sepals dull purple, the lip green with brown markings, hairy and tipped with long purple hairs, June–July. Trop. Afr.

Careyanum. Pseudobulbs to 2½ in. high, with 1 lf. to 9 in. long and 1½ in. wide: fls. in nodding racemes to 3½ in. long, yellow thickly spotted with red-brown, Jan.–May. Himalayas.

comosum. Pseudobulbs 1½ in. high, with 1 broad lf. to 8 in. long: fls. small, yellowish-white, in dense racemes on scapes to 8 in. high, the lip yellow, Jan. Burma.

congolanum. Pseudobulbs 1 in. high, with 2 lvs. to 3 in. long and ½ in. wide: fls. pale yellow, in racemes on flattened red scapes. W. Afr.

Cumingii (*Cirrhopetalum Cumingii*). Lvs. to 4 in. long: fls. purple, in 9–12-fld. umbels, with fringed petals and dorsal sepal and fleshy lip. Philippine Isls.

cupreum. Differing from *B. Careyanum* in the copper-yellow fls. and the purplish-brown lip, Feb.-Apr. Philippine Isls.

cylindraceum: a listed name.

Dayanum. Pseudobulbs about 1¼ in. high, with 1 narrow lf. to 4 in. long: fls. about 1 in. across, in 2–3-fld. clusters, the sepals yellow-green spotted with red and hairy, the petals half as long and purple-red edged with green, the lip pale purple edged with green and covered with warts, May–July. Burma.

Dearei. Pseudobulbs 1½ in. high, with 1 strap-shaped lf. to 6 in. long: fls. solitary, large, the sepals brownish-yellow spotted with red, the petals shorter, yellow marked with red, the lip white finely dotted with red, May–June. Philippine Isles.

falcatum (*Megaclinium falcatum*). Pseudobulbs about 3 in. high, with 2 lvs. to 7 in. long and 1½ in. wide: fls. golden-brown, May–June. W. Afr.

grandiflorum. Pseudobulbs to 3 in. high, with 1 lf. to 8 in. long and 2½ in. wide: fls. solitary on scapes to 10 in. long, very large, the sepals brownish-green with white transparent dots, the petals very small, the lip small, greenish dotted with brown and hairy on edge, Oct. New Guinea.

Lobbii. Pseudobulbs to 2 in. high, with 1 lf. to 8 in. long and 2 in. wide: fls. solitary, 4 in. across, the sepals and petals yellow spotted or lined outside with red, the lip golden-yellow, May–June. Java to Sumatra.

Medusæ (*Cirrhopetalum Medusæ*). Lvs. to 6 in. long and 2 in. wide: fls. pale yellow spotted at base with red, in many-fld. umbels, the lateral sepals prolonged into tails to 6 in. long, Oct.–Dec. Malaya.

odoratissimum. Pseudobulbs to 1½ in. high, with 1 linear-oblong lf. to 3 in. long: fls. small, in dense globose heads, yellow, fragrant. India to China.

picturatum (*Cirrhopetalum picturatum*). Lvs. to 6 in. long and 1½ in. wide: fls. about 2 in. long, in 10-fld. umbels, sepals and petals green spotted with red, the upper sepal with a terminal red thread, the lip dark red, May–June. Burma.

pulchrum (*Cirrhopetalum pulchrum*). Fls. purple, in 7-fld. umbels, the lateral sepals yellow spotted with purple, over 1 in. long. Malaya.

refractum (*Cirrhopetalum refractum*). WINDMILL ORCHID. Lvs. lanceolate, to 5 in. long: fls. yellow, 2½ in. long, the lip spotted with red. Himalayas.

Reinwardtii. Pseudobulbs to 4 in. high, with 1 elliptic lf. to 8 in. long: fls. about ¾ in. long, yellowish tinged with crimson. Java.

Roxburghii (*Cirrhopetalum Roxburghii*). Lvs. linear-oblong, to 4 in. long: lateral sepals yellow; petals and dorsal sepal yellow striped with red; lip red-purple. India.

saurocephalum. Pseudobulbs bearing 1 oblong lf.: fls. in many-fld. racemes with a bright red rachis, the sepals light yellow lined with brown, petals small and white bordered with reddish, lip yellow, deep purple at base. Philippine Isls.

suavissimum. Pseudobulbs 1 in. high, with 1 lanceolate lf. to 4 in. long: fls. bright rose or whitish, the lip yellow, in many-fld. arching racemes to 8 in. long, June–July. Burma.

Thouarsii (*Cirrhopetalum Thouarsii*). Lvs. to 7 in. long and 1½ in. wide: fls. bright yellow, 2 in. long, in 5–8-fld. umbels, the petals with a thread-like tail, July. Madagascar, Mauritius.

virescens. Pseudobulbs about 5 in. high, with 1 lf. to 1 ft. long and 5 in. wide: fls. large, in umbels, the sepals and petals greenish-yellow, the lip yellow spotted with red, June. Moluccas.

BULBS, as a class in horticultural terminology, are ornamental partial-season mostly simple-stemmed plants arising from bulbs, corms, tubers or thickened rootstocks that may be cured and dried off and stored over winter. The term is incapable of close definition: it includes crocuses, tulips, hyacinths, narcissi, squills, lilies, amaryllids and similar groups. It specially denotes spring-blooming subjects. Because of their quick growth and showy bloom, bulbs are unceasing favorites with cultivators. For more particular mention the reader is referred to the different classes under their alphabetic entries.

The outdoor culture of the common bulbs is simple. The plants care for themselves throughout a greater part of the year, many of them flowering very early when no other kinds are able to grow and bloom out-of-doors. Success depends to a large degree on good stock to begin with. Not only should the varieties be good and true to name, but the bulbs themselves should be well ripened and firm although it is not necessary to choose the biggest ones. While the so-called Holland bulbs thrive in any kind of soil, they all do better in deep sandy ground well enriched with well-rotted manure; but do not let the manure come into direct contact with the bulb. Even heavy clay may be fitted for the growing of bulbs by the addition of sharp sand, either worked into the soil or placed directly under the bulb when planted.

To make a bulb bed, choose, if possible, a light or loamy soil and throw out the top earth to the depth of 6 inches. Put into the bottom of the bed about 2 inches of well-rotted (not fresh) manure and spade it into the soil. Throw back half of the top soil, level it off nicely, set the bulbs firmly on this bed and then cover them with the remainder of the soil; in this way one will have the bulbs from 3 to 4 inches below the surface and of uniform depth. When the weather is cold enough to freeze a hard crust the bed should have its winter covering. This may be straw, hay, cornstalks or leaves spread over the bed to the depth of 6 inches if the material is coarse; but if leaves are used, 3 inches will be enough, because the leaves lie close together and may smother out the frost that is in the ground and let the bulbs start. If they start too early the hard freezes of March and early April will spoil their beauty if the leaves or flowers are near or above the surface. Early in April, in New York, the covering may be removed gradually, and should all be off the beds before the leaves show above the ground. Some of the bulbs may be readily naturalized in grassy and untilled areas, as grape-hyacinth, crocus, jonquil, daffodil, lily-of-the-valley, tulip. The plants are usually massed irregularly for pleasing and striking effect. The area may be fertilized in autumn with top-dressing.

The growing of flowering bulbs in winter adds to the list of house-plants a charming variety. Hyacinths, narcissi, tulips, and crocus can be made to flower in the winter without difficulty. Pot the bulbs by the middle or last of October, or if earlier all the better. The soil should be rich sandy loam, if possible; if not, the best one can get, to which add about one-fourth the bulk of sand and mix thoroughly. If ordinary flower-pots are to be used, put in the bottom a few pieces of broken pots, charcoal or small stones for drainage, then fill the pot with earth so that when the bulbs are set on it the top of the bulb is even with the rim of the pot. Fill around it with soil, leaving just the tip of the bulb showing. If the soil is heavy, a good plan is to sprinkle a small handful of sand under the bulb to carry off the water, the same as is in beds outdoors. If one does not have pots, boxes may be used. Starch boxes are a good size, as they are not heavy to handle; and excellent flowers are sometimes obtained from bulbs planted in old tomato cans. If boxes or cans are used, care must be taken to have holes in the bottoms for drainage. A large size hyacinth bulb will do well in a 5-inch pot. The same size pot will do for three or four narcissi or eight to twelve crocuses. After the bulbs are planted they should be placed in a cold pit or cellar, or on the shady side of a building, or, better yet, plunged or buried up to the rim of the pot in a shady border. This is to force the roots to grow before the top appears, as only the bulbs with good roots will give good flowers. When the weather is so cold that a crust is frozen on the soil, the pots should be covered with a little straw, and as the weather becomes colder more straw must be added. In six to eight weeks after planting the bulbs, they should have made roots enough to grow the plant, and the pots may be taken up and placed in a cool room for a week or so, after which, if plants have started into growth, they may be taken into a warmer room where they have plenty of light. They will grow very rapidly now and will want much water. When just coming into bloom the plants may have full sunlight part of the time to help bring out the color of the flowers. Crocuses and tulips open only in sunlight. After blooming in the house, the bulbs are usually discarded and new ones purchased for the following year, although it is possible to grow them on for future blooming.

BULLACE, DAMSON: *Prunnus domestica* var. *insititia.*

BULLATE: the surface blistered or puckered, as the leaf of a Savoy cabbage.

BULLOCKS-HEART: *Annona reticulata.*

BULRUSH: *Scirpus.*

BUMELIA. *Sapotaceæ.* Evergreen or deciduous often thorny shrubs and trees in S. U. S. and southward with very hard wood, one sometimes transferred to grounds in its region: lvs. mostly fascicled or crowded on short spurs: fls. small, white, fascicled in axils: fr. small, black, drupe-like.

lanuginosa. CHITTAMWOOD. FALSE BUCKTHORN. Deciduous tree to 25 ft., but the oblong-obovate thick lvs. persisting late, tomentose underneath, entire, 2–3 in. long: fr. about ⅓ in. long. Woods and copses, Va. to Fla. and west to Kans. and Tex.

BUNCHBERRY: *Cornus canadensis.*

BUNCH-FLOWER: *Melanthium.*

BUNYA-BUNYA: *Araucaria Bidwillii.*

BUPHTHALMUM. OX-EYE. *Compositæ.* Showy herbaceous perennials with large yellow heads of disk- and ray-fls. and alternate entire or toothed lvs.; pappus of scales united into a crown. Native in Eu. and W. Asia. Of easy cult. in the border, and mostly hardy N. Propagated by division; also by seeds and sometimes blooming first year.

cordifolium: *B. speciosum.*

grandiflorum. Perhaps synonymous with *B. salicifolium* but with long-acuminate nearly glabrous lvs. S. Eu.

salicifolium. To 2 ft.: lvs. oblong-lanceolate, toothed, white-hairy: heads solitary and terminal, to 2 in. across. S. Eu.—Spreads rapidly by underground parts.

speciosissimum (*Telekia speciosissima*). To 5 ft.: lvs. oval-cordate, clasping, toothed, hairy only on midrib below: heads solitary and terminal. S. Eu.

speciosum (*B. cordifolium. Telekia speciosa*). To 4 ft., pubescent: lvs. cordate-ovate, coarsely toothed, very large: heads 2–5, large. S. Eu., W. Asia.

BUPLEURUM. THOROUGH-WAX. *Umbelliferæ.* Old World herbs or shrubs with simple entire lvs., yellow fls. in compound umbels, and compressed frs.; suitable for dry sterile soils in warm climates, being grown for ornament.

fruticosum. Subshrub to 6 ft., evergreen or partially so: lvs. oblong, to 3½ in. long, leathery: umbels to 4 in. across, subtended by deflexed bracts. S. Eu.

BUR, BUTTER-: *Petasites.* New Zealand: *Acæna microphylla.*

BURDOCK: *Arctium.*

BURLINGTONIA FRAGRANS: *Rodriguezia venusta.*

BURNET: *Sanguisorba.*

BURNING-BUSH: *Dictamnus albus, Euonymus atropurpureus.*

BURSARIA. *Pittosporaceæ.* Shrubs or trees with alternate simple lvs., small fls. in terminal panicles, and fr. a flat caps.; one species grown in S. Calif. for ornament.

spinosa. Spiny shrub or small tree: lvs. to 1 in. long: fls. white: caps. about ¼ in. across. Australia.

BURST-WORT: *Herniaria.*

BUSH: shrub, particularly when dense and much branched.

BUSHMANS-POISON: *Acokanthera venenata.*

BUTIA. *Palmaceæ.* A few species of Cocos segregates but without the aspect of Cocos, Arecastrum, Rhyticocos or Syagrus, of warm-temp. Brazil to Uruguay, Paraguay and Argentina: short stocky monœcious feather-lvd. palms, trunk solitary and covered with lf.-bases or their scars and 3–15 ft. high, plant unarmed except for the spine-margined hard flattened or thin-edged petiole: lvs. stiffish, decurved beyond the middle, grayish- or glaucous-green; pinnæ standing well up from the rachis then curving, strongly conduplicate toward base, long and narrow: spadix from axils of lower lvs., the spathe not plicate or grooved outside; stamens 6, borne on upper part of spadix branches: fr. globose, ovoid or ovoid-conic, yellow or reddish, 1 in. long more or less, with a pulpy-fibrous or rather soft yellowish exterior, 3-celled but 1 or 2 seeds sometimes aborted; albumen not ruminate. The Butias are hardy palms, hardly regarded as real trees by planters, thriving in S. Calif., on the Gulf Coast and southward. See *Palm.*

Bonneti (*Cocos Bonneti. C. Gaertneri*). Low palm, the trunk 1–4 ft., small in all parts: pinnæ equally spaced, not aggregate, narrow: spadix 2 ft. or so, the spathe glabrous on outside; fls. and fr. small, the latter about ¾ in. long and four-fifths as broad, ovoid-conic and acute and held for a third or half its length in the enlarging perianth. Brazil.—See note under *Arikuryroba.*

capitata (*Cocos capitata. C. australis* of hort. *C. coronata* of hort. not of botanists). Variable in arrangement of pinnæ and character of fr.: trunk stout, to 12–20 ft. or more and 1½ ft. diam., becoming bare of lf.-bases at the bottom: lvs. long and gracefully curving; pinnæ many, to 2½ ft., whitish beneath, often 2–3 together; petiole glabrous, spiny at base: spadix 4–5 ft. long, spathe generally glaucescent: fr. ovoid, about 1 in. long or a little more at maturity and four-fifths as broad; nutlet elliptic, more or less acute; perianth deeply cup-like at base of fr. Brazil; commonly planted in S. Calif. and elsewhere. Var. **odorata** (*Cocos odorata*). Fr. depressed-globose, about ¾–1 in. lengthwise, at maturity broader than long; nutlet nearly spherical; fruiting perianth not cup-like, flattened and expanded under base of fr. Var. **pulposa** (*Cocos pulposa*). Fr. globose, only lightly depressed, very pulpy, 1¼–1½ in. lengthwise; nutlet and seed spherical; fruiting perianth cup-like but not deep.

eriospatha (*Cocos eriospatha*). Trunk stout, 4–10 ft., becoming naked below: spathe densely brown-tomentose on outside: pinnæ equally distant, not assembled unless at base of rachis, green above and somewhat glaucous underneath, petiole tomentose on margin at base: fr. small, nearly globular, ⅝–¾ in. either way, with a short abrupt point; nutlet globose; fruiting perianth shallowly cup-like. S. Brazil.—*Cocos Blumenavia*, planted in Calif., apparently belongs here.

Nehrlingiana (*Cocos Nehrlingiana*). Described as having very long and elegantly reclined glaucous-green lvs. to 10 ft. long: fls. violet-red, the spadix to 3 ft. long and much branched: fr. size of small cherry, red. Perhaps Argentina; name bestowed in Fla.; botanical identity undetermined.

Yatay (*Cocos Yatay*). Stout palm, trunk to 8 or 10 ft. and about 1½ ft. diam.: petiole glabrous and armed on margin; pinnæ numerous, about equally placed or somewhat aggregate near the base, glaucescent underneath: fr. ovoid-conic and acuminate, 1½–2 in. long and 1 in. or more thick; cup-like fruiting perianth ⅓–½ length of fr. Uruguay, Argentina. Var. **paraguayensis** (*Cocos paraguayensis*) has a narrower fr. ¾ in. or less thick and 1½ in. or less long.—*Cocos Yurumaguas*, planted in Calif., belongs here.

BUTNERIA: *Calycanthus.*

BUTOMACEÆ. Butomus Family. Four genera of aquatic per. herbs with basal lvs., bisexual fls. solitary or in umbels, having 3 sepals and petals, 9 or more stamens, and 6 or more ovaries. By some writers the genera have been placed in Alismaceæ. Butomus, Hydrocleys and Limnocharis may be grown in ponds and aquaria.

BUTOMUS. *Butomaceæ.* One erect aquatic herb native in Eu. and Asia, **B. umbellatus.** Flowering-Rush. Lvs. linear, to 3 ft. long: fls. rose-colored, 1. in across, in many-fld. umbels on naked rush-like scapes to 4 ft. high. Easily grown in ponds, hardy N. Propagated by division. Somewhat run wild in N. E.

BUTTER-AND-EGGS: *Linaria vulgaris.*

BUTTERCUP: *Ranunculus.* Bermuda: *Oxalis cernua.*

BUTTERFLY-BUSH: *Buddleja.*

BUTTERFLY-FLOWER: *Schizanthus, Bauhinia monarda.*

BUTTERFLY-WEED: *Asclepias tuberosa.*

BUTTERNUT: *Juglans cinerea.*

BUTTERWORT: *Pinguicula.*

BUTTON-BUSH: *Cephalanthus.*

BUTTONWOOD: *Platanus occidentalis.*

BUXACEÆ. Box Family. Herbs, shrubs or trees, with persistent foliage, of about 6 widely distributed genera, with simple lvs., monœcious fls. without petals, superior usually 3-celled ovary, and capsular or drupaceous fr. The ornamental genera Buxus, Pachysandra, Sarcococca and Simmondsia are cult.

BUXUS. Box. *Buxaceæ.* Evergreen shrubs with small opposite entire stiff lvs., very small fls. in little axillary clusters or spikes, and fr. a caps.

Extensively used for hedges and edgings, as the plants stand pruning and shearing well. Box is suited to any well-drained soil and thrives in partial shade. Plants may be set out in spring or in August and September. Propagated by hardwood cuttings, suckers or division, or layering. Seeds may be sown but the plants grow very slowly. Dwarf varieties may also be propagated by division. In protected or favored places both common species stand in parts of New York and central New England.

arborescens: *B. sempervirens* var.

balearica. To 30 ft.: lvs. larger and not so shining as *B. sempervirens.* Spain, Balearic Isls.

Fortunei: *B. microphylla* var. *japonica.*

japonica: *B. microphylla* var.

microphylla. To 3 ft. or often prostrate, branches conspicuously winged: lvs. somewhat obovate, broadest above middle. Japan. Var. **japonica** (*B. japonica. B. Fortunei*). To 6 ft.: runs into several forms, as **angustifolia** with long narrow lvs.; **aurea** with yellowish foliage; **latifolia** with broad lvs.; **rotundifolia** with large bluish-green lvs. Var. **koreana,** to 2 ft., Korea.

nana: dwarf forms of *B. sempervirens.*

sempervirens. Common B. To 25 ft., with 4-angled or slightly winged branches: lvs. elliptic, broadest about or below the middle. Eu., N. Afr., W. Asia. There are many forms in cult., such as: **angustifolia** (var. *salicifolia*) with long narrow lvs.; **arborescens** which grows to a small tree; **argenteo-variegata** (var. *argentea*), the lvs. edged with silvery-white; **aureo-variegata** (var. *aurea*), lvs. yellow or variegated with yellow; **bullata,** lvs. bullate, large; **elegans,** a variegated form with oblong lvs.; **Handsworthii,** a bushy type with large broad lvs.; **marginata,** lvs. edged with yellow; **myrtifolia,** a dwarf form with narrow lvs.; var. **rosmarinifolia,** a low kind with narrow lvs.; var. **rotundifolia** (var. *latifolia*) has broadly oval lvs.; var. **suffruticosa,** a dwarf form with small lvs.

suffruticosa: *B. sempervirens* var.

BYRNESIA. *Crassulaceæ.* One per. herb with a rosette of thick broad lvs., either basal or borne on a st. to 7 in. long. **B. Weinbergii** (*Echeveria Weinbergii. Cotyledon paraguayensis*). Lvs. obtusely keeled beneath, glaucous, to nearly 2 in. long: fls. white, in cymes from axils of upper lvs., seldom produced. Mex.—Of easy cult. from plantings of lvs. See *Graptopetalum.*

C

CABBAGE (*Brassica oleracea* var. *capitata*). One of the standard garden vegetables and truck crops, essentially a cool-season plant but growing continuously through the summer; in all stages it withstands considerable frost, although young plants from hotbeds must be hardened off. Soil should be deep and fertile, and it should be capable of holding abundant moisture to supply the heavy demands in growth. The cabbages of many kinds have been developed through centuries apparently from *Brassica oleracea* of coasts of western Europe. The varieties differ in season, in color and size and shape of head. The Savoy cabbages, which are of excellent quality, are a race with puckered or blistered (bullate) leaves. It is usual to classify by season into three groups, early, midseason, late or winter. Consult experiment station and government bulletins, and dealers' catalogues, for current varieties.

For very early and early crops, as of Wakefield and Jersey, seeds are usually sown in a hotbed or indoors a month at least before hard frosts are expected to cease. The seedlings may be transplanted once or twice, into larger pans or boxes or into other frames, to keep them stocky. At the later transplanting they should be given plenty of air, with reduction of temperature, to harden them for the field. In the field the plants are placed in rows 24–30 inches apart, and about 18 inches in the row.

For later and midseason crop, as of Winnigstadt, Succession, and All Season, seeds are commonly sown in the open in seed-beds as soon as sharp freezing is past, in rows 3 inches or more apart; from these rows they are usually transplanted directly to the field, the plants having been well thinned in the meantime if they begin to crowd. These later or main summer kinds are commonly given more room in the field, both because they grow larger and to allow for horse tillage.

Of the autumn and winter kinds, as Ballhead, Drumheads, and Flat Dutch, seeds are sometimes placed in hills where the plants are to stand, all plants but one being removed as they grow. A much better procedure, however, is to grow in seed-beds, sowing in mid-spring or even late spring, transplanting to the field in July in the North. The plants usually stand 2 feet apart in rows with 2½–3 feet space between. For winter storage only the long-keeping varieties should be employed; the heads should be mature and solid, free from injury and disease, internally moist and plump, but the center of the head should be free of water. They may be buried, usually heads down to keep them clear of water, or placed on racks in a building kept near freezing yet warm enough so that the heads do not freeze. When buried, care must be taken to choose a well-drained place, and if any quantity is stored provision should be made for ventilation; they are covered deeply enough to keep them cool in warm spells and also to protect from hard freezing in cold weather. If too warm they may rot. Usually 3 or 4 inches of earth are first placed on the pit or trench, and more added, or a straw covering applied, as cold weather advances. The heads are usually not more than two tiers deep.

In the midsouthern parts of the United States, cabbage plants are often started in autumn and carried over winter in the field; they are then ready for growth in earliest spring. Far South cabbage is treated as a winter or early spring crop, being grown continuously in the cool season.

Allowing for losses, 4 to 6 ounces of seed are generally required to produce sufficient plants for an acre.

Many insects and fungi attack cabbages. The grower should keep in touch each year with the new advice issuing from the experiment stations and departments of government. The root-maggot is often a serious pest; young plants in seed-beds may be protected from the egg-laying fly by covering securely with cheese-cloth; in the field, early plants may be protected by a disk of tarred paper slipped around the plant on the ground. The club-root fungus is best circumvented by long rotations in which related host-plants (crucifers) are not allowed; also by top-dressings of lime (75 bushels to acre) the previous autumn. The cabbage-worm is controlled by poison sprays; in the home garden by hand-picking, hellebore, insect powder, tobacco sprays, hot water (130° F.), and sometimes more or less by salt water; take special pains to destroy the first brood. The aphis or louse is controlled by very thorough spraying with Black-leaf 40 or the fish-oil and whale-oil soaps.

CABBAGE, SKUNK-: *Symplocarpus fœtidus*. Yellow: *Lysichitum*.

CABBAGE-TREE: *Andira inermis*; *Sabal Palmetto*, and other palms in the tropics.

CABOMBA. FANWORT. WATER-SHIELD. *Nymphæaceæ* (or *Cabombaceæ*). Aquatics of the western hemisphere, sometimes grown in ponds and aquaria: floating lvs. entire, submerged lvs. finely divided: fls. very small, with 3 sepals and petals. Grown from cuttings set in the earth in 1–2 ft. of water, by division of the plants, and by seeds.

aquatica of some authors: *C. caroliniana*.

caroliniana (*C. aquatica*. *C. viridifolia*). WASHINGTON PLANT. FISH-GRASS. Floating lvs. green, very narrow, to ¾ in. long: fls. axillary, ½ in. broad, white with 2 yellow spots at base of each petal. Ponds and slow streams, S. Ill. to Fla. and Tex. Var. **pulcherrima**, sts. reddish-purple, lvs. darker with narrow segms., petals bright purple, Ga. Var. **rosæfolia** has reddish lvs. and is more difficult to propagate than the type.

viridifolia: *C. caroliniana.*

CACALIA: *Emilia, Senecio succulentus.*

CACAO: *Theobroma Cacao.*

CACTI, CACTACEÆ. Cactus Family. There are about 1300 known species of cacti, now arranged in more than 100 genera. They are American plants, the few that occur wild in other parts of the world being probably spread from the western hemisphere. They are plants of varied habit, but in most kinds (with marked exception in Pereskia) the leaves are minute and indistinguishable to the general observer, or are very early deciduous, and the vital functions are performed by the green plant body. For the most part the cacti are spiny, the spines arising from cushions or areoles; often, as in Opuntia, the spines are accompanied by small easily detached barbed bristles or glochidia that penetrate the skin. In many or most cases some of the spines at the areole are spreading or radial and others more or less erect and central. The flowers are bisexual, mostly without well-defined distinction between calyx and corolla; they are often very showy, in white, yellow and shades of red. The fruit is mostly a fleshy berry-like body, sometimes edible. Cacti are grown for the odd shape of the plant body as well as for the flowers; sometimes the plant is rigidly columnar, or barrel-shaped or even globular; but there are slender climbing and trailing forms and massive tree-like structures. Cacti are fascinating to lovers of oddities and novelties, and any number of kinds may be brought into cultivation from the wild; in fact, much of the stock has been collected rather than propagated plants. In this book obviously only the more generally cultivated or mentioned species can be included. The genera represented in cultivation are Acanthocereus, Aporocactus, Ariocarpus, Astrophytum, Bergerocactus, Carnegiea, Cephalocereus, Cereus (now divided into many genera), Chamæcereus, Cleistocactus, Cochemiea, Coryphantha, Discocactus, Disocactus, Dolichothele, Echinocactus, Echinocereus, Echinofossulocactus, Echinomastus, Echinopsis, Epiphyllanthus, Epiphyllum, Epithelantha, Escobaria, Escontria, Ferocactus, Gymnocalycium, Hamatocactus, Harrisia, Hatiora, Heliocereus, Homalocephala, Hylocereus, Lemaireocereus, Lobivia, Lophophora, Machærocereus, Malacocarpus, Mamillopsis, Mammillaria, Mediocactus, Melocactus, Monvillea, Myrtillocactus, Neobesseya, Neolloydia, Neomammillaria, Nopalea, Nopalxochia, Nyctocereus, Opuntia, Pachycereus, Pediocactus, Pelecyphora, Peniocereus, Pereskia, Pereskiopsis, Phellosperma, Phyllocactus, Pilocereus, Rathbunia, Rhipsalis, Roseocactus, Schlumbergera, Sclerocactus, Selenicereus, Solisia, Strombocactus, Thelocactus, Trichocereus, Wilkcoxia, Zygocactus. See *Succulents*. The Cactus and Succulent Society of America publishes a journal in Los Angeles.

The Cactaceæ or Cactus Family divides itself into two rather marked groups, one of which is characterized by regular foliage leaves as in other plants and not looking much like cacti to the general observer, and the flowers are more or less stalked: to this group belongs the single genus Pereskia with about a score of species. The other group has no true foliage leaves, except in the anomalous genus Pereskiopsis, such leaves as appear being small or rudimentary and often falling early, and the flowers are without stalks. The second group divides itself into two tribes, the opuntia-like plants mostly bearing glochids on the areoles, the vegetative parts having small and short-lived leaves and the flowers rotate (wheel-shaped, without definite tube), and the cereus-like plants without glochids and leaves and the flowers mostly with definite and often very long tubes. To the Opuntia tribe belong seven genera, as now treated, only Opuntia and perhaps Nopalea being much known horticulturally. To the Cereus tribe belong all the other genera of the Cactaceæ, of which some of the most promnent horticulturally are Cereus, Cephalocereus, Echinocactus, Echinocereus, Echinopsis, Epiphyllum, Harrisia, Hylocereus, Mammillaria, Nyctocereus, Rhipsalis, Selenicereus, Zygocactus.

In the recent studies of cacti many new names have been introduced, but the familiar old names are given here as synonyms (in parentheses) so that the identities and relationships may be traced; and these synonyms also suggest the cultural requirements of plants under strange appellations.

Although most of the cacti are desert or dry-country plants, they need liberal supply of water in their growing period. For the most part they are summer bloomers and are more or less dormant in winter, when care should be taken not to over-water them, but they soon suffer in pots if allowed to be dry for any length of time, and they should not be grown close to hot pipes. Soils should be open in texture to insure proper drainage; sand and sometimes pounded brick are often added to the soil, and care should be taken not to have much fresh organic material in it. In summer, if placed out-of-doors, the plants are usually plunged rather than turned out of the pots.

Propagation is by offsets in the species that produce them, and most kinds grow readily from cuttings made of the stems or joints. The severed or cut surface should be allowed to dry in the air for several days, until it is seared or a corky layer has formed; the cutting is then inserted shallowly in sand in a pot or pan. Cacti start quickly from seeds, when they are available, and seed-grown plants commonly are more amenable under glass than those transplanted directly from the wild. Seeds should be sown only in sterilized soil. Seeds of some cacti, as of opuntias and echinocacti, germinate in a few days. The seedlings may remain in their pots or pans for several months or more before transplanting. When large enough they are transplanted to other pots or pans; and the shifting may then proceed as required, being careful not to use too large pots.

The cacti are easily grafted on other stocks. This practice is employed in order to provide weeping kinds with straight stout stems or standards, and also to propagate the many crested and contorted forms, and sometimes to elevate small globular kinds. Pereskia stocks are often employed, and also some of the strong columnar kinds of the Cereus group. The cacti graft rather indiscriminately. Any method of applying the cut surfaces of stock and cion together is satisfactory if the surfaces are held firmly in place by cords or thongs. Wax is not employed. The cleft-graft is perhaps most commonly used, but when small globular forms are grafted on columnar stocks it is necessary only to cut off squarely the top of the stock and the base of the cion and to set one on the other, and tie the parts firmly together.

CACTUS (as a genus): see *Melocactus.* **CACTUS** (as a popular name): **Christmas:** *Zygocactus truncatus.* **Crab:** *Zygocactus truncatus.* **Deerhorn:** *Peniocereus Greggii.* **Easter:** *Schlumbergera Gaertneri.* **Giant:** *Carnegiea gigantea.* **Hair-brush:** *Pachycereus pecten-aboriginum.* **Hatchet:** *Pelecyphora.* **Mistletoe:** *Rhipsalis cassutha.* **Old-Man:** *Cephalocereus senilis.* **Organ-Pipe:** *Pachycereus marginatus.* **Rainbow:** *Echinocereus rigidissimus.* **Rat-tail:** *Aporocactus flagelliformis.* **Redbird-:** *Pedilanthus tithymaloides.* **Sea Urchin:** *Echinopsis.* **Snowball:** *Pediocactus Simpsonii.* **Star:** *Astrophytum.* **Turks-Cap or -Head:** *Melocactus communis.* **Vine-:** *Fouquieria splendens.*

CÆSALPINIA. *Leguminosæ.* Armed or unarmed trees and shrubs, sometimes climbing, native in warm regions of both hemispheres, with 2-pinnate lvs., yellow or red fls., not papilionaceous, in racemes, and mostly flattened pods; planted for ornament in tropical and subtropical countries.

Propagated by seeds which will germinate more readily if soaked in warm water some hours before sowing. Transplant into pots as soon as seedlings show the first true leaf. In frostless regions the plants may soon be set permanently out-of-doors.

coriaria (*Libidia coriaria*). Divi-Divi. To 30 ft.: lfts. numerous and small: fls. yellow: pods oblong, curved, about 1 in. long. Trop. Amer.

Crista (*Guilandina Crista*). Nicker-Nut. Straggling more or less climbing prickly shrub: lfts. numerous, ovate: fls. yellow: pods oval, prickly, 2½ in. long. Trop. Amer.

echinata. Brazil-Wood. Tree with prickly trunk: lfts. numerous, rhombic-oblong: fls. yellow: pod oblong, 3 in. long. Brazil.

Gilliesii: *Poinciana Gillesii.*

japonica. Thorny shrub to 8 ft.: lfts. oblong: fls. canary-yellow with bright red stamens: pod 3 in. long. Japan.

mexicana. Shrub or small tree to 18 ft., unarmed: lfts. oblong to nearly orbicular: fls. yellow: pod 2½ in. long. Mex.

Nuga (*Ticanto Nuga*). Wood-Gossip. Prickly climbing shrub: lfts. ovate: fls. bright yellow: pod ovoid-oblong, 2 in. long. Malay Archipelago to S. China and Australia.

pulcherrima: *Poinciana pulcherrima.*

regia: *Delonix regia.*

Sappan (*Biancæa Sappan*). Prickly tree to 15 ft.: lfts. rhombic-oblong: fls. yellow: pod oblong, 3 in. long, beaked. India, Malaya.

sepiaria (*Biancæa sepiaria*). Mysore Thorn. Prickly scrambling shrub: lfts. oblong: fls. yellow: pod 3 in. long, beaked. India.

CÆSALPINIACEÆ: *Leguminosæ.*

CAFTA: *Catha edulis.*

CAILLIEA (*Dichrostachys*). *Leguminosæ.* Shrubs with finely divided acacia-like lvs., fls. in spikes, the upper ones bisexual and those on the lower half of spike with long slender staminodia, and flattened twisted pods; one species sometimes planted out-of-doors in S. Fla. and S. Calif. for ornament.

glomerata (*Dichrostachys nutans*). Spiny hard-wooded shrub or small tree: fls. sulfur-yellow on upper part of spike, rosy or lilac on lower part: pods in heads. Trop. Afr.—A serious pest in Cuba, where it is known as *Aroma.*

CAIOPHORA (spelled also *Cajophora*). *Loasaceæ.* S. American herbs usually with stinging hairs, opposite lvs., yellow, white or red fls., and capsular twisted frs.; one species cult. in the flower-garden. Propagated by seeds and cuttings.

lateritia (*Blumenbachia lateritia. Loasa lateritia. L. aurantiaca*). Ann., twining to 20 ft.: lvs. pinnate: fls. orange-red, to 2 in. across, on very long stalks.

CAJANUS. *Leguminosæ.* One shrub native probably in the Old World. C. Cajan (*C. indicus*). Pigeon-Pea. Cajan. Much cult. in trop. countries for the edible small truncate-orbicular somewhat flattened seeds which often are known simply as "peas." To 10 ft.: lvs. of 3 lanceolate soft-hairy lfts. to 4 in. long: fls. yellow or orange, papilionaceous, in axillary racemes: pods to 3 in. long, hairy, constricted between the seeds, slender pointed.—Often grown as an ann. from seeds; in greenhouses propagated by cuttings. It thrives in S. Fla.

CAJEPUT-TREE: *Melaleuca Leucadendra.*

CAJOPHORA: *Caiophora.*

CALABASH GOURD: *Lagenaria.*

CALABASH-TREE: *Crescentia Cujete.*

CALABAZILLA: *Cucurbita fœtidissima.*

CALACINUM (*Muehlenbeckia*). Wire-Plants. *Polygonaceæ.* Prostrate, viney or climbing more or less polygonum-like woody plants with wire-like sts. and alternate lvs., small unisexual fls. in axillary clusters or short spikes or racemes, and berry-like frs.; grown in greenhouses and hanging-baskets and out-of-doors in warm climates. Propagated by cuttings, when seeds are not available.

axillare. Much branched prostrate or sprawling small bush forming matted clumps 1 ft. or less through, or at other times straggling: lvs. ⅓ in. or less long, oblong to nearly orbicular, rounded at base: fls. solitary or in 2's. New Zeal.—Cult. as *Muehlenbeckia nana.*

chilense. Twining: lvs. ovate to oblong, triangular at base, about ½ in. long: fls. in axillary and terminal racemes. Chile, Peru.

complexum. Wire-Vine. Maidenhair-Vine. Twining, covering bushes, rocks and chimneys with interlaced sts.: lvs. orbicular or fiddle-shaped, ½–¾ in. across: fls. in axillary or terminal spikes. New Zeal.—Much grown in Calif.

platycladum: *Homalocladium platycladum.*

CALADIUM. *Araceæ.* Trop. American herbs with tubers or rhizomes, usually peltate arrow-shaped lvs. mostly beautifully marked in many colors and patterns, and unisexual fls. on spadices slightly shorter than the spathes which have boat-shaped limbs; popular foliage plants in the S. and under glass in the N., often improperly called Colocasias.

Tubers may be planted in the open in well-worked soil to which bone-meal has been added. In the greenhouse tubers may be started in boxes of moss in a temperature varying from 70° to 85°; when roots are formed they should be put in pots and shifted as they grow. Propagation may also be effected by seeds.

argyrites: *C. Humboldtii.*

bicolor. Lvs. ovate, variously colored above, giving rise to many named forms, glaucescent beneath, the petioles 3–7 times longer than blades: spathes green, violet at throat, the limb tipped white. Trop. Amer.—The usual species in cult.

bulbosum: hort. name.

esculentum: *Colocasia esculenta.*

Humboldtii (*C. argyrites*). Lvs. ovate-oblong or oblong, green, spotted between veins with large transparent white markings, the petioles 2–3 times longer than blades. Brazil.

picturatum. Lvs. lanceolate, variously colored above, pale beneath, the petioles variegated below: spathes green, purplish inside, the limb white. Brazil, Peru.

CALAMINTHA: *Satureja.*

CALAMONDIN: *Citrus mitis;* see *Citrus Fruits* (page 155).

CALAMPELIS: *Eccremocarpus.*

CALAMUS. CANE and RATTAN PALMS. *Palmaceæ.* The largest genus of palms, with more than 200 species in trop. and subtrop. Asia and Afr. to the Philippines, New Guinea and Australia; some of them have been tried in S. Fla., but are not sufficiently hardy; Dæmonorops is a similar genus. The Calami are mostly climbing plants with hooks on the midrib or the upper pinnæ transformed into hooked spines or the rachis perhaps prolonged and whip-like and making very long reed-like sts.; feather-palms, polygamo-diœcious, with axillary branched spadices: fr. globose or ellipsoid, clothed with close scales. See *Palm.*

ciliaris. Very slender, covering a trellis or other support, climbing by means of long leafless branches with hooked spines: lf.-blade 1½–2½ ft. long, petiole very short, pinnæ 40–50 pairs and hairy: fr. globose, about ½ in. diam. Java, Sumatra.

Rotang. One of the species that yield rattan: very slender climber: lvs. 1½–2 ft. long, without whip-like prolongation; petiole very short; pinnæ very many and ½ in. or less broad, setose on ribs and margins: fr. subglobose, ½ in. diam. India.

CALANDRINIA. *Portulacaceæ.* Rather fleshy low herbs of the western side of the Americas, with narrow alternate or basal lvs., red or rose ephemeral fls. in racemes or panicles, and capsular frs.; suitable for borders or rock-gardens. Cult. as annuals and propagated by seeds or cuttings.

Burridgii. Ann. to 1 ft.: lvs. linear-lanceolate: fls. copper-rose or brick-red, small. S. Amer.

caulescens var. **Menziesii** (*C. Menziesii. C. speciosa*). RED MAIDS. Ann., diffuse or erect, sts. to 2 ft. long: lvs. oblanceolate to linear, to 2 in. long: fls. crimson or rose-red, about ½ in. long. W. N. Amer.

grandiflora. Per. to 3 ft.: lvs. oval, to 8 in. long: fls. light purple. Chile.

Menziesii: *C. caulescens* var.

speciosa: *C. caulescens* var. *Menziesii.*

umbellata. Per. to 6 in.: lvs. linear, basal: fls. bright crimson-magenta. Peru.

CALANTHE. *Orchidaceæ.* Terrestrial or epiphytic orchids, sometimes having pseudobulbs, with broad plaited lvs. and white, rose or yellow fls. on erect or nodding scapes, the sepals and petals similar, the lip with the claw united to the column, 3-lobed and usually spurred; they require hothouse conditions; mostly deciduous and require rest after fls. are past in winter. See *Orchids.*

bella (*C. Harrisii*). Hybrid between *C. Veitchii* and *C. Turneri* (the latter a form of *C. vestita* with crimson-blotched lip).

furcata (*C. veratrifolia*). Lvs. to 2 ft. long, oblong-lanceolate: fls. snow-white, to 2 in. across, in many-fld. racemes on scapes 3 ft. or more high, the lip 4-lobed and with slender spur, Apr.–May. Malaya, Australia.

Harrisii: *C. bella.*

Regnieri: *C. vestita* var.

Sanderiana. Lvs. elliptic-lanceolate, to 1 ft. long: fls. in many-fld. racemes, the sepals and petals pale lilac edged with purple, the lip dark purple with brown on spur. Trop. Afr.

Sandhurstiana: *C. Veitchii* var.

Veitchii. Hybrid between *C. rosea* and *C. vestita*, having rose-colored fls. with a white spot at base of lip. Var. **Sandhurstiana** (*C. Sandhurstiana*) has crimson fls.

veratrifolia: *C. furcata.*

vestita. Pseudobulbs 3 in. high; lvs. broad-lanceolate, to 1½ ft. long: fls. white or creamy, 2½ in. across, in 6–12-fld. racemes on scapes to 2½ ft. long, the 4-lobed lip marked with orange-yellow at base and with slender spur, Nov.-Dec. India, Malaya. Var. **Regnieri** has less deeply lobed rose-colored lip marked with purple in throat. Var. **Williamsii** has white sepals and petals bordered with rose and deep rose lip.

Williamsii: *C. vestita* var.

CALATHEA. *Marantaceæ.* Trop. American or African per. herbs with attractively colored basal tufted lvs. and fls. in heads or cones borne on scapes among the lvs.; commonly known as Marantas, but Maranta is a separate genus distinguished by technical characters. These plants, in both genera, are difficult to determine as to species without inflorescence, and foliage should be had from normally grown and developed subjects. Leaf-blades are intended in the subjoined dimensions of lvs.

Calatheas should be grown in a moist close greenhouse with a night temperature not below 65°. They require good drainage and loam soil mixed with leaf-mold and sand. They should be shaded from the direct rays of the sun. In subtropical climates calatheas may be grown out-of-doors with winter protection. Leaf colors are likely to differ between young and old plants. Propagated by dividing the crowns, by tubers or by cuttings in spring.

Allouia. To 4 ft., with edible tubers: lvs. to 24 in. long and 6 in. broad, light green above, silvery beneath. Trop. Amer.—Tubers edible.

Bachemiana (*Maranta Kegeliana*). To 16 in.: lvs. to 10 in. long and 2½ in. wide, unequal-sided, silvery-green above with white lines along nerves, purplish or greenish beneath. Brazil.

bella. Stemless: lvs. to 6 in. long and 3 in. broad, whitish-green above, pale purple beneath. Habitat unknown.

bicolor: *Maranta bicolor.*

Chantrieri. To 7 ft.: lvs. to 1½ ft. long, rich dark green but in juvenile stages pale yellowish-green with dark green band around margins and midrib, purplish-red beneath. Brazil.

eximia. To 1½ ft.: lvs. to 15 in. long, striped above with olive-green and silver, wine-red and pubescent beneath. Cent. Amer.

fasciata. To 1 ft.: lvs. to 9 in. long and 7 in. broad, dark olive-green above transversely barred with silvery-white, dull grayish-green below. Brazil.

Gouletii: *C. Vandenheckei.*

illustris. To 9 in.: lvs. to 6 in. long and 5 in. wide, shining olive-green with metallic luster above having white marginal zone, dull red beneath. Ecuador.

imperialis: a variant of *C. ornata.*

insignis. To 6 ft.: lvs. to 1½ ft. long and 8 in. broad, pale yellowish-green above margined and blotched with olive-green, dark maroon-red beneath. Brazil.

Legrelliana. To 1 ft.: lvs to 8 in. long and 3½ in. wide, shining green above with broad white central band and white transverse lines, whitish-green marked with red and green beneath. Colombia, Ecuador.

leopardina. To 1½ ft.: lvs. to 8 in. long and 3½ in. broad, rich green but in juvenile stage dark olive-green in center surrounded by band of paler green. Brazil.

Lietzei (*Maranta conspicua*). To 2 ft.: lvs. to 9 in. long and 2½ in. broad, velvety green above striped between side veins with olive-green and splashed with yellowish-green, purplish-red underneath. Brazil.

Lindeniana (*Maranta Lindeni*). To 3 ft.: lvs. to 1 ft. long, dark green above with olive-green zone either side the midrib and then darker zone, purplish zone beneath. Brazil.—Probably *Phrynium Lindeni*, Hort. belongs here.

Louisæ. To 3 ft.; lvs. to 1 ft. long, light green above feathered with white along midrib, tinted with purple-red below. Habitat unknown.

Luciana. To 3 ft.: lvs. to 1 ft. long, light green above with zone of greenish-white near margin and feathered along midrib, grayish-green beneath. Trop. Amer.

Makoyana. To 4 ft.: lvs. olive-green or cream-colored beneath blotched with dark green, red beneath. Brazil.

medio-picta. To 20 in.: lvs. to 8 in. long and 3½ in. wide, dark green above feathered with white along the midrib, pale green beneath. Brazil.

micans. To 8 in.: lvs. to 4 in. long and 1 in. broad, shining green above feathered with white, pale green beneath. Brazil.

musaica. Dwarf: lvs. cordate-ovate, to 6 in. long, pale shining green above transversely lined with lighter green. Brazil.

Oppenheimiana: *Ctenanthe Oppenheimiana.*

ornata. To 3 ft.: lvs. to 3 ft. long, rich green above, dull purple-red beneath, in juvenile forms often striped with pink and white. Guiana, Colombia, Ecuador.

Pavonii (*C. tubispatha*). To 2 ft.: lvs. to 10 in. long and 5½ in. wide, bright green above spotted with light green and brown. Peru.—The plant cult. as *Maranta tubispatha* may be a form of *M. bicolor.*

princeps. Lvs. to 10 in. long and 3½ in. wide, light green above with broad central band of black-green, violet-purple below. Amazon.

pulchella. Lvs. to 4 in. long and 2 in. wide, light green with transverse green bands, purple beneath. Brazil.

roseo-picta. To 8 in.: lvs. to 9 in. long and 6 in. broad, dark green above with red midrib and zone of bright red near margin, purple beneath. Brazil.

Sanderiana: a variant of *C. ornata.*

smaragdina: *Monotagma smaragdinum.*

splendida. To 1½ ft.: lvs. to 14 in. long and 10 in. wide, shining dark green above transversely barred with pale green, purple beneath. Brazil.

tubispatha: *C. Pavonii.*

undulata. To 8 in.: lvs. to 4 in. long and 2 in. broad, wavy, shining dark green above with a central white stripe, purplish beneath. Peru.

Vandenheckei (*C.* and *Maranta Gouletii*). To 2½ ft.: lvs. to 9 in. long, dark green above marbled with silvery-white along midrib and band along margin, purplish-red beneath. Brazil.

Veitchiana. To 4 ft.: lvs. to 1 ft. long and 6 in. wide, shining dark green above with irregular pale green band on either side midrib having brownish blotches, reddish underneath. Peru.

vittata. To 3 ft.: lvs. to 1½ ft. long and 9 in. broad, light green above transversely striped with white, tinted yellowish-green beneath. Colombia.

Wallisi. To 4 ft.: lvs. to 1 ft. long, light green above with a row of olive-green blotches on either side midrib, grayish-green beneath. Peru.

Warscewiczii. To 3 ft.: lvs. 1 ft. long and 5 in. broad, velvety green above and midrib feathered with yellow-green, purple beneath. Costa Rica.

zebrina. ZEBRA PLANT. To 3 ft.: lvs. to 2 ft. long and 1 ft. across, velvety green above with transverse bands of pale yellow-green and olive-green, purplish-red beneath. Brazil. Var. **Binotii** is a large form with darker colored lvs.

CALCEOLARIA (*Fagelia*). SLIPPERWORT. *Scrophulariaceæ.* Herbaceous and shrubby plants cult. in greenhouses in the N. and in the open in warm regions, having irregular cymes of showy saccate fls., the upper part of the fl. small and more or less pouched, the lower lip, in the cult. forms, very large and inflated and somewhat slipper-like, usually yellow, sometimes purple, often spotted; mostly native from Mex. to Chile.

The herbaceous calceolarias are grown from seed sown from late spring to early autumn for plants for the next winter and spring. Finely sifted soil should be provided, preferably one containing leaf-mold, and care should be exercised in watering as the seed is very small; sub-irrigation is the best method. A temperature of 60° is recommended and no direct sun till the plants are quite large.

The shrubby types are grown from seed or from cuttings. The latter are usually taken when the plants are trimmed in late summer or early autumn, choosing firm wood and cutting down to two joints, giving a temperature of 45–50° and protection from the sun.

alba. Shrubby, to 2 ft.: lvs. linear, to 2 in. long, remotely toothed: fls. white, ½ in. long and ⅓ in. across. Chile.

angustifolia: *C. integrifolia* var.

chelidonioides. Ann. to 3 ft.: lvs. to 8 in. long, pinnate into toothed segms.: fls. yellow, ½ in. long and 2 in. wide. Ecuador, Peru, Chile.

Clibranii: *C. profusa.*

crenatiflora. Per. to 2½ ft., pubescent: lvs. ovate, to 8 in. long, coarsely toothed: fls. drooping, to 1 in. long and broad, yellow with orange-brown spots on the inflated wavy lower lip. Chile.—Much grown by florists in many colors and large fls.

fruticohybrida. A group of shrubby cultigens with yellow, orange or dull red spotted fls.; to be considered as forms of *C. integrifolia.*

gracilis. Ann. to 1½ ft., sticky-pubescent: lvs. pinnate, the lobes toothed, white beneath: fls. pale yellow, ½ in. long and ¼ in. wide. Peru, Ecuador.

herbacea: see *C. herbeohybrida.*

herbeohybrida (*C. herbacea. C. hybrida. C. Youngii*). A group of herbaceous cultigens, usually dwarf or small, 2 ft. or less, with inflated pouches, in many colors; to be regarded as forms of *C. crenatiflora.*

hybrida: see *C. herbeohybrida.*

integrifolia (*C. rugosa*). Sts. woody, to 6 ft.: lvs. oblong or oval, to 3 in. long, rugose, toothed: fls. ½ in. across, yellow to red-brown, not spotted. Chile.—Much used by gardeners. Var. **angustifolia** (*C. angustifolia*) has lanceolate lvs. Var. **viscosissima** (*C. viscosissima*) is a sticky-hairy form.

Lymani: a hort. shrubby form with bronzy-red fls.

Medfordi: a hort. form with velvety-maroon fls.

mexicana. Ann. to 1 ft., glandular-hairy: lower lvs. 3-parted or -lobed, the upper pinnate into ovate toothed segms., to 2½ in. long: fls. pale yellow, ½ in. long and ¼ in. wide. Mex., Cent. Amer.

pinnata. Ann. to 3 ft., pubescent: lvs. pinnate, to 3 in. long: fls. pale yellow, ½ in. long and broad. Chile, Peru, Bolivia.

polyrrhiza. Dwarf tufted per. to 2 in.: lvs. lanceolate, to 2½ in. long: fls. yellow spotted purple, 1 in. long and ½ in. wide, solitary on scapes to 4 in. long. Chile.

profusa (*C. Clibranii*). A garden form, to 3 ft., very free-flowering: fls. light and graceful, rich golden-yellow.

rugosa: *C. integrifolia.*

scabiosæfolia. Pubescent ann. to 2 ft.: lvs. pinnate, to 8 in. long, the bases of the petioles united across the sts., lfts. toothed or cut: fls. pale yellow, ½ in. long and ⅓ in. across. Ecuador to Chile.

Stewarti: a hort. shrubby form with yellow fls.

umbellata. Cespitose herb, mostly with very short st.: lvs. all nearly or quite radical, oblong, lanceolate, or somewhat ovate, obtuse, entire, slightly hairy underneath: fls. yellow, 2–8 terminating a scape-like peduncle, the lip ½ in. or less across. Bolivia.

Veitchii. Hybrid with *C. alba* as one parent, to 5 ft.: fls. rather small, pale lemon-yellow.

violacea: *Jovellana violacea.*

viscosissima: *C. integrifolia* var.

Youngii: see *C. herbeohybrida.*

CALENDULA. *Compositæ.* Herbaceous annuals and perennials with simple alternate lvs. and usually large yellow or orange heads of ray- and disk-fls.; pappus none: fr. large, flattened or curved. Native from Canary Isls. to Persia, one a garden favorite.

Calendulas are of easy culture in the greenhouse as well as in the garden, growing quickly from seeds. Also propagated by cuttings, of special colors.

eriocarpa. Branching ann.: lvs. lanceolate, partly clasping, nearly glabrous: heads yellow, about 1 in. across. Country unknown.

hybrida: *Dimorphotheca hybrida.*

maderensis. Per. to 2 ft.: lvs. oblong-spatulate, attenuate at base, rough, nearly entire: heads yellow. Madeira.

maritima. Ann., sticky-pubescent: lvs. obovate to lanceolate, entire, the upper partly clasping: heads yellow, about 1½ in. across. Sicily.—Probably only a race of *C. officinalis.*

officinalis. Pot-Marigold. Hardy branching ann. to 2 ft., hairy: lvs. thickish, oblong to oblong-ovate, entire or minutely toothed, partly clasping: heads to 4 in. across, rays white-yellow to deep orange, closing at night, blooming for the entire season; sometimes proliferous from the involucre. S. Eu.—A favorite flower-garden plant and grown for cut-flowers in winter.

pluvialis: *Dimorphotheca annua.*

Pongei: *Dimorphotheca annua* var. *ligulosa.*

sicula. Probably only a race of *C. officinalis* distinguished by being almost glabrous and heads only about 1 in. across. S. Italy.

stellata. Ann. to 1 ft., rough: lvs. ovate-oblong, the upper partly clasping, wavy-toothed: heads yellow, 1–2 in. across. Medit. region.

suffruticosa. Ann., woody at base, pubescent: lvs. lanceolate, somewhat toothed: heads bright yellow, very numerous, about 1 in. across. Medit. region.

Tragus: *Dimorphotheca aurantiaca.*

CALICO-BUSH: *Kalmia latifolia.*

CALICO-FLOWER: *Aristolochia elegans.*

CALIMERIS. *Compositæ.* Hardy per. aster-like herbs, differing from Aster in the character of the involucre; native in Asia. One is cult. in the border and requires the same treatment as the perennial asters.

incisa (*C. incisæfolia. Aster incisus*). To 2 ft.: lvs. oblong-lanceolate, cut-toothed, the upper narrower and entire: heads solitary, 1 in. across, rays purple or almost white, disk yellow. Siberia. Var. **rosea** has pink fls.

CALLA. *Araceæ.* One herb growing in bogs in the north temp. zone, sometimes transplanted to pond-margins and wet places. The callas of gardens belong to the genus Zantedeschia. C. palustris. Water-Arum. Wild Calla. Lvs. ovate-cordate, to 6 in. long and broad, the petioles to 10 in. long: spathes green outside, white inside, about 2 in. long and 1½ in. wide; berries red, in dense cluster.

CALLA, BLACK: *Arum palæstinum.* **Red**: *Sauromatum guttatum.*

CALLIANDRA (*Anneslia*). *Leguminosæ.* Trop. shrubs and trees with 2-pinnate lvs., fls. in heads or clusters having long conspicuous stamens, and flat pods with thickened margins; grown out-of-doors in trop. and subtrop. regions and in greenhouses N. Propagated by cuttings over bottom heat, when seeds are not available.

californica. To 4 ft.: weak slender spines at base of petioles: lfts. ¼ in. long: fls. purple with long purple stamens. Lower Calif.

Guildingii. Small tree: lfts. to 2½ in. long: fls. greenish-white with crimson stamens to 3 in. long. Trinidad.

Houstoniana. To 20 ft.: lfts. to ¼ in. long: fls. brown-tomentose with long purple stamens, the heads in terminal racemes. Mex., Cent. Amer.

portoricensis. To 25 ft.: lfts. ⅗ in. long: fls. white with long white stamens. W. Indies.

Tweedii (*Inga pulcherrima*). To 6 ft.: lfts. linear: fls. purple with long purple stamens. Brazil.

CALLICARPA. Beauty-Berry. *Verbenaceæ.* Shrubs and trees with opposite simple lvs., small pink, bluish or white fls. in axillary clusters, and attractive berry-like frs.

Callicarpas can be grown in a light airy place in the greenhouse in a compost of loam and peat. Propagated by cuttings, layers and seeds. They are raised for both the ornamental flowers and colored fruits in clusters. Some of them are fairly hardy in the North and if the tops kill, new shoots usually bloom and fruit.

americana. French-Mulberry. Shrub to 6 ft.: lvs. to 6 in. long, toothed, white- or rusty-tomentose beneath: fls. bluish, May–July: fr. violet or white in var. **alba.** Va. to Tex., W. Indies; not hardy N.

cana (*C. sinensis*). To 12 ft.: lvs. to 6 in. long, toothed, gray- or white-pubescent beneath: fls. lavender: fr. lavender. Malaya.

dichotoma (*C. purpurea*). Shrub to 4 ft.: lvs. to 3 in. long, toothed above middle: fls. pink, Aug.: fr. lilac-violet. Japan, China; stands well N.

Giraldiana. To 10 ft.: lvs. to 4 in. long, toothed, pubescent beneath: fls. pink, July-Sept.: fr. violet. China; stands N.

japonica (*C. Mimurazaki*). Shrub to 5 ft.: lvs. to 5 in. long, finely-toothed: fls. pink or whitish, Aug.: fr. violet or white in var. **leucocarpa.** Japan; stands N.

longifolia. Shrub: lvs. to 5 in. long, lanceolate, pubescent beneath: fls. pink or purple: fr. white. Himalayas, China.

Mimurazaki: *C. japonica.*

purpurea: *C. dichotoma.*

sinensis: *C. cana.*

CALLICHROA: *Layia.*

CALLICOMA. *Cunoniaceæ.* A few small trees of Australia having opposite leathery lvs. and small fls. in heads, without petals; one species planted in S. Calif.

serratifolia. To 40 ft.: lvs. oblong to ovate-lanceolate, to 4 in. long, coarsely toothed, shining above, tomentose beneath: heads globular, dense, stamens much exserted.

CALLIGLOSSA: *Layia Calliglossa.*

CALLIOPSIS: *Coreopsis.*

CALLIPRORA: *Brodiæa ixioides.*

CALLIRHOË. Poppy-Mallow. *Malvaceæ.* N. American herbs, root often tuberous, with alternate lobed or dissected lvs. (as if compound) and showy pink or red-purple fls.; some of them are attractive flower-garden subjects.

Seeds should be sown where the plants are to stand. Perennial kinds may also be propagated by cuttings and division of the roots.

digitata. Per. to 1½ ft.: lvs. deeply parted into linear lobes or sometimes entire: fls. reddish-purple to violet, to 2 in. across, with small calyx. Mo. to Tex.

involucrata (*C. verticillata*). Per. to 1 ft.: lvs. deeply 5–7-parted: fls. red-purple or paler, to 2½ in. across, with leafy calyx. Minn. to Tex.

Papaver. Per., main st. 1 ft. or more, peduncle-like branches 8–12 in. long and solitary or somewhat clustered: lvs. 3–5-parted into narrow divisions: fls. rose or purple, 2 in. across. Ga., Fla. to Tex.

pedata. Ann. to 3 ft.: lower lvs. 5–7-lobed, the upper ones 3–5-parted: fls. red-purple to lilac, 1 in. long, with small calyx. Mo. to Tex.

verticillata: *C. involucrata.*

CALLISTACHYS: *Oxylobium.*

CALLISTEMMA: *Callistephus.*

CALLISTEMON. Bottle-Brush. *Myrtaceæ.* Australian shrubs or small trees with scattered linear or lanceolate entire simple leathery lvs., showy yellow or red fls. in dense spikes resembling a bottle-brush due to the long exserted stamens (which are not united with each other) and capsular frs.; suitable for cult. in warm-temp. regions, particularly in Calif.

They are not particular as to soil. Propagated by seeds or cuttings of ripened wood. Seeds are gathered in summer by allowing the capsules to open in boxes or sheets of paper and are sown the next spring.

brachyandrus. Shrub: lvs. stiff and needle-like, to 1½ in. long: fls. with dark red stamens and yellow anthers, in spikes to 3 in. long.

citrinus: *C. lanceolatus.*

coccineus. To 30 ft.: lvs. lanceolate, to 1½ in. long: fls. with red stamens and yellow anthers, the spikes not very dense.

Cunninghami. Branches yellowish: lvs. elliptic, pale, reddish when young.

hybridus: a name of uncertain application.

lanceolatus (*C. citrinus. Metrosideros floribunda. M. semperflorens. M. citrina*). To 30 ft.: lvs. lanceolate, to 3 in. long: fls. with bright red stamens, the spikes not very dense.

linearis. Lvs. narrowly linear, to 5 in. long: fls. with red stamens, the spikes dense.

paludosus: *C. salignus* var. *australis.*

phœniceus. Lvs. narrowly lanceolate, to 4 in. long: fls. with rich red stamens, the spikes not dense.

pinifolius. Tall shrub: lvs. stiff and terete, linear, to 4 in. long: fls. with yellowish-green stamens.

rugulosus: name of uncertain application.

rigidus. Lvs. linear or narrowly lanceolate, to 5 in. long: fls. with red stamens, the spikes very dense.

salignus. To 40 ft.: lvs. lanceolate, to 3 in. long: fls. with yellow or light pink stamens, the spikes not very dense. Var. **australis** (*C. paludosus*) has lvs. to 2 in. long. Var. **viridiflorus** has greenish-yellow stamens and shorter lvs.

speciosus. To 40 ft.: lvs. lanceolate, to 4 in. long: fls. with rich red stamens and yellow anthers, the spikes very dense.

CALLISTEPHUS. China Aster. *Compositæ.* Erect branching plants with herbage of strong odor, large terminal heads bearing prominent rays; pappus of bristles. A single species from Asia which has resulted in many races of well-known and adaptable garden annuals. Grown from seed; for early bloom the seed is sown indoors in late spring, but the main crop may be sown directly in the open. The distance at which the plants are to stand is governed by the stature of the particular variety, ranging from 6 in. to 2 ft. **C. chinensis.** Erect, hairy, to 2½ ft.: lvs. alternate, ovate, deeply toothed or lobed: heads terminal, in the wild plant with 1–2 series of ray-fls. and yellow disk-fls., but under cult. the rays are numerous and vary in color from violet, purple, blue, rose to white but no true yellow, and 5 in. and more across; there are dwarf and condensed forms. China, Japan. —Known also as *Callistemma chinense* and *hortense.*

CALLITRIS. Cypress-Pine. *Pinaceæ.* Evergreen trees with scale-like lvs. and jointed mostly angled branchlets, staminate fls. in ovoid or cylindrical catkins and cones usually of 6 unequal scales; native in Australia and New Caledonia. Grown in warm regions, as Fla. and Calif.; for cult. see *Conifers.* The genus belongs in the cypress section of the Pine family.

Actinostrobus: *Actinostrobus pyramidalis.*

arborea: *Widdringtonia juniperoides.*

australis: *C. oblonga.*

calcarata. Tree to 60 ft. and more: cones ovoid, ½ in. across. Australia.

cupressiformis (*C. rhomboidea*). Tree to 50 ft.: cones nearly globose, ½ in. across, often clustered. Australia.

Drummondii. Shrub or small tree: cones globose, ½ in. across. Australia.

glauca: *C. robusta.*

Muelleri. Tree to 30 ft.: cones globular, to 1 in. across. Australia.

oblonga (*C. australis*). Tree to 25 ft.: cones ovoid or oblong, to 1 in. long, usually clustered. Tasmania.

quadrivalvis: *Tetraclinis articulata.*

rhomboidea: *C. cupressiformis.*

robusta (*C. glauca. C. verrucosa*). Tree to 100 ft.: cones subglobose, ¾ to 1 in. or more across. Australia.

verrucosa: *C. robusta.*

Whytei: *Widdringtonia Whytei.*

CALLUNA. Heather. *Ericaceæ.* One hardy evergreen shrub native in Eu. and Asia Minor (also in a few localities in E. N. Amer., but probably intro.), cult as for Erica and differing in having a colored calyx longer than the corolla. **C. vulgaris** (*Erica vulgaris*). To 3 ft.: lvs. scale-like and overlapping: fls. natively mostly purplish, ⅛ in. long, in racemes to 10 in. long, blooming profusely in late summer. There are numerous hort. vars., as: **alba**, fls. white and its forms *elata, minor, pilosa, pumila, tenella;* **Alportii**, tall and vigorous, fls. carmine; **argentea**, lvs. pale; **aurea**, dwarf, lvs. golden; **carnea**, fls. pink; **coccinea** (var. *rubra*), fls. deep red; **compacta**, of compact habit; **cuprea**, lvs. golden turning bronze; **Foxii**, dwarf and matted; **Hammondii**, fls. white; **hirsuta** (var. *tomentosa*), lvs. gray-tomentose; **humilis**, low, fls. white; **hypnoides**, to 1 ft., fls. deep pink; **monstrosa**; **nana** (var. *pygmæa*), to 4 in., fls. purple; **rosea**, fls. pink; **rubra**, fls. rosy-carmine; **Searlei**, fls. white, late; **sericea**, fls. white, late; **variegata**, lvs. somewhat variegated with white.

CALLUS: a hard prominence or protuberance; in a cutting or on a severed or injured part, the roll of new covering tissue.

CALOCARPUM: *Achras.*

CALOCEPHALUS. *Compositæ.* Australian ann. herbs or small shrubs with mostly alternate entire lvs. and fl.-heads in terminal clusters, fls. all tubular; pappus of scales or plumose bristles. One species is grown in Calif. as a foliage edging. Propagated by cuttings.

Brownii (*Leucophyta Brownii*). To 1 ft., white-woolly: lvs. linear, ⅙ in. long: heads ½ in. across, subtended by a few floral lvs.

CALOCHORTUS. Mariposa-Lily. Globe-Tulip. *Liliaceæ.* Cormous herbs native in W. N. Amer., with linear-lanceolate lvs. borne on the st. and broadly campanulate yellow, white or lilac interesting fls. solitary or in terminal clusters, blooming in spring and summer, mostly showy.

Calochortuses should have a light porous soil, not too stimulating, with perfect drainage, such as equal parts of light loam and spent tan-bark, with a little broken charcoal. They withstand much cold but not alternate thawing and freezing. Winter protection of leaves should be provided. Planting should be late in autumn and bulbs lifted after ripening the following season. They are useful in borders and frames and are sometimes bloomed indoors. Propagated by natural increase and by seeds when obtainable.

albus. To 2 ft.: fls. white, purplish at base, 1¼ in. long, nodding. Calif. Var. **rubellus** has fls. tinged with rose.

amabilis. Golden G. To 1½ ft.: fls. golden-yellow, 1¼ in. long, nodding. Calif.

amœnus. Purple G. To 1½ ft.: fls. rose-purple, 1¼ in. long, nodding. Calif.

Benthami: *C. monophyllus.*

cæruleus. Cats-Ear. To 6 in.: fls. blue, ½ in. long, hairy, erect. Calif.

catalinæ. To 2½ ft.: fls. white to lilac-purple, maroon at base, 2 in. long. S. Calif., Catalina Isl.

citrinus: *C. luteus* var.

clavatus. To 3 ft.: fls. rich yellow lined with brown, having club-shaped hairs at base, 2 in. long. Calif.

flavus (*Cyclobothra flava*). To 2 ft.: fls. yellow, ¾ in. long. Mex.

flexuosus. Sts. decumbent or ascending and flexuose: fls. purple or white with yellowish base, 1 in. long. Nev., Utah, Ariz.

Greenei. To 1½ ft.: fls. lilac marked below with yellow, to 1½ in. long. Calif.

Gunnisoni. To 1½ ft.: fls. white streaked with purple, 1¾ in. long. S. D. to New Mex.

Howellii. To 1½ ft.: fls. white, 1 in. long. Ore.

Kennedyi. To 6 or rarely 14 in. high: fls. orange-red or vermillion, to 1½ in. long. Calif., Nev., Ariz.

Leichtlinii. To 1 ft.: fls. white tinged with purple, yellow at base with dark spot, 1¼ in. long. Ore. to S. D. and Calif.

lilacinus: *C. uniflorus.*

luteus. To 2 ft.: fls. yellow or orange lined with brown, to 2 in. long. Calif. Var. **citrinus** has lemon-yellow petals with dark brown spot near base. Var. **oculatus** has white or lilac petals, the brown spot bordered with yellow. Var. **Vestæ** has pure white fls. with brown spot.

macrocarpus. Green-banded M. To 2 ft.: fls. purple with green band down middle, 2 in. long. B. C. to Calif.

Maweanus. To 8 in.: fls. white or tinged with purple, 1 in. long. Ore. to Calif. Var. **major** is a larger form and var. **roseus** has fls. tinged with rose.

monophyllus (*C. Benthami*). Yellow Star-Tulip. To 10 in.: fls. yellow with brown at base, ¾ in. long. Calif.

nitidus. To 1½ ft.: fls. lilac or purple with dark purple spot, 1½ in. long. Wash., Mont., Ore.

Nuttallii. Sego-Lily. To 1½ ft.: fls. white lined with purple, with purple spot at base, to 1¾ in. long. Wash. to Calif. and New Mex.

Plummeræ. To 2 ft.: fls. purple with orange-colored hairs, 1½ in. long. Calif.

pulchellus. To 2 ft.: fls. golden-yellow, ciliate on margin, 1¼ in. long, nodding. Calif.

Purdyi. To 1 ft.: fls. creamy-white tinged with purple, hairy, ¾ in. long. Wash., Ore.

splendens. Lilac M. To 2 ft.: fls. lilac, 2 in. long. Calif. Var. **rubra** has reddish-lilac fls.

uniflorus (*C. lilacinus*). To 10 in.: fls. lilac, 1 in. long. Calif.

venustus. White M. To 10 in. or more: fls. pale lilac with reddish-brown spot, 2 in. long. Calif. Var. **purpurascens** has darker fls. and var. **roseus** a rose-colored spot at apex. Var. **superbus** is an improved form.

Weedii. To 2½ ft.: fls. yellow dotted with orange-brown, 1¼ in. long. Calif.

CALODENDRUM. *Rutaceæ.* One S. African evergreen tree adapted to cult. in warm regions (as S. Fla.), for interest and beauty, for its dark green foliage and profusion of showy bloom. **C. capensis.** Cape-Chestnut. To 70 ft.: lvs. simple, ovate, the veins parallel, to 5 in. long: fls. 1½ in. long, light rose-lilac with purple dots, in large terminal panicles: frs. nearly spherical, woody, covered with tubercles.—Propagated by cuttings of young wood over heat.

CALONYCTION. Moonflower. *Convolvulaceæ.* Trop. American twining herbs with heart-shaped to arrow-shaped lvs., large fragrant white or purple fls. blooming at night, having long tube, flat limb and exserted stamens and style; grown rarely as a greenhouse vine in the N. and out-of-doors in the S. Propagated by seeds, which are often notched to hasten germination. Per., but often grown as ann.

aculeatum (*Ipomœa Bona-Nox. I. noctiflora. I. mexicana grandiflora*). Juice milky: sts. more or less prickly: lvs. broad-ovate, to 8 in. long, sometimes 3-lobed: fls. white, often banded with green, with tube to 6 in. long and limb 6 in. across. Tropics, Fla.—The common moonflower.

muricatum. Similar to *C. aculeatum* but with smaller purple fls. to 3 in. across. Tropics.

Tuba (*Ipomœa Tuba*). Differs from *C. aculeatum* in thick cordate ovate not lobed lvs. and very broad obtuse rather than narrow-acuminate calyx-lobes: fls. white, 5 or 6 in. long. S. Fla., W. Indies.

CALOPHACA. *Leguminosæ.* Low shrubs or herbs with alternate pinnate lvs., yellow or violet papilionaceous fls. in racemes or solitary, and cylindrical pods. Grown in borders or on rocky slopes in well-drained soil. Propagated by seeds and sometimes grafted high on Laburnum.

wolgarica. To 3 ft.: lfts. ½ in. long: fls. bright yellow, 1 in. long, in racemes: pods to 1¼ in. long. S. Russia, Turkestan.

CALOPHANES: *Dyschoriste.*

CALOPHYLLUM. *Guttiferæ.* Trees of trop. Asia and Amer., with opposite leathery lvs. which have numerous parallel cross veins, polygamous fls. in racemes or panicles, and fr. a drupe. Several species yield oil and gum; sometimes planted for ornament in tropics.

antillanum (*C. Calaba* of some authors). Maria. To 90 ft. or more: lvs. to 6 in. long: fls. white, fragrant, in axillary few-fld. racemes: fr. about 1 in. across. W. Indies.

Calaba: *C. antillanum.*

CALOPOGON. *Orchidaceæ.* N. American terrestrial orchids with grass-like lvs. and fls. borne in racemes on naked scapes, the sepals and petals similar, the lip long-clawed and hairy above; sometimes planted in bog- or rock-gardens.

pulchellus (*C. tuberosus. Limodorum tuberosum*). Grass-Pink Orchid. To 14 in.: lvs. linear, to 8 in. long: fls. violet-rose, 1½ in. across, in 2–5-fld. racemes, the lip bearded with golden-yellow hairs, June–Aug. Swamps, E. N. Amer.

tuberosus: *C. pulchellus.*

CALOTHAMNUS. *Myrtaceæ.* Australian shrubs with narrow scattered lvs., usually showy red fls. in clusters or spikes, the stamens long-exserted and united into bundles, and capsular fr. For cult. see *Callistemon.*

coccineus: a hort. name for *C. quadrifidus.*

homalophyllus. To 6 ft.: lvs. oblong to nearly linear, very obtuse, 1–2 in. long: fls. rich crimson, to 1 in. long, in spikes.

longissimus. Low shrub: lvs. terete, 6 in. to 1 ft. or more long: fls. 1 in. long, in few-fld. spikes.

quadrifidus. To 8 ft.: lvs. needle-like, to 1 in. long: fls. rich crimson, to 1 in. long, in clusters.

sanguineus. Tall shrub: lvs. terete, to 1½ in. long: fls. rich red, 1 in. long, in clusters or short spikes.

CALPIDISCA: see *Utricularia.*

CALPURNIA. *Leguminosæ.* Trees or shrubs with pinnate lvs., yellow papilionaceous fls. in racemes, and rather flat slightly winged pods; native in Afr. Grown out-of-doors in subtrop. climates, and sometimes in greenhouses, for ornament; propagated by cuttings under glass or by seeds.

aurea (*C. lasiogyne*). To 15 ft.: lfts. oval, to 1¾ in. long: fls. about ½ in. long: pods linear, to 3 in. long. S. Afr.

lasiogyne: *C. aurea.*

CALTHA. *Ranunculaceæ.* Per. small herbs growing in marshes in the north temp. zone, having simple usually heart-shaped lvs. and yellow, white or pink fls. without petals but with petal-like sepals; grown in moist and boggy situations. Propagated by division of roots in autumn and by seed.

leptosepala (*C. rotundifolia*). To 1 ft.: lvs. oval, to 4 in. long: fls. white tinged blue outside, about 1 in. across, solitary, June–Aug. Alaska to New Mex.

palustris (*C. parnassifolia*). Marsh-Marigold. To 2 ft.: lvs. cordate, to 7 in. wide: fls. bright yellow, to 2 in. across, several together, Apr.–June, making masses of yellow. Newf. to S. C. and Neb.—The young lvs. are eaten as greens under the name "cowslip." Var. **monstrosa-pleno** (var. *flore-pleno*) has large double fls.

parnassifolia: *C. palustris.*

polypetala. To 2 ft.: lvs. to 1 ft. across: fls. golden-yellow, to 3 in. across, in spring. Caucasus, W. Asia.

rotundifolia: *C. leptosepala.*

CALTROP FAMILY: *Zygophyllaceæ.*

CALYCANTHACEÆ. Calycanthus Family. Two or three genera of deciduous shrubs having aromatic bark, opposite entire lvs., bisexual solitary fls. with many similar sepals and petals, many stamens, and fr. of many 1-seeded achenes inclosed in the receptacle; native in N. Amer. and E. Asia. Calycanthus and Meratia are cult.

CALYCANTHUS (*Butneria*). Sweet-scented Shrub. Sweet-Shrub. *Calycanthaceæ.* Deciduous N. American shrubs with large fragrant brownish fls. borne at the tips of short branchlets; hardy in the N. except *C. occidentalis.* They do best in rich well-drained soil. Propagated by seeds, layers, suckers, and division.

elongatus: *C. fertilis* var. *ferax.*

fertilis (*C. glaucus*). To 10 ft.: lvs. ovate to oblong, to 6 in. long, glaucous and nearly glabrous beneath: fls. reddish-brown, to 2 in. across: fr. contracted at mouth. Pa. to Ga. and Ala. Var. **ferax** (*C. lævigatus, C. elongatus*) has lvs. green beneath.

floridus. Carolina Allspice. To 10 ft.: lvs. ovate or elliptic, to 5 in. long, densely pubescent and pale beneath: fls. dark reddish-brown, 2 in. across: fr. contracted at mouth. Va. to Fla. Var. **ovatus**, lvs. ovate.

glaucus: *C. fertilis.*

lævigatus: *C. fertilis* var. *ferax.*

macrophyllus: *C. occidentalis.*

occidentalis (*C. macrophyllus*). To 12 ft.: lvs. ovate to oblong-lanceolate, to 8 in. long, green and nearly glabrous beneath: fls. light brown, to 3 in. across: fr. not contracted at mouth. Calif.

præcox: *Meratia præcox.*

CALYCOTOME. *Leguminosæ.* Spiny deciduous shrubs with lvs. of 3 lfts., yellow papilionaceous fls. solitary or in clusters, and linear-oblong pods with thickened or winged margin; native in the Medit. region. Sometimes grown in mild climates for ornament. Cult. as for Cytisus.

spinosa. To 5 ft.: lfts. ½ in. long: fls. in clusters of 1–4, ½ in. long: pods about 1 in. long. S. Eu.

CALYPSO (*Cytherea*). *Orchidaceæ.* One terrestrial orchid native in cool bogs in N. Amer. and Eu., and sometimes planted in similar places. **C. bulbosa** (*C. borealis*). To 6 in., with small bulbs: lf. solitary, round-ovate, to 1½ in. long: fls. solitary, variegated purple, pink and yellow, with large saccate lip.

CALYSTEGIA PUBESCENS: *Convolvulus japonicus.*

CALYTRIX. *Myrtaceæ.* Heath-like Australian shrubs with small scattered entire lvs. and yellow, pink, lilac or white fls., stamens commonly numerous; one species intro. in Calif.

Sullivani. Shrub, glabrous or nearly so: lvs. linear-3-angled, to ¼ in. long: fls. probably white, in heads or short spikes terminal or lateral on branchlets; calyx-lobes awned.

CALYX: the outer circle of floral envelopes.

CAMAROTIS. *Orchidaceæ.* Epiphytes with short lvs. and fls. in erect or stiffly spreading racemes, the sepals and petals similar, the lip 3-lobed and spurred, the column with an upright beak; suitable for hothouse cult. See *Orchids.*

Mannii. Lvs. very thick, to 4 in. long and ⅔ in. wide: fls. ¼ in. across, of pale color, in short racemes. India.

purpurea: *C. rostrata.*

rostrata (*C. purpurea*). St., to 2½ ft. long: lvs. to 4 in. long and ½ in. across: fls. about ½ in. across, in 5–10-fld. spreading racemes about length of lvs., sepals and petals pale purple, lip somewhat saccate, bright rose, May–July. India.

CAMASSIA (*Quamasia*). CAMASS. *Liliaceæ.* N. American bulbous herbs with linear basal lvs. and blue or nearly white fls. in bracted racemes terminating scapes, the perianth-segms. distinct.

Camassias are hardy and do well in loamy soils. Bulbs should be planted 3–4 inches apart in early autumn and not disturbed; also propagated by seeds. Useful in borders.

Cusickii. To 3 ft.: fls. pale blue, ¾ in. long. Ore.

esculenta (*C. Fraseri. Q. hyacinthina*). To 2 ft.: fls. light blue or rarely white, ½ in. long. Pa. to Ga. and Tex.

Fraseri: *C. esculenta.*

hyacinthina: *C. esculenta.*

Leichtlinii. To 2 ft.: fls. dark blue to creamy-white, 1 in. long. B. C. to Calif. Var. **alba** has white fls.

Quamash (*C. esculenta* of some authors). To 3 ft.: fls. dark blue to nearly white, 1 in. long. B. C. to Calif.

CAMEL-HAY: *Cymbopogon Schœnanthus.* **-THORN**: *Acacia Giraffæ.*

CAMELLIA. *Theaceæ* or *Ternstrœmiaceæ.* Evergreen trees and shrubs native in Asia, having alternate simple toothed lvs., white, or red showy sessile fls. with deciduous sepals, and capsular frs.

Camellias are popular ornamentals for the greenhouse and for out-of-doors South, blooming in late winter and spring. They do not thrive in direct sunlight and when in bloom should be kept in a temperature of 50° or a little more. Propagated by cuttings in winter. The plants are sometimes included in Thea, but that genus has smaller pedicelled flowers with persistent sepals.

cuspidata: *Thea cuspidata.*

japonica (*Thea japonica*). COMMON C. To 40 ft.: lvs. to 4 in. long, dark green and shining above: fls. red varying to white and rose, to 5 in. across, often double. China, Japan.—Popular out-of-doors Ga. south. Hort. vars are: **alba-plena**, double white; **althææflora**; **Chandlerii**, dark red; **Donklaeri**, semi-double, crimson and white; **Mathotiana alba**, large white; **pæoniæflora**; **variegata**, crimson and white.

reticulata. Shrub: lvs. to 5 in. long, dull green: fls. purplish-rose, to 7 in. across, sometimes double. China.

Sasanqua (*Thea Sasanqua*). Shrub: lvs. to 2 in. long, dark green and shining above: fls. white, to 2 in. across, often double. China, Japan.

Thea: *Thea sinensis.*

CAMOENSIA. *Leguminosæ.* Trop. African woody climbers with digitately 3-parted lvs., papilionaceous fls., and flattened pods; one species planted in tropics and intro. in S. Calif., showy.

maxima. Lfts. obovate, to 6 in. long, shining: fls. white, to 4 in. across, petals frilled and edged with gold: pods to 8 in. long.

CAMPANULA. BELLFLOWER. *Campanulaceæ.* Mostly per. herbs (a few kinds ann. and others bien.) with alternate or radical lvs., 5-lobed bell-shaped or wheel-shaped attractive and mostly showy fls. with prevailing colors in shades of blue, and fr. an ovoid or top-shaped caps.; northern hemisphere.

Campanulas are popular for the flower-garden, rock-garden and borders, and *C. Rapunculus* is known as a vegetable, the roots and leaves being eaten as a salad. The perennial species are propagated by seeds under glass and transplanted to the open after danger of frost is over, and by cuttings and division; seeds are sometimes sown in summer to produce blooming plants the following season, and this is the procedure with the biennials as Canterbury bells. A covering of leaves is good winter protection in the North. The annuals are propagated by seed sown out-of-doors or under glass. In the following account, the species are perennial unless otherwise stated.

abietina. To 15 in., tufted: lvs. lanceolate or basal ones ovate, toothed: fls. light blue, in loose branching spikes. E. Eu.

acaulis: listed name, probably the short-stemmed large-fld. form of *C. glomerata.*

alliariæfolia. To 2 ft., pubescent: lvs. ovate-cordate, toothed, tomentose beneath, to 3 in. long, the basal long-stalked: fls. white, to 1¼ in. long, axillary, nodding, with appendage at base of each sinus of calyx. Caucasus, Asia Minor.

Allionii. To 5 in., with creeping underground rootstocks: lvs. linear-lanceolate, to 2 in. long: fls. purple, 1½ in. long and broad, nodding, solitary. W. Alps.

amabilis: *C. phyctidocalyx.*

ardonensis. Small and slender, with grass-like foliage, cespitose: lvs. linear or filiform, sparsely serrate: fls. deep blue, solitary on st. scarcely surpassing radical lvs. Caucasus.

arvatica: *Wahlenbergia hederacea.*

asiatica: garden name of an erect white-fld. plant.

attica: *C. drabifolia.*

Aucheri. Dwarf, cespitose, the sts. 1-fld.: lvs. pubescent, oblong or ovate-spatulate, crenate, those on st. becoming linear: fls. violet, pubescent outside. Caucasus, alpine.

barbata. To 9 in.: lvs. mostly basal, lanceolate, to 6 in. long, hairy: fls. pale blue, 1 in. long, nodding, in loose racemes, with bearded throat. Alps. Var. **alba** has white fls.

Bellardi: a synonym of *C. cæspitosa.*

bellidifolia. To 3 in., tufted: lvs. ovate, coarsely toothed, the basal long-stalked: fls. violet, solitary. Caucasus.

betonicæfolia. To 2½ ft., hairy: lvs. oblong or ovate, coarsely toothed: fls. purplish-blue, pale yellow at base, ¾ in. long, solitary or few. Asia Minor.

bononiensis. To 2½ ft., rough: lvs. ovate, to 3 in. or more long, the basal long-stalked, pale beneath: fls. purplish, ¾ in. long, in loose pyramidal spikes. E. Eu., W. Asia.

cæspitosa (*C. pusilla*). To 6 in., tufted: lvs. ovate, toothed: fls. blue, ½ in. long, nodding, solitary. Eu.

calycanthema: *C. Medium* var.

carnica. To 1 ft.: lvs. linear or linear-lanceolate, the lover oval: fls. blue, ¾ in. long, solitary or few. Eu.

carpatica. To 1½ ft., glabrous: lvs. ovate, 1½ in. long, toothed, the basal long-stalked: fls. bright blue, to 2 in. across, open bell-shaped, solitary, erect. E. Eu. Var. **alba** has white fls. and **cœlestina** sky-blue. Var. **turbinata** (*C. turbinata*) decumbent with top-shaped fls.

cenisia. To 2 in., tufted: lvs. obovate, ¼ in. long, entire and ciliate: fls. deep blue, to ½ in. long, solitary, erect. Alps.

cervicaria. Bien. to 2 ft., hairy: lvs. linear-lanceolate to linear, to 6 in. long, toothed: fls. blue, ½ in. long, in terminal bracted heads. Eu.

collina. To 1 ft.: lvs. oblong to lanceolate, the lower long-stalked: fls. deep blue, in few-fld. one-sided racemes. Caucasus.

divaricata (*C. flexuosa*). To 3 ft., glabrous: lvs. ovate-lanceolate, sharp-toothed, to 3 in. long: fls. pale blue, ¼ in. long, nodding, in compound panicles. Va. to Ga. and Tenn.

drabifolia (*C. attica*). Ann. to 6 in., hairy: lvs. oval-oblong, to ½ in. long, toothed: fls. blue with white tube, to ½ in. long, solitary. Greece, Asia Minor.

Elatines. To 6 in., pubescent: lvs. ovate, sharp-toothed, the lower long-stalked: fls. purplish, ¼ in. long, in loose racemes, the style exserted. Piedmont.

elatinoides. To 9 in., hairy: lvs. oval, coarsely toothed, the lower long-stalked: fls. blue. Italy.

elegans. To 3 ft.: lvs. ovate-lanceolate, toothed, the lower long-stalked: fls. blue, 1¼ in. long, nodding, in long terminal spikes. Siberia.

Erinus. Ann. to 9 in.: lvs. oval, deeply toothed, the lower short-petioled: fls. pale bluish with white center, ½ in. across, in long racemes. Medit. region.

excisa. To 5 in., glabrous: lvs. linear, about 1 in. long, entire: fls. pale blue, ½ in. long, solitary. Alps.

fenestralis: a listed name.

fenestrellata. Sts. decumbent or ascending, to 8 in. long: lvs. ovate-cordate, toothed: fls. lilac, ½ in. across, in racemes. Croatia, Dalmatia.

flexuosa: *C. divaricata.*

fragilis. To 6 in., with trailing sts.: lvs. round-cordate to ovate-lanceolate, toothed, the lower long-stalked: fls. purplish-blue with white center, 1½ in. across, in corymbs. Italy.

garganica. Branches trailing to 10 in., nearly glabrous: lvs. ovate, toothed: fls. blue, wheel-shaped, to ¾ in. across, solitary or few, stamens and style exserted. Italy, Dalmatia. Var. **hirsuta** is hairy.

glomerata. To 2 ft.: lvs. ovate, to 5 in. long, toothed, the basal long-stalked: fls. blue or white, to 1 in. long, often double, in dense clusters. Eu., Asia. Var. **acaulis** has sts. to 5 in. high. Var. **dahurica** has clusters 3 in. across. Var. **superba** has deep violet fls. in large clusters.

grandiflora: *Platycodon grandiflorum.*

grandis: *C. latiloba.*

Grossekii. To 2½ ft., stiff-hairy: lvs. ovate, coarsely toothed: fls. violet, large, in long racemes, with appendages or wings and stiff hairs on calyx-tube. S. Eu. —See *C. Trachelium.*

hirsuta: perhaps *C. garganica* var. is meant by the catalogue name.

isophylla. Sts. trailing, making good basket-plant: lvs. cordate-ovate, to 1½ in. long, the lower long-stalked: fls. pale blue, saucer-shaped, 1 in. across, solitary, numerous. Italy. Var. **alba** has white fls.

istriaca. Much like *C. Portenschlagiana* but robust, sts. straw-colored, lvs. whitish, fls. large (¾ in. across) on villous peduncles: plant hairy-tomentose, the sts. to 12 in. long: lvs. cordate or ovate, toothed: fls. blue, with reflexed corolla-lobes. Istria (N. Adriatic).

kolenatiana. To 9 in.: lvs. ovate, toothed, 1 in. long: fls. bluish-violet, 1 in. long, nodding, in racemes. Caucasus.

lactiflora. To 4 ft. or more: lvs. oval-oblong, to 3 in. long, toothed: fls. milk-white (var. **alba**) or pale blue (var. **cærulea**), 1 in. long, in terminal panicles, Caucasus.

lasiocarpa. To 6 in., nearly glabrous: lvs. obovate to linear, to 1¾ in. long, sharp-toothed: fls. blue, to 1 in. long, solitary. N. N. Amer., N. Asia.

latifolia. To 4 ft., hairy: lvs. oblong-ovate, to 6 in. long, toothed, the lower long-stalked: fls. purplish-blue, 1¼ in. long, solitary. Eu., Asia. Var. **alba** has white fls. Var. **macrantha** (*C. macrantha*) has fls. to 2¼ in. long.

latiloba (*C. grandis*). To 4 ft., glabrous: lvs. lanceolate, to 5 in. long, toothed: fls. blue, to 2 in. across, solitary or clustered, with 3 long styles. Caucasus. Var. **alba** has white fls.

Laurii: a listed name.

lingulata. Bien. to 1 ft., bristly-hairy: lvs. oblong-spatulate, wavy-toothed: fls. in sessile heads. S. E. Eu.

longestyla. To 2½ ft., hairy: lvs. oval to oblong, the basal lobed and with winged petiole: fls. blue-purple, constricted below middle, nodding. Caucasus. Var. **parviflora** has smaller fls.

Loreyi: *C. ramosissima.*

macrantha: *C. latifolia* var.

macrorrhiza. Tufted, with thick rootstocks: lvs. ovate to linear, toothed: fls. blue, solitary, erect. S. Eu.

macrostyla. Ann. to 2 ft., hairy: lvs. ovate-oblong, to 2 in. long, nearly entire: fls. purple, broad-bell-shaped, to 2½ in. across, solitary, erect, stigma to 1 in. long. Asia Minor.

Medium. CANTERBURY BELLS. Popular bien. to 4 ft., hairy: lvs. oblanceolate, to 10 in. long, toothed and wavy: fls. violet-blue, 1 in. across, 1–2 together and forming open racemes. S. Eu. Color forms are vars. **alba** and **rosea**. Var. **calycanthema** has corolla-like calyx, resembling the corolla in the Hose-in-Hose or Duplex race, and in the Cup-and-Saucer race spreading or wheel-shaped.—All forms are excellent for late spring and summer bloom.

michauxioides. To 4 ft., hairy: lvs. ovate-cordate to oblong, coarsely toothed, the lower long-stalked: fls. pale blue, nodding, in panicles. Asia Minor.

mirabilis. To 1 ft.: lvs. obovate, to 6 in. long, coarsely toothed, with winged petioles: fls. pale lilac, 2 in. across, erect, numerous. Caucasus.

mollis (*C. velutina*). To 8 in., gray-tomentose, sts. procumbent: lvs. ovate or obovate: fls. purplish-blue or lavender with white throat, erect. Spain, Crete.

muralis: *C. Portenschlagiana.*

nobilis: *C. punctata.*

Pallasiana: *C. pilosa.*

patula. To 2 ft.: lvs. obovate to lanceolate, toothed: fls. violet or blue, 1 in. long, solitary, forming panicles. Eu.

pentagonia: *Specularia pentagonia.*

persicifolia. To 3 ft., glabrous: lvs. oblanceolate to linear, to 8 in. long, fine-toothed: fls. blue or white, to 1½ in. long, in terminal racemes. Eu. Some of the hort. vars. are **alba grandiflora** with large white fls., **Backhousei**, white fls., **flore-pleno** and **humosa** double forms, **macrantha** with larger fls., **Moerheimei** with double white fls. to 3 in. across.

petiolata. The western representative of *C. rotundifolia:* basal lvs. long-petioled, usually longer than broad. B. C. to Calif. and New Mex.

petræa. Bien. to 1 ft.: lvs. lanceolate to ovate, toothed, gray-hairy beneath: fls. pale yellow, ½ in. long, in dense heads. S. Eu.

phyctidocalyx (*C. amabilis*). To 2½ ft., glabrous: lvs. oblong to lanceolate, wavy-toothed: fls. dark blue, in racemes. W. Asia.

pilosa (*C. Pallasiana*). To 9 in., pubescent: lvs. ovate to linear, toothed: fls. blue, 1 in. long, solitary, hairy within. N. Asia to Alaska.

Piperi. Glabrous, with many leafy sts. to 4 in. high: lvs. cuneate or spatulate, sharp-serrate, to 1½ in. long, persistent: fls. bright blue, corolla ½–¾ in. long, broad-campanulate. Olympic Mts., Wash.

Portenschlagiana (*C. muralis*). To 9 in., diffuse or decumbent: lvs. orbicular or reniform, to 1 in. across, coarsely toothed, long-stalked: fls. blue-purple, to 1 in. long, 1–3 together. Dalmatia.

primulæfolia. To 3 ft., hairy: lvs. lanceolate to oblong, coarsely toothed: fls. blue or purple, tomentose at bottom, wheel-shaped, in racemes. Portugal.

pseudo-carnica: listed name.

pulla. To 8 in., tufted, glabrous: lvs. ovate, toothed: fls. dark purple, nodding, solitary. E. Eu.

pulloides. Supposed hybrid between *C. pulla* and *C. carpatica* var. *turbinata:* fls. blue-purple.

punctata (*C. nobilis*). To 2 ft., hairy: lvs. ovate, to 5 in. long, coarsely toothed, the lower long-stalked and cordate: fls. white spotted inside or lilac-blue in "Marian Gehring," 2 in. long, nodding, solitary. Asia.

pusilla: *C. cæspitosa.*

pyramidalis. CHIMNEY B. To 5 ft., glabrous: lvs. ovate, 2 in. long, toothed, the lower long-stalked and cordate: fls. pale blue, 1 in. or more long, saucer-shaped, in narrow racemose panicles. S. Eu. Var. **alba** has white fls.

pyrenaica. To 1 ft., soft-hairy: lvs. lanceolate or basal oval and toothed: fls. solitary. Pyrenees.

Raddeana. To 1 ft., glabrous: lvs. ovate, toothed, the lower deeply cordate and long-stalked: fls. dark purple, ¾ in. long, solitary in axils. Caucasus.

Rainerii. To 3 in.: lvs. ovate, toothed: fls. dark purplish-blue, to 1½ in. long, solitary, erect. N. Italy.

ramosissima (*C. Loreyi*). Ann. to 1 ft., nearly glabrous: lvs. obovate to lanceolate, to 2 in. long, toothed: fls. violet, whitish at base, 1 in. across, saucer-shaped, solitary, erect. S. E. Eu. Var. **alba** has white fls.

rapunculoides. To 3 ft.: lvs. ovate to ovate-lanceolate, to 4 in. long, toothed, the lower long-stalked and cordate: fls. blue, 1 in. long, nodding, in one-sided terminal racemes. Eu., Asia; escaped in N. Amer.

Rapunculus. RAMPION. To 3 ft., with thick taproot, usually bien.: basal lvs. oval, to 8 in. long, long-stalked, wavy-toothed; st.-lvs. linear-lanceolate: fls. lilac, ½ in. long, in narrow racemes. Eu.

rhomboidalis. To 2 ft., nearly glabrous: lvs. ovate, to 2 in. long, toothed: fls. purplish-blue, to 1 in. long, nodding, in racemes. Eu. Var. **alba** has white fls.

Robsoni. Described as a hybrid between *C. carpatica* var. *turbinata* and *C. Scheuchzeri*, with deep blue fls.

rotundifolia. Bluebell. Harebell. To 1½ ft., slender: basal lvs. ovate or orbicular, 1 in. across, long-stalked; st.-lvs. linear or lanceolate, to 3 in. long: fls. bright blue, to 1 in. long, in loose racemes. Eu., Asia, N. Amer. Var. **alba** has white fls. Var. **Hostii** has larger fls. Var. **soldanellæflora** has fls. partially double and the corolla split into shreds.

sarmatica. To 2 ft.: lvs. oblong, toothed, gray-tomentose and rough, the lower long-stalked: fls. pale blue, 1 in. long and 1½ in. across, nodding, axillary. Caucasus.

Saxifraga. To 6 in.: lvs. linear or linear-lanceolate, nearly entire, ciliate: fls. violet, to 1 in. long, solitary. Caucasus.

Scheuchzeri. To 1 ft.: lvs. ovate to linear, toothed: fls. dark blue, to ¾ in. long, nodding, usually solitary. N. N. Amer., Eu., N. Asia.

sibirica. Bien. or per. to 1½ ft., bristly-hairy: lvs. obovate and crenulate, those on st. lance-acuminate: fls. violet, 25 or more in a panicle, drooping. Eu., Asia.—Variable.

speciosa. To 1 ft., very hairy: lvs. oblong- to linear-lanceolate, toothed: fls. blue, 1 in. long, solitary in the axils and forming a pyramidal raceme. S. Eu.

Speculum: *Specularia Speculum-Veneris.*

spicata. Bien. to 2 ft., hairy: lvs. linear-lanceolate, nearly entire: fls. blue, in a long interrupted spike. Eu.

Stansfieldii. Supposed hybrid, perhaps between *C. carpatica* and *C. Waldsteiniana;* described as a creeper with deep purple fls.

Steveni. Low, in clumps or mats, with ascending sts.: lvs. oblong-spatulate, entire or crenate, those on sts. linear: fls. purple-blue, 1–4 on a st. Caucasus, Siberia, in mts.

thyrsoides. Bien. to 1½ ft., hairy: lvs. spatulate, to 2½ in. long, forming rosettes: fls. yellow, in a dense spike. Eu.

Tommasiniana: *C. Waldsteiniana.*

Trachelium. To 3 ft., rough-hairy: lvs. ovate-lanceolate, to 3 in. long, coarsely toothed, the lower long-stalked: fls. blue-purple, to 1 in. long, sometimes double, nodding, in loose racemes. Eu., Asia; escaped in N. Amer. Var. **alba** has white fls.—Sometimes grown as *C. Grossekii*, but it has no appendages on calyx-tube.

tridentata. To 5 in.: lvs. oblong to linear, ciliate, entire except the 3-toothed apex: fls. deep blue, solitary. Asia Minor.

turbinata: *C. carpatica* var.

velutina: *C. mollis.*

versicolor. To 4 ft., glabrous: lvs. ovate to ovate-lanceolate, toothed, the lower long-stalked: fls. pale blue with violet throat, in long spike-like racemes. Greece.

Vidalii. To 2 ft., glabrous and clammy: lvs. oblong, to 4 in. long, coarsely toothed: fls. white with yellow base, 2 in. long, nodding, in short racemes. Azores.

Waldsteiniana (*C. Tommasiniana*). To 6 in., glabrous: lvs. lanceolate, slightly toothed: fls. purplish-blue with darker throat, wheel-shaped, ¾ in. across, in racemes. S. Eu.

warleyensis: a garden form.

Zoysii. To 4 in., tufted, the sts. few-fld.: lvs. ovate or obovate, entire, those on st. becoming oblanceolate: fls. pale blue, mostly terminal on 1-fld. peduncles, the corolla cylindrical and constricted at apex. Austria, alpine.

CAMPANULACEÆ. Bellflower Family. About 40 genera of widely distributed herbs, shrubs or trees, with usually alternate simple lvs., bisexual mostly showy fls. prevailingly in blue, and having gamopetalous 5-lobed corolla, 5 stamens, mostly inferior 1–5-celled ovary, and fr. a dehiscent caps. Several herbaceous genera are popular flower-garden subjects, as Adenophora, Campanula, Canarina, Codonopsis, Edraianthus, Jasione, Michauxia, Ostrowskia, Phyteuma, Platycodon, Specularia, Symphyandra, Trachelium, Wahlenbergia. For the most part they are of simple cultural requirements.

CAMPANULATE: bell-shaped.

CAMPE: *Barbarea.*

CAMPHORA OFFICINARUM: *Cinnamomum Camphora.*

CAMPHOROSMA. *Chenopodiaceæ.* Small shrubs or herbs with camphor-like odor, native in Eu., Asia and Afr., having needle-like lvs. and small fls. in dense spikes toward ends of branches; intro. in Calif.

monspeliacum. Hairy subshrub to 2 ft.: lvs. clustered: fls. whitish, solitary in the axils and forming leafy spikes. Medit. region.

CAMPHOR-TREE: *Cinnamomum Camphora.*

CAMPION: *Lychnis, Silene.*

CAMPSIDIUM. *Bignoniaceæ.* Evergreen climbing shrubs with pinnate lvs., orange tubular 5-lobed fls. in terminal racemes, and narrow capsular frs.; grown out-of-doors in S. U. S. Propagated by cuttings of green wood under glass.

valdivianum. Lvs. of 11–13 oval-oblong sessile lfts. to 1½ in. long, toothed at tip: fls. 1½ in. long, the racemes drooping: caps. to 4 in. long. Chile.

CAMPSIS. Trumpet-Creeper. *Bignoniaceæ.* Two shrubs climbing by aerial rootlets, having deciduous pinnate lvs. with toothed lfts., orange or scarlet funnelform fls. in late summer with spreading 5-lobed limb, and fr. a long dehiscent caps.

The trumpet-creepers thrive in fertile soil in sunny locations. *C. radicans* is fairly hardy North and both species do well in southern United States. Propagated by seeds, cuttings of green wood under glass, layers, and cuttings of mature wood or roots.

chinensis (*Bignonia chinensis. Tecoma* and *Bignonia grandiflora*). Chinese T. Lvs. of 7–9 ovate or ovate-lanceolate glabrous lfts. to 2½ in. long: fls. scarlet, to 3 in. across, the tube only slightly longer than the deeply 5-lobed calyx. China.

hybrida (*Bignonia* and *Tecoma Princei*). Hybrid between *C. chinensis* and *C. radicans* with fls. to 3 in. long and 2 in. across.

radicans (*Bignonia* and *Tecoma radicans*). Trumpet-Vine. Lvs. of 9–11 oval lfts. to 2½ in. long, pubescent at least on midrib beneath: fls. orange with scarlet limb 2 in. across, the tube 3 in. long, about 3 times as long as short-toothed calyx. Pa. to Fla. and Tex.

CAMPTOSORUS. Walking-Fern. *Polypodiaceæ.* Hardy small ferns with simple long-pointed lvs. that root at the tip and therefore are called "walking fern" or "walking leaf"; sori linear or oblong, irregularly scattered; 2 species, the native one, growing on lime-bearing rocks, used somewhat in rock- and wild-gardens; the other is N. Asian.

rhizophyllus. Lvs. evergreen, to 9 in. long, heart-shaped at base, tapering to a long often thread-like point. Que. to Ga. and Ala.

CAMPTOTHECA. *Nyssaceæ.* One deciduous tree native in China and intro. into S. Calif. **C. acuminata.** To 75 ft., quick-growing, with pale gray smooth bark: lvs. alternate, ovate, to 6 in. long: fls. small, polygamous, in heads which are solitary or racemose, the white stamens long-exserted: fr. a samara about 1 in. long, brown and shining.

CAMPYLOBOTRYS: *Hoffmannia Ghiesbreghtii.*

CAMPYLONEURON: *Polypodium Phyllitidis.*

CAMPYLOTROPIS. *Leguminosæ.* Deciduous shrubs and subshrubs of Asia distinguished from Lespedeza by the pedicels mostly solitary in the axils of usually deciduous bracts and jointed below the calyx rather than usually 2 in the axils of persistent bracts and not jointed.

macrocarpa (*Lespedeza macrocarpa. L. chinensis. L. ciliata*). To 3 ft.: lfts. 3, oblong, to 2 in. long, not pointed, silky underneath: fls. purple, about ⅓ in. long, in attractive racemes. China; hardy N.

CAMWOOD: *Baphia racemosa.*

CANAIGRE: *Rumex hymenosepalus.*

CANANGA (*Canangium*). *Annonaceæ.* Malayan trees with alternate simple lvs., large fls. in axillary clusters, and fr. of many oblong fleshy carpels; one species is grown for ornament and for the perfume derived from the fls. It requires a warm or trop. climate.

odorata. Ylang-Ylang. To 80 ft.: lvs. oblong-ovate, to 8 in. long: fls. greenish or yellowish, drooping, very fragrant, with narrow petals to 2 in. long: fr. greenish, 1 in. long.

CANANGIUM: *Cananga.*

CANARINA. *Campanulaceæ.* One or perhaps more species from the Canary Isls., grown in a cool greenhouse. **C. Campanula.** Per. to 8 ft. with tuberous root: lvs. whorled or opposite: fls. bell-shaped, yellow marked with purplish-brown, 1½ in. across, solitary, the corolla-lobes reflexed: fr. a berry.

CANARY-BIRD-FLOWER: *Tropæolum peregrinum.*

CANAVALIA. *Leguminosæ.* Trop. herbs or sts. somewhat woody, with pinnate lvs. of 3 lfts., papilionaceous fls. in axillary racemes, and large flat woody pods strongly ribbed near upper margin.

Sometimes grown for ornament in warm countries, as stock feed, a green-manure crop, and the beans for human food. Adapted to about the same climatic conditions as cotton and require a long season. Seeds should be planted 6 to 12 inches apart in rows 3 feet apart.

ensiformis. Jack Bean. Ann., partially erect, to 4 ft.: fls. purple: pods to 14 in. long, with white seeds. W. Indies.

gladiata. Sword Bean. Twining: pods to 12 in. long, with seeds usually red, pink or brown. Tropics of Old World.

CANDLE-BERRY-TREE: *Aleurites moluccana.*

CANDLENUT: *Aleurites molucanna.*

CANDLE-PLANT: *Senecio articulatus.*

CANDLE-TREE: *Parmentiera cereifera.*

CANDOLLEA. *Dilleniaceæ.* Shrubs or herbs with alternate simple lvs. and mostly yellow fls. few or solitary at ends of branches, the parts mostly in 5's; grown in S. Calif. or sometimes under glass.

cuneiformis (*Hibbertia cuneiformis*). Shrub to 6 ft.: lvs. oblong, 1 in. long, toothed at apex: fls. ½ in. or more long, solitary and sessile. Australia.

CANDYTUFT: *Iberis.*

CANELLA. *Canellaceæ.* One evergreen tree of S. Fla. and W. Indies. **C. Winterana** (*C. alba*). Wild Cinnamon. To 45 ft., often shrubby, with gray aromatic bark: lvs. oblanceolate or spatulate, to 4 in. long, obtuse, shining above: fls. purple, red or violet, to ¾ in. long, in corymbs, anthers yellow: fr. a crimson berry ¼ in. across.

CANELLACEÆ. Canella Family. Five genera of aromatic trees or shrubs native in trop. Amer. and Afr., having alternate entire lvs., bisexual fls. of 3 sepals, 4–12 or no petals, many stamens with filaments united in tube, superior 1-celled ovary, and fr. a berry. Canella may be grown in S. Fla. or S. Calif.

CANESCENT: gray-pubescent and hoary, or becoming so.

CANE, SOUTHERN: *Arundinaria macrosperma.*

CANISTEL: *Lucuma nervosa.*

CANISTRUM. *Bromeliaceæ.* Brazilian terrestrial or epiphytic herbs with lvs. in a basal rosette and green, yellow or blue fls. in heads or spikes subtended by colored bract-lvs.; occasionally cult. in the greenhouse. Cult. as for *Bromelia.*

amazonicum (*Nidularium amazonicum*). Lvs. to 1½ ft. long and 3 in. wide, finely toothed, brownish: fls. greenish-white, in dense heads.

aurantiacum. Lvs. to 2 ft. long and 2 in. wide, finely toothed, spotted with dark green when young: fls. orange-yellow, in dense heads, the inner bract-lvs. bright red.

Lindeni (*Nidularium Lindeni*). Lvs. to 2 ft. long and 3 in. wide, finely toothed, green spotted with darker green: fls. pure white, in dense heads.

CANNA. *Cannaceæ.* Striking tall erect tender per. herbs with thick branching rootstocks and mostly simple main sts., grown usually in masses and lines for foliage effect and the showy terminal fl.-clusters; botanical characters of the family (Cannaceæ); native in tropics and subtropics. They reach 2½ to 10 ft. in height, bearing large simple lvs. that are sometimes bronzy. Few of the original species are in common cult., those known to hort. being hybrid or other derivatives.

Of easy cultivation in fertile moist deeply-prepared soil; in the North, cannas should not be planted out until all danger of frost is past. In spring, old roots should be divided before planting; for mass effects, plants may stand 12–24 inches apart. In autumn the roots should be dug and stored over winter in a warm dry place. The usual method of rapid multiplication is by division of the roots, each piece having a bud. These pieces should be started in heat in early April, covering them 2 or 3 inches in loose soil. Also propagated by seed sown in flats or pots in February and March and grown over heat; the seedlings usually bloom the first year; new varieties are obtained this way. To hasten germination, seeds may be soaked in warm water before sowing, or the seed-coat notched or filed.

edulis. Edible C. Bearing edible tubers which are cult. under the name "Tous-les-mois": to 10 ft., st. purple: lvs. to 2 ft. long, purplish beneath: fls. bright red, 3 upper staminodia varying to orange and 2½ in. long. W. Indies, S. Amer.

flaccida. To 5 ft., st. green: lvs. to 2 ft. long and 5 in. wide: fls. tubular at base, yellow, the petals strongly reflexed and the 3 staminodia to 3 in. long. S. C. to Fla.—The most important parent of the orchid-fld. cannas.

generalis. Common Garden C. Varying in height and color of foliage but usually glaucous: fls. not tubular at base, in many colors, to 4 in. across, with commonly 4 erect staminodes, and petals not reflexing. Of garden origin.—The original Crozy or French cannas are incorporated in this group.

glauca. To 6 ft., st. glaucous: lvs. 1½ ft. long and 4 in. wide, white-edged: fls. yellow, sometimes spotted or tinged with red in hort. forms, the 3 upper staminodia to 3 in. long. Trop. Amer.

indica. Indian Shot. To 4 ft., st. green: lvs. to 1½ in. long and 8 in. wide: fls. bright red, the lip orange spotted with red, 3 upper staminodia 2 in. long. Trop. Amer.; spontaneous in S. U. S.

iridiflora. To 10 ft., st. green: lvs. to 4 ft. long and 1½ ft. wide: fls. rose, drooping, the corolla-tube 2½ in. long. Peru.

orchiodes. Orchid-flowered C. Foliage green or bronzy: fls. tubular at base, yellow to red, striped and splashed, to 6 in. across, with soft flowing outlines, the petals reflexed after first day, having 5 staminodes. Of garden origin.—To this group belong such varieties as Italia and Austria.

Warscewiczii. To 5 ft., st. purplish or brown-purple: lvs. about twice as long as broad: fls. scarlet often tinged with blue, the 2 or 3 upper staminodia to 3 in. long. Costa Rica, S. Amer.

CANNABIS. *Moraceæ.* One variable ann. herb native in temp. Asia and nat. in E. N. Amer., grown for the fiber obtained from the inner bark and sometimes for ornament. **C. sativa** (*C. gigantea*). Hemp. To 12 ft.: lvs. alternate, digitately divided into 3–7 narrow toothed lfts. to 9 in. long: staminate fls. in panicled racemes to 1 ft. or more long; pistillate spikes short and leafy: fr. a small achene.—Hemp thrives on soil rich in humus and with a good moisture supply. Propagated by seeds sown where plants are to stand or started in boxes indoors. For field cult. about 1 bushel of seed is used for an acre, sown at a depth of 2 in. Hemp sown late in Apr. should be ready for cutting early in Sept.

CANNACEÆ. Canna Family. One trop. or subtrop. genus of some 30 species, having alternate entire lvs. with sheathing petioles and red or yellow fls. in terminal spikes, racemes or panicles, of peculiar structure: sepals 3, small; petals 3 and sepal-like, remaining erect or reflexing; showy part of fl. represented by 2–5 petal-like staminodia, one reflexed and forming the lip; ovary inferior, 3-celled: fr. a dry caps.

CANTALOUPE: *Cucumis Melo;* see *Melon.*

CANTERBURY BELLS: *Campanula Medium.*

CANTUA. *Polemoniaceæ.* S. American shrubs or small trees with opposite simple lvs. and red, violet or white long-tubular fls. in terminal clusters; grown in a cool greenhouse or out-of-doors in mild climates. Propagated by cuttings under glass.

bicolor. Similar to *C. buxifolia* but with shorter lvs. and solitary fls. with a short yellow tube. Peru.

buxifolia. Shrub to 10 ft.: lvs. 1 in. or less long, entire: fls. narrow, pinkish-red striped with yellow, to 3 in. or somewhat more long, handsome. Peru, Bolivia, N. Chile.

CAOUTCHOUC TREE: *Hevea brasiliensis.*

CAPER-BUSH: *Capparis spinosa.*

CAPILLARY: hair-like; very slender.

CAPITATE: headed; in heads; formed like a head; aggregated into a very dense or compact cluster.

CAPNOIDES: *Corydalis.*

CAPPARIDACEÆ. Caper Family. About 35 trop., subtrop. and temp. genera of herbs and shrubs, sometimes trees, with simple or palmately compound lvs., mostly bisexual irregular fls. with 4–8 sepals and petals or rarely petals lacking, 6 to many stamens, superior sessile or stalked 1-celled ovary, and fr. a caps. or berry. Capparis, Cleome and Polanisia are known to hort.

CAPPARIS. *Capparidaceæ.* Shrubs or trees with simple lvs., large white fls. in corymbs, the ovary long-stalked, and berry-like frs.; one species grown for the flower-buds which are pickled and sold as capers. Propagated by cuttings in heat or by seeds. Not hardy N., but may be grown as annual.

rupestris: *C. spinosa.*

spinosa (*C. rupestris*). Caper-Bush. Spiny shrub to 3 ft.: lvs. roundish, to 2 in. long: fls. about 1 in. long, solitary on thick stalks. Medit. region. Var. **inermis** is unarmed.

CAPRIFOLIACEÆ. Honeysuckle Family. Thirteen widely distributed genera consisting mainly of shrubby plants: lvs. opposite, simple or pinnate: fls. bisexual, with 4–5-toothed calyx, gamopetalous 4–5-lobed corolla, 4–5 stamens, and inferior usually 1–5-celled ovary: fr. a berry, drupe, achene or caps. The family furnishes many very attractive ornamental plants in the genera Abelia, Alseuosmia, Diervilla, Dipelta, Kolkwitzia, Leycesteria, Linnæa, Lonicera, Sambucus, Symphoricarpos, Triosteum, Viburnum, Weigela.

CAPRIOLA: *Cynodon.*

CAPSICUM. Red-Pepper. *Solanaceæ.* Shrubs but grown mostly as herbaceous annuals in the N., much branching and glabrous: lvs. simple and entire: fls. small, white or greenish-white sometimes tinged violet, corolla wheel-shaped: fr. a pod-like many-seeded fleshy indehiscent berry varying widely in size, shape, color and pungency under cult. For cult. see *Pepper.*

annuum: *C. frutescens.*

baccatum: *C. frutescens.*

frutescens (*C. annuum. C. baccatum*). Shrub to 8 ft., trunk becoming 3 in. through: lvs. from 1–5 in. long: fls. about ½ in. across: fr. variable, erect, declined or drooping. Native in warm countries. The type of *C. frutescens* is the Bird Pepper, with erect spherical or oblong fr. to ¾ in. long, usually red. The races with developed frs. may be grouped as follows: Var. **cerasiforme.** Cherry P. Fr. erect or declined, spherical, to 1 in. across, yellow or purplish, very pungent. Var. **conoides.** Cone P. Fr. conical or oblong-cylindrical, to 2 in. long, usually erect. Var. **fasciculatum.** Red Cluster P. Fr. erect, fascicled, very slender, to 3 in. long, red, very pungent. Var. **grossum.** Bell or Sweet P. Tall, stout: fr. large and puffy with depression at base, sides usually furrowed, oblong, bell-shaped or apple-shaped, red or yellow, mild in flavor. Var. **longum.** Long P. Fr. mostly drooping, elongated to 1 ft. long, usually tapering to apex, often 2 in. across at base; includes Long Red, Long Yellow, Chilli, Cayenne and others.

CAPSULE: a dry fruit of more than one carpel, usually opening at maturity; compound pod.

CARAGANA. Pea-Tree. Pea-Shrub. *Leguminosæ.* Shrubs or small trees mostly from Cent. Asia, with deciduous pinnate lvs., papilionaceous mostly yellow fls. borne singly or in few-fld. clusters, and linear cylindrical pods; grown for ornament, hardy in central and northern states.

Pea-trees should be planted in sunny positions in open soil. Propagated by seeds sown in fall, or in spring after being soaked in warm water; by root-cuttings, layers, or grafting on *C. arborescens.*

altagana: *C. microphylla.*

arborescens. To 20 ft.: lfts. 4–6 pairs, the stipules spiny: fls. yellow, May–June. Siberia, Manchuria. Var. **pendula** has pendulous branches.

aurantiaca. To 4 ft.: lfts. of 2 pairs, the stipules spiny: fls. orange-yellow, May-June. Cent. Asia.

Chamlagu. To 4 ft.: lfts. of 2 pairs, the lf.-stalk spine-tipped: fls. reddish-yellow, May. N. China.

ferox: *C. spinosa.*

frutescens: *C. frutex.*

frutex (*C. frutescens*). To 10 ft.: lfts. of 2 pairs: fls. bright yellow, in May. S. Russia to Japan. Var. **grandiflora** has larger fls.

Maximowicziana. To 6 ft.: lfts. of 2–3 pairs, the stipules spiny: fls. bronzy-yellow. W. China.

microphylla (*C. altagana*). To 10 ft.: lfts. of 6–9 pairs, the lf.-stalk with short deciduous spine: fls. yellow, May–June. Siberia, China.

pygmæa. To 4 ft. or sometimes prostrate: lfts. of 2 pairs, the lf.-stalk spine-tipped: fls. yellow, May–June. Caucasus to Tibet.

spinosa (*C. ferox*). To 6 ft. or sometimes prostrate, the branches spiny: lfts. of 2–4 pairs, those of spurs with 2 pairs. Siberia.

CARAMBOLA: *Averrhoa Carambola.*

CARARA CORONOPUS: *Coronopus procumbens.*

CARAWAY: *Carum Carvi.*

CARDAMINE. Bitter-Cress. *Cruciferæ.* One little per., **C. pratensis**, Ladys-Smock or Cuckoo-Flower, native in Eu. and the northernmost U. S. and northward, is sometimes grown for its bright white or rose-colored fls., often double. It is a spring bloomer, the erect sts. 1–1½ ft. high, adapted to rock-gardens and cool moist borders or to bog-margins. In parts of Eu. the lvs. are said to be used as a cress. Propagated usually by offsets, but may be started from seed. The genus Cardamine, of temp. regions, has many species some of which are showy, but they appear not to be in general cult. They are little ann., bien. and per. herbs, bearing linear pods or siliques.

CARDAMON: *Elettaria.*

CARDIANDRA. *Saxifragaceæ.* Japanese and Chinese subshrubs, sometimes essentially herbaceous, with alternate lvs. and small fls. surrounded by large sterile fls. borne in summer in terminal corymbs; not hardy N. Propagated by cuttings of young wood under glass.

alternifolia. To 3 ft.: lvs. elliptic, to 7 in. long, coarsely toothed: fls. pink, lilac or white. Japan.

CARDINAL-CLIMBER: *Quamoclit Sloteri.*

CARDINAL-FLOWER: *Lobelia cardinalis.*

CARDIOSPERMUM. Heart-Seed. *Sapindaceæ.* Herbaceous vines with alternate bipinnate coarsely toothed lvs., small irregular polygamous or diœcious fls. in axillary corymbs which have two opposite tendrils, and fr. an attractive inflated caps.

These vines are grown for ornament and for covering trellises and bushes. Propagated by seeds sown where plants are to grow and treated as annuals; in mild regions they may self-sow.

grandiflorum. Slender essentially glabrous vine, probably ann. or bien., with white fls. about ½ in. across and oblong pods to 2 in. long. W. Indies, S. Amer.

Halicacabum. Balloon-Vine. Ann. or bien., perhaps sometimes per., climbing to 10 ft.: fls. white, very small: fr. much inflated, nearly globular but 3-angled, about 1 in. long and broad. Bermuda, Fla., Tex., trop. Amer. but nat. in many parts of world and commonly cult.

hirsutum. Probably ann. or bien., perhaps per., with densely hairy st.: fls. white: fr. much inflated, 3-angled, pubescent, to 2 in. long and much narrower. Afr.

CARDOON: *Cynara Cardunculus.*

CARDUUS. Plumeless Thistle. *Compositæ.* Stout herbs with sessile spiny-toothed or lobed lvs. and spiny heads, solitary or in panicles, the fls. all tubular; pappus bristly but not plumose (see *Cirsium*); native from the Canary Isls. to Japan.

The plumeless thistles grow well in ordinary soil, and are easily propagated by seeds or division. They are employed for bold effects of herbage and bloom.

arabicus: *C. pycnocephalus;* see also *Silybum eburneum.*

benedictus: *Cnicus benedictus.*

Kerneri. Bien. or per., much branched, to 3 ft., sts. with spiny wings: lvs. pinnately lobed: heads solitary or in pairs, rose-purple, to 2½ in. across. Probably Balkans.

Marianus: *Silybum Marianum.*

pycnocephalus (*C. arabicus*). Ann. to 3 ft. or more, spiny: lvs. pinnatifid: heads 2–5, purple. Medit. region.

CAREX. Sedge. *Cyperaceæ.* Per. grass-like herbs of about 900 widely distributed species, having inconspicuous unisexual fls. borne in dense spikes, and achenes inclosed in a sac (perigynium).

Sedges are sometimes planted for edgings in the greenhouse or as pot-plants; many of the native species, with pendent spikes, are useful for colonizing in bogs and along pond borders; some of them make attractive clumps. Propagated by division of the clumps or rhizomes, or by seeds sown in fall.

comans. Densely tufted: lvs. thread-like, to 1½ ft. long. New Zeal.

crinita. To 5 ft.: lvs. several ft. long and to 1½ in. wide. Newf. to Fla. and Tex.

Fraseri (*Cymophyllus Fraseri*). Lvs. evergreen, flat, to 1½ ft. long and 2 in. wide, without midnerve. Va. to N. C.

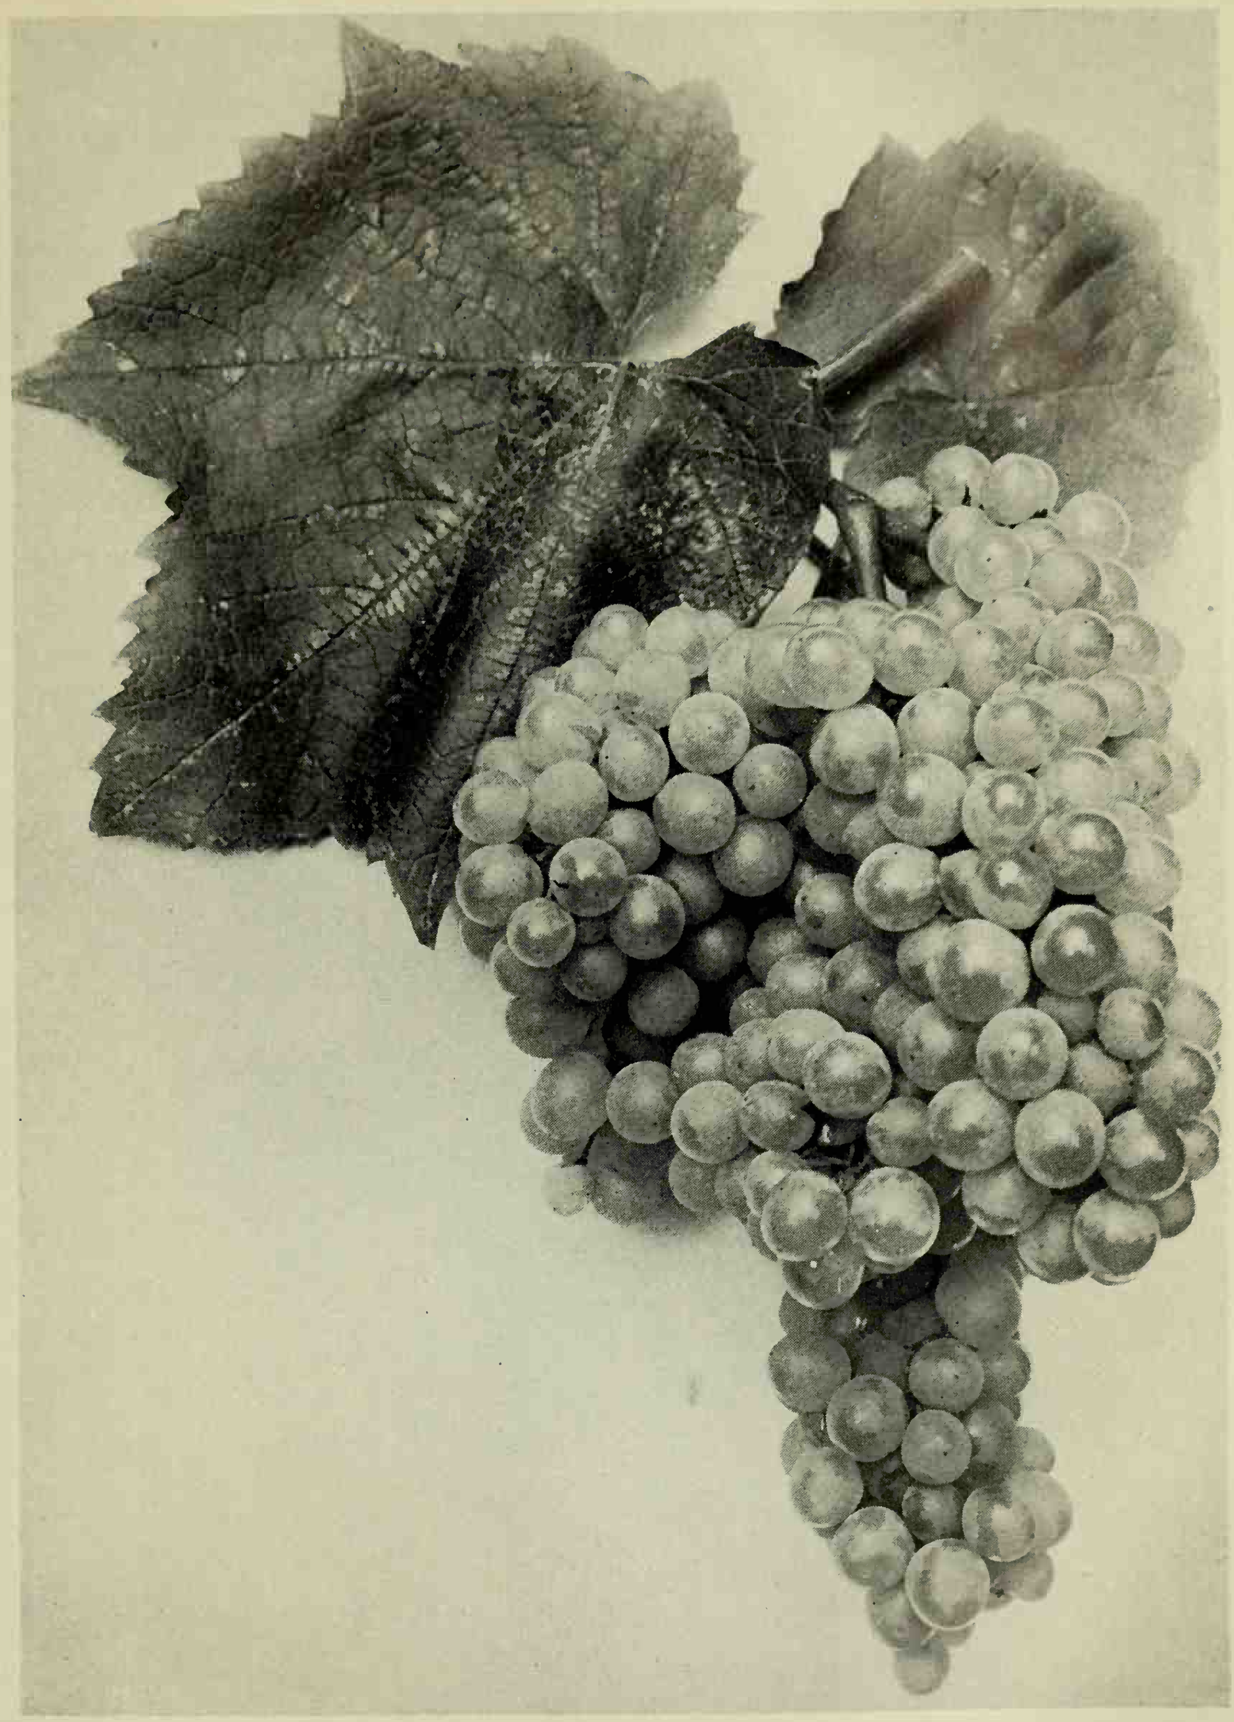
japonica: *C. Morrowii.*

Morrowii (*C. japonica*). Tufted: lvs. evergreen, flat, to 1 ft. long and ¼ in. wide, often white-striped. Japan.

plantaginea. Woods plant with flat persistent strongly ribbed lvs. to 1 in. broad and 1 ft. or more long, and early culms with red-brown sheaths and 3 or 4 fertile spikes. N. B. south and west.—Useful for colonizing and in rock-gardens.

CARICA. *Caricaceæ.* More or less succulent trees, commonly diœcious or often imperfectly so, with straight trunks bearing at summit a crown of palmately lobed lvs., and fr. a fleshy berry resembling a melon; one species is widely grown in the tropics for the edible fr. Commercial papain is also extracted from the fr. and other parts of the plant.

Papayas require tropical temperatures but withstand a few degrees of frost. They do best on rich well-drained loam. Trees bear within a few months after planting but are short-lived. For orchard cultivation they should be set about 10 feet apart. Care must be taken to have both staminate and pistillate plants, although some varieties have bisexual flowers. Propa-



IV. GRAPE. — Stout Seedless, product of Triumph crossed with Dutchess, and then again crossed with Sultanina Rosea

gated by seeds although sometimes cuttings or grafts are employed.

Papaya. PAPAYA. PAWPAW. To 25 ft.: lvs. to 2 ft. across, deeply 7-lobed, the lobes themselves pinnately lobed: fls. yellow, the staminate slender and long-tubed, to 1 in. or more long, in racemes to 3 ft. long, pistillate much broader, solitary or few together; staminate plant sometimes bearing a few pistillate fls.: fr. yellow or orange, to 20 in. long, with thick yellow flesh. Trop. Amer.

CARICACEÆ. PAWPAW FAMILY. Two genera of trees with milky juice, Carica grown for the edible fr. The family is characterized by palmately lobed lvs. in terminal clusters, mostly diœcious fls. having 5-lobed calyx and corolla, 10 stamens, superior 1-celled ovary, and fr. a berry.

CARINATE: keeled: provided with a projecting central longitudinal line or ridge on the lower or under surface, like the keel of a boat.

CARISSA. *Apocynaceæ.* Spiny much branched evergreen shrubs of the tropics of Afr., Asia and Australia, with opposite leathery lvs., milky juice, white or pink mostly fragrant fls. in terminal cymes, and berry-like often showy fr.; grown as popular hedge plants and for the edible frs.

Carissas are grown on almost any soil in regions having only a few degrees of frost. Propagated by cuttings, layers and shield-budding.

acuminata: *C. Arduina.*

Arduina (*C. acuminata. C. bispinosa*). HEDGE-THORN. To 10 ft.: lvs. ovate to oblong, to 3 in. long: fls. white, ½ in. across: fr. bright red, ½ in. long. S. Afr.

bispinosa: *C. Arduina.*

Carandas. KARANDA. Lvs. ovate or oblong, to 3 in. long: fls. white or pink, fragrant: fr. red but becoming black, to 1 in. long. India.

edulis. Straggling much branched shrub: lvs. ovate, to 2 in. long: fls. white or purple, ¾ in. long: fr. purple to black, ⅕ in. across, edible. Egypt.

grandiflora. NATAL-PLUM. AMATUNGULA. To 18 ft.: lvs. ovate, to 3 in. long: fls. white, fragrant, about 2 in. across: fr. scarlet, 1–2 in. long, edible. S. Afr.

ovata. To 4 ft.: lvs. ovate, usually ¾ in. long: fls. ⅕ in. long: fr. to ¾ in. long, edible. Australia.

spinarum. Lvs. ovate, to 1½ in. long: fls. white, ½ in. long: fr. black, ¼ in. across. India, Ceylon.

CARLINA. *Compositæ.* Herbs with spiny usually pinnately cut lvs. and large heads of tubular fls.; involucre with outer row leaf-like, inner often ray-like; pappus with plumose branches; native in Eu. and Asia. Sometimes grown in the rock-garden or similar places.

acanthifolia. Stemless per.: outer lvs. pinnatifid, inner entire, white-tomentose beneath: heads white, solitary, 4 in. across. S. Eu. to W. Asia.

acaulis (*Cirsium acaule. Cnicus acaulis*). Stemless per. to 9 in.: lvs. pinnatifid, glabrous or pubescent beneath: heads white, solitary, to 6 in. across. S. Eu.

CARLUDOVICA. *Cyclanthaceæ.* Shrubby or herbaceous plants with palm-like lvs. and unisexual fls. borne in a dense spadix subtended by bract-like spathes; about 40 trop. American species.

Carludovicas are grown in greenhouses and require abundant water and good drainage after the manner of palms. Propagated by division or by seeds sown on surface of finely chopped sphagnum, after the pulp has been washed off.

atrovirens. Stemless: lvs. 2-lobed to below the middle, glabrous, very dark green. N. S. Amer.

humilis. Dwarf, nearly stemless: lvs. angular, 2-lobed and jagged at tip. Colombia.

Laucheana (*Ludovia Laucheana*). St. very short: lvs. to 12 in. long, 2-lobed to middle or below, the segms. linear-oblong, acuminate, 5- to 7-ribbed. Colombia.

palmata. Stemless: lvs. fan-shaped, 4-lobed nearly to base and the lobes cut, ends drooping. Peru.—The lvs. furnish fiber from which Panama hats are made; frequent in greenhouses.

plicata. Sts. to 1 ft.: lvs. deeply 2-lobed, the segms. 1-nerved. Colombia.

CARMICHÆLIA. *Leguminosæ.* New Zealand shrubs with flattened or cylindrical green branches functioning as lvs., simple or pinnate lvs. which soon fall and leave the plants with bare odd twigs, small papilionaceous fls. in lateral racemes, and small leathery pods; occasionally cult. in warm regions for ornament and interest, as in Calif.

australis. To 12 ft., much branched: lvs. to 2 in. long, of 1–5 lfts.: fls. pale purple, to ⅙ in. long, in 3–12-fld. racemes: pods to ½ in. long.

Enysii. Much branched, forming dense patches 2 in. high: fls. reddish, to ¼ in. long, solitary or in 3–6-fld. racemes: pods to ⅓ in. long.

flagelliformis. To 8 ft., much branched: lvs. to 1½ in. long, of 3–5 lfts.: fls. minute, in 3–7-fld. racemes: pods to ⅓ in. long.

grandiflora. To 6 ft., much branched: lvs. of 3–5 lfts.: fls. purplish veined with violet, ¼ in. long, in 5–12-fld. racemes: pods to ½ in. long.

odorata. To 10 ft., with pendulous branchlets: lvs. to ¾ in. long, pinnately 3–7-parted: fls. white or lilac, ⅙ in. long, in 10–20-fld. racemes: pods to ¼ in. long.

uniflora. Matted, sts. to 2 in. high: fls. purplish-red, ⅓ in. long, solitary: pods to ½ in. long.

Williamsi. To 12 ft. or more, much branched: lvs. of 1–3 lfts.: fls. pale yellow marked with purple, to 1 in. long, solitary or in 2–6-fld. racemes: pods to 1¼ in. long.

CARNATION (*Dianthus Caryophyllus*). A perennial herbaceous fragrant pink or dianthus of many forms, some of which are hardy with protection in the northern states and parts of Canada. In North America the name carnation is ordinarily understood to mean the florists plant, grown under glass for cut-flowers, but it rightly belongs to all the forms of the species. The highly developed large-flowered forms are of two general groups, the border or outdoor carnations and the glasshouse or florists carnations; these are commonly propagated by means of cuttings or layers, to perpetuate particular varieties. The border carnations are little raised or fancied in North America although they are charming plants when well grown. The interest in this general group of plants is represented in the American Carnation Society.

Another group comprises the marguerite carnations, mostly propagated from seeds and that usually bloom the first year, although unspent plants may be carried over winter in the open outside the severer parts of the country and should flower freely the second year. The marguerites make attractive house plants if potted in autumn. The seeds of these carnations may be sown in boxes in March and the young plants set out as early as possible, pinching out the center of the plant to make it branch freely. Give the same space as for other garden pinks, 8–15 inches apart.

The winter-flowering or perpetual carnations have long been favorites although in the commercial field demands change from year to year. They may be considered either as house plants or as florists stock grown in glass ranges. The propagation and general cultural requirements are the same in either case, although the extent of the operations may be very different.

Propagation of carnations for window-garden and greenhouse is by means of cuttings taken from the strong shoots that arise at the base, the side shoots of the flowering stem, or the main shoots before they show flower-buds. The cuttings from the base make the best plants in most cases, or from the middle of strong flower-stems.

For window-garden use, the cuttings may be taken at any time in autumn or winter, rooted in sand and potted up, to be held in pots until planting out time in spring, usually in April, or any time when the ground is ready to handle. Care should be taken to pinch out the tops of young plants while growing in the pot, and later while in the ground, causing them to grow stocky and send out new growths along the stem. The young plants should be grown cool, a temperature of 45° suiting them well. Attention should be given to syringing the cuttings each day while in the house to keep down red-spider. In summer, the plants are grown in the field, and not in pots. The soil in which they are to be planted should be moderately rich and loose. Clean cultivation should be given throughout the summer. Frequently pinch out the tops. The plants are taken up in September and potted firmly, and well watered; then set in a cool partially shaded situation until root growth has started. They are then taken to the residence, on approach of cold weather, to bloom. The usual living-room conditions as to moisture and heat are not such as the carnation demands, and care must be taken to overcome the heat and dryness. Pick off most or all the side buds, to add to the size of the leading flowers. It is probably advisable in most cases to purchase plants from a florist, and after blooming either throw them away or store them for planting in the spring, when they will bloom in the summer. Be sure that plants and cuttings are free from disease.

For commercial or florists work cuttings are preferred from good flowering stems, not choosing either the soft tip or the hardened base. They are cut midway between the joints and inserted a half inch or so in sand, the lower leaves having been removed. The illustration in Fig. 15, page 496, shows a good carnation cutting. The cuttings are set close together in a well-prepared sand bed on a bench. Cuttings are usually taken December to March, for the following winter bloom. When well struck the cuttings are potted, to make ready for planting out in summer.

The plants grow thereafter in the field, being set in late spring when the weather has become settled, and turned out of the pots; the soil should be deep and in a good state of cultivation. They are set 8–10 inches apart in the row. The space between rows is determined by the ground available, and by the method of tillage; it varies from 16–24 inches or even more. Late in summer or at least before freezing weather the plants are dug and removed to greenhouse benches for winter bloom. The exact date of digging will depend somewhat on the strength of the plants and also on the time at which bloom is required. In some cases plants are grown continuously in the house for summer or very early bloom. Blooms may be expected in a month or six weeks after benching.

Benches are refilled with good soil in summer or autumn, the house being thoroughly cleaned. Plants are spaced regularly about 9 by 12 inches on the benches. The beds should be kept uniformly moist until the plants are well rooted. The field stock is assorted before it is brought to the house, and all weak and diseased plants discarded. If plants are dug early, the weak ones may be left for later digging if they are healthy.

Carnations are cool-temperature plants. If the house is too warm the growth becomes soft and the flowers are fewer and of poor quality. About 50° F. night temperature is commonly advised; it may run 10° higher by day; it should be steadily maintained. The house should be well ventilated but cold currents should not strike the plants.

The varieties of florists' carnation are many, and new ones are continuously introduced. The intending grower will need to keep informed on them. The character of bloom depends on the skill in growing as well as on the particular variety. For cut-flowers, the plants are grown to single long stems by pinching out side shoots. The usual blooming season is September or October to May or June, and in this period a plant should yield 18–24 good flowers.

Aphis is controlled by nicotine spray or vapor, and thrips largely by spraying with trade preparations. Red-spider is combatted by the usual method of applying fine water spray under pressure. Rust and other diseases are controlled by propagating only from healthy stock, by disease-free soil, by keeping benches clean and sterile, by maintaining uniform temperature and plenty of fresh air and general good growing conditions with care not to keep the plants wet, by removal of affected plants, and then by dusting with sulfur or by other fungicide.

CARNEGIEA. *Cactaceæ.* One great desert cactus of Ariz., S. E. Calif. and Sonora, Mex., with an erect columnar trunk sometimes with a few akimbo branches, many ribs and strong spines: fls. at or near top of plant. See *Cacti.*

C. gigantea (*Cereus giganteus*). SUWARRO. GIANT CACTUS. Post-like, 20–60 ft., sometimes 2 ft. diam., tapering to either end; ribs 18–21 in mature plants; spines different on fertile and sterile areoles: fls. white, diurnal, 4 in. long or somewhat more: fr. 2–3 in. long, pale red, edible.—Sometimes transplanted from the wild in its native regions or similar climates, but does not thrive under cult.

CARO: *Enterolobium cyclocarpum.*

CAROB: *Ceratonia Siliqua.*

CAROLINEA PRINCEPS: *Pachira aquatica.*

CAROSELLA: *Fœniculum vulgare* var. *piperitum.*

CARPANTHEA. *Aizoaceæ.* One S. African plant separated from Mesembryanthemum (which see for cult.): stigmas and cells of fr. 12–20; expanding keels of caps. terminating in awns. **C. pomeridiana** (*M. pomeridianum*). Ann., with ascending branches to 1 ft.: lvs. spatulate or somewhat narrower, to 4 in. long, flat, narrowed to petiole: fls. yellow, to 2 in. across, on peduncles to 5 in. long, opening in the afternoon.

CARPEL: one of the units of a compound pistil; a simple pistil is one carpel.

CARPENTERIA. *Saxifragaceæ.* One evergreen shrub native in the southern parts of the Sierra Nevada Mts., Calif. **C. californica.** To 10 ft.: lvs. opposite, oblong to lanceolate, to 4 in. long, bright green above, whitish-tomentose beneath: fls. pure white, 2–3 in. across, fragrant, showy, single or few in a cluster, June–July.—Hardy only in warm-temp. regions. It requires a well-drained light and sandy soil, and a sunny sheltered position; the excess of water in winter is especially harmful, probably more than the cold. Propagated by greenwood cuttings under glass in summer, by suckers which are freely produced, and by seeds sown in spring.

CARPET-WEED FAMILY: *Aizoaceæ.*

CARPINUS. HORNBEAM. *Betulaceæ.* Northern hemisphere deciduous monœcious trees of medium or small size, with smooth gray bark, alternate toothed lvs., unisexual fls. in catkins, and fr. a small achene-like nut subtended by a 3-lobed leafy bract; planted for hedges and specimen plants.

Hornbeams are hardy North and thrive in most soils. Propagated by seeds in fall; if seeds do not germinate the next spring the bed should be covered with moss and kept moist until the remaining seed sprout. Varieties may be grafted or budded on seedling stocks.

americana: *C. caroliniana.*

Betulus. EUROPEAN H. To 70 ft.: lvs. ovate or ovate-oblong, to 4 in. long: fruiting catkins to 5 in. long, bracts to 2 in. long, the middle lobe much larger. Eu. to Persia. Some of the hort. vars. are: **carpinizza**, lvs. smaller and often cordate; **columnaris**, of slender pyramidal habit; **fastigiata** (var. *pyramidalis*), of pyramidal form; **incisa**, lvs. deeply lobed; **pendula**, branches drooping; **purpurea**, young lvs. purple; **quercifolia**, lvs. with deep toothed lobes.

caroliniana (*C. americana*). AMERICAN H. BLUE BEECH. To 40 ft., but usually small: lvs. ovate-oblong, to 4 in. long: fruiting catkins to 4 in. long, bracts about 1 in. long, the middle lobe largest. Que. to Fla. and Tex.

cordata. To 50 ft.: lvs. ovate or oblong-ovate, cordate, to 5 in. long: fruiting catkins to 3 in. long, the bracts overlapping. N. Asia.

japonica. To 50 ft.: lvs. oblong-ovate or oblong-lanceolate, to 4 in. long: fruiting catkins to 2½ in. long, the ovate bracts ¾ in. long and overlapping. Japan.

Tschonoskii (*C. yedoensis*). To 50 ft., young branches densely pubescent: lvs. ovate or oblong-ovate, to 3½ in. long: fruiting catkins to 3 in. long, bracts lobed on one side. N. Asia.

yedoensis: *C. Tschonoskii.*

CARPOBROTUS. *Aizoaceæ.* A widely dispersed group separated from Mesembryanthemum on the mostly 10–16 stigmas and fleshy fr.: per. with sts. trailing or decumbent: lvs. opposite, sharply 3-angled and very fleshy: fls. large, showy in sunlight, yellow to reddish and purple: fr. indehiscent, edible. S. Afr., Australia, New Zeal., Calif., Chile. For cult. see *Mesembryanthemum.*

acinaciformis (*M. acinaciforme*). Sts. angled, to 4 ft.: lvs. scimitar-shaped (incurved, acinaciform), widely keeled, to 3 in. long: fls. very large, purple, on 2-bracted peduncle; stigmas 14. S. Afr.

æquilaterus: see *C. chilensis.*

chilensis (*M. chilense*). Trailing several ft.: lvs. fleshy-triangular, 2½ in. or less long: fls. rose-purple, diurnal, 2 in. or less broad, the petals 1 in. or less long, anthers yellow or yellowish. Coasts Ore., Calif., Chile, making a good sand-cover.—Heretofore known in N. Amer. as *M. æquilaterale*, but that name is properly a synonym of *C. æquilaterus*, an Australian plant not native in N. Amer. nor in cult.

edulis (*M. edule*). HOTTENTOT-FIG. Much like *C. chilensis* but parts larger: lvs. to 3 in. and more long: fls. yellow varying to rose-purple, opening wide, to 3 in. across, petals about 1½ in. long: fr. very large. S. Afr., planted and somewhat escaped in Calif.—Usually seen with yellow fls.: frequently grown under glass.

glaucescens (*M. glaucescens*). Similar to the other species: stouter than *C. chilensis*, with smoky-brown anthers: plant more or less glaucous: sts. stout, ¼ in. thick: lvs. 2 in. or less long and ¼ in. to nearly ½ in. thick near tip: fls. rose-purple. Australia.

CARPOCERAS: *Thlaspi.*

CARPODETUS. *Saxifragaceæ.* One New Zeal. shrub or small tree to 30 ft., intro. to cult. in Calif. **C. serratus.** Lvs. alternate, ovate-oblong, to 2 in. long, coarsely toothed, often lobed when young: fls. white, ⅕ in. across, in many-fld. panicles: caps. black and shining, globose, to ¼ in. diam.

CARRIEREA. *Flacourtiaceæ.* One or 2 deciduous trees native in Cent. China; one is planted in Calif. and has been fairly hardy in the S. E.; attractive for its foliage. Propagated by seeds and by cuttings of green wood and roots.

calycina. To 30 ft.: lvs. alternate, oval or ovate, to 6 in. long, toothed, shining: fls. diœcious, with white sepals ¾ in. long and no petals, in corymbs or racemes: fr. a caps. to 2½ in. long.

CARRION-FLOWER: *Smilax herbacea, Stapelia.*

CARROT (*Daucus Carota* var. *sativa*). Biennial or sometimes annual plant, grown for the thick edible root. It is an esteemed garden vegetable and also a farm crop raised for stock feed.

Carrots require deep friable soil for the largest and most shapely roots. They are hardy and easily grown. The extra-early varieties may be forced in a hotbed, or seed may be sown as soon as the ground is fit to work in the spring. The stump-rooted, or half-long varieties, are sown for the early garden crop. Well-enriched mellow loam, deeply dug or plowed, is best suited to the requirements of carrots. The seed for the main crop may be sown as late as July 15. Sow thickly, thinning to 3–4 inches in the row. The rows, if in a garden that is hand-worked, may be 12 inches apart. If the cultivation is by horse, the rows should be 2 to 3 feet apart. One ounce will sow 100 feet of drill. Seeds germinate slowly, and they should not be placed in land that is likely to become hard and crusted.

CARTHAMUS (*Kentrophyllum*). *Compositæ.* Spiny-lvd. stiff annuals with yellow, purple or whitish heads of disk-fls. subtended by leafy spiny involucres; pappus scale-like or lacking; native from the Canary Isls. to Cent. Asia. Cult. for ornament and for the dye obtained from the fls. of one species. Propagated by seeds.

lanatus. Ann. or bien. to 3 ft. high, sometimes cobwebby: root-lvs. lyrate, st.-lvs. lanceolate and spiny pinnatifid: heads yellow, 1 in. long. Medit. region.

leucocaulos. Glabrous: lvs. pinnatifid into lanceolate spiny segms., shining: heads pale rose. Greece.

tinctorius. Safflower. False Saffron. To 3 ft., glabrous: lvs. broadly ovate, minutely spiny-toothed: heads orange, 1 in. long, with broad short lower bracts. Asia.

CARUM. *Umbelliferæ.* Thick-rooted herbs with pinnately or ternately compound lvs., small white or yellow fls. in compound umbels, and somewhat compressed frs.; one species is grown for its seeds which are used as flavoring; it is of easy cult. in any garden soil. Propagated by seeds sown in spring.

Carvi. Caraway. Ann. or bien. to 2 ft.: lvs. pinnately cut into linear or thread-like segms.: fls. white. Eu.; nat. in N. Amer.

CARUMBIUM: *Homalanthus populifolius.*

CARYA (*Hicoria*). Hickory. *Juglandaceæ.* Deciduous monœcious trees, all but one native in N. Amer., with alternate odd-pinnate lvs., unisexual fls., the staminate borne in drooping catkins, and fr. a nut inclosed in a thick green husk which splits into 4 valves; grown for ornament, the edible nuts, and for the strong hard wood.

Any of the native hickories may be transferred to parks and private grounds. Hickories are of slow growth and not readily transplanted. Propagated by seeds stratified and sown in spring, by root-sprouts, or special varieties by grafting. For cultural detalis see *Hickory-Nut* and *Pecan.*

alba (*C. tomentosa*). Mockernut. To 90 ft.: lvs. of 7–9 oblong lfts. to 7 in. long, tomentose beneath: nut nearly globose, angled, light brown. Mass. to Fla. and Tex.

aquatica. Bitter Pecan. To 90 ft.: lvs. of 7–13 lanceolate lfts. to 5 in. long, yellow-tomentose when young: nut broad-obovoid, compressed and 4-angled, reddish-brown. Va. to Fla. and Tex.

cathayensis. Chinese H. To 60 ft.: lvs. of 5–7 ovate to ovate-lanceolate lfts. to 6 in. long, yellowish beneath: nut ovoid, slightly angled. China.

cordiformis. Bitternut. To 90 ft.: lvs. of 5–9 ovate-lanceolate to lanceolate lfts. to 6 in. long: nut almost globose, nearly smooth, gray. Que. to Fla. and La.

glabra (*C. porcina*). Pignut. Tree to 40 ft., with close not shaggy bark: lfts. mostly 5, oblong or somewhat oblanceolate, acuminate, serrate, to 6 in. long: nut obovoid and somewhat ridged, to 1 in. long, the kernel astringent. Me. and Ont. to Fla.

laciniosa (*C. sulcata*). Big Shellbark H. To 120 ft.: lvs. of 7–9 oblong-lanceolate lfts. to 8 in. long, pubescent beneath: nut nearly globose, compressed and angled, yellow or reddish. N. Y. to Okla.

ovata. Shagbark H. To 120 ft.: lvs. of usually 5 elliptic lfts. to 6 in. long: nut ellipsoid, slightly angled, white. Que. to Fla. and Tex.

Pecan. Pecan. To 150 ft.: lvs. of 11–17 oblong-lanceolate lfts. to 7 in. long: nut ovoid or oblong, smooth, light brown. Ind. to Mex.

porcina: *C. glabra.*

sulcata: *C. laciniosa.*

tomentosa: *C. alba.*

CARYOLOPHA: *Pentaglottis.*

CARYOPHYLLACEÆ. Pink Family. Herbs or sometimes subshrubs, of about 75 widely distributed genera, with sts. usually swollen at the joints, opposite entire lvs. with parallel veins, regular mostly bright-colored fls. having 4–5 sepals, commonly 4–5 petals, 8–10 stamens, superior 1-celled ovary with 2–5 styles, and fr. a caps. or rarely a berry. The family furnishes many flower-garden subjects, such as Acanthophyllum, Agrostemma, Arenaria, Cerastium, Dianthus, Gypsophila, Herniaria, Lychnis, Paronychia, Petrocoptis, Sagina, Saponaria, Silene, Spergula, Stellaria, Telephium, Tunica.

Most of the species are outdoor plants, but the carnation (*Dianthus Caryophyllus*) is extensively grown under glass for cut-flowers. Some of them are annuals, others essentially biennials, and many are good low perennials for borders. They are plants of simple culture, grown from seeds, cuttings and sometimes from layers and division of the stools. They require open sunny situations.

CARYOPHYLLUS: *Eugenia.*

CARYOPTERIS. Bluebeard. *Verbenaceæ.* Asian deciduous shrubs or herbs with opposite toothed lvs. and lavender or white fls. in cymes, the stamens exserted.

Grown in pots in the greenhouse in a compost of peat and loam. Not fully hardy out-doors in the North, but in the southern states may bloom from root shoots. Propagated by seeds in spring or by cuttings in autumn under glass.

incana (*C. Mastacanthus*). Shrub to 5 ft. but often dying back and treated essentially as a per. herb: lvs. ovate, to 3 in. long, grayish-tomentose beneath: fls. violet or lavender-blue, ¼ in. long, in autumn. China, Japan.—Sometimes called "blue spirea." Var. **candida** has white fls.

Mastacanthus: *C. incana.*

mongolica. Shrub: lvs. linear-lanceolate, to 2 in. long, nearly entire: fls. ½ in. long. N. China, Mongolia.

tangutica. Shrub to 5 ft.: lvs. lanceolate, toothed, tomentose beneath: fls. pink or bluish, small. China.

CARYOTA. Fish-tail Palms. *Palmaceæ.* Irregularly pinnate monœcious unarmed often soboliferous palms, perhaps 20 species, trop. Asia, Malaya to Australia, monocarpic (dying after fruiting): lvs. 2-pinnate or -pinnatisect, the pinnæ or lfts. broadly cuneate and widening upwards and variously jagged or lobed at apex and many-veined: spadices axillary, long and narrowly branched and mostly hanging, the staminate and pistillate blooming alternately from the top of the tree downward and the tree perishing when the bottom infl. has fruited; stamens many: fr. globose or short-oblong, ½–¾ in. diam. Attractive as tub specimens, and grown in the open in S. Fla. See *Palm*.

mitis (*C. sobolifera*). Soboliferous, trunks ringed, to 25 or 40 ft.: lvs. 4–9 ft. long and light green; pinnæ rather thin and with many light ribs or nerves, the toothed edge or end usually not occupying more than half the length and the outer margin produced into a short point: spadix not greatly elongated, the stamens 15–25. Burma.

Rumphiana. Trunk solitary, 60 ft. or more: lvs. to 20 ft. long; pinnæ very oblique and about half-fan-shaped, as much as 1 ft. and more long, rigid, obtusely toothed, the lower margin sometimes extended into a long obtuse lobe: spadix to 2 ft. and more; stamens more than 30. Malaya, Australia.

sobolifera: *C. mitis.*

urens. Wine Palm. Trunk solitary, to 60 ft.: lvs. to 20 ft. long and 10–15 ft. broad, dark green; pinnæ thick and rigid, strongly ribbed, lateral ones long-oblique so that the prominently toothed edge commonly occupies more than half the length, the outer margin mostly produced into a long finger-like lobe: spadix 10–12 ft. long, pendent; stamens 40 or more. India, Malaya.

CASCARA SAGRADA: *Rhamnus Purshiana.*

CASHEW: *Anacardium occidentale.*

CASIMIROA. *Rutaceæ.* Trop. American trees with leathery digitate lvs., small fls. in axillary panicles or corymbs, and fr. a large 2–5-seeded drupe; one species is grown in warm countries for its edible fruit.

The white sapote thrives on any well-drained soil. Propagated by seeds sown in flats or pots. Seedlings should not be planted out until about 3 feet high and should then receive liberal watering. The terminal bud should be pinched off to induce branching. For quick results and to reproduce special varieties, shield-budding should be practiced.

edulis. White Sapote. To 50 ft.: lvs. of 3–7 ovate to lanceolate lfts. to 5 in. long: fls. greenish: fr. 3–4 in. across, globular, smooth, yellowish-green, with soft cream-colored edible pulp bearing 3 or 4 seeds.

CASSABANANA: *Sicana odorifera.*

CASSANDRA: *Chamædaphne calyculata.*

CASSAVA: *Manihot esculenta.*

CASSENA: *Ilex vomitoria.*

CASSIA. Senna. *Leguminosæ.* A large genus, as commonly accepted, comprising herbs, shrubs and trees native in trop. and temp. regions, having pinnate lvs., showy nearly regular fls. often in large racemes, and flattened or cylindrical sometimes winged pods; grown for ornament, and many species of medicinal value for the senna lvs. used as a cathartic.

The woody species require a tropical climate and can be grown only under glass in the North. Propagated by division and cuttings. The herbaceous kinds may be grown in the border from seeds or division.

alata (*Herpetica alata*). Ringworm C. Shrub to 8 ft.: lvs. very large, of 12–28 oblong lfts. to 2½ in. long: fls. yellow, in spike-like racemes: pods winged, to 6 in. long. Tropics.

artemisioides. Wormwood S. Shrub covered with silky gray pubescence: lvs. of 6–8 linear needle-like lfts. to 1 in. long: fls. sulfur-yellow, in axillary racemes: pods flattened, to 3 in. long. Australia.

australis. Tall shrub: lvs. of 12–24 oblong-lanceolate to linear lfts. to 1 in. long: fls. yellow, in clusters of 2–6: pods to 4 in. long, often curved. Australia.

Beareana. Tree to 30 ft.: lvs. of 16–20 elliptic lfts. to 2 in. long: fls. canary-yellow, veined with red or brown, in short racemes: pods cylindrical, to 2½ ft. long. Trop. Afr.

cinerea (*Chamæcrista cinerea*). Shrub with ascending or prostrate sts. to 6 in. long: lvs. of 12–15 linear lfts. to ¼ in. long: fls. yellow, solitary or clustered: pods to 2 in long. Mex.

corymbosa (*C. floribunda*). Shrub to 10 ft.: lvs. of 6 oblong-lanceolate lfts.: fls. yellow, in axillary corymbs, blooming under glass from spring to autumn: pods cylindrical, 3 in. long. Argentina.—The commonest greenhouse species.

Fistula. Golden-Shower. Pudding-Pipe-Tree. Tree to 30 ft.: lvs. large, of 8–16 ovate lfts. to 2½ in. across: fls. pale yellow, in racemes 1 ft. or more long, blooming in spring before the lvs.: pods cylindrical, to 2 ft. long. India.

floribunda: *C. corymbosa.*

glauca. Tall shrub or tree: lvs. of 12–20 obovate lfts. about 1½ in. long: fls. bright yellow, in umbel-like racemes: pods flat, to 6 in. long. Trop. Asia.

grandiflora: *C. lævigata.*

grandis. Pink-Shower. Tree to 50 ft.: lvs. of 16–40 oblong lfts. to 2½ in. long, tomentose beneath: fls. rose-colored, in lateral racemes: pods somewhat flattened, to 2 ft. long. Trop. Amer.

javanica. Small tree: lvs. of many oval lfts. to 2 in. long: fls. rosy-pink: pods cylindrical, to 2 ft. long. Sumatra, Java.

lævigata (*C. grandiflora. Adipera lævigata*). Shrub to 6 ft.: lvs. of 6–8 ovate-lanceolate lfts. to 3 in. long: fls. yellow, in axillary racemes: pods cylindrical, to 3½ in. long. Tropics.

magnifica is referred to *C. multijuga.*

marilandica. Wild S. Per. herb to 4 ft.: lvs. of 10–20 oblong lfts. to 2 in. long: fls. yellow, in axillary racemes: pods linear, flat, to 4 in. long. E. U. S.

moschata. Tree to 30 ft. and more: lvs. of 10 or more pairs of oblong lfts. pubescent beneath: fls. yellow or orange-red, 1 in. across, in drooping racemes to 8 in. long: pods cylindrical. Trop. Amer.

multijuga. Tree to 20 ft.: lvs. of 18–40 pairs of linear-oblong lfts. to ¾ in. long: fls. yellow, to 2 in. across: pods flattened, 6 in. long. S. Amer., W. Indies.

nairobensis. Shrub to 10 ft.: lvs. of numerous oblong lfts. to 2 in. long: fls. yellow, 1½ in. across, in racemes: pods flattened, 4 in. or more long. Afr.

nodosa. Jointwood. Tree to 50 ft.: lvs. of 12-24 oblong lfts. to 4 in. long: fls. bright pink, in dense racemes: pods cylindrical, to 15 in. long. E. Himalayas to Malaya.

pilifera. Herb or subshrub to 6 ft.: lvs. of 4 ovate lfts.: fls. 1 in. across, petals contracted into long claw. Brazil.

polyantha. Shrub or small tree to 18 ft.: lvs. of 16–28 elliptic-oblong lfts. to ¾ in. long: fls. yellow: pods flattened, winged, about 2½ in. long. Mex.

Roemeriana. Per. to 1½ ft.: lvs. of 2 linear-lanceolate lfts. to 2½ in. long: fls. orange-yellow, in terminal corymbose racemes: pods about 1 in. long. Tex. to Mex.

siamea. Kassod Tree. Tree to 40 ft.: lvs. of 16–18 oblong lfts. to 3 in. long: fls. bright yellow, in corymbs forming a large terminal panicle: pods flat, to 9 in. long. E. Indies and Malaya.

spectabilis. Tree to 40 ft.: lvs. of 8–15 pairs of lanceolate lfts. to 3 in. long: fls. bright yellow, 1½ in. across, in racemes to 2 ft. long: pods cylindrical, 1 ft. long. Trop. Amer.

splendida. Shrub to 10 ft.: lvs. of 4 oval to oblong lfts. to 3 in. long: fls. yellow, large, in panicled racemes: pods nearly cylindrical, to 1½ in. long. Brazil.

tomentosa. Shrub to 12 ft.: lvs. of 12–16 oblong lfts. to 2½ in. long, white-tomentose beneath: fls. deep yellow: pods flattened, to 5 in. long. Mex.

CASSIA-BARK-TREE: *Cinnamomum Cassia.* **-Flower-Tree**: *Cinnamomum Loureirii.*

CASSIE: *Acacia Farnesiana.*

CASSINIA. *Compositæ.* Evergreen shrubs native in Australia, New Zeal. and S. Afr., with alternate entire lvs. and small heads of disk-fls. borne in corymbs or panicles; pappus bristly. A few species are grown out-of-doors in Calif.

albida: *C. Vauvilliersii* var.

aurea. Lvs. linear-lanceolate, to 2 in. long, glandular beneath, glabrous above: heads in compound corymbs; scales with bright yellow tips. Australia.

fulvida. To 6 ft.: lvs. crowded, to ⅓ in. long, yellowish-tomentose beneath, sticky above: heads white, in dense corymbs to 2 in. across; scales lacking or few among the florets. New Zeal.

leptophylla. To 15 ft.: lvs. crowded, to ⅛ in. long, white- or yellowish-tomentose beneath: heads white, in terminal corymbs; scales many among florets. New Zeal.

Vauvilliersii. To 6 ft.: lvs. crowded, ⅓ in. long, white- or yellowish-tomentose beneath, sticky above: heads white, in terminal corymbs; scales many among florets. New Zeal. Var. **albida** (*C. albida*) has lvs. whitish beneath.

CASTALIA: *Nymphæa.*

CASTANEA. Chestnut. *Fagaceæ.* Attractive hardy deciduous trees and shrubs of the north temp. zone, having alternate, toothed, oblong or lanceolate lvs., unisexual fls. in catkins, and 1–7 large brown nuts inclosed in a prickly dehiscent involucre or bur; grown for ornament and the edible nuts. For cult. see *Chestnut.* See also *Bertholletia.*

americana: *C. dentata.*

crenata (*C. japonica*). Japanese C. To 30 ft.: lvs. to 6 in. long, closely toothed with sinuses between, commonly tomentose beneath: nuts usually 2–3, about 1 in. across. Japan.

dentata (*C. americana*). American C. To 100 ft.: lvs. to 10 in. long, coarsely toothed, glabrous beneath, mostly tapering or narrow at base: nuts usually 2–3, 1 in. or less across. Me. to Miss.

japonica: *C. crenata.*

mollissima. Chinese C. To 60 ft.: lvs. to 6 in. long, coarsely toothed, pubescent beneath: nuts usually 2–3, about 1 in. across. China, Korea.

pumila. Chinquapin. Shrub or tree to 45 ft.: lvs. to 5 in. long, coarsely toothed, white-tomentose beneath: nut usually solitary, ½ in. or less across. Pa. to Fla. and Tex.

sativa (*C. vesca*). Spanish or Eurasian C. To 100 ft.: lvs. to 8 in. long, with coarse spreading teeth, pubescent beneath when young, mostly rounded or broad at base: nuts 1–3, 1 in. or more across. S. Eu., N. Afr., W. Asia.—There are forms with variegated lvs., and var. **asplenifolia** has lobed and abnormal lvs.

vesca: *C. sativa.*

CASTANOPSIS. *Fagaceæ.* Evergreen trees and shrubs native in Asia and W. N. Amer., with alternate entire or dentate lvs., unisexual fls. usually in separate catkins, and 1–3 nuts inclosed in a spiny or tubercled involucre; not hardy in cold climates. Cult. as for *Chestnut,* which see.

chrysophylla. Giant Chinquapin. To 100 ft. or more although sometimes shrub-like: lvs. oblong, to 6 in. long, entire, shining dark green above and with golden-yellow scales beneath: fr. with spiny husk. Ore., Calif., Nev. Var. **sempervirens** (*C. sempervirens*) is a shrubby form.

cuspidata (*Quercus cuspidata*). Lvs. ovate or oblong, to 3 in. long, entire or toothed toward tip, gray-tomentose beneath: fr. with tubercled husk. Japan.

sclerophylla. Lvs. oblong-ovate, to 6 in. long, toothed above middle: fr. with tubercled husk. China.

sempervirens: *C. chrysophylla* var.

CASTANOSPERMUM. *Leguminosæ.* Two species, only one from Australia planted in trop. and semi-trop. regions. C. australe. Moreton-Bay-Chestnut. Black Bean. Evergreen tree to 60 ft. with large pinnate lvs. composed of 11–15 broadly oblong lfts. to 5 in. long, striking yellow to orange and reddish papilionaceous long-stamened fls. in racemes to 6 in. long, and cylindrical pods to 9 in. long.—Propagated by seeds; the latter are eaten by the natives of Australia.

CASTILLA (*Castilloa*). *Moraceæ.* Trop. American trees with milky juice from which commercial rubber is obtained, having large alternate lvs. and unisexual fls. in dense heads.

Propagated by seeds and the seedlings should be transplanted to a permanent position when about 1 foot high. Trees are ready for tapping at about eight years old.

elastica. Mexican Rubber-Tree. To 60 ft.: lvs. elliptic-obovate, to 1½ ft. long, densely pubescent beneath, short-stalked. Mex., Cent. Amer., N. S. Amer.

CASTILLEJA. Painted-Cup. *Scrophulariaceæ.* Herbs usually parasitic on roots of other plants, ann., bien., per., with narrow alternate lvs., small 2-lipped tubular fls. in terminal gaudy-bracted heads or spikes; mostly native in western hemisphere, many of them in U. S. They are seldom grown in the garden or transferred from the wild.

affinis. Per. to 2 ft : lvs. linear to lanceolate, to 4 in. long: fls.-bracts scarlet, fls. yellowish, 1¼ in. long. Calif.

californica. Indian Paint-Brush. Per., slender, to 1½ ft.: lvs. linear, to 1½ in. long: fl.-bracts red or red-tipped, fls. bright red, the tube greenish-yellow, 1 in. long. Calif.

coccinea. Scarlet P. Ann. or bien. to 2 ft., hairy: lvs. oblong to linear, to 3 in. long, st.-lvs. 3–5-lobed: fl.-bracts scarlet, fls. pale yellow, to 1 in. long. Me. to N. C. and Tex.

foliolosa. Woolly P. Per., white-woolly, to 1½ ft., base woody: lvs. linear, 1 in. long: fls. yellowish or greenish, ¾ in. long. Calif.

indivisa. Texas P. Ann. to 2 ft.: lvs. linear or linear-lanceolate, to 4 in. long: bracts bright red, calyx red and about length of corolla. Tex.

integra. Per. to 1 ft., tomentose: lvs. narrow-linear, to 3 in. long: fl.-bracts crimson, pink or yellowish, fls. green bordered with crimson, 1 in. long. Colo. to Mex.

latifolia. Per., viscid-pubescent, to 1½ ft.: lvs. thick, mostly oval or obovate, to 1 in. long (usually shorter), the upper ones sometimes 3-lobed at apex: fls. in leafy spike, the bracts yellow or red· corolla about ¾ in. long. Calif.

Martini. Per. with woody decumbent base, branches ascending, sticky-hairy: lvs. linear, 1 in. long: bracts scarlet-tipped, fls. reddish, 1 in. long. Calif.

parviflora. To 2 ft., hairy: lvs. cut into lanceolate or linear segms., or the upper ones entire: corolla about 1 in. long, the bracts red, yellow to white. Colo., Calif. and elsewhere.—Variable.

rhexifolia. Per. to 2 ft.: lvs. oblong-lanceolate to ovate, 2 in. long: fl.-bracts scarlet or rose, fls. green bordered with scarlet, 1 in. long. Rocky Mts.

sulphurea. Per. to 1½ ft.: lvs. lanceolate to ovate, 2 in. long: fl.-bracts light yellow, fls. greenish, 1 in. long. Rocky Mts.

CASTILLOA: *Castilla.*

CASTOR-OIL PLANT: *Ricinus communis.*

CASUARINA. Beefwood. She-Oak. Australian-Pine. *Casuarinaceæ.* Hard-wooded trees or shrubs native in Australia and Pacific Isls., having jointed branches resembling the horsetail or equisetum, lvs. reduced to minute scales or teeth, unisexual fls., the staminate borne in spikes and the pistillate in dense heads becoming dry cones in fr.

Casuarinas are much planted as avenue trees in Florida and other warm regions; they do well near salt water. Propagated by cuttings of half-ripened wood, and also by seeds.

Cunninghamiana. To 70 ft.: cones globular, ⅓ in. or less across, with glabrous valves: teeth on branchlets 8–10.

distyla. Shrub or small tree: cones oblong, to 1 in. long, the valves with dorsal protuberance: teeth on branchlets usually 6.

equisetifolia. Horsetail-Tree. To 70 ft., the branches drooping: cones globular, ½ in. across, with pubescent valves: teeth on branchlets commonly 7. Nat. in Fla.

glauca. To 50 ft., glaucous: cones globular, ½ in. across: teeth on branchlets about 16.

horrida. Shrub to 9 ft. with erect stiff branches: cones nearly globular, about ½ in. across, bristly: teeth on branchlets 10 or 12.

quadrivalvis: *C. stricta.*

stricta (*C. quadrivalvis*). To 30 ft., the branches drooping: cones globular or ovoid, 1 in. or more across: teeth on branchlets about 10.

suberosa. To 50 ft.: cones cylindrical-oblong, ½ in. across: teeth on branchlets 6–8.

CASUARINACEÆ. Casuarina Family. Only one genus, trees or tree-like, Casuarina which is employed for ornamental planting in Calif., Fla. and other southern parts.

CATALPA. *Bignoniaceæ.* Trees with large simple long-stalked lvs., mostly deciduous, bell-shaped irregular white, whitish or rose-colored fls. in terminal panicles or racemes, and fr. a long narrow caps. 1 ft. or more long; native in N. Amer. and E. Asia.

Catalpas are popular lawn and avenue trees and mostly hardy North, very showy when in bloom in late spring and early summer; sometimes planted for small timber. They do well in any good soil. Propagated by seeds in spring and cuttings of mature wood; also by layers, root-cuttings, cuttings of young wood in early summer, and named varieties by grafting on seedlings or cuttings of young trees.

bignonioides (*C. syringæfolia. C. cordifolia*). Common C. Indian-Bean. To 60 ft.: lvs. ovate, to 8 in. long, abruptly short-acuminate, pubescent beneath: fls. white with 2 yellow stripes and brown spotted, 2 in. across, in panicles 8 in. long. Ga. to Fla. and Miss. Var. **aurea** has yellow lvs. and var. **nana** is dwarf.

Bungei. Small tree: lvs. triangular-ovate, to 6 in. long, long-acuminate, sometimes toothed or angled near base, glabrous: fls. white spotted purple, 1½ in. long. China.—This name is often applied to *C. bignonioides* var. *nana.*

chinensis: a listed name.

cordifolia: *C. bignonioides.*

Duclouxii. To 80 ft.: lvs. ovate, to 8 in. long, acuminate, glabrous: fls. rose marked with orange, 1½ in. long. China.

Fargesi. To 60 ft.: lvs. ovate, to 6 in. long, long-acuminate, densely pubescent beneath, 3-lobed on young plants: fls. pink or purplish spotted with brown, 1½ in. long. China.

hybrida (*C. Teasii*). Hybrid between *C. bignonioides* and *C. ovata*, intermediate in character: lvs. larger than in *C. ovata*, mostly purplish when young, sometimes angled or shallowly lobed: fls. resembling *C. bignonioides* but smaller. Much planted.

Kaempferi: *C. ovata.*

ovata (*C. Kaempferi*). To 30 ft. or more: lvs. broad-ovate, sometimes 3–5-lobed, to 10 in. long, abruptly acuminate, pubescent on veins beneath: fls. yellowish-white marked with orange and violet, to ¾ in. long, in panicles to 10 in. long. China.

speciosa. Western C. To 100 ft.: lvs. ovate, to 1 ft. long, long-acuminate, densely pubescent beneath: fls. white spotted with brown, 2½ in. across, in panicles 6 in. long. Ill. to Ark.

syringæfolia: *C. bignonioides.*

Teasii: *C. hybrida.*

CATANANCHE. Cupids-Dart. *Compositæ.* Herbaceous annuals and perennials with narrow lvs. borne near base of st. and long-stalked blue or yellow heads of ray- and disk-fls. and chaffy involucre; pappus of bristles or scales; native to Medit. region.

One is cultivated in the flower-garden and as an everlasting. It grows well in the average garden soil and under the usual treatment for perennials. Raised from seed sown in spring and blooming the same year; also by division.

cærulea. Per. to 2 ft., blooming first year from seed: lvs. lanceolate, few-toothed, tomentose: heads 2 in. across, ray-fls. blue, involucre chaff-like, June–Aug. S. Eu. Var. **alba** has white rays and bicolor blue rays edged with white.

CATASETUM. *Orchidaceæ.* Trop. American terrestrial or epiphytic orchids, having pseudobulbs bearing 2–4 plaited lvs., polygamous fls. of 3 different forms borne in racemes, the pollen-masses flying out when the appendages of the column are touched; cult. in the hothouse, commonly suspended and given a resting period. See *Orchids.*

Bungerothii: *C. pileatum.*

callosum. Fls. in 10–15-fld. racemes to 1 ft. high; sepals and petals brown, about 2 in. long; lip green spotted with red, shortly saccate at base, Dec. Venezuela, Colombia.

macrocarpum. Fls. in 4–10-fld. racemes to 1½ ft. high; sepals and petals greenish spotted with red, 1–2 in. long; lip yellow, Oct.–Dec. Trop. Amer.

maculatum. Fls. in 6–12-fld. racemes to 14 in. high; sepals and petals bright green tinged with red, about 2 in. long; lip green spotted outside with brown, Sept.–Oct. Guatemala, Venezuela.

medium. Fls. small, in many-fld. racemes; sepals and petals greenish-yellow barred with brown; lip yellowish. Habitat unknown.

pileatum (*C. Bungerothii*). Fls. in 4–8-fld. racemes to 1 ft. high; sepals and petals bright yellow, 2 in. long; lip yellow with a short sac at base orange-red within, Oct. Venezuela.

scurra. Fls. pale straw-color, in drooping racemes, fragrant, the lip with the 2 fringed side lobes and the middle lobe consisting of a broad stalk with fringed edges. Guiana.

CAT-BRIER: *Smilax glauca.*

CATCHFLY: *Silene.* **German:** *Lychnis Viscaria.*

CATESBÆA. *Rubiaceæ.* W. Indian spiny shrubs or small trees with opposite or whorled lvs., white, funnelform or campanulate, 4-lobed, solitary fls., and fr. a white berry; one species grown in S. Fla. and other warm regions.

spinosa. Lily-Thorn. To 15 ft., with spines 1 in. or more long: lvs. ovate, to 1 in. long: fls. creamy, to 6 in. long, much exceeding the small lvs.:berries to 2 in. long. Cuba, Bahamas.

CATHA. *Celastraceæ.* An evergreen shrub native from Abyssinia to S. Afr., the lvs. much used by the Arabs in the preparation of a drink. **C. edulis.** Khat. Cafta. To 10 ft.: lvs. opposite, sometimes alternate on infertile shoots, oval, to 4 in. long, toothed: fls. small, white, in axillary clusters: fr. a 3-angled caps., about ¼ in. long.—Planted in S. Fla. and Calif., and also sometimes under glass for its economic interest. See *Gymnosporia.*

CATHARTOLINUM: *Linum.*

CATHCARTIA. *Papaveraceæ.* Per. low poppy-like herbs with yellow juice, native in Cent. Asia: lvs. lobed or wavy: fls. showy, long-stalked and solitary or in few-fld. cymes:

probably only one species differing from Meconopsis in characters of caps. and stigmas.

betonicifolia: *Meconopsis betonicifolia.*

villosa. To 1 ft., tomentose: basal lvs. cordate-ovate, 3–5-lobed and the lobes cut, long-stalked: fls. yellow, 2 in. across, in cymes: caps. to 2½ in. long. Himalayas.

CATJANG: *Vigna Catjang.*

CATKIN: a scaly-bracted spike with unisexual flowers; ament; prominent in willows and poplars.

CATMINT: *Nepeta Cataria.*

CATNEP, CATNIP: *Nepeta Cataria.*

CATS-CLAW: *Doxantha Unguis-cati, Pithecellobium Unguis-cati.*

CATS-EAR: *Calochortus cæruleus, Hypochæris.*

CAT-TAIL: *Typha.* **Redhot**: *Acalypha hispida.*

CATTLEYA. *Orchidaceæ.* Epiphytes native in trop. Amer., having pseudobulbs with 1–3 very thick lvs. and fls. in terminal clusters or rarely solitary, the sepals similar, the petals broader, lip of 2 lateral lobes which form a tube around the column, and spreading middle lobe; require intermediate temperatures. See *Orchids* for cult. There are large numbers of hybrids and hort. forms; popular orchids grown in the intermediate house.

Aclandiæ. Pseudobulbs 3 in. long, with 2 broadly elliptic lvs. to 2 in. long: fls. to 4 in. across, 1 or 2 together; sepals and petals yellowish-green spotted with purple-brown; lip with short red side lobes and magenta wavy middle lobe, June–July. Brazil.

amabilis. Hybrid between *C. labiata* and *C. Warscewiczii.*

amethystoglossa. Lvs. broadly lanceolate, to 8 in. long: fls. 3 in. across, 5–8 together; sepals and petals white suffused with rose and spotted with violet; lip with whitish side lobes and bluish-violet middle lobe, Feb.–June. Brazil.

armainvillierensis. Hybrid between *C. Mendelii* and *C. Warscewiczii.*

Armstrongiæ. Hybrid between *C. Hardyana* and *C. Harrisoniana.*

aurantiaca (*Epidendrum aurantiacum*). Fls. orange-red, 3 in. across, July–Aug. Mex., Guatemala.

aurea: *C. Dowiana* var.

Ballantineana. Hybrid between *C. Trianæi* and *C. Warscewiczii.*

Bertii. Hybrid between *C. Harrisoniana* and *C. labiata.*

Beyrodtiana: *C. labiata* var.

bicolor. Lvs. oblong-lanceolate, to 6 in. long: fls. to 4 in. across, 2 together; sepals and petals bronze-green; lip rose edged with gold, toothed, without side lobes, Sept.–Nov. Brazil.

Blackii. Hybrid between *C. Gaskelliana* and *C. Mendelii.*

Bowringiana. Lvs. broadly lanceolate, to 6 in. long: fls. 3 in. across, 5–12 together; sepals and petals rose-violet; lip rose, lilac within, yellow in throat, Sept.–Dec. Honduras.

Cappei alba. Hybrid between *C. Trianæi* var. *Schroederiana* and var. *alba.*

chocoensis: *C. Trianæi* var.

chrysotoxa: *C. Dowiana.*

citrina. Lvs. strap-shaped, to 8 in. long: fls. citron-yellow, solitary on drooping stalks slightly longer than lvs., the lip white on edges and wavy, Oct.–Apr. Mex.

Clarkiæ. Hybrid between *C. labiata* and *C. bicolor.*

Cooksoni. Hybrid between *C. Hardyana* and *C. Trianæi.*

Dowiana (*C. labiata* var. *Dowiana. C. chrysotoxa*). Lvs. to 1 ft. long: fls. to 7 in. across, 2–5 together; sepals and petals nankeen-yellow; lip with yellow tube striped with purple and wavy purple limb lined with gold, July–Sept. Costa Rica. Var. **aurea** (*C. aurea*). Lip with more and deeper yellow lines. Var. **rosita** has creamy-white sepals tinged with purple, and rose-purple petals tinged with yellow.

Dupreana. Hybrid between *C. Warneri* and *C. Warscewiczii.*

Dusseldorfi. Hybrid between *C. intermedia* var. *alba* and *C. Mossiæ* var *alba.*

Edwardi. Hybrid between *C. Schilleriana* and *C. Warscewiczii.*

Eldorado. Pseudobulbs to 8 in., 1-lvd., stout: lvs. oblong, to 12 in.: fls. fragrant, to 6 in. across, pale rosy-lilac shading to white; lip crisped, centrally blotched orange and purple. Brazil.

elongata. Lvs. elliptic, to 6 in. long: fls. 3 in. across, 2–8 together; sepals and petals red-brown; lip rose, darker lined in throat, wavy-margined, May. Brazil.

Fernandi. Hybrid between *C. Warscewiczii* and *C. Aclandiæ.*

Forbesii. Lvs. elliptic, to 5 in. long: fls. to 4 in. across, 1–5 together; sepals and petals olive- or yellow-green; lip white outside, yellow inside marked with red, the limb wavy, June–Sept. Brazil.

Gaskelliana (*C. labiata* var. *Gaskelliana*). Lvs. oblong, to 1 ft. long: fls. to 7 in. across, 2–3 together; petals and sepals purple-violet suffused with white; lip purple-violet with a yellow streaked throat, wavy, June–Nov. Venezuela. Var. **alba** has pure white sepals and petals, creamy-white lip with yellow throat. Var. **cærulea** has pure white fls. with bluish spot on base of lip.

gigas: *C. Warscewiczii* var.

granulosa. Lvs. lanceolate-oblong, to 6 in. long: fls. to 4 in. across, 5–8 together; sepals and petals olive-green spotted with brown; lip white dotted with purple, the claw yellow marked with red, wavy, Aug.–Sept. Guatemala.

guttata. Lvs. oblong-elliptic, to 9 in. long: fls. to 4 in. across, 10–25 together; sepals and petals green spotted with red; lip with rose or white side lobes and white limb spotted with violet, Oct.–Nov. Brazil.

Hardyana. Hybrid between *C. Dowiana* and *C. Warscewiczii.*

Harrisoniana. Lvs. oblong-lanceolate, to 6 in. long: fls. to 4 in. across, 2–5 together, rose-lilac, the middle lobe of lip purple with yellow spot, July–Oct. Brazil.

Hassellii. Hybrid between *C. labiata* and Empress Frederick.

Heloisiæ. Hybrid between *C. Forbesii* and *C. Mossiæ.*

intermedia. Lvs. oblong, to 6 in. long: fls. to 5 in. across, 3–7 together, pale rose with middle lobe of lip purple and wavy, May–June. Brazil. Var. **alba** has pure white fls.

iridescens. Hybrid between *C. Eldorado* and *C. bicolor.*

Kienastiana. Hybrid between *C. Dowiana* and *C. Lueddemanniana.*

labiata. Lvs. oblong, to 10 in. long: fls. to 6 in. across, 2–5 together, rose-lilac, the very wavy limb of lip violet-purple with deeper streaks and yellow throat, June–Nov. Trinidad, Brazil. Var. **alba** has white fls. with a yellow throat. Var. **Cooksoniæ** has white fls. with crimson-purple lip edged with white. Var. **Beyrodtiana** has yellow lip streaked with purple. Var. **Amesiana** has white fls. with lilac lip.

Lawrenceana. Lvs. oblong, to 9 in. long: fls. to 5 in. across, 5–7 together, rose-purple, the limb of lip purple with a maroon band, Mar.–Apr. British Guiana.

Leopoldii (*C. guttata* var. *Leopoldii*). Lvs. oblong-elliptic, to 8 in. long: fls. to 4 in. across, 10–25 together; sepals and petals brown dotted with red; lip purple, wavy, Oct.–Nov. Brazil.

lobata: *Lælia Boothiana.*

Loddigesii. Pseudobulbs to 12 in., 2-lvd., cylindric: lvs. oblong, to 5 in.: fls. to 4 in. or more across, rose-lilac, the lip 3-lobed and crisped and yellow at base. Brazil.

Lueddemanniana (*C. labiata* var. *Lueddemanniana. C. speciosissima*). Lvs. oblong, to 10 in. long: fls. to 6 in. across, 2–5 together, rose-purple, the lip with wavy amethyst-purple limb, throat spotted with yellow or white, July–Sept. Brazil. Var. **alba** has white fls. In var. **Stanleyi** the white fls. have the limb lined with purple.

luteola. Lvs. oblong-elliptic, to 4 in. long: fls. to 2 in. across, 2–5 together, citron-yellow, the middle lobe of lip white and wavy, Nov.–Dec. Brazil.

Mantini. Hybrid between *C. Bowringiana* and *C. Dowiana* var. *aurea.*

Maroni. Hybrid between *C. Dowiana* and *C. velutina.*

maxima. Lvs. oblong, to 10 in. long: fls. to 5 in. across, 3–8 together, lilac or pale rose, the limb of lip dark purple with orange-yellow markings, wavy, Oct.–Jan. Colombia.

McMastersiæ. Hybrid between *C. Schilleriana* and *C. Mendelii.*

Mendelii (*C. labiata* var. *Mendelii*). Lvs. oblong, to 10 in. long: fls. 8 in. across, 2–3 together, white or rosy, the limb of lip very wavy, purple with yellow throat, June–Nov. Colombia.

Minucia. Hybrid between *C. Loddigesii* and *C. Warscewiczii.*

Mossiæ. Lvs. oblong, to 8 in. long: fls. to 8 in. across, 3–5 together, rose, the very wavy lip with purple limb variegated with violet and edged with white, the throat yellow, Apr.–July. Venezuela. Var. **alba** has white fls. In var. **cærulea** the sepals and petals are blue-violet and also spot on lip. Var. **Reineckiana** has white fls. with yellow throat and violet limb. Var. **Wageneri** has white fls. with yellow spot on lip.

Murrayi. Hybrid between *C. Mendelii* and *C. Lawrenceana.*

Peetersi. Hybrid between *C. Hardyana* and *C. labiata.*

Percivalliana (*C. labiata* var. *Percivalliana*). Similar to *C. Mossiæ* but with smaller somewhat darker colored fls., Jan.–Mar. Venezuela.

Pittiana. Hybrid between *C. Dowiana* and *C. granulosa.*

Rafaeliæ. Hybrid between *C. Dowiana* and *C. Trianæi.*

Rex. Lvs. oblong, to 1 ft. long: fls. to 7 in. across, 3–6 together; sepals and petals white; lip yellow with crimson limb edged with white, wavy, July–Aug. Peru.

Roehrsiana. Hybrid between *C. Hardyana* and *C. Mendelii.*

Rothschildiana. Hybrid between *C. Dowiana* and *C. Gaskelliana.*

Sanderiana: *C. Warscewiczii* var. *gigas.*

Schilleriana. Lvs. elliptic, to 5 in. long: fls. to 4 in. across, 1–2 together; sepals and petals green spotted with brown; lip crimson with wavy limb and yellow throat, July–Sept. Brazil.

Schroederiana: *C. Trianæi* var.

Skinneri. Lvs. elliptic, to 6 in. long: fls. to 4 in. across, 4–6 together, rose-purple with yellow throat, Mar.–June. Guatemala. Var. **alba** has white fls.

speciosissima: *C. Lueddemanniana.*

Stuarti. Hybrid between *C. Mendelii* and *C. Mossiæ.*

suavior. Hybrid between *C. Mendelii* and *C. intermedia.*

superba: *C. violacea.*

Thayeriana. Hybrid between *C. intermedia* and *C. Trianæi* var. *Schroederiana.*

Thurgoodiana. Hybrid between *C. Hardyana* and *C. Lueddemanniana.*

Trianæi (*C. labiata* var. *Trianæi*). Lvs. oblong, to 8 in. long: fls. to 7 in. across, 2–3 together, rose, the lip with dark purple wavy limb and yellow throat, Dec.–Feb. Colombia. Var. **alba** has white fls. and **atropurpurea** crimson-purple. Var. **Backhousiana** has rose-purple sepals and petals with darker spot at tip. Var. **chocoensis** has fragrant white fls. sometimes tinged pale lilac. Var. **Schroederiana** has fragrant pink fls. with very wavy limb. Forms of this var. are *alba, cærulea, citrina* and *refulgens.*

velutina. Lvs. elliptic, to 6 in. long: fls. to 4 in. across, 4–7 together, fragrant; sepals and petals orange-yellow spotted with purple; lip whitish with purple lines, throat yellow, May–July. Brazil.

violacea (*C. superba*). Lvs. elliptic, to 5 in. long: fls. 5½ in. across, 3–7 together, fragrant; sepals and petals rose-purple; lip deep purple, the throat with a band of yellow, June–Aug. British Guiana.

Warneri (*C. labiata* var. *Warneri*). Lvs. oblong, to 7 in. long: fls. to 8 in. across, 3–5 together, rosy with limb of lip carmine and very wavy, the throat yellow, June–Aug. Brazil. In var. **alba** the fls. are white except the yellow throat.

Wavriniana. Hybrid between *C. granulosa* and *C. Warscewiczii.*

Warscewiczii (*C. labiata* var. *Warscewiczii*). Lvs. oblong, to 10 in. long: fls. to 8 in. across, 2–3 together; sepals and petals violet-rose; lip deep purple with 2 yellow spots in throat, wavy, Jan.–Apr. Colombia. Var. **gigas** (*C. Sanderiana*) has fls. larger. Forms of this var. are *alba* with pure white fls. and *rochellensis* with white fls. having lip tinged with color.

Wendlandiana. Hybrid between *C. Bowringiana* and *C. Warscewiczii.*

Wigani. Hybrid between *C. Dowiana* and *C. Schilleriana.*

Williamsiæ. Hybrid between *C. Gaskelliana* and *C. Harrisoniana.*

CAUDOXALIS: *Oxalis Bowieana.*

CAULESCENT: more or less stemmed or stem-bearing; having an evident stem above ground.

CAULIFLOWER, BROCCOLI (*Brassica oleracea* var. *botrytis*). Biennial plants (running to seed the second year) of the cabbage tribe but more tender to frost and untoward conditions, the edible part being a head formed of the condensed and thickened malformed flower-cluster rather than an aggregation of leaves. If the old plant is set out the following year, good flowering and seed-bearing shoots will arise from the stump and from such parts of the head as may not have been removed, as in the cabbage.

Cauliflower is not as cosmopolitan as to conditions as cabbage, or as easy to grow. It does best in a rather cool moist soil and under equable conditions; only highly selected seed should be used; the plant must be kept in a continuous state of thrift. Insects and diseases must be kept under full control; they are the same as the pests of cabbage.

The great heats and dryness of midsummer are to be avoided as far as possible at heading time, if the crop is to be grown in untoward regions. To this end, very early varieties may be grown, starting them under glass and harvesting the crop in June or early summer. The plants are handled as are cabbages, and the distances for the early varieties may be 24 inches or less in the row. For the late or main crop, seeds may be sown in seed-beds in late spring or early summer, and as these varieties make bigger plants the distances should be 2 feet in the row or even more for the larger kinds. Far South the crop may be grown for early spring use from seeds sown in autumn. Wherever irrigation is available, many of the difficulties of cauliflower growing may be overcome. About 1 ounce of seed is required for 1,000 plants.

A continuous steady growth from high-class seeds and well-grown plants should produce a solid head of regular shape, without "buttons" or breaks or straggling branches. To whiten the head, the outer leaves are sometimes tied together over it, but openings should be left on the sides for ventilation or the head may decay from the accumulation of moisture. Heads should be harvested as fast as they mature or they may crack or become discolored or develop decayed spots. In harvesting, a good circle of leaves should go with the head, and these leaves are trimmed a little above the head to serve as a protection, and to provide a cup in which the head sits attractively.

A race of very late large cauliflower is known as broccoli; the culture is in general the same as for the ordinary cauliflower except that it requires the entire season in which to grow; in mild climates it may be left in the field over winter, maturing its heads in spring. The Asparagus or Sprouting broccoli, Calabrese, is a different plant, *Brassica oleracea* var. *italica* (or var. *asparagoides*). It does not produce a thick solid white head but rather a small greenish head on the main stalk and similar heads on thick branches after the first head is cut; all these shoots are edible and are prized by those who know them; plants are usually allowed to stand over winter in mild climates where it is chiefly grown and the shoots are produced in the spring, the stock being one year old. It may be started early in plant beds and brought to maturity in late spring or in autumn of the same year. All the broccolis are specially prized by Italians.

Another plant sometimes but erroneously known as broccoli or "Italian kale" is the Seven-top turnip; see *Turnip*.

CAULINE: pertaining or belonging to the stem.

CAULOPHYLLUM. *Berberidaceæ.* Two erect per. rhizomatous herbs, one in E. N. Amer., and one in E. Asia, the former sometimes planted in the wild-garden or border. The genus is distinguished by the naked seeds left by the bursting of the pericarp and which become blue and berry-like. Fls. small, in a cluster, with the young ternately compound rue-like lvs.

thalictroides. Blue Cohosh. To 3 ft.: fls. yellow-green, about ½ in. across, in early spring: fr. ornamental, ⅓ in. across. Deep woods; requires shade.—The Asian *C. robustum* (sometimes considered a var. of the American plant) has less deeply toothed and more pointed lfts.

CEANOTHUS. *Rhamnaceæ.* N. American shrubs, particularly on the Pacific Coast, or small trees, with simple deciduous or persistent lvs., mostly showy blue or white small fls. in dense panicles or racemes, and 3-lobed capsular fr.; furnishes many ornamental subjects, among them many hybrids of European origin and giving rise to named hort. vars. The Pacific species and their derivatives are not hardy in the northeastern states. The following species are mostly deciduous.

Ceanothus thrives best in light well-drained soil in sunny positions. Few species are hardy North and plants may be dug in fall, stored in a frost-proof place, and set out again in spring. Propagated by seeds sown in spring, layers, and varieties by grafting on roots of *C. americanus* in spring under glass; also by cuttings of mature wood in autumn or soft-wood cuttings in spring from forced plants. Those native in the eastern parts of the country are sometimes transferred to grounds in that region.

americanus. New-Jersey-Tea. To 3 ft.: lvs. alternate, ovate, finely toothed: fls. white. Me. to S. C. and Tex.

arboreus. Evergreen shrub or tree to 20 ft.: lvs. alternate, ovate, finely toothed, white-tomentose beneath: fls. pale blue, fragrant. Isls. off Calif. coast.—The plant cult. in Calif. as *C. hybridus* is said to be a hybrid between *C. arboreus* and *C. spinosus.*

Arnouldi: *C. Delilianus.*

azureus: *C. cæruleus.*

cæruleus (*C. azureus*). Shrub or small tree to 20 ft. and more: lvs. alternate, oblong-lanceolate to ovate, finely toothed, rusty-tomentose beneath: fls. blue or nearly white. Mex., Guatemala.

cuneatus. Evergreen, to 14 ft., densely branched: lvs. opposite, oblong or obovate, ½ in. long, entire, pale beneath: fls. white. Calif. to Ore.

cyaneus. Tall shrub: lvs. alternate, ovate-elliptical, to ¾ in. long, finely toothed: fls. dark blue becoming lighter, with yellow anthers: pods yellowish. S. Calif.

Delilianus (*C. Arnouldi. C. hybridus*). A hybrid between *C. americanus* and *C. cæruleus:* to 3 ft.: lvs. alternate, ovate, finely toothed: fls. pale or deep blue. The commonly cult. "Gloire de Versailles" belongs here.

divaricatus. To 14 ft.: lvs. alternate, ovate, entire or slightly toothed: fls. white or blue. Calif., Lower Calif.

Fendleri. To 1½ ft., spiny: lvs. alternate, ovate, entire, silky beneath: fls. white. S. D. to Wyo. and N. Mex.

foliosus. Evergreen, to 1 ft. or more, densely branched: lvs. alternate, oblong, to ¾ in. long, pale beneath: fls. blue. Cent. Calif.

hybridus: see *C. Delilianus* and *C. arboreus.*

integerrimus. Deer-Brush. To 12 ft.: lvs. alternate, ovate, entire: fls. white, rarely pale plue or pink. Calif.

Lobbianus. Hybrid between *C. dentatus* and *C. thyrsiflorus:* evergreen shrub to 10 ft.: lvs. alternate, oblong, remotely toothed, whitish beneath: fls. dark blue.

macrocarpus (*C. megacarpus*). To 12 ft.: lvs. alternate, obovate, rather thick, entire: fls. white. Calif.

megacarpus: *C. macrocarpus.*

oliganthus. To 9 ft.: lvs. alternate, ovate, finely toothed, pale green or brown beneath: fls. deep blue or purplish. Calif.

ovatus. To 3 ft.: lvs. alternate, oblong or oval, toothed, shining above: fls. white. Vt. to Colo. and Tex.

pallidus. Hybrid between *C. Delilianus* and *C. ovatus:* to 3 ft. or less: lvs. alternate, oblong, finely toothed: fls. light blue. "Marie Simon," with flesh-colored fls. belongs here.

prostratus. Mahala Mat. Prostrate: lvs. evergreen, opposite, obovate, coarsely spiny-toothed: fls. blue. Wash. to Calif.

spinosus. To 10 ft., sometimes tree to 24 ft., often spiny: lvs. alternate, oblong, entire or finely toothed: fls. pale blue or white. Calif.

thyrsiflorus. Blue-Blossom. Evergreen, to 8 ft. or tree to 25 ft.: lvs. alternate, oblong, finely toothed, shining above: fls. blue or rarely white. Ore. to Calif.

Veitchianus. Hybrid between *C. rigidus* and *C. thyrsiflorus:* to 10 ft.: lvs. evergreen, alternate, obovate, remotely toothed, shining above, whitish beneath: fls. deep blue.

verrucosus. Low shrub: lvs. alternate, obovate, entire or slightly toothed, small, pale beneath: fls. white. S. and Lower Calif.

CEBATHA: *Cocculus.*

CECROPIA. *Moraceæ.* Trop. American trees with milky juice, large palmately-lobed peltate lvs. and unisexual fls. in dense catkins; grown in trop. countries and sometimes in S. Fla. and S. Calif. As plants are diœcious both pistillate and staminate should be planted if fruiting specimens are desired.

palmata. Snakewood Tree. To 50 ft., with soft wood: lvs. borne at ends of branches, 7–11-lobed to middle or below, rough above, white-tomentose beneath. W. Indies, S. Amer.

CEDAR: *Cedrus.* **Cigarbox-:** *Cedrela odorata.* **Ground-:** *Lycopodium complanatum.* **Incense-:** *Libocedrus.* **Red-:** *Juniperus.* **Spanish-:** *Cedrela odorata.* **Stinking-:** *Torreya taxifolia.* **West-Indian-:** *Cedrela odorata.* **White-:** *Chamæcyparis thyoides, Tabebuia pallida.*

CEDRELA. *Meliaceæ.* Trees with colored wood furnishing valuable timber, that of *C. odorata* extensively used for cigar-boxes, also several species grown for ornament: deciduous or evergreen; lvs. alternate, many-pinnate and somewhat ailanthus-like: fls. small and whitish, in panicles: fr. a woody caps., with winged seeds: occidental and oriental tropics and warm regions.

Cedrelas thrive in fertile loamy soil. Propagated by seeds, cuttings of mature wood, and root-cuttings, over heat.

fissilis. Tree to 50 ft. or more: lfts. oblong-lanceolate, densely pubescent beneath: fls. yellowish, in pubescent panicles longer than lvs., petals velvety: fr. 1 in. or more long. Panama, S. Amer., perhaps Mex.

odorata. West-Indian- or Spanish-Cedar. Cigar-box-Cedar. To 100 ft.: lfts. entire: fls. yellowish, in panicles shorter than lvs.: fr. to 1½ in. long, the seeds winged below middle. W. Indies, S. Amer.

sinensis (*Toona sinensis*). To 50 ft.: lfts. toothed: fls. white, in very long pendulous panicles: fr. 1 in. long, the seeds winged above. China; stands in N. Y. and S. New England.

Toona (*Toona ciliata*). To 70 ft., nearly evergreen: lfts. entire or wavy-margined: fls. white, fragrant, in panicles shorter than lvs.: fr. to 1 in. long, the seeds winged at both ends. Himalayas; planted in S. Fla.

CEDRONELLA. *Labiatæ.* One per. shrubby herb to 4 ft. high, native in Canary Isls. and grown in the flower-garden. Propagated by cuttings. **C. canariensis** (*C. triphylla. Dracocephalum canariense*). Canary-Balm. Lvs. of 3 oblong or lanceolate toothed lfts.: fls. white or lilac, in whorls in loose terminal spikes. For *C. cana* and *C. mexicana* see *Brittonastrum*.

CEDRUS. Cedar. *Pinaceæ.* Large evergreen trees with wide-spreading branches, of 4 species in N. Afr. and Asia, having stiff needle-like 4-angled clustered lvs. and small ovoid erect cones with closely imbricated scales. For cult. see *Conifers*. The species are not reliable north of the latitude of N. Y. on the eastern side of the continent, and then only in favorable locations; they are mostly trees for the middle and warmer parts of the country, but all except perhaps *C. brevifolia* can be grown to some extent in favorable sheltered locations in S. New England.

atlantica. Atlas C. Lvs. less than 1 in. long, bluish-green: cones to 3 in. long. N. Afr. Var. **argentea**, lvs. silvery-white; var. **aurea**, lvs. yellowish; var. **glauca**, lvs. glaucous; var. **fastigiata**, habit narrow-pyramidal; var. **pendula**, branchlets drooping.

brevifolia. Closely allied to *C. libanotica* but with shorter glaucous lvs. and shorter cones. Cyprus.

Deodara. Deodar C. Branchlets drooping: lvs. to 2 in. long, dark bluish-green: cones to 5 in. long. Himalayas. Var. **argentea**, lvs. silvery-white; var. **aurea**, lvs. yellow; var. **crassifolia**, stiff stunted tree with shorter thicker lvs.; var **pendula**, branches long and drooping; var **robusta**, a stronger form with stiffer lvs.; var. **verticillata**, compact form with bluish-white lvs.; var. **viridis**, lvs. deeper green.

libani: *C. libanotica.*

libanotica (*C. libani*). Cedar of Lebanon. Lvs. 1 in. long, dark or bright green: cones to 4 in. long. Asia Minor. Var. **glauca**, lvs. blue or silvery-white; var. **nana** (var. "Comte de Dijon"), dwarf and compact; var. **pendula**, branches drooping.

CEIBA. *Bombacaceæ.* Very large deciduous trees with digitately compound lvs., showy fls. in axillary clusters and fr. a leathery caps., the seeds with long cotton-like fiber which is the kapok of commerce; planted as a shade tree in the tropics.

Casearia: *C. pentandra.*

pentandra (*C. Casearia. Eriodendron anfractuosum*). Silk-Cotton-Tree. To 120 ft., with widely spreading branches, the trunk often 9 ft. thick and the thin buttresses sometimes extending for 30 ft.: lfts. 7, to 6 in. long: fls. white or rose, the woolly petals about 1 in. long, often appearing before the lvs.: fr. to 5 in. long. Tropics of both hemispheres.

CELANDINE: *Chelidonium.* Tree: *Macleaya cordata.*

CELASTRACEÆ. Staff-Tree Family. Widely distributed trees and shrubs, often twining, of about 45 genera, with simple mostly deciduous lvs., small regular usually bisexual fls. having 4–5 sepals, petals and stamens, superior 3–5-celled ovary, and seeds usually with a pulpy aril which is disclosed when the pericarp ruptures in autumn. Species in the following genera are cult. for ornament: Catha, Celastrus, Elæodendron, Euonymus, Gymnosporia, Maytenus, Pachistema, Tripterygium.

CELASTRUS. *Celastraceæ.* Species here entered are twining shrubs, seldom evergreen, with alternate simple lvs., greenish-white polygamous fls. in racemes or panicles, capsular fr. and seed with a crimson aril that is showy when ripe. See *Celastraceæ.*

Suitable for covering walls, trellises and the like. They thrive in common soils. Propagated by seeds sown in fall or stratified, by suckers, cuttings of young or mature wood, and root-cuttings.

angulatus. Branches angular: lvs. to 7 in. long: fls. in terminal panicles to 6 in. long: frs. orange-red. China; not hardy in northern states.

articulatus (*C. orbiculatus*). Branches spiny only when young: lvs. to 4 in. long: fls. in few-fld. axillary cymes: frs. orange-yellow. Japan, China. Var. **punctatus** is a less vigorous form with smaller lvs.

cassinoides: *Gymnosporia cassinoides.*

flagellaris. Branches with spiny stipules: lvs. to 2 in. long: fls. in few-fld. axillary cymes: frs. orange-yellow. N. China, Korea, Japan; hardy in S. New England.

orbiculatus: *C. articulatus.*

Orixa: *Orixa japonica.*

paniculatus. Branches with pale lenticular warts: lvs. to 4 in. long: fls. in terminal pendulous panicles to 8 in. long. Himalayas; adaptable S.

punctatus: *C. articulatus* var.

Rosthorniana. Lvs. to 3 in. long: fls. in nearly sessile cymes. China; not hardy far N.

scandens. Waxwork. False or Shrubby Bitter-Sweet. Lvs. to 4 in. long: fls. in terminal racemes to 4 in. long: frs. orange-yellow. Que. to N. C. and N. Mex.

CELERI: *Apium graveolens* var. *dulce.*

CELERIAC: see *Celery.*

CELERY (*Apium*, which see). Biennial or perennial herb grown for the edible leaf-stalks; it is raised from seeds, coming to horticultural maturity the same year, but flowers are normally produced the second year although the plant sometimes runs to seed the first year. The leaf-stalks are blanched in the field but the process is often completed in the storage cellar for the late kinds.

Ordinary deep fertile mellow garden land will produce good celery. It must be thoroughly prepared, and if not naturally retentive of moisture it should be supplemented with a system of irrigation or watering for dry times. The large-area commercial growing of celery is an important industry on reclaimed lands, particularly on muck and other lowlands that can be drained. Under such conditions a uniform moisture supply can be assured and the ground readily provides the proper tilth. In such areas celery-growing has become a special skilled industry of great importance.

Celery should make a continued rapid growth. It is specially important that the plants get a "quick" start. Stimulation by some form of available nitrogen, as in nitrate of soda, is advisable. This nitrate may be applied to seed-beds, about 1 teaspoonful to a gallon of water. It may also be applied to the field before transplanting. Heavy applications of well-rotted stable-manure are advisable on uplands, and a chemical fertilizer of a 4-8-12 analysis on muck lands liberally applied.

For the home-garden celery may be planted in shallow trenches to facilitate blanching, but this method is now less used than formerly. The dwarf varieties are commonly set 6 inches apart in rows 3 feet apart, and the large-growing kinds about 8 inches in rows to 5 feet distant. Blanching may be accomplished by banking with earth late in the season until only the tops are visible, by shading with boards placed on edge on either side, and by tying with paper, or a drain tile put over each plant. The late crop may be packed in boxes, the roots covered with earth, and placed in the cellar to complete the blanching. Self-blanching may also be practiced, which consists of setting the plants very close together; this requires very rich soil and plenty of moisture; the plants may be set 5 or 6 inches apart in rows 10 inches apart.

Propagation is entirely by seed which for the early crop should be sown in February or March in boxes or hotbeds and transplanted several times before being permanently set out. Seed for the late crop should be sown in April or May in a well-prepared seed-bed. The seedlings should be transplanted to the garden or field about the middle of July in the North, the roots and tops being trimmed first.

Celery is harvested by cutting the plants just beneath the crown. This is accomplished with a spade in small areas, and by special horse tools in large plantations. The plants are taken to a packing shed, where they are trimmed and washed, then tied in bunches and crated for local market or shipment. Storage of celery is combined with the blanching of it, as already indicated. Plants are taken with roots attached and placed closely in crates; the storage house or cellar should not freeze but there should be good ventilation and clean sanitary conditions. For late autumn or early winter use late celery may be stored and bleached in field trenches, the tops being covered with straw or similar material.

The celery crop is subject to devastation by early and late blight, that produce spots and holes on the foliage. These diseases may be prevented by spraying thoroughly every week or ten days with bordeaux mixture, beginning in the seed-bed. Other diseases and pests are frequent, and the grower should avail himself of the latest books and bulletins.

Celeriac is grown the same as celery for the thickened edible crown, except that no blanching is required; the leaves are not eaten after the manner of celery.

CELMISIA. *Compositæ.* Per. herbs of New Zeal. and Australia, having basal lvs. or imbricated st.-lvs. and large solitary heads of white ray- and disk-fls.; pappus of bristles; planted somewhat on Pacific Coast.

coriacea. To 3 ft.: lvs. to 2 ft. long and 3 in. wide, leathery, silvery-tomentose: heads to 3 in. across, on woolly scapes. New Zeal.

longifolia. To 1½ ft.: lvs. linear or linear-lanceolate, to 10 in. long, white-tomentose beneath. Australia.—The New Zeal. plant known under this name has been separated into other species.

spectabilis. Lvs. to 6 in. long and ¾ in. wide, leathery, woolly beneath: heads 1½ in. across, on woolly scapes. New Zeal.

CELOSIA. *Amaranthaceæ.* The cult. celosias are herbaceous annuals, with the st. and branches terminated by dense chaffy spikes usually enlarged and highly colored and in various often fantastic shapes; native in warm countries. The fls. are small and not individually showy.

Celosias thrive in fertile soil with plenty of moisture. Propagated by seeds.

argentea. To 3 ft.: lvs. linear to ovate-lanceolate, to 2 in. long: fl.-spikes 1–4 in. long, erect or drooping, silvery-white. Tropics.—Little cult. Var. **cristata** (*C. cristata*). Cockscomb. Infl. in many forms, some with heavy-crested heads, others plumy or feathered with a large number of intermediates, the colors ranging from white to yellow, purple, and shades of red; also with variegated lvs. Often the cult. types have Latin-form names as *C. Thompsonii*, *Thompsonii magnifica*, *Childsii*, *plumosa*, *floribunda*.

Childsii: *C. argentea* var.

cristata: *C. argentea* var.

floribunda. Much branched green or glaucous glabrous shrub to 12 ft.: lvs. triangular-ovate to somewhat hastate, to 8 in. long, becoming oblong toward top: fls. very many in close panicles. Lower Calif.; sometimes planted in S. Calif. for general interest.—The flower-garden plant known as *C. floribunda* is a form of *C. argentea* var. *cristata*.

Huttoni. To 2 ft., bushy, pyramidal: lvs. red or crimson: spikes 1½ in. long, cylindrical, red. Java.

plumosa: *C. argentea* var.

Thompsonii: *C. argentea* var.

CELSIA. *Scrophulariaceæ.* Yellow-fld. bien. or per. herbs much like Verbascum but with 4 stamens instead of 5; mostly native in Medit. region and Asia, frequently planted for ornament.

Propagated by seeds sown in the greenhouse, the plants set out in the open after all danger from frosts is past; also by cuttings.

Arcturus. Cretan Bears-Tail. To 1½ ft., pubescent: lvs. ovate, toothed, the lower lyrate-pinnatifid: fls. clear yellow, long-stalked, with purple anthers, in loose racemes. Crete, Asia Minor.

cretica. Cretan Mullein. Stout hairy plant to 6 ft.: lvs. ovate, clasping, toothed, the lower lyrate-pinnatifid: fls. yellow marked with purple, almost sessile, in loose racemes, violet anthers. Medit. region.

CELTIS. Hackberry. *Ulmaceæ.* Northern hemisphere deciduous or seldom evergreen trees or rarely shrubs, with alternate elm-like lvs., unisexual or bisexual small fls., and drupaceous frs.

Most of the species are hardy in the northern and north-central states where they are grown for shade and ornament. They are not particular as to soil. Propagated by seeds, layers and cuttings in the fall, or sometimes grafted on *C. occidentalis.*

Audibertiana: *C. occidentalis* var. *crassifolia.*

australis. To 80 ft.: lvs. to 6 in. long, sharply toothed, grayish-green and pubescent beneath: fr. dark purple. S. Eu., N. Afr., W. Asia.—Grown in Calif.

Bungeana (*C. Davidiana*). To 50 ft.: lvs. to 3 in. long, slightly toothed only above middle, shining above: fr. purplish-black. China, Manchuria, Korea.

caucasica. Similar to *C. australis* but with lvs. to 3 in. long and reddish-brown frs. Caucasus, W. Asia.

cordata: *C. occidentalis.*

Davidiana: *C. Bungeana.*

Douglasii (*C. rugulosa*). To 20 ft.: lvs. to 3 in. long, coarsely toothed, pubescent on veins beneath: fr. brown. Colo. to Wash.—The Colorado form is separated by some authors as *C. rugulosa*, distinguished by the lvs. being pubescent beneath.

Julianæ. To 80 ft.: lvs. to 6 in. long, wavy-toothed above the middle, yellowish-green and pubescent beneath: fr. orange. China.—Grown in Calif. and mild climates.

labilis. To 60 ft.: lvs. to 4 in. long, wavy-toothed above the middle, pale or brownish beneath, pubescent on veins: fr. orange. China.—Grown in Calif. and mild climates.

lævigata (*C. mississippiensis. C. occidentalis* var *integrifolia*). SUGARBERRY. MISSISSIPPI H. To 100 ft.: lvs. to 4 in. long, long-acuminate, usually entire, thin: fr. orange-red becoming dark purple. S. Ind. to Fla. and Tex.

mississippiensis: *C. lævigata.*

occidentalis (*C. cordata*). To 120 ft.: lvs. to 5 in. long, toothed, shining above, paler below: fr. orange-red to dark purple. Que. to N. C. and Ala. Var. **crassifolia** (*C. Audibertiana*) has firmer larger lvs. pubescent on nerves beneath.

orientalis: *C. Tournefortii.*

rugulosa: *C. Douglasii.*

sinensis. To 60 ft.: lvs. to 4 in. long, wavy-toothed, pubescent beneath when young: fr. dark orange. China, Korea, Japan.—Grown in Calif. and elsewhere.

Tala. Shrub, with short spines: lvs. about 1 in. long, coarsely toothed or nearly entire. Uruguay.

Tournefortii (*C. orientalis*). To 20 ft.: lvs. to 3 in. long, toothed, bluish- or grayish-green: fr. reddish-yellow. S. E. Eu., W. Asia.

CENTAUREA. *Compositæ.* Herbaceous annuals and perennials with entire, pinnately lobed or divided lvs.: heads solitary or panicled, purple, blue, yellow or white; fls. all tubular, the marginal ones often enlarged; pappus of scales or bristles. The genus yields a wide variety of ornamental subjects from flower-garden annuals to bedding and foliage plants, basket plants, and stout thistle-like species for rear background effects. They are prevailingly Old World plants.

The annuals are grown from seeds sown directly in the garden or started earlier indoors. *C. Cineraria* and other foliage types are increased from cuttings taken in September and carried over winter indoors or sometimes from seeds sown in August. *C. Cyanus*, the bachelors-button, is an easily grown hardy annual.

alpina. To 3 ft.: lvs. spiny, tomentose beneath: heads yellow. S. E. Eu.

Amberboi: *C. moschata.*

americana. BASKET-FLOWER. Ann. to 6 ft.: lvs. mostly entire, oblong-lanceolate, to 5 in. long: heads solitary, rose or flesh-colored, sometimes purplish, to 5 in. across, marginal fls. enlarged; bracts of involucre with fringed appendages. Mo. to La. and Mex. Var. **alba** has white fls.

argentea: *C. gymnocarpa.*

babylonica. Per. 4–12 ft., silvery-white: basal lvs. lyrate, to 2 ft. long; st.-lvs. oblong to lanceolate, entire or wavy: heads yellow, 1½ in. long, in panicles; bracts of involucre with short recurved tips. Asia Minor.

benedicta: *Cnicus benedictus.*

candidissima: see *C. Cineraria.*

Cineraria. DUSTY MILLER. Per. to 1 ft. or more, white-tomentose: lvs. pinnately parted into obtuse linear-lanceolate lobes: heads rather large, golden-yellow or purple; bracts of involucre ciliate. S. Italy, Sicily.—For the plant known in cult. as var. *candidissima* see *Senecio leucostachys.*

Clementei. Per., white-woolly: lvs. pinnate into ovate lobes: heads terminal, yellow; bracts of involucre ciliate. Spain.

conifera: *Leuzea conifera.*

cristata. Bien.: lower lvs. 3-pinnate, upper linear, entire: heads pale pink; bracts of involucre ciliate. S. Eu.

Crocodylium. Ann. to 4 ft.: lower lvs. ovate or lyrate, upper pinnate into linear segms.: heads solitary, rose, marginal fls. enlarged. Syria.

Crupina: *Crupina vulgaris.*

Cyanus. CORNFLOWER. BACHELORS-BUTTON. BLUE-BOTTLE. Popular hardy ann. to 2 ft., woolly-white only when young: lvs. linear, to 6 in. long, entire or lower toothed, sometimes pinnately cut: heads blue, purple, pink or white, to 1½ in. across, marginal fls. enlarged; bracts of involucre fringed. S. E. Eu.; frequently self-sows and sometimes escapes. Var. **flore-pleno** has double fls.

cynaroides (*Rhaponticum cynaroides*). Per.: lvs, oblong to ovate, pinnatifid: heads solitary or few, purplish; bracts of involucre fringed. Pyrenees.

dealbata. Per. to 2 ft.: lvs. pinnate into coarsely toothed lobes, lower to 1½ ft. long, white-tomentose beneath: heads solitary, inner fls. red, marginal ones rosy or white; bracts of involucre fringed. Asia Minor, Persia.

depressa. Per., almost prostrate, white-pubescent: lower lvs. oblong, entire or lyrate, upper linear-lanceolate: heads blue, about 1½ in. across, marginal fls. enlarged; bracts of involucre with black or white margins. Persia, Caucasus.

gymnocarpa (*C. argentea. C. plumosa*). DUSTY MILLER. Per. to 2 ft., densely white-woolly: lvs. 2-pinnate into linear entire lobes: heads in panicles, small, rose-violet or purple, mostly hidden by the lvs. Capri.

imperialis. Supposed hybrid between *C. moschata* and its var. *alba*: to 4 ft.: heads white, rose, lilac or purple, fragrant.

Jacea. Per. to 2 ft.: lvs. entire, lanceolate: heads solitary, purple or rarely white, to 1½ in. across, marginal fls. enlarged; bracts of involucre brown and fringed. Cent. Eu.; nat. in N. Amer.

macrocephala. Per. to 3 ft.: lvs. ovate-lanceolate, toothed: heads solitary, yellow, to 4 in. across; bracts of involucre fringed. Armenia.

maculosa. Bien.: lvs. 1–2-pinnate into linear segms.: heads pale purple or rarely white. S. Eu.

Margaritæ: *C. moschata* var. *alba.*

melitensis. Ann. to 4 ft., gray-pubescent, the sts. winged by decurrent lf.-bases: basal lvs. lyrate, upper entire or lobed: heads solitary or clustered, yellow, small; bracts of involucre spiny-tipped. Medit. region; nat. in N. and S. Amer.

montana. MOUNTAIN BLUET. Per. to 1 ft. or more: lvs. broadly lanceolate, silvery-white when young: heads blue, to 3 in. across, marginal fls. enlarged; bracts of involucre with black fringe. Eu. Color forms are **alba, carnea, citrina, purpurea** and **rosea.**

moschata (*C. odorata. C. suaveolens. C. Amberboi*). SWEET SULTAN. Ann., glabrous, to 2 ft.: lvs. toothed or pinnately cut: heads solitary, fragrant, white, yellow or purple, 2 in. across, marginal fls. enlarged; bracts of involucre entire. Orient. Var. **alba** (*C. Margaritæ*) has white fls.

muricata: *Amberboa muricata.*

nervosa. Per. to 2½ ft.: lvs. lanceolate, toothed: heads solitary, deep purple; bracts of involucre fringed. Cent. Eu.

nigra. KNAPWEED. HARDHEADS. Per., rough-pubescent, to 2 ft.: lvs. oblong or lanceolate, entire or toothed, to 6 in. long: heads solitary, rose-purple, to 1 in. across; bracts of involucre fringed. Eu.; nat. in N. Amer. Var. variegata has lvs. margined with white.

odorata: *C. moschata.*

orientalis (*C. rigidifolia*). Per. to 3 ft.: lvs. leathery, mostly pinnately cut: heads yellow; bracts of involucre with pale or reddish ciliate appendages. Eu.

phrygia. Per. to 2 ft.: lvs. oblong, toothed: heads solitary, rose; bracts of involucre fringed. Eu.

plumosa: *C. gymnocarpa.*

pulcherrima (*Ætheopappus pulcherrimus*). Per. to 2½ ft.: lvs. lanceolate or pinnatifid, to 7 in. long, gray-pubescent beneath: heads solitary, purple; bracts of involucre brown and fringed. Caucasus.

rigidifolia: *C. orientalis.*

ruthenica. Per. to 3 ft., glabrous: lvs. pinnately cut into linear toothed lobes: heads usually solitary, pale yellow, marginal fls. enlarged; bracts of involucre entire. Eu., W. Asia.

rutifolia. Per. to 3 ft., gray-pubescent: lower lvs. pinnate, upper oblong, entire: heads 5–7, rose, marginal fls. enlarged; bracts of involucre ciliate at tips. Bulgaria.

Scabiosa. Per. to 2 ft., pubescent: lvs. pinnately cut, to 6 in. long: heads solitary, purple, 2 in. across, marginal fls. enlarged; bracts of involucre fringed and black-margined. Eu.; nat. in N. Amer.

sordida. Per. to 2 ft.: lvs. pinnatifid into linear entire lobes: heads purple or yellowish; bracts of involucre ciliate and spiny-tipped. Possibly a hybrid.

suaveolens: *C. moschata.*

verbascifolia. Per., branching: lvs. oval-lanceolate, toothed, white-tomentose: heads violet; bracts of involucre brown. Arabia.

CENTAURIDIUM DRUMMONDII: *Xanthisma texanum.*

CENTAURIUM (*Erythræa*). CENTAURY. *Gentianaceæ.* Small mostly ann. herbs with opposite, simple and entire lvs. and red or rose more or less pink-like bright fls. borne in cymes.

Sometimes cultivated in the rock-garden and in borders. They thrive in light sandy loam and require protection from sun and frost. Propagated by seeds, the perennials by cuttings and division. The following are annuals or perhaps sometimes biennials.

Beyrichii. To 8 in., sts. ascending: lvs. to 1 in. long: fls. deep pink, 1 in. across. Ark. to Tex.

conferta (*Erythræa conferta* and *E. chloodes*). Ann. or bien. to 4 in., glabrous, the sts. many: lvs. fleshy, oblong, obtuse, lower ones in rosette, upper ones narrower: fls. rose. England, S. W. Eu.

diffusum: *C. Massoni.*

Massoni (*C. diffusum*). To 4 in., tufted: lvs. to ½ in. long: fls. bright rose. Azores.

pulchella (*C. ramosissima*). To 6 in.: lvs. oval: fls. pink. Eu.

ramosissima: *C. pulchella.*

venustum. To 8 in.: lvs. to 1 in. long: fls. rose, the throat white spotted with red. Calif.

CENTAURY: *Centaurium.*

CENTIPEDE-PLANT: *Homalocladium.*

CENTRADENIA. *Melastomaceæ.* Herbs and small shrubs native in Mex. and Cent. Amer., with entire unequal lvs., small pink or white fls. in cymes, and capsular fr.; grown in greenhouses for the attractive fls. and often showily colored lvs. They thrive in soil composed of rich leaf-mold and sharp sand. Propagated by cuttings.

floribunda. Little shrub with obscurely angled not winged somewhat pubescent sts.: lvs. narrow-lanceolate, 3-nerved, to about 2 in. long, red underneath: fls. pink. Mex.

grandifolia. To 2 ft., the sts. winged: lvs. oblong-lanceolate, very unequal-sided, about 5-nerved, to 6 in. long, bright red beneath: fls. rose-pink. Mex.

CENTRANTHUS (*or Kentranthus.*) *Valerianaceæ.* Ann. or per. herbs native in the Medit. region, having small white or red fls. in dense terminal clusters, the calyx pappus-like, corolla tubular and 5-parted, spurred at base, stamen 1. A few species are grown in the flower-garden, *C. ruber* being common. Propagated by seeds and division.

angustifolius. Per. to 2 ft., glaucous: lvs. linear-lanceolate or linear, entire, to 3 in. long: fls. rose, fragrant. S. Eu.

Calcitrapa. Ann. to 1½ ft.: lvs. pinnatifid, the lower lyrate, to 3 in. long: fls. rose. S. Eu., N. Afr.

macrosiphon. Ann. to 2 ft.: lvs. ovate, to 3 in. long, toothed or lobed, glaucous: fls. rose. Spain. Var. **albus** has white fls.

ruber (*Valeriana coccinea* and *rubra*). RED VALERIAN. JUPITERS-BEARD. Per. to 3 ft., glaucous: lvs. ovate to lanceolate, to 4 in. long, nearly entire: fls. crimson or pale red, fragrant. Eu. to S. W. Asia. Var. **albus** has white fls.

CENTROPOGON. *Lobeliaceæ.* Trop. American shrubs or herb-like with alternate toothed lvs., red, orange or greenish tubular 2-lipped fls. having the stamens united with the lower part of corolla-tube, and fr. a berry; grown in hanging-baskets in a warm greenhouse. Propagated by cuttings over heat.

Lucyanus. To 2 ft.: lvs. ovate- or oblong-lanceolate: fls. rose-carmine, 1½ in. long, clustered at ends of branches, the stamen-column exserted.

surinamensis. To 3 ft., with purplish sts.: lvs. ovate, to 6 in. long: fls. red, to 2 in. long, solitary at ends of branches, the stamen-column exserted.

CENTROSEMA (*Bradburya*). BUTTERFLY-PEA. CONCHITA. *Leguminosæ.* Twining vines with pinnate lvs. mostly of 3 lfts., white or purplish papilionaceous fls. in the axils, and flat linear pods; native of Amer., a few species grown as cover-crops in the tropics.

brasilianum. Lfts. ovate-oblong, to 2½ in. long: fls. white or blue, 1½ in. across: pods to 4 in. long and ⅙ in. wide. Brazil.

Plumieri. Lfts. ovate, to 5 in. long, blackening in drying: fls. 2 or more in. across, white with purple center: pods to 6 in. long and ½ in. wide. Trop. Amer.

pubescens. Lfts. ovate to oblong, to 3 in. long: fls. white or yellowish: pods to 8 in. long and ¼ in. wide. Trop. Amer.

virginianum. Lfts. ovate to linear-lanceolate, to 2 in. long: fls. purple to whitish: pods to 5 in. long and ⅛ in. wide. E. N. Amer., trop. Amer., Afr.

CENTROSOLENIA BULLATA: *Episcia tessellata.*

CENTURY PLANT: *Agave.*

CEPHAELIS (*Evea*). *Rubiaceæ.* Trop. shrubs or small trees with opposite lvs. and rather small fls. in terminal heads subtended by involucral bracts; one intro. in S. Calif.

tomentosa. Shrub to 15 ft., hairy: lvs. lanceolate to elliptic, to 10 in. long, long-acuminate: fls. yellow, the bright red bracts to 2 in. across: fr. blue. Mex. to Bolivia.

CEPHALANDRA: *Coccinea.*

CEPHALANTHUS. BUTTON-BUSH. *Rubiaceæ.* A few shrubs or small trees with opposite or whorled entire lvs., ours deciduous, and small tubular 4-lobed fls. in dense globose showy heads, the styles long-exserted; native in Asia, Afr. and N. Amer.

Of easy cultivation in good land if moist. Propagated by seeds and by cuttings of mature wood in autumn or green wood in spring.

occidentalis. To 20 ft.: lvs. ovate to oval-lanceolate, to 6 in. long, shining above: fls. creamy, in long-stalked heads about 1 in. across, July–Sept. N. Amer., in swamps.—It runs into narrow-lvd. and pubescent forms.

CEPHALARIA. *Dipsaceæ.* Ann. and per. Old World mostly coarse scabiosa-like herbs with opposite simple or compound lvs., small 4-parted whitish, yellowish or bluish fls. in long-stalked prominent heads, and fr. a ribbed achene; grown in the flower-garden. Easily propagated by seeds.

alpina. Per. to 6 ft.: lvs. pinnately cut into toothed decurrent lanceolate segms.: fls. sulfur-yellow, in heads to 1½ in. across. S. Eu.

balearica. Per. to 2½ ft.: lvs. entire or lyrate-pinnatifid, oval or the upper entire, toothed, shining: fls. yellowish-white. Balearic Isls.

centauroides: a name appearing in lists, but of confused and uncertain botanical standing.

rigida. Per. to 3 ft.: lvs. stiff, ovate-oblong, to 3 in. long, toothed: fls. white. S. Afr.

tatarica. Per. to 6 ft.: lvs. pinnately divided into toothed broad-lanceolate lfts.: fls. creamy-white, in heads to 2 in. across. Russia, W. Asia.

CEPHALOCEREUS. *Cactaceæ.* About 50 species of tall slender-columnar spiny or bristle-bearing cacti, Fla. and N. Mex. to Ecuador and Brazil, often with long white hair or wool at or near the top: fls. small, mostly nocturnal, fleshy, often in a head-like aggregation. See *Cacti.*

With the exception of *C. senilis* the species of Cephalocereus are little known in our horticulture. They are handled in the same way as the columnar or arboreous kinds of Cereus, mostly in large collections of cacti or succulents. They are propagated by seeds and cuttings.

euphorbioides (*Cereus* and *Pilocereus euphorbioides*). Columnar and usually simple, to 15 ft. and more, with 8 sharp ribs and areoles close together and felted with white, the flowering ones not confluent: fls. diurnal, brownish outside, rose-red inside, tube to 2 in. long. Probably S. Amer.

Nickelsii: *C. polylophus.*

polylophus (*C. Nickelsii. Cereus* and *Pilocereus polylophus*). Erect and simple, to 40 ft., ribs 15–18, the small areoles about ½ in. apart and felted but not woolly: fls. about 2 in. long, red. Mex.

senilis (*Cereus* and *Pilocereus senilis*). OLD-MAN CACTUS. To 40 ft. and more, mostly simple, ribs 20–30, the areoles bearing long white bristles or hairs and aggregated into a head: fls. about 2 in. long, rose-colored. Mex.

CEPHALOSTACHYUM. *Gramineæ.* East Indian bamboo-like shrubby grasses with spikelets borne in heads or the heads panicled or clustered, stamens 6. Sometimes planted in warm countries. See *Bamboo.*

pergracile. To 40 ft., sts. glaucous: lvs. to 1 ft. long and 1½ in. wide, rough on edges, rugose: heads about 2 in. apart in the large panicles.

CEPHALOTAXUS. PLUM-YEW. *Taxaceæ.* Asian evergreen trees and shrubs with linear lvs. having 2 broad glaucous bands beneath, and drupe-like stalked frs. or seeds; they can be grown in N. Y. and New England. Distinguished from Taxus in the glaucous lines on under surface of lvs., the drupe-like fr. and characters of fls. For cult. see *Conifers.*

drupacea. Tree to 30 ft.: lvs. 1–2 in. long, abruptly pointed: fr. green. Japan. Hort. vars. are: **fastigiata,** of columnar habit; **nana,** to 6 ft. tall; **pedunculata** (*C. Harringtonia*), with heads of male fls. long-stalked; hardy in sheltered positions Northeast, but grows slowly; **sinensis,** a shrub to 12 ft. with tapering lvs. China.

Fortuni. Tree to 30 ft.: lvs. 2–3 in. long, tapering: fr. purple. China; hardy in sheltered positions in the Northeast, but usually remains a bush.

Harringtonia: *C. drupacea* var. *pedunculata.*

Oliveri. Shrub: lvs. closely set, 1 in. long, spiny-pointed. China.

CERASTIUM. MOUSE-EAR CHICKWEED. *Caryophyllaceæ.* Herbaceous often tufted or mat-forming annuals and perennials, usually more or less hairy and sometimes hoary, with white fls. in terminal cymes and small entire opposite lvs.; of world-wide distribution, especially abundant in temp. zones.

Cerastiums are employed in rock-gardens or for edgings in bedding and borders. They grow well under ordinary garden conditions. Propagated by divisions or by cuttings taken after flowering, also by seeds.

alpinum. Per. to 6 in., generally silky-hairy: lvs. small: fls. white, solitary or in rather hairy few-fld. panicles, summer. Que., Lab., arctic Amer., and in alpine and arctic Eu. and Asia.

argenteum: *C. grandiflorum.*

arvense. STARRY GRASSWORT. Per. to 10 in., densely tufted with erect or ascending sts.: lvs. very narrow, to 1½ in. long: fls. numerous, white, Apr.–May. N. Amer., Eu., Asia. Var. **compactum** is a low form.

Biebersteinii. Per. to 6 in., creeping and spreading: lvs. grayish-woolly, to 1½ in. long and ⅕ in. wide: fls. white, May–June. Mts. of Asia Minor.

Boissieri (*C. gibraltaricum*). Per. to 1 ft.: lvs. silvery: fls. large, white, in cymes. Spain.

gibraltaricum: *C. Boissieri.*

grandiflorum (*C. argenteum*). Per., creeping, to 8 in.: lvs. linear, grayish: fls. transparent white. E. Eu.

Lerchenfeldianum. Erect, to 8 in.: lvs. lanceolate, about ½ in. long and ¼ in. wide, ciliate: fls. white, the cymes usually many-fld. Eu.

tomentosum. SNOW-IN-SUMMER. Per., creeping, branching, to 6 in., grayish-woolly: lvs. to ¾ in. long and ⅛ in. wide: fls. white, rather large, early summer. Eu.

villosum: the plants cult. under this name are probably *C. alpinum.*

CERASUS: *Cherry*; see *Prunus.*

CERATOCHLOA PENDULA: *Bromus unioloides.*

CERATONIA. *Leguminosæ.* One evergreen tree to 50 ft., with pinnate lvs. of 4–6 round or obovate shining lfts. to 4 in. long, small red fls. in short lateral racemes from old branchlets, and flattened leathery pods to 1 ft. long. **C. Siliqua,** CAROB, ST. JOHNS-BREAD, from the E. Medit. region, has been intro. into S. Calif. and Fla. for the pods which are eaten by live-stock and as human food; a special dehydrated product has been developed as a breakfast food and for other uses. A very useful tree.

The carob sometimes withstands a few degrees of frost but is generally adapted to the same range as the orange. It will grow on any well-drained soil, and trees in orchards should be planted 35–40 feet apart. Propagated by seeds, preferably under glass, and the seedlings afterwards budded; or by cuttings over bottom heat.

CERATOPETALUM. *Cunoniaceæ.* Australian resinous trees or shrubs with opposite lvs. of 1–3 digitate lfts. and small white, rose or yellow fls. in terminal cymes or panicles; grown under glass or out-of-doors in the S. Propagated by cuttings of half-ripened wood.

apetalum. Tree to 60 ft., bark silvery: lfts. usually 1, ovate-lanceolate, to 5 in. and more long, toothed: fls. without petals, calyx to ¼ in. long in fr.

gummiferum. Tree to 40 ft.: lfts. 3, lanceolate, to 1½ in. and more long, toothed: fls. with deeply lobed petals, calyx to ½ in. long in fr.

CERATOPHYLLUM, the only genus of *Ceratophyllaceæ.* One submerged aquatic herb, widely distributed in ponds and lakes in temp. and trop. regions, sometimes grown in aquaria for its foliage. **C. demersum.** HORNWORT. Lvs. forked into thread-like divisions, to 1 in. long, in whorls: fls. minute, unisexual, without perianth, solitary and sessile in the axils: fr. oval, with a spine-like beak.—Of easy cult., pieces being transferred from ponds.

CERATOPTERIS. WATER-FERN. FLOATING-FERN. *Parkeriaceæ.* The only true aquatic ferns, growing in the mud with the sterile lvs. often floating, the fertile lvs. erect, 2–4-pinnate.

These ferns are useful in ponds and aquaria, planted in pots and submerged slightly. Propagated by buds which are formed on all parts of the leaves.

cornuta: *C. thalictroides.*

pteridoides. Sterile lvs. to 10 in. long, short-stalked, irregularly lobed, floating; fertile lvs. erect, to 16 in. long, divided into linear segms. Fla. to Brazil.

thalictroides (*C. cornuta*). Sterile lvs. long-stalked, 1–2-pinnatifid into triangular segms., not floating; fertile lvs. similar but segms. linear. Old World tropics.

CERATOSTIGMA. *Plumbaginaceæ.* Per. herbs or shrubs with alternate simple lvs. and blue or rose salver-shaped fls. in terminal clusters or heads; grown in the border. Propagated by division and cuttings.

Griffithii. Low shrub, much branched, rusty-hairy: lvs. spatulate, with red margins: fls. blue. India.

plumbaginoides (*Plumbago Larpentæ*). Per. to 1 ft., diffuse: lvs. obovate, to 3 in. long, the margins ciliate: fls. deep blue, ½ in. across, Aug.–Sept. China; hardy N.

Willmottianum. Shrub to 5 ft.: lvs. rhombic, to 2 in. long, ciliate: fls. bright blue with rosy tube, to ¾ in. across, July–Nov. China.

CERATOZAMIA. *Cycadaceæ.* Mexican palm-like cycads with stiff pinnate lvs. borne in a whorl at top of short trunk, the fls. in cones and the cone-scales horned; 6 species, one sometimes grown in the greenhouse or out-of-doors in warm regions. For cult. see *Cycas.*

angustifolia: an unidentified hort. name.

longifolia: *C. mexicana.*

mexicana (*C. longifolia*). To 4 or rarely 6 ft., trunk short: lvs. about 3 ft. long, with 15–20 pairs of lfts., petioles prickly.

CERBERA THEVETIA: *Thevetia nereifolia.*

CERCIDIPHYLLACEÆ. CERCIDIPHYLLUM or KATSURA-TREE FAMILY. Only the genus Cercidiphyllum comprises this family which is separated from Trochodendraceæ: lvs. opposite, with stipules: carpel in the fl. 1.

CERCIDIPHYLLUM. *Cercidiphyllaceæ.* One bushy deciduous tree sometimes attaining 100 ft., from Japan. **C. japonicum.** KATSURA-TREE. Lvs. orbicular or ovate, to 4 in. long, cordate at base, obtuse, wavy-toothed, palmately veined, becoming yellow or scarlet in autumn: fls. unisexual, before the lvs.: fr. a pod about ¾ in. long. Japan. Var. **sinense** is a taller form from China.—The katsura-tree grows best in rich moist soil; hardy in N. Y. and Cent. New England. Propagated by seeds, cuttings of green wood in spring, or by layers.

CERCIDIUM. *Leguminosæ.* A few trees and shrubs in the warmer parts of Amer., with alternate bipinnate deciduous lvs., sharp spines and green-barked branches: fls. not papilionaceous, nearly regular, yellow, in short axillary racemes: pod flattish, linear or oblong. **C. Torreyanum,** PALO VERDE, is a characteristic small bushy tree in the arid regions of Mex., Ariz., S. Calif. and sometimes planted in its region: to 25 ft., leafless most of the year, the foliage appearing in spring and soon falling, sometimes a second leafage in autumn: fls. to ¾ in. across: pods to 3 in. long.

CERCIS. REDBUD. JUDAS-TREE. *Leguminosæ.* Trees and shrubs native in N. Amer., S. Eu. and Asia, with simple entire broad lvs., pink or red imperfectly papilionaceous fls. in racemes or clusters appearing in spring before or with the lvs., and flattened pods having narrow wings on the ventral suture.

Redbuds thrive in fertile sandy loam; only *C. canadensis* is hardy north of New York. Propagated by seeds sown in spring in heat; by layers, greenwood cuttings in spring, or *C. chinensis* by soft cuttings in summer under glass.

canadensis. Shrub or tree to 40 ft.: lvs. roundish, abruptly acute: fls. rosy-pink, ½ in. long, in clusters: pods to 3½ in. long. N. J. to Fla. and Tex. Var. **alba** has white fls. and **plena** double fls.

chinensis (*C. japonica*). Tree to 50 ft.: lvs. roundish, abruptly acute: fls. purplish-pink, ¾ in. long, in clusters: pods to 5 in. long. China, Japan.

japonica: *C. chinensis.*

occidentalis. Shrub to 15 ft.: lvs. kidney-shaped, notched or obtuse at tip: fls. reddish, ½ in. long, in clusters: pods 2½ in. long. Calif.

racemosa. Tree to 30 ft.: lvs. roundish, abruptly acute: fls. rosy-pink, ½ in. long, in many-fld. racemes: pods to 4 in. long. Cent. China.

reniformis. Shrub or tree to 40 ft.: lvs. reniform, blunt-pointed: fls. reddish, ½ in. long, in clusters: pods to 4 in. long. Tex., N. Mex.

Siliquastrum. Shrub or tree to 40 ft.: lvs. roundish, obtuse or notched at tip: fls. purplish-rose, ¾ in. long, in clusters: pods to 4 in. long. S. Eu., W. Asia. Var. **alba** has white fls.

CERCOCARPUS. MOUNTAIN MAHOGANY. *Rosaceæ.* Evergreen shrubs or partially deciduous small trees native in W. N. Amer., with simple lvs., small greenish or reddish fls. without petals, solitary or clustered, in spring and summer, and fr. an achene with a long feathery style.

Sometimes planted as shrubbery in regions of which they are native or in similar places; they succeed in dry soils and mostly with sunny exposure. Propagated by seeds or cuttings.

betulæfolius: *C. betuloides.*

betuloides (*C. betulæfolius*). To 30 ft.: lvs. obovate, to 2 in. long, toothed, pale beneath. Calif.

ledifolius. To 40 ft.: lvs. lanceolate, to 1 in. long, with entire revolute margins, pubescent beneath. Wash. to Calif. and Ariz.

montanus (*C. parvifolius*). To 6 ft.: lvs. obovate, to 2 in. long, toothed, pale beneath, pubescent both sides. S. D. to New Mex.

parvifolius: *C. montanus.*

Traskiæ. To 20 ft.: lvs. broadly ovate, to 2 in. long, toothed toward apex, densely white-tomentose beneath. Catalina Isl.

CEREUS. *Cactaceæ.* Some 900 names have been used in Cereus, a genus formerly held to include many inharmonious species; as now defined, it has about two dozen species in S. Amer. and W. Indies: mostly arborescent columnar plants (but sometimes spreading or prostrate), often massive, usually branching, strongly angled or ribbed, areoles spiny and more or less short-woolly but not bearing long hairs: fls. funnelform, mostly white, nocturnal, tube nearly or quite naked on outside: fr. naked. See *Cacti.*

The word Cereus is most popularly known in the name "night-blooming cereus," but the plants so designated are now placed in other genera, particularly in Selenicereus, Nyctocereus and Hylocereus. The kinds of true cereus are not much known in cultivation with us, and mostly under glass. The flowers are not very attractive or striking. The plants are mostly large and columnar. They propagate readily by seeds and cuttings.

æthiops (*C. cærulescens*). Bush-like, to 6 or 7 ft., sts. bluish-green to purplish, ribs 7 or 8, areoles large and black: fls. 7 in. or more long and about 5 in. across, white. Brazil.

alacriportanus (*C. peruvianus* var. *alacriportanus*). Tall and columnar, to 6 ft., ribs mostly 5 and strongly compressed, the areoles nearly or quite 1 in. apart, spines 6 to 9 and spreading: fls. 8 or 9 in. long and 4 in. broad, white with rosy tinge. S. Brazil, Paraguay.

azureus. Slender and flexuose, 3–4 ft. high and 1 in. diam., bluish, ribs 6 or 7, areoles several inches apart, radial spines 8–12: fls. 4–5 in. long, white. Brazil.

cærulescens: *C. æthiops.*

Hankeanus: *C. validus.*

Hildmannianus. Tall and columnar, to 15 ft., often much branched, ribs 5 or 6, young joints dark blue, areoles distant and developing a few spines: fls. to 9 in. long, white, inner segms. obtuse. Brazil.

Jamacaru. To 30 ft., very much branched, with short woody trunk, the top compact of upright branches, joints blue when young, ribs 4–6, areoles large and about 1 in. apart, spines usually many: fls. 1 ft. long, white, green outside, ovary purplish. Brazil.

peruvianus. Tall, to 40 ft. or more, much branched and tree-like, branches usually green but sometimes glaucous, ribs 4–9, spines needle-like: fls. about 6 in. long, outer segms. red or brownish, inner white. S. E. S. Amer.

validus (*C. Hankeanus*). Shrubby, 6 ft. or more, somewhat branched, glaucous when young, ribs 4–8 and obtuse, radial spines 5 and short and stout: fls. funnelform, reddish outside, white or reddish inside. Argentina.

Other names in Cereus may now be discovered in the following places:

acifer: *Echinocereus acifer.*
aggregatus: *Coryphantha aggregata.*
alamosensis: *Rathbunia alamosensis.*
amecamensis: *Heliocereus amecamensis.*
Baumannii: *Cleistocactus Baumannii.*
baxaniensis: *Acanthocereus pentagonus.*
Berlandieri: *Echinocereus Blanckii.*
biformis: *Disocactus biformis.*
Blanckii: *Echinocereus Blanckii.*
Boeckmannii: *Selenicereus Boeckmannii.*
Bonplandii: *Harrisia Bonplandii.*
Bridgesii: *Trichocereus Bridgesii.*
cæspitosus: *Echinocereus Reichenbachii.*
calcaratus: *Hylocereus calcaratus.*
candicans: *Trichocereus candicans.*
Cavendishii: *Monvillea Cavendishii.*
chiloensis: *Trichocereus chiloensis.*
Chiotilla: *Escontria Chiotilla.*
chloranthus: *Echinocereus chloranthus.*
chrysomallus: *Pachycereus chrysomallus.*
cinerascens: *Echinocereus cinerascens.*
coccineus: *Echinocereus coccineus; Heliocereus elegantissimus, Mediocactus coccineus.*
colubrinus: *Cleistocactus Baumannii.*
Columna-Trajani: *Pachycereus Columna-Trajani.*
conglomeratus: *Echinocereus conglomeratus.*
conoideus: *Echinocereus conoideus.*
costaricensis: *Hylocereus costaricensis.*
ctenoides: *Echinocereus ctenoides.*
dasyacanthus: *Echinocereus dasyacanthus.*
Donkelaarii: *Selenicereus Donkelaarii.*
dubius: *Echinocereus dubius.*
Dumortieri: *Lemaireocereus Dumortieri.*
eburneus: *Lemaireocereus griseus.*
Emoryi: *Bergerocactus Emoryi.*
Engelmannii: *Echinocereus Engelmannii.*
enneacanthus: *Echinocereus enneacanthus.*
eriophorus: *Harrisia eriophora.*
eruca: *Machærocereus eruca.*
euphorbioides: *Cephalocereus euphorbioides.*
Fendleri: *Echinocereus Fendleri.*
flagelliformis: *Aporocactus flagelliformis.*
gemmatus: *Pachycereus marginatus.*
geometrizans: *Myrtillocactus geometrizans.*
giganteus: *Carnegiea gigantea.*
gracilis: *Harrisia gracilis.*
grandiflorus: *Selenicereus grandiflorus.*
Greggii: *Peniocereus Greggii.*
gummosus: *Machærocereus gummosus.*
hamatus: *Selenicereus hamatus.*
lamprochlorus: *Trichocereus lamprochlorus.*
Lemairei: *Hylocereus Lemairei.*
Macdonaldiæ: *Selenicereus Macdonaldiæ.*
macrogonus: *Trichocereus macrogonus.*
mamillatus: *Echinocereus mamillatus.*
marginatus: *Pachycereus marginatus.*
Martianus: *Aporocactus Martianus.*
Martinii: *Harrisia Martinii.*
mojavensis: *Echinocereus mojavensis.*
monacanthus: *Hylocereus monacanthus.*
Nickelsii: *Cephalocereus polylophus.*
nycticallus: *Selenicereus pteranthus.*
obtusangulus: *Epiphyllanthus microsphæricus.*
ocamponis: *Hylocereus ocamponis.*
octacanthus: *Echinocereus octacanthus.*
pasacana: *Trichocereus pasacana.*
paucispinus: *Echinocereus triglochidiatus.*
pecten-aboriginum: *Pachycereus pecten-aboriginum.*
pectinatus: *Echinocereus pectinatus.*
pentagonus: *Acanthocereus pentagonus.*
pentalophus: *Echinocereus pentalophus.*
phoeniceus: *Echinocereus coccineus.*
polyacanthus: *Echinocereus polyacanthus.*
polylophus: *Cephalocereus polylophus.*
Poselgeri: *Wilcoxia Poselgeri.*
Pringlei: *Pachycereus Pringlei.*
procumbens: *Echinocereus pentalophus.*
pteranthus: *Selenicereus pteranthus.*
Reichenbachianus: *Echinocereus Reichenbachii.*
repandus: *Harrisia gracilis.*
Roemeri: *Echinocereus coccineus* and *E. octacanthus.*
rostratus: *Selenicereus hamatus.*
senilis: *Cephalocereus senilis.*
serpentinus: *Nyctocereus serpentinus.*
setaceus: *Mediocactus coccineus.*
Silvestrii: *Chamæcereus Silvestrii.*
Spachianus: *Trichocereus Spachianus.*
speciosissimus, speciosus: *Heliocereus speciosus.*
spinulosus: *Selenicereus spinulosus.*
splendens: *Monvillea Cavendishii.*
stellatus: *Lemaireocereus stellatus.*

stenopterus: *Hylocereus stenopterus.*

stramineus: *Echinocereus stramineus.*

testudo: *Deamia testudo.*

texensis: *Echinocereus Reichenbachii* and *E. papillosus.*

thelegonus: *Trichocereus thelegonus.*

Thurberi: *Lemaireocereus Thurberi.*

tortuosus: *Harrisia tortuosa.*

triangularis: *Hylocereus triangularis.*

tricostatus: *Hylocereus undatus.*

triglochidiatus: *Echinocereus triglochidiatus.*

tuberosus: *Wilcoxia Poselgeri.*

undatus: *Hylocereus undatus.*

viridiflorus: *Echinocereus viridiflorus.*

Weberi: *Lemaireocereus Weberi.*

CERIMAN: *Monstera deliciosa.*

CERINTHE. Honeywort. *Boraginaceæ.* Old World herbs, often glabrous and glaucous, with alternate simple lvs. and yellow fls. among leafy bracts in terminal racemes or cymes; ovary in 2 parts but style undivided. Of easy cult. Propagated by seeds.

major. Ann. to 1 ft.: lvs. rough and ciliate: fls. purplish at top, the bracts showy. Medit. region.

retorta. Ann. to 2 ft.: lvs. glaucous, often spotted with white or red: fls. tipped with purple, the bracts purple. Greece.

CERNUOUS: drooping; declining somewhat from the perpendicular.

CEROPEGIA. *Asclepiadaceæ.* Herbs or subshrubs, sometimes twining, with opposite lvs. (sometimes lacking) and tubular fls. mostly in axillary clusters; corolla tubular and often inflated at base, crown joined to the staminal tube; follicles slender; native in trop. Asia, Afr. and Malaya, one grown in the greenhouse.

They grow in soil composed of loam, leaf-mold or peat, and sand. Propagated by cuttings in spring over bottom heat.

Woodii. Sts. trailing or prostrate: lvs. heart-shaped, to ⅝ in. long: fls. light-purple or pink, to ¾ in. long, usually 2 together. Natal.

CEROPTERIS: *Pityrogramma.*

CEROXYLON. *Palmaceæ.* Tall unarmed feather-palms of Colombia and Ecuador, monœcious or polygamous, with long paniculate spadices among the lvs.; species perhaps 5: lvs. terminal, making a heavy crown: fls. large; stamens 9–15: fr. a red or purplish berry, 1 in. or less diam. For cult. see *Palm.*

andicola. Wax Palm. Very tall, the trunk ringed and incrusted with wax, swollen at or above the middle: lvs. to 20 ft. long; pinnæ many, linear, acuminate, bifid at apex, deep green above, densely silvery-tomentose underneath: fr. purplish.—This tree has been intro. into S. Calif., but with only indifferent success.

CERVICINA: *Wahlenbergia.*

CESPITOSE, CÆSPITOSE: matted; growing in tufts or dense clumps; said of low plants that make mats or turf of their basal growths.

CESTRUM. *Solanaceæ.* Shrubs and small trees grown in warm countries and under glass in northern latitudes for the axillary or terminal cymes of bright small tubular mostly fragrant fls., red, yellow, greenish or white, blooming from Jan. to Apr.: lvs. simple, entire and usually narrow, deciduous or persistent: fr. a small berry: native in American tropics.

Propagated by cuttings in February or early March and kept in a warm temperature; also by seed when obtainable.

aurantiacum. Half-climbing shrub: lvs. oval, to 4 in. long: fls. in a terminal panicle, orange-yellow, 1 in. long, the lobes strongly reflexed. Guatemala.

coccineum: hort. name for the color form of *C. fasciculatum.*

diurnum. Day-Jessamine. Shrub to 15 ft.: lvs. oblong or oval, to 3½ in. long, thick and evergreen, glossy above: fls. white, ½ in. long, the lobes reflexed, fragrant by day, in short clusters on long axillary sts. W. Indies.—Frequently planted far S. even along the coast.

elegans (*Habrothamnus elegans*). Shrub to 10 ft. or more, somewhat climbing, branches soft-hairy: lvs. ovate to ovate-lanceolate, to 4 in. long and 1½ in. wide: fls. in loose terminal more or less nodding clusters, to 1 in. long, red-purple, constricted at throat, of continuous bloom: berries red. Mex. Var. **Smithii** (*C. Smithii*), fls. blush-rose. There is also a variegated form.

fasciculatum. Differs from *C. elegans* in the broader lvs. to 2½ in. wide, larger purplish-red fls. in compact clusters usually subtended by lvs. Mex. Var. **Newelli** (*C. Newelli*), fls. crimson, large, free-blooming.

Newelli: *C. fasciculatum* var.

nocturnum. Night-Jessamine. Shrub to 12 ft.: lvs. oblong-ovate or oval, to 8 in. long, more or less shining on both sides: fls. greenish-white to cream-colored, ¾ in. long, the pointed lobes erect or spreading, very fragrant at night, in axillary clusters, blooming at intervals throughout the year. W. Indies.

Parqui. Willow-leaved Jessamine. Shrub to 6 ft.: lvs. lanceolate, to 6 in. long: fls. greenish-white to greenish-yellow, 1 in. long, the pointed lobes spreading, fragrant at night, in profuse axillary and terminal clusters. Chile; probably the hardiest.

Smithii: *C. elegans* var.

CHÆNOMELES. Flowering Quince. *Rosaceæ.* Deciduous or semi-evergreen shrubs native in E. Asia, with alternate toothed lvs., solitary or clustered showy waxy fls. in early spring before the lvs., and fr. a hard quince-like pome. Often listed as Cydonia.

These are attractive ornamental subjects and hardy North except *C. sinensis*, and this fruits on Long Island and in similar climates. The fruits of some kinds are also used sparingly for making preserves. Propagated by seeds stratified and sown in spring, by root-cuttings or cuttings of half-ripe wood under glass, by layers, and rare kinds by grafting on *C. lagenaria* or *Cydonia oblonga.*

japonica (*C., Pyrus,* and *Cydonia Maulei. Pyrus japonica*). Dwarf Japanese Quince. To 3 ft., with spiny branches: lvs. broad-ovate, to 2 in. long, coarsely toothed: fls. orange-scarlet, to 1½ in. across, clustered, Mar.–Apr.: fr. yellow, 1½ in. long. Japan. Var. **alpina** (*Cydonia Sargentii*) has procumbent sts. and lvs. to 1 in. long.

lagenaria (*Cydonia japonica* of horticulturists). Japanese Quince. To 10 ft., with spiny branches: lvs. oblong, to 3 in. long, finely toothed, shining above: fls. scarlet-red, to 2 in. across, clustered, Mar.–Apr.: fr. greenish-yellow, to 2 in. long. China. Var. **alba**, fls. nearly white; var. **Baltzii**, fls. rosy-pink; var. **cathayensis**, lvs. lanceolate; var. **grandiflora**, fls. large, nearly white; var. **Moerloosei**, fls. white, striped with pink; var. **roseo-pleno**, fls. rose, partially double; var. **rubra grandiflora**, fls. deep crimson, large; var. **sanguinea plena**, fls. scarlet, double; var. **umbilicata**, fls. rose-red; var. **Wilsonii**, lvs. tomentose beneath, fls. salmon-pink.—This, in its many forms, is the commonly cult. Japanese quince, and formerly supposed to be the plant originally intended to bear the name *japonica.*

Maulei: *C. japonica.*

sinensis (*Cydonia,* and *Pseudocydonia, sinensis*). Chinese Quince. To 20 ft., spineless: lvs. elliptic, to 3 in. long, sharp-toothed, semi-evergreen: fls. light pink, solitary, to 1½ in. across, May: fr. yellow, to 7 in. long, woody, aromatic. China.

superba. Hybrid between *C. japonica* and *C. lagenaria*: fls. blood-red.

CHÆNOSTOMA. *Scrophulariaceæ.* S. African herbs and subshrubs with opposite lvs., white, yellow or reddish tubular fls. with 4 exserted stamens, and capsular frs.

Certain low kinds are grown out-of-doors in southern United States and in the greenhouse for the profuse small bloom and compact habit; useful for edgings. Propagated by seeds or cuttings.

fastigiatum (*Sutera cephalotes*). Per. to 1 ft.: lvs. oblong, about ½ in. long, with few teeth toward apex: fls. ½ in. long, in head-like racemes.

hispidum (*Sutera brachiata*). Per. or subshrub to 2 ft., hairy: lvs. oval to oblong, to 1¼ in. long, entire: fls. pink or whitish, to ⅓ in. long, in leafy racemes.

polyanthum (*Sutera polyantha*). Ann. to 1 ft.: lvs. ovate to lanceolate, to 1¼ in. long, toothed: fls. bluish-lilac, ¼ in. long, in racemes.

CHÆROPHYLLUM. *Umbelliferæ.* Herbs with pinnately or ternately compound lvs., small white fls. in compound umbels, and flattened frs.; one species is grown for the edible root. See *Chervil.*

bulbosum. Turnip-rooted Chervil. Bien. to 3 ft., with gray or blackish tuberous root having yellowish-white flesh: lvs. decompound into linear segms. Eu.

CHÆTOCHLOA: *Setaria.*

CHÆTOSPERMUM: *Swinglea.*

CHAFF: a small, thin, dry and membranous scale or bract; in particular, the bracts in the flower-heads of composites.

CHALCAS: *Murræa.*

CHALICE-VINE: *Solandra.*

CHAMÆCEREUS. *Cactaceæ.* One species, Argentina, forming little clumps of cylindric plant bodies or joints that are 2 in. or so long with 6–9 ribs and soft white spines. **C. Silvestrii** (*Cereus Silvestrii*) resembles some of the creeping kinds of Echinocereus, with orange-scarlet diurnal solitary fls. nearly 3 in. long, the tube narrow and stamens included: fr. small, globular, woolly.

CHAMÆCRISTA: *Cassia cinerea.*

CHAMÆCYPARIS. False-Cypress. *Pinaceæ.* Large evergreen trees of pyramidal habit, mostly attaining 100 ft. or more in native habitats, with scale-like lvs. densely clothing the branchlets, appressed on old branches, spreading and needle-like on young growth, yellow (or red in *C. Lawsoniana*) staminate fls., and small globose cones of peltate scales bearing a point or prominence in middle; species few, in northern hemisphere. For cult. see *Conifers.* Excellent in cult. as small trees, ornamental and most of them hardy in the northern parts of the country, and widely variable. Retinisporas (or retinosporas) are juvenile forms of Chamæcyparis and Thuja.

formosensis. Branches drooping at tips: cones to ⅓ in. across. Formosa.—Not to be confused with *C. obtusa* var. *formosana.*

Lawsoniana (*Cupressus Lawsoniana*). Branches usually drooping, the branchlets frond-like: lvs. obtuse, with indistinct white markings below: cones ⅓ in. across. Ore., Calif.; hardy in latitude of central states and some of the forms stand in sheltered positions in S. New England; much grown in warm regions and greatly prized in its many very ornamental forms. Some of the hort. vars. are: **albo-spica,** Cream C., branchlets creamy-white at tips; **Allumii,** Scarab C., columnar form with very glaucous foliage; **argentea,** foliage silvery; **aurea,** foliage golden-yellow when young; **Bowleri,** compact form with branchlets drooping at tips; **darleyensis,** low form with lvs. slightly golden-yellow; **erecta** (var. *erecta viridis*), columnar form with bright green lvs. or glaucous in its form **glauca**; **filiformis,** branchlets drooping; **Fletcheri,** dense columnar form with glaucous lvs.; **Forsteckiana,** branchlets twisted into cockscomb-like heads, **Fraseri,** columnar form with dark blue lvs.; **glauca,** lvs. steel-blue; **gracilis,** branchlets drooping, lvs. light green; **intertexta,** pyramidal form with bluish-green lvs.; **Krameri,** of thin habit with slender whip-like branches; **lutea,** young growth bright yellow; **lycopodioides,** with irregular branches and twisted branchlets; **minima glauca,** dwarf form with steel-blue lvs.; **nana,** of dwarf globose habit, and its form **glauca** with lvs. bluish-green; **patula,** compact, branches spreading, lvs. glossy dark green; **pendula,** branchlets drooping and its form **vera** with branches also drooping; **pyramidalis,** columnar and its form **alba** with young growth white; **Westermanni,** of stiff pyramidal habit, lvs. light yellow; **Wisseli,** of columnar habit, with glaucous lvs.; **Youngii,** vigorous upright form. Other listed names under this species are: *Drummondii, elegans, elegantissima, lutescens, monumentalis* and *glauca, Rosenthalii, semper-horizontalis, stricta* and *cærulea, sulphurea, tortuosa, versicolor.*

leptoclada: *C. thyoides* var. *andelyensis.*

nootkatensis (*Cupressus nootkatensis. Thujopsis borealis*). Nootka C. Branchlets drooping: lvs. acute, dark green, without white markings: cones ½ in. across. Alaska to Ore.; hardy N., but should have protection from winter winds. Var. **compacta,** dwarf and compact; **glauca,** lvs. very glaucous; **lutea,** young growth light yellow; **pendula,** branches drooping. A form *viridis* is also listed.

obtusa (*Retinispora* and *Cupressus obtusa*). Hinoki C. Branchlets flattened and frond-like, drooping: lvs. obtuse, glossy above and with whitish lines beneath: cones ½ in. across. Japan. Some of the hort. vars. are: **albo-spicata,** shoots creamy-white when young; **aurea,** lvs. golden-yellow when young and its form **Youngii** with more drooping branchlets: **breviramea,** pyramidal form with short branches: **compacta,** dwarf broad form; **Crippsii,** lvs. pale yellow; **erecta,** branches ascending; **ericoides,** low form with linear bluish-gray lvs.; **filicoides,** branchlets short and frond-like; **filiformis,** branches thick and thread-like, drooping; **formosana,** with slenderer branchlets and smaller cones, Formosa; **gracilis,** pyramidal form with dark green lvs. or in **aurea** bright yellow when young; **lycopodioides,** of dwarf shrubby habit; **magnifica,** vigorous form; **nana,** of low growth and in **aurea** golden-yellow when young; **pendula,** drooping habit; **pygmæa,** very dwarf form with almost creeping branches; **tetragona,** dwarf form with 4-angled branchlets, partly golden-yellow. Other listed names are *acuta* and *decussata.*

pisifera (*Retinispora* and *Cupressus pisifera*). Sawara C. Branchlets flattened and slightly drooping: lvs. acuminate, glossy above and with whitish lines beneath: cones to ⅓ in. across. Japan; likely to suffer in exposed places N. There are many hort. vars. as: **aurea,** lvs. golden-yellow; **filifera,** branches thread-like, drooping, and its forms **aurea** with young growth golden-yellow, and **aureo-variegata** with branchlets variegated yellow; **plumosa,** dense conical habit with feathery branchlets, and its forms **argentea** with tips of branchlets whitish, **aurea** with young growth golden-yellow, and **flavescens** with tips of branchlets yellowish; **squarrosa,** Moss R., bushy habit with feathery branchlets, and its form **dumosa** of more compact and slower-growing habit, and **sulphurea** with yellow lvs., *Veitchii* and *Sieboldi* are listed under this var.; **sulphurea,** lvs. light yellow.

sphæroidea: *C. thyoides.*

texana glauca: a listed name.

thyoides (*C. sphæroidea. Cupressus thyoides*). White-Cedar. Branchlets flattened, not drooping: lvs. acute, light green or glaucous: cones ¼ in. across. Me. to Fla. and Miss., hardy near coast. Hort. vars. are: **andelyensis** (*C. leptoclada*), of upright habit with loosely appressed lvs.; **ericoides,** Cedar R., dense shrub with spreading lvs. having 2 glaucous lines beneath; **glauca,** lvs. nearly silvery-white; **Hoveyi,** of slender habit, the branchlets with dense terminal tufts; **variegata,** branchlets variegated yellow.

CHAMÆDAPHNE. *Ericaceæ.* One evergreen shrub to 5 ft., native in bogs in N. Eu.,

N. Asia and N. Amer. **C. calyculata** (*Andromeda* and *Cassandra calyculata*). Leather-Leaf. Lvs. alternate, oblong, to 2 in. long, rusty-scaly beneath: fls. white, urn-shaped, nodding, ¼ in. long, in racemes to 5 in. long, Apr.–June. Var. **nana,** to 1 ft. — A good shrub for the rock-garden where it does best in a moist soil of sand and peat. Propagated by seeds only slightly covered, by cuttings of ripe wood under glass, by layers and suckers.

CHAMÆDOREA. *Palmaceæ.* Small thin-lvd. shade-loving unarmed diœcious or seldom monœcious palms, Mex. to S. Amer., with solitary or clustered reed-like ringed or jointed or sheathed sts., sometimes climbing, and pinnate, pinnatisect or pinnate-veined lvs., probably more than 60 species: spadices among the lvs. or below them, simple and cord-like or paniculately branched and with slender parts, the spathes usually prominent; stamens 6; pistillate fls. very small and often sunken in pits: fr. small, of 1–3 globose or oblong carpels, purplish or red or orange. The Chamædoreas are imperfectly known botanically; the identity of the cult. kinds is perplexing inasmuch as the two sexes may not be grown together and as fr. is little known. They are attractive neat green-stemmed palms for porch and patio use where protection may be provided from winds and burning sun, in S. Calif. and S. Fla.; well adapted to lath houses. For cult. see *Palm.*

Arenbergiana. St. erect, 5–6 ft., remotely ringed: lvs. pinnate, recurved at apex; pinnæ 16–30, long-oblong and falcate, very long-acuminate, the apex pendulous, primary nerves 9: spadices below the lvs.: fr. subglobose, in a dense cluster. Cent. Amer.

bambusoides: listed name.

corallina. St. solitary, sheathed and not ringed, to 4 ft. or more: spadices among the lvs., the pistillate divaricately branched: lvs. pinnate, green both sides but lighter underneath, 2 ft. or more long; pinnæ 8–12 in. long, broad-oblong and abruptly long-pointed, 3 in. broad at middle, the terminal one confluent and bifid and many-ribbed, lateral ones with 1 prominent rib off-center and many secondary ones. Venezuela.

desmoncoides. Climbing with age, with long slender sts.: lvs. pinnate, 2–3 ft. long; pinnæ 12 in. long, narrow, drooping; petiole glaucous. Mex.

elatior (*C. scandens*). Slender and more or less climbing, the st. covered with petiole-sheaths: st.-lvs. pinnate, 6–8 ft. long, sheath 18 in. long; pinnæ 2 ft. long, 1 in. broad, long-acuminate, strongly several-nerved. Mex.

elegans. Apparently the commonest chamædorea in cult.: sts. solitary or clustered, with many rings or nodes, 6–8 ft.: lvs. pinnate; pinnæ narrow-lanceolate and long-acuminate, green both sides, rather soft in texture, not ridged: spadix much branched. Mex.

Ernesti-Augusti. St. solitary, slender, ringed, with brace-roots at base: lvs. simple; blade obovate or ovate-oblong, 1½ ft. long and half as broad, bifid at apex to half or more the depth, strongly many-ribbed, the margins bluntly dentate; sometimes the lf. is pinnate, with a broad bifid terminal lobe and many-ribbed lateral pinnæ 1–2 in. broad: fertile spadix simple; staminate erect, branched: fls. reddish. Mex.

fragrans. St. 4–6 ft., scarcely 1 in. thick, ringed: lvs. mostly 5 or 6, 1 ft. long, 2-lobed below the middle, each lobe long-acuminate and many-nerved: fls. fragrant: fr. elliptic, black-purple. Peru.

geonomæformis. St. solitary, sheathed, about 4 ft.: lvs. simple, oblong, 8–12 in. long, 5 or 6 in. broad, deeply bifid, deep green, about 12 nerves on either lobe: staminate spadix from st. just below the lvs., with several long drooping branches 8–10 in. long. Guatemala.

glaucifolia. St. tall, to 20 ft., solitary, ringed remotely: lvs. pinnate, 4–6 ft. long, glaucous on both sides; pinnæ 70–80, long and slender, very long-acuminate: spadix tall, erect or ascending, among the lvs., on slender elongated peduncle. Guatemala.

graminifolia. St. remotely ringed: lvs. pinnate, erect, dark green; pinnæ about 40, rather close together, linear-lanceolate, very long-acuminate, spreading horizontally, strongly several-nerved: staminate spadix erect, with long pendulous branches. Guatemala.

Martiana. St. short, creeping, dwarf and spreading, with many forking sts.: lvs. pinnate; pinnæ many, linear, pendent, 6–8 in. long. Mex.

oblongata. St. ringed: lvs pinnate, at apex pinnæ confluent and commonly truncate and erose but otherwise oblong or falcate-acuminate: pistillate spadix erect, much branched: fr. oblong, black. Mex.

Pacaya. St. slender and erect, 8–10 ft., remotely ringed: lvs. erect-spreading, 2–3 ft. long; pinnæ about 7, dull green, plicate, middle ones 7–8 in. long and 1½ in. broad, long-acuminate, the terminal ones very broad and serrate on outer margins: fertile spadix about 20 in. long, with flattened peduncle compressed below to caudex, the branches 5 or 6 and 3–4 in. long: fr. oblique-obovoid, about ⅓ in. long. Costa Rica.

Pringlei. Nearly or quite stemless: lvs. pinnate, erect, firm in texture, 3 ft. long; pinnæ 25–30, widely spaced, linear-lanceolate and very long-acuminate, 6–8 in. long and ⅓ in. or less broad, strongly nerved: spadix simple. San Louis Potosi, Mex.

Sartorii. St. 8–14 ft., solitary, ringed and above covered with lf.-sheaths: lvs. pinnate, 3 ft. long, rather soft; pinnæ about 15, broad-lanceolate, 10–12 in. long and to 2½ in. broad, abruptly acuminate, with 1 mostly off-center rib and several secondary ones, the upper ones more or less confluent at base: spadices with and below the lvs., simply branched, the staminate with long pendulous branches. Mex.

scandens: *C. elatior.*

Tepejilote. St. to 10 ft., solitary, strongly and rather closely ringed, with swollen joints: lvs. pinnate, to 4 ft. long; pinnæ 20–30, about 1–1½ ft. long, 1½–2 in. broad, long-acute: spadices below the lvs., with a sheathed peduncle, simply branched, the staminate branches long-drooping. Mex.

Wendlandiana. St. stout, solitary, a few ft., ringed: lvs. pinnate, large, strongly ascending, to 4 ft.; pinnæ 36–40, narrow-lanceolate, 1½ ft. long and to 2 in. broad, long-acuminate, with several or many very strong light-colored ribs: spadix on the trunk, the staminate with many and the pistillate with few branches. Mex.

CHAMÆLAUCIUM. *Myrtaceæ.* Australian heath-like shrubs with mostly small opposite lvs., 5-parted fls. borne in axils or short terminal racemes, the stamens 10; one species planted in Calif.

ciliatum. To 2 ft.: lvs. terete or 3-angled, to ¼ in. long: fls. about 1/12 in. long, axillary, the calyx-lobes fringed.

CHAMÆLIRIUM. *Liliaceæ.* One per. herb with tuberous roots, native from Mass. to Fla. and Ark., sometimes planted in shady situations in the garden. **C. luteum.** Blazing Star. Fairywand. To 4 ft.: lvs. to 8 in. long and 1½ in. wide: fls. yellowish-white, small, diœcious, in spike-like racemes.

CHAMÆNERION: *Epilobium angustifolium.*
CHAMÆPERICLYMENUM: *Cornus canadensis.*
CHAMÆPEUCE: *Cirsium Diacantha.*

CHAMÆROPS. *Palmaceæ.* One low bushy diœcious (or polygamous) fan-palm in the Medit. region, the only palm native in Eu., and much planted where a hardy small species is required and under glass: very variable, and several specific names have been applied to the forms. Plant usually suckering and making a clump but growing to a single trunk in some forms and when sprouts are removed: spadices among the lvs. and shorter than they, short-branched, not pendent; stamens 6–9: fr. ovoid, oblong or globose (depending on the var.), drupe-like, ½–1½ in. long, with somewhat succulent exterior, brown or yellow; one group of vars. has ovoid or oblong frs., and another group has nearly or quite spherical frs. Trachycarpus was formerly included in this genus. See *Palm.*

argentea. Glaucous-blue form of *C. humilis.*

excelsa: see *Trachycarpus.*

Fortunei: see *Trachycarpus.*

humilis. Usually with trunks only 3–5 ft. tall, but sometimes to 20 ft. or more in arborescent forms: lvs. relatively small, mostly 2–3 ft. across, stiff, green or glaucous-blue, with many narrow bifid segms. extending nearly to the base; petiole long and slender, strongly long-spined.—Easily grown; hardy along the Gulf Coast and somewhat northward; propagated by seeds and suckers. There are a number of named vars., differing in stature, lvs. and fr., but hardly distinguishable as species.

macrocarpa. A large-fruited var. of *C. humilis*: fr. spherical, ¾ in. diam.

Ritchieana: *Nannorrhops Ritchieana.*

stauracantha: *Acanthorhiza Mocinni.*

CHAMBEYRONIA. *Palmaceæ.* Two recognized monœcious unarmed tall handsome feather-palms of New Caledonia, more or less confused in cult. and usually known as Kentia or Kentiopsis; the name *Kentia Lindenii* appears to have been applied to both species. From Kentiopsis the genus differs in technical characters of the larger fr., and the indefinite (rather than definite, say 20 or less) number of stamens.

macrocarpa (*Kentia* and *Kentiopsis macrocarpa*). Tall tree, attaining 60 ft. and more: lvs. large, reddish underneath when young but becoming nearly equally green both sides; pinnæ many, 3–4 in. broad, equidistant on rachis, with strong rib on margin as well as midrib and prominent intermediate nerves: spadix below the crown, branched, glabrous; fls. normally in 3's, center one pistillate or all staminate toward end of branches; staminate fls. about ⅜ in. long, stamens numerous: fr. ovoid-elliptic, about 1½ in. long, in a shallow cup-like enlarged perianth.—C. Hookeri has lvs. paler underneath: staminate fls. larger: fr. long-ellipsoid, about 2 in. long, the perianth deeply cup-like.—Grown under glass, probably adapted to S. Fla.

CHAMISO: *Adenostoma.*

CHAMOMILE: *Matricaria, Anthemis nobilis.*

CHAMOMILLA: *Matricaria.*

CHARD, SWISS: see *Beta.*

CHARIEIS. *Compositæ.* One ann. herb in S. Afr., sometimes grown in flower-gardens and of easy cult. **C. heterophylla** (*C. Neesii. Kaulfussia amelloides*). To 1 ft., hairy: lvs. oblong, entire, to 2½ in. long: heads solitary and long-stalked, ¾ in. across, rays blue, disk yellow or blue; pappus plumose.

CHARITY: *Polemonium cæruleum.*

CHARLOCK: *Brassica arvensis.*

CHASTE-TREE: *Vitex Agnus-castus.*

CHAULMOOGRA: see *Taraktogenos.*

CHAYOTE (*Sechium edule*, which see for botanical description). A cucurbit grown for the edible fruits and root tubers, native in tropical America, widespread in the western tropics as a cultivated plant and adaptable also to the coastal parts of the United States from South Carolina southward and in southern California; in regions in which the ground does not freeze more than an inch or so deep the roots survive the winter if given protection. If grown only as an annual each year from seed, the plant may be raised to fruiting stage farther north, although a long season is required. Two or more plants should be grown to insure pollination.

The chayote is propagated from seed, the entire ripe fruit being planted in spring, or perhaps in autumn in southern Florida; the fruit is placed with the broad end sloping downward and the stem end slightly exposed. There is one seed in a fruit. The plants are started where they are to stand, and they should be 8–12 feet apart and trellis or other support provided. Special or named varieties are propagated by cuttings of shoots taken at the crown of the plant, and struck under glass or other protection. If the soil is fertile, a plant should produce 50 to 100 or more fruits in a season. The fruits are boiled, and prepared in various ways for eating. In tropical countries the large root tubers are eaten after the manner of potatoes; the tubers are usually harvested after the second year's growth. If tubers are left in the ground in regions where they do not freeze, the plant is of course perennial. The chayote fruit is much prized in tropical America, where it may be known also as christophine and chuchu, and in some places as mirliton and vegetable-pear. The herbage supplies good forage, and the young parts are sometimes used after the manner of asparagus and spinach.

CHECKERBERRY: *Gaultheria procumbens.*

CHECKERBLOOM: *Sidalcea malvæflora.*

CHEILANTHES. LIP-FERN. *Polypodiaceæ.* Small rock-loving greenhouse or semi-hardy ferns, often hairy or woolly: lvs. 1–3-pinnate; sori terminal on veins: widely distributed in temp. and trop. regions, where they do best in dry rocky situations. Under glass the foliage should be kept dry. See *Ferns.*

alabamensis. Lvs. to 10 in. long, 2-pinnate, nearly glabrous, on black stipes to 7 in. long. Va. to Ala. and Ariz.

Covillei. Lvs. tufted, to 4 in. long, 3-pinnate, densely covered beneath with white or brown scales, on brown or purplish stipes to 7 in. long. S. Calif., Nev., Ariz.

densa (*C. siliquosa. Pellæa densa. Cryptogramma densa*). Lvs. to 3 in. long, 3-pinnate, glabrous, margins of segms. revolute, on shining brown stipes to 9 in. long. W. N. Amer.

Fendleri. Lvs. to 10 in. long, 3-pinnate, brown-scaly beneath not tomentose, on brown stipes. Tex., Colo., Ariz.

lanosa. Lvs. to 9 in. long, 2-pinnate, densely rusty-hairy, on brown stipes to 4 in. long. Conn. to Ga. and Tex.

myriophylla. Lvs. densely tufted, to 9 in. long, 3–4-pinnate, densely scaly and woolly beneath, on brown stipes. Mex. to S. Amer.

siliquosa: *C. densa.*

tomentosa. Lvs. to 1½ ft. long, 3-pinnate, covered all over with brownish-white hairs, on stout brown tomentose stipes to 8 in. long. Va. to Ariz. and Mex.

CHEIRANTHUS. *Cruciferæ.* A few perennials, sometimes woody at base, native from the Canary and Madeira Isls. to the Himalayas, one of them an old garden plant, and others sometimes planted for ornament. Plants more or less grayish-pubescent: lvs. narrow, nearly or quite entire: fls. for the most part yellow or orange, sometimes brownish: pod or silique long, angled.

The usual species in cultivation is the wallflower, *C. Cheiri.* It is a spring-blooming low erect perennial, much like stock but the colors in yellow, yellow-brown, red to red-black, much prized in Europe (where it is native) but less popular in this country. It requires a cool season for best bloom, and in the northern United States the maiden plants must usually be carried over in a frame. In England they are frequent inhabitants of fence-walls and quarries. The free flowering, rich deep colors, and pleasant fragrance make wallflowers good subjects for very early spring bloom, or for winter bloom in mild climates. Special colors are propagated by means of cuttings. Usually they are grown from seeds; plants should be strong and bushy to go through the winter well. Seeds may be sown early in the year, the plants transplanted once or twice, and be ready for bloom the following spring. If wanted for bedding-out, they may be carried over winter dormant in pots, and turned out as soon as the ground is open. Plants started in late spring or early summer may make satisfactory spring-blooming subjects if the season and all other conditions turn out favorable to them, but it is better to sow seeds earlier. Good plants may be purchased of dealers. Some of the strains give bloom the first year from seeds, started early, the plants being practically annual.

Allionii of gardens: see *Erysimum asperum.*

Cheiri. Wallflower, discussed above. To 2½ ft., strongly erect: lvs. lanceolate or narrower, acute, to 3 in. long: fls. to 1 in. long, fragrant, yellow to yellow-brown. S. Eu.

kewensis. Bushy per, with upright racemes: fls. about 1 in. across, brownish-orange inside and reddish-brown outside, becoming pale purple. Hybrid.

linifolius: *Erysimum linifolium.*

Senoneri. Per., woody, much branched, with curved parts: lvs. ovate-oblong and entire or short-toothed: fls. orange, fragrant. Greece.

CHEIRINIA: *Erysimum asperum.*

CHELIDONIUM. Celandine. *Papaveraceæ.* One weedy bien. or per. herb with orange-colored juice, sometimes grown in wild-gardens. Propagated by seeds or division of roots. **C. majus.** To 4 ft.: lvs. deeply pinnatifid, glaucous beneath: fls. yellow, to ⅔ in. across, in small umbels, sometimes double: fr. linear, to 2 in. long. Eu.; nat. in E. N. Amer. Var. **laciniatum** has more finely divided lvs. See *Dicranostigma* for *C. Franchetianum.*

CHELONE. Turtle-Head. *Scrophulariaceæ.* Hardy herbaceous perennials, closely allied to Penstemon, with showy 2-lipped or gaping fls. in dense axillary or terminal spikes, in summer: lvs. opposite and toothed: native in N. Amer.

These plants thrive in partial shade and in soil not too dry as they are native mostly in swampy places and damp woods. Propagated by seed or by division.

barbata: *Penstemon barbatus.*

glabra. White T. Snake-Head. To 3 ft.: lvs. lanceolate, to 6 in. long, short-petioled: fls. white or pinkish, 1 in. long. Newf. to Ga. and Minn.

Lyoni. To 3 ft.: lvs. ovate, to 7 in. long, long-petioled: fls. rose-purple, 1 in. long. Mts. N. C., S. C. and Tenn., but hardy N. There is a lower or dwarf form.

nemorosa: *Penstemon nemorosus.*

obliqua. To 2 ft.: lvs. oblong, to 8 in. long, very veiny, petioled: fls. deep rose, 1 in. long. Md. to Ill., Fla. and Miss.

Pentstemon: *Penstemon lævigatus.*

CHENILLE PLANT: *Acalypha hispida.*

CHENOPODIACEÆ. Goosefoot Family. Herbs or shrubs of about 75 widespread genera, many of them weedy but a few grown as vegetables and for ornament. Family characterized by mostly alternate simple lvs. and small inconspicuous bisexual or unisexual fls. having no petals, 2–5-lobed calyx or sometimes lacking, 2–5 stamens, usually superior 1-celled ovary, and fr. a utricle or achene. Those herein treated are Atriplex, Beta, Camphorosma, Chenopodium, Enchylæna, Eurotia, Kochia, Rhagodia, Salicornia, Salsola, Spinacia.

CHENOPODIUM. Goosefoot. Pigweed. *Chenopodiaceæ.* Mealy or glandular herbs or subshrubs with alternate lvs. and small greenish bisexual fls. in spikes or panicles; mostly weedy, but a few grown as pot-herbs and for ornament, and one is medicinal. Of easy cult. Propagated by seed.

album. Lambs-Quarters. Ann. to 10 ft.: lvs. rhombic-ovate to lanceolate, to 4 in. long, entire, toothed or lobed, often white-mealy beneath. Eu., Asia, N. Amer. —Sometimes collected for greens.

amaranticolor. Ann. to 8 ft.: lvs. triangular-ovate, to 4 in. long, irregularly toothed and notched, violet-red toward top of plant. Original habitat unknown.

ambrosioides. American Wormseed. Mexican-Tea. Ann. or per. to 3½ ft., strong-smelling: lvs. ovate to lanceolate, to 5 in. long, coarsely toothed or cut. Trop. Amer.; nat. in N. Amer., Eu., Asia.—Has medicinal properties.

Atriplicis: *C. purpurascens.*

Bonus-Henricus. Good King Henry. Mercury. Per. to 2½ ft.: lvs. arrow-shaped, to 3 in. and more long, entire. Eu., nat. in E. N. Amer.—Grown as pot-herb.

Botrys. Feather-Geranium. Jerusalem-Oak. Ann. to 2 ft., glandular-pubescent and strong-smelling: lvs. oval to oblong, to 2 in. long, lobed or pinnatifid. Eu., Asia, Afr.; nat. in N. Amer.—The plant is sometimes cult. under the name *Ambrosia mexicana.*

capitatum (*Blitum capitatum*). Ann. to 1½ ft.: lvs. triangular-ovate, toothed: fls. in dense heads becoming berry-like in fr. Eu.—Sometimes grown for pot-herb.

purpurascens (*C. Atriplicis*). Ann. to 3 ft., covered with violet-purple crystalline pubescence: lower lvs. spatulate to oval and toothed, upper lanceolate and entire. China.

Quinoa. Quinoa. Ann. to 5 ft.: lvs. triangular-ovate, angular-toothed or pinnatifid. Andes.—The seeds are extensively eaten in S. Amer.

CHERIMOYA (*Annona Cherimola*). A South American small tree, cultivated in warm and subtropical regions for the delicious edible fruit, which is heart-shaped or conical and may sometimes weigh as much as five pounds. The flesh is white, soft and melting, containing bean-like seeds. It is a dessert fruit, with a subacid flavor somewhat suggestive of the pineapple. There are many varieties, and the failure to make a success in the growing of it is often due to inferior kinds. It should thrive in many regions where avocados can be grown. It is not strictly a tropical fruit, being native in more or less elevated regions, and requires a relatively dry climate. It should thrive in parts of southern California. It does not endure temperatures much below freezing without injury.

The cultivation of the cherimoya is similar to that of the citrus fruits. It is planted 20 to 30 feet apart. Choice varieties are multiplied by shield-budding or grafting on seedlings of cherimoya although other species of Annona may be employed as stocks. Trees begin to bear in three or four years after planting in the orchard. Probably the scant yield of some trees of cherimoya is the result of insufficient pollination.

CHERRY. The usual fruit-bearing cherries are of two species, the sweet cherry, *Prunus avium*, and the sour cherry, *Prunus Cerasus;* the duke cherries, with the habit of *P. avium* but bearing acid fruit, are *P. avium* var. *regalis*, by some investigators accounted hybrids between the two species. The dwarf cherries of the Plains region are *Prunus Besseyi*, a native species; this is sometimes employed as a stock for sour cherries in cold regions.

As to regions, the sweet and sour cherries differ markedly in their ability to succeed under a wide range of climatic and soil conditions. The sweet cherry is the much more restricted of the two and can be grown to advantage only in the more favored fruit regions which have an equable climate, as, for example, the Hudson Valley of New York, the shores of the Great Lakes and on the Pacific Coast. It is about as tender to injury from winter cold and late frosts as is the peach and does not endure heat as well. The sour cherry, on the other hand, can be grown over a much wider territory extending north of the sweet cherry belt and south into the Mississippi Valley and along the Atlantic Coast. The largest sour cherry plantings are in New York and Michigan.

Soils are of less importance than climate in cherry growing. Sour cherries thrive on most well-drained soils, either light or heavy, and withstand rather dry conditions. Sweet cherries are more exacting, and reach their best development in deep well-drained sandy or gravelly loams.

Propagation of both sweet and sour cherries is by budding on seedling stocks. The sweet cherry grows best on Mazzard stock although Mahaleb stocks are used in many cases with fair results. Sour cherries are commonly budded on the Mahaleb stock which is preferred by the nurserymen because it makes a better nursery tree. Mazzard stocks make better orchard trees.

Orchard treatment is not unusual. One- or two-year nursery trees are set in very early spring or, in the milder climates, in the late autumn. Sour cherries are placed about 18 x 18 feet, although 24 x 24 feet is better for the more vigorous sorts on good soil. Sweet cherries may be set 25 x 25 feet, or 30 x 30 feet in favorable situations. Sour cherries succeed best commercially under cultivation and cover-crops, as described for the apple, although in the home fruit-garden considerable fruit will be produced under sod or almost total neglect. Sweet cherries withstand sod culture even better than the sour kinds. Fairly vigorous terminal growth is necessary for crop production with both sweet and sour cherries. This can be stimulated by nitrate of soda, applied early in the spring at the rate of 3–5 pounds to the mature tree.

Pruning is begun when the two-year tree is set out; all but the leader and two or three well spaced laterals should be removed. The remaining branches should not be headed back. For the mature sweet cherry the spreading type of tree with several large scaffold branches is the most desirable. The main branches may be headed back when they become too high for convenient harvesting. Sour cherries are pruned rather lightly at first, but as soon as growth begins to get short and spurry, the branches must be thinned out and renewal pruning practiced to keep up the vigor of growth.

Harvesting and marketing require special attention. For the cannery, which absorbs a large part of the crop in the fruit districts, cherries are allowed to become dead ripe and then picked without the stems, into 6–8-pound baskets. If they are to be sold fresh on the market they are picked with the stems, taking great care not to bruise the fruit. In the East they are packed either in quart berry baskets and shipped in berry crates or in climax baskets holding 4–12 pounds. In the West sweet cherries are usually marketed in 8–10-pound boxes which are faced. Sometimes sour cherries are held on the trees for a month or more after they are ripe by dusting or spraying to control the cherry maggot. Quantities of sour cherries are pitted and frozen at about 0° F. either with or without sugar, and thus held indefinitely.

Yields are likely to be very variable, due to local conditions. Sour cherries may yield from 15–40 quarts a tree or 3 or 4 tons to the acre. Sweet cherries may yield much more than this under good conditions. Storing cherries for more than a few weeks is not practicable.

Most varieties of sweet cherries need a pollinizer, so at least two varieties should be planted near together. In commercial planting this matter should receive careful attention for some varieties, as for example Napoleon, Lambert and Bing, will not pollinate each other, but may be pollinated by such varieties as Black Tartarian, Black Republican, and Windsor. Sour cherries do not need a pollinizer. The following lists are given in approximate order of ripening, commercial varieties being starred: *Sweet cherries* — Lyons, Ida, Governor Wood, Coe, *Black Tartarian, *Black Republican, *Napoleon, *Lambert, *Bing, *Yellow Spanish, *Schmidt, *Windsor. *Sour cherries* — *Early Richmond, *Montmorency, *English Morello, Chase. *Duke or hybrid cherries* — May Duke, Arch Duke, Olivet, Louis Phillippe, Reine Hortense, Late Duke.

Pests and diseases are in large number. With sweet cherries brown-rot often takes heavy toll by rotting the fruit just as it is ripening. Lime-sulfur 1–50, applied when the fruits are the size of a pea, will help control it. This spray, with ½ pint of nicotine sulfate and 1½ pounds powdered arsenate of lead added and applied just as the petals fall will hold aphis and curculio in check. With sour cherries the fruit-fly or cherry maggot may cause many wormy cherries. Satisfactory control can usually be obtained by spraying the leaves of the lower branches with a mixture of 3 pounds powdered arsenate of lead, 1 pint of molasses and 50 gallons water applied when the fruit-flies appear. In the northern states this is about June 1st to 15th. Farther south it is earlier. Leaf-spot may defoliate the trees late in the season. Control is possible by spraying with lime-sulfur 1–50, immediately after the fruit is picked and, if needed, a month later.

CHERRY, BARBADOS-: *Malpighia glabra.* **Cornelian-**: *Cornus mas.* **Ground-**: *Physalis.* **Indian-**: *Rhamnus caroliniana.* **Jerusalem-**: *Solanum Pseudo-Capsicum* and *Capsicastrum.* **Madden-**: *Maddenia hypoleuca.* **Spanish-**: *Mimusops Elengi.* **Surinam-**: *Eugenia uniflora.* **Winter-**: *Physalis Alkekengi.*

CHERVIL. Two vegetable-garden plants are known as chervil, both native in Europe and members of the Parsley family.

Salad chervil is a hardy annual, *Anthriscus Cerefolium,* of simple culture, the leaves employed in salad and garnishing. It is grown as a spring or autumn crop, not thriving in the heat of summer. Usable leaves are obtained in six or eight weeks after seeds are sown; the autumn sowing is sometimes carried over winter in frames or in mild climates with a protection of mulch. Plants may stand at distances of 8–12 inches; they grow 1½ feet or more tall.

Tuberous chervil is a hardy biennial, *Chærophyllum bulbosum,* producing a carrot-like small gray or blackish edible root. Seed may be sown in August or September (that is, as soon as ripe), but usually it does not germinate till spring and the roots mature in four to six months thereafter; culture otherwise as for carrot. It is the better practice to stratify the seeds in autumn, and they are then regularly sown in spring. If kept in the usual way and allowed to remain dry, they will probably not germinate till the second spring if at all.

CHESTNUT. Attractive trees grown for the edible nuts and to some extent for shade and ornament. The native chestnut *Castanea dentata* (*americana*), European chestnut *C. sativa,* and Japanese chestnut *C. crenata* (*japonica*) are more or less planted; but the chestnut industry is threatened by the bark-disease or blight and in many regions the plantings have been destroyed by it. The Japanese chestnut is reputed more resistant. Chestnut planting for the nuts is now in an arrested or experimental stage in the eastern states on account of the disease; there is yet no remedy except to check its spread by destroying all affected trees; it is hoped that disease-resisting races may be developed. In the Middle West and Pacific region the chestnut is still grown successfully.

The American or native chestnuts, of which there are several improved varieties, are the hardiest and most desirable, and the nuts are the sweetest, but they are also the smallest. The Japanese varieties are often injured by the winter in central New York; the trees are small in stature and precocious; there are several good fruit varieties; the European varieties are somewhat hardier, and some of the varieties thrive in the northern states.

Chestnuts are easily grown when free from blight. They usually bear better when two or more trees are planted near each other. Sprouts in old chestnut clearings are often allowed to remain, and sometimes they are grafted to the improved varieties. The young trees may be grafted in the spring by the whip-graft or cleft-graft method; but the cions should be perfectly dormant, and the operation should be very carefully performed. Even with the best workmanship, a considerable percentage of the grafts is likely to fail or to break off after two or three years. The most popular single variety of chestnut is perhaps the Paragon, which bears large and excellent nuts when the tree is very young; it is accounted a hybrid of European and American species. All chestnuts require well-drained land.

CHESTNUT: *Castanea.* **Cape-**: *Calodendrum capensis.* **Guiana-**: *Pachira aquatica.* **Horse:-** *Æsculus.* **Moreton-Bay-**: *Castanospermum australe.* **Water-**: *Trapa.*

CHICKWEED, MOUSE-EAR: *Cerastium.*

CHICORY (*Cichorium Intybus*). This perennial, native in Europe, is grown for the roots and also as salad. The same plant is also extensively run wild in North America along roadsides and in neglected fields.

The thick roots are employed as substitute for coffee. In this capacity it is a field crop, grown in deep well-prepared soil. Seeds are sown in spring in drills about 18 inches apart, good tillage is provided, and the hard parsnip-like roots are garnered in autumn.

Chicory is grown for the foliage, used as greens or salad. The best-known product is witloof, which is the crown of uncolored leaves forced in winter or spring from stored roots. Seeds of the strain of chicory mostly employed for the production of witloof are sown in drills in spring and thinned to about 6 inches in the row. At the close of the season the roots are lifted, the tops cut off above the crown, and stored in a cellar, the same as other root-crops. For the production of the crown of leaves known as witloof, the roots are trimmed on the lower end to 8 or 9 inches long, then placed upright in soil or sand in a box and the crowns covered with about 8 inches of sand; temperature is kept at about 60°, and in a fortnight the white salad witloof should be ready, a good "head" being 6 inches long.

Sometimes the leaves of chicory are blanched in the field late in the season by banking as for celery; or the same treatment may be applied in spring to the new leaves arising from roots remaining in the ground over winter. Some persons force the stored roots in darkness to obtain the blanched tops. The unblanched leaves are sometimes used as greens.

CHILDSIA: *Hidalgoa Wercklei.*

CHILEAN NUT: *Gevuina Avellana.*

CHILICOTHE: *Echinocystis macrocarpa.*

CHILOPSIS. *Bignoniaceæ.* One deciduous shrub or tree to 20 ft., native Tex., Calif. and Mex. in dry regions, mostly near springs or stream beds, and planted in the S. **C. linearis** (*C. saligna*). DESERT- or FLOWERING-WILLOW. Lvs. linear, to 1 ft. long, entire: fls. trumpet-shaped with 5-lobed crimped limb, lilac with 2 yellow stripes inside, to 2 in. long, in terminal racemes: fr. linear, to 1 ft. long. Var. **alba** has white fls.

CHIMAPHILA. PIPSISSEWA. *Pyrolaceæ* or *Ericaceæ.* Evergreen woods herbs or little subshrubs with creeping sts., toothed lvs. in irregular whorls, white or pinkish fls. in few-fld. terminal long-stalked umbels, and capsular frs.; grown in the wild-garden where it prefers partial shade. Propagated by divisions of the creeping sts.

maculata. To 10 in.: lvs. broadest below the middle, variegated white along the veins. Me. to Ga. and Ala.

umbellata. To 10 in.: lvs. broadest above the middle, not variegated. Eu., Asia. Var. **cisatlantica** is the form native in E. N. Amer.

CHIMONANTHUS FRAGRANS: *Meratia præcox.*

CHINA-BERRY: *Melia Azedarach.*

CHINA-BRIER, FALSE: *Smilax laurifolia.*

CHINA-TREE: *Melia Azedarach.*

CHINESE EVERGREEN: *Aglaonema simplex.*

CHINESE-HAT PLANT: *Holmskioldia sanguinea.*

CHINKAPIN, WATER: *Nelumbium luteum.*

CHINQUAPIN: *Castanea pumila.* Giant: *Castanopsis chrysophylla.*

CHIOCOCCA. SNOWBERRY. *Rubiaceæ.* Shrubs or vines with opposite leathery lvs., small yellow or white fls. in axillary racemes, and fr. a globular white drupe; native Fla. to trop. Amer.

alba (*C. racemosa*). Shrub to 10 ft., or vine: lvs. elliptic or ovate, to 3 in. long: fls. yellow, to ⅓ in. long.

racemosa: *C. alba.*

CHIOGENES. *Ericaceæ.* Two evergreen creeping little plants with small alternate lvs., bell-shaped solitary fls. and fr. a white berry; adapted to the rock-garden, forming mats. A moist peaty soil and partial shade are desirable. Propagated by seeds, division or cuttings.

hispidula. CREEPING SNOWBERRY. Lvs. ovate, to ⅓ in. long: fls. white, ⅙ in. long, May–June. N. Amer.

CHIONANTHUS. FRINGE-TREE. *Oleaceæ.* Two deciduous practically diœcious trees or shrubs with opposite entire lvs., many small white fls. in showy panicles, the 4 petals linear and united only at base, and fr. a dark blue drupe.

The fringe-trees are hardy North with some protection. They succeed in sunny positions in moist sandy loam. Propagated by seeds in autumn or stratified, by layers and cuttings of forced plants, and by grafting or budding on the ash.

retusa. To 20 ft.: lvs. ovate or elliptic, to 4 in. long: panicles to 4 in. long, June–July. China.

virginica. To 30 ft.: lvs. mostly oblong or obovate-oblong, to 8 in. long: panicles to 8 in. long, May–June. Pa. to Fla. and Tex.

CHIONODOXA. GLORY-OF-THE-SNOW. *Liliaceæ.* Early spring-blooming bulbous herbs with narrow basal lvs. and blue or white short-tubed open fls. in loose racemes terminating the scape.

Chionodoxas thrive in any soil but need plenty of moisture and light. Bulbs should be planted approximately 3 inches deep and replanted about the third year. Propagated by offsets or seeds.

gigantea: a large form of *C. Luciliæ.*

grandiflora: a large-fld. form of *C. Luciliæ.*

Luciliæ. To 8 in.: fls. bright blue with white center, 1 in. across. Asia Minor. Var. **alba** has white fls.

sardensis. Perhaps only a form of *C. Luciliæ* with fewer dark blue fls. without white center.

tmolusii: a late-blooming form of *C. Luciliæ.*

CHIONOPHILA. *Scrophulariaceæ.* One per. herb to 6 in. high native in the Rocky Mts. of Colo. and Wyo. and sometimes transferred to the rock-garden. **C. Jamesii.** Lvs. mostly basal, spatulate or lanceolate, entire: fls. cream-colored, ½ in. long, tubular and 2-lipped, in one-sided spikes.

CHIRONIA. *Gentianaceæ.* African herbs with simple opposite lvs. and pink or rarely purple 5-lobed fls. borne in cymes; one species intro. in Calif.

linoides. Sts. to 3 ft.: lvs. linear or lanceolate, to 1½ in. long: fls. about ½ in. long, solitary or 2–5 together. S. Afr.

CHITTAMWOOD: *Bumelia lanuginosa.*

CHIVE: under *Onion.*

CHLORANTHACEÆ. CHLORANTHUS FAMILY. Three genera growing in warm regions, trees or shrubs with opposite lvs., small unisexual fls. without perianth borne in spikes or panicles, having 1 or 3 stamens, 1-celled ovary, and drupaceous fr. The family is allied to Piperaceæ. Ascarina may be planted out-of-doors in the S.

CHLORIS. FINGER-GRASS. *Gramineæ.* Ann. and per. grasses grown for ornament or forage, native in warm regions of the world: spikelets awned, in 2 rows on one side of the rachis, in spikes which are solitary or in terminal umbels. See *Grasses.*

barbata: may be either *C. paraguayensis* or *C. polydactyla*; see also *C. truncata.*

elegans: *C. virgata.*

Gayana. Rhodes-Grass. Per. to 4 ft., stoloniferous: lvs. to 1 ft. long and ⅛ in. wide, flat or folded: spikes to 4 in. long, in umbels of 6–15. Afr., but nat. elsewhere.—Grown in the S. for forage.

paraguayensis. Ann. to 2 ft.: lvs. to 4 in. long, flat or folded: spikes to 2 in. long, purplish, few or several in the umbels. Tropics.

polydactyla. Per. to 4 ft.: lvs. to 2 ft. long and ⅛ in. wide: spikes to 6 in. long, in umbels of 6–25. Trop. Amer.

truncata (*C. barbata vera*). Per. to 1 ft.: lvs. short, to 1/12 in. wide, flat or folded: spikes to 6 in. long, several in one or two whorls. Australia, but nat. in N. Amer.

virgata (*C. elegans*). Per. or ann. to 3 ft.: lvs. to 4 in. long and 1/12 in. wide, flat or folded: spikes to 2½ in. long, pale or purplish, in umbels of 6–15 or more. Tropics.

CHLOROCODON (*Mondia*). *Asclepiadaceæ.* Vines with opposite large lvs., toothed or frilled stipules, and wheel-shaped fls. in axillary panicles; 2 species in Afr., the roots used in medicine and one grown under glass or out-of-doors in the S. Propagated by cuttings over bottom heat.

Whiteii. Mundi-Root. Tall-twining: lvs. ovate, heart-shaped at base, to 7 in. long: fls. purplish, to 1 in. across, having a white 5-lobed crown, Aug. Natal, trop. Afr.

CHLOROGALUM (*Laothoe*). *Liliaceæ.* Tall bulbous herbs with mostly basal tufted lvs. and white or purplish fls. in panicles, the perianth-segms. distinct; native in Calif. Cult. as for *Camassia.*

pomeridianum. Soap-Plant. Amole. To 5 ft.: lvs. to 1½ ft. long and ¾ in. wide, wavy-margined: fls. white veined purple, ¾ in. long, opening in afternoon.

CHLOROPHORA. *Moraceæ.* Milky-juiced trees from trop. Amer. and trop. Afr., with alternate lvs., staminate fls. in dense catkin-like spikes, pistillate in dense heads, and fr. an achene; grown in trop. countries for the yellow dye and the valuable yellow wood.

tinctoria. Fustic. To 60 ft., with spreading broad head: lvs. lanceolate to elliptic, to 5 in. long, entire or toothed. W. Indies, S. Amer.

CHLOROPHYTUM. *Liliaceæ.* Trop. herbs closely related to Anthericum and differing chiefly in the somewhat broader lvs. and sharply 3-angled caps.; fls. in long open erect racemes or spikes. Grown in greenhouses and out-of-doors in warm regions; they are more or less proliferous, and are easily multiplied.

comosum (*Anthericum comosum. C. Sternbergianum*). To 3 ft.: lvs. 2 ft. long: fls. white. Cent. Afr.

elatum (*Anthericum elatum*). To 3 ft.: lvs. 1 ft. long: fls. whitish, ¾ in. across. S. Afr.—Known mostly in the striped-leaved forms, as *Anthericum Mandaianum, variegatum* and *vittatum*, margined and ribbed with white, and *A. picturatum* with yellow band down center.

Sternbergianum: *C. comosum.*

CHOISYA. *Rutaceæ.* Mexican evergreen shrubs with digitately compound lvs., showy white fls. in axillary cymes, and fr. of 3 or 5 carpels.

One species is grown under glass, and out-of-doors in the South and California where it stands a few degrees of frost. Propagated by cuttings of young wood over heat or of older wood in a coldframe.

ternata. Mexican-Orange. To 10 ft.: lvs. of 3 oblong to ovate lfts. to 3 in. long: fls. fragrant, 1 in. or more across, conspicuous over the foliage.

CHOKEBERRY: *Aronia.*

CHOKE-CHERRY: *Prunus virginiana.*

CHOLLA: *Opuntia.*

CHONDROSEA: *Saxifraga Aizoon.*

CHORISIA. *Bombacaceæ.* S. American spiny trees with alternate digitately compound lvs., large fls. and pear-shaped capsular frs., the silky floss on the seeds used for stuffing pillows. Sometimes planted in S. U. S.

speciosa. Floss-Silk Tree. Lfts. lanceolate, toothed: fls. yellowish striped with brown at base, 3 in. across, solitary in axils. Brazil.

CHORIZEMA. *Leguminosæ.* Shrubs or subshrubs with simple alternate lvs., papilionaceous showy fls. in racemes, and short pods; native to Australia.

They may be planted out-of-doors in the South or grown in greenhouses; they require plenty of sun. Propagated by cuttings in spring under glass.

cordatum. Shrub to 10 ft. with weak branches: lvs. with small prickly teeth, ovate-lanceolate: fls. orange-red, or scarlet with purplish keel, in long loose or open racemes, abundantly produced.

ilicifolium: the plant known to the trade under this name is *C. cordatum.*

varium. Shrub to 6 ft.: lvs. cordate-ovate, with prickly teeth: fls. with light orange standard and purple-red wings and keel, borne in short close racemes.—Apparently not in general cult. with us.

CHOROGI: *Stachys Sieboldii.*

CHRISTMAS-BERRY: *Heteromeles arbutifolia.* -Tree: *Schinus terebinthifolius.*

CHRISTMAS-ROSE: *Helleborus niger.*

CHRISTOPHINE: *Chayote, Sechium.*

CHROSPERMA: *Amianthium muscætoxicum.*

CHRYSALIDOCARPUS. *Palmaceæ.* About 10 diœcious gregarious unarmed feather-palms of small stature in Madagascar, one of them popular in cult.: sts. slender, ringed: lvs. plume-like, gracefully arching; pinnæ very many, bifid, narrow: spadix among the lvs., branching; stamens 6, pistillode more or less 3-lobed: fr. ovoid or ellipsoid, about 1 in. or less long. See *Palm.*

lutescens (*Areca lutescens*). Sts. many, forming an attractive clump to 25 or 30 ft., foliaged nearly or quite to the base: pinnæ 40–60 pairs, mostly less than 1 in. broad, midrib strong, the ends not much arching or drooping; petiole 2 ft. long, yellow, convex below and deeply furrowed above, suddenly much expanded at base: fr. oblong-ellipsoid, about ¾ in. long, violet-black.—Much grown as a florists' plant for pots and tubs, and attractive in the open in S. Fla. and tropics.

madagascariensis (*Dypsis madagascariensis*). Clumps with a denser head than *C. lutescens* and less likely to be foliaged to base, the lvs. more numerous and the pinnæ about twice as many with the tips arching or hanging: fr. ovoid-elliptic, about ½ in. long.

CHRYSAMPHORA: *Darlingtonia.*

CHRYSANTHEMUM. *Compositæ.* A large genus of ann. and per. herbs, some of them woody at the base, a number of which are grown for the showy bloom; native in temp. and boreal regions, mostly in the Old World. Matricaria and Tanacetum are closely allied.

The cultivated chrysanthemums are hardy and half hardy mostly strong-scented and rather coarse plants, with colors in various series except blue and true purple; they usually bloom late in the season in the open. A half dozen cultural classes may be distinguished: 1. The flower-garden annuals; 2. feverfews; 3. pyrethrums; 4. marguerites; 5. perennial border kinds, yielding some of the flowers known as daisies; 6. the florists' chrysanthemum. In these various ranges are excellent decorative materials and possibilities. The interest in these plants is represented by the Chrysanthemum Society of America.

1. The annual chrysanthemums are big flower-garden subjects, suitable for late summer and autumn mass colors, raised readily from seeds which commonly are sown as soon as the ground is fit directly where the plants are to stand; they may be grown thickly in back rows, but for best blooms should be thinned to 12–24 inches apart; provide an open sunny position. Three species are involved. *C. coronarium* is the tallest, and single large plants sometimes need staking. *C. carinatum* is the usual flower-garden kind, in many colors. *C. segetum* yields good clear yellows.

2. Feverfews are forms of *C. Parthenium*, sometimes known as a pyrethrum. All are perennial, hardy, of the simplest culture, and persistent. They are grown for the abundant little white-rayed heads with yellow center, and dwarf compact forms for the foliage which is sometimes crisped and yellow-tinged; the latter kinds are known as Golden-Feather. They grow readily from seeds, blooming the second year, and frequently they seed themselves; offsets may be taken from the clumps.

3. Pyrethrums, product of *C. coccineum*, useful for cutting and employed as a florist's flower. The stems are long and simple from a crown of attractive foliage; the daisy-like heads are bright white, rose, carmine, lilac and other shades; bloom in late spring and summer; an autumn cutting may be had if the flowers are all cut regularly. Propagated by seeds, blooming the second year; named horticultural varieties by offsets or division.

4. Marguerite chrysanthemums belong to *C. frutescens*, although the related *C. anethifolium* is sometimes seen; it is sometimes known as Paris daisy. It is tender in the North, and is grown in pots and tubs for late winter, spring and summer bloom. Propagated by cuttings, like the florist's chrysanthemum; taken in spring they should give blooming plants for the following winter and spring. Shift into larger pots as needed. Old plants may be cut down and bloom renewed for another year if grown in tubs or big pots.

5. The perennial border chrysanthemums are hardy strong plants propagated by division, and by seeds which give blooming plants the second year; if necessary, they may be multiplied by short cuttings of young firm shoots. They require sunny positions.

6. The common chrysanthemum of florists (*C. morifolium*) is known in two races or types: the kinds developed into very large flowers for pot culture, and the border bushy kinds that remain always in the perennial garden. These two types are not essentially different, however, as the large flowers of the florists' kinds are developed not alone by selection but by extra care in propagation, culture, pruning and disbudding; they express the skill of the grower; if left to themselves to produce bushy plants, the florists kinds bear many small or medium-sized flowers. All these plants are essentially hardy perennials, propagated by seeds, cuttings and division.

The usual propagation of the house chrysanthemum is by cuttings taken in spring from shoots that arise from crowns of plants that have been carried through the winter; when the plants begin to stool or to send up new growth, the shoots are cut 2 or 3 inches long and inserted in sand in boxes or on a bench; the cuttings are trimmed of their lower leaves and the remaining (upper) leaves are usually cut in two to reduce evaporating surface; as soon as rooted they are placed in small pots, say 2½-inch.

The young plants may be carried through the summer in pots, after repotting two or three times, or planted in the ground and lifted in October or November. Every pains should be taken to keep the plants growing without check or insect or fungus injury. If one does not care to propagate them, plants may be purchased in late spring or early summer, that have been potted and are well rooted and stocky. By the time the plants are to bloom they should be in 6-inch pots or larger; if very large bushy plants are desired, the pots should be 10- or 12-inch.

For cut-flowers, the plants are usually grown by florists in benches under glass from first till last, after the cuttings are turned out of their first small pots; if to be grown to single stems for very large bloom, the plants may be set 8–12 inches apart each way on the benches, and they are tied, trained and disbudded as they grow, only the terminal bud being retained.

The amateur usually prefers to allow bushy plants with a good number of smaller flowers. The plants are allowed to branch. All weak growths should be removed as they appear, and when buds begin to show they should all be removed except the terminal one on the branch; in this way there will be as many flowers as branches, say one to two dozen depending on the size and vigor of the plant and the wish of the grower. The heads or flowers will be of approximately one size. The plants may be bloomed in pots 6 inches or larger or in soap boxes for the window. The plants are discarded after blooming unless one wants to propagate a new lot for the following year, and in this case the tops are cut down and the pot or box placed in a cellar and kept dry enough to maintain life and strength but not to start into growth or induce decay; in February or March the plant may be brought to warmth and light, given water, and shoots for cuttings will soon start. It is to be remembered that the plant is a hardy perennial and that it should be grown cool when in the house.

The types or groups of *C. morifolium* are many, and there are named varieties under each group. This range allows of a choice to satisfy any taste.

achilleæfolium. Yarrow C. Per. border species, 2 ft., little branched, rooting at bottom: lvs. soft-hairy: fls. yellow. Siberia, Caucasus.

anethifolium. Glaucous Marguerite or Dill C. Per. with fine glaucous foliage: fls. white, sometimes lemon-yellow. Canaries.—Greenhouse plant in the N. much like marguerite but less coarse.

alpinum (*Leucanthemum alpinum*). Per., 2–6 in. high, with 1 terminal head on each st.: lvs. to 2 in. long at base of st., cut into narrow segms., those on st. few and very small: fl.-heads white. High Alps.—Rock-garden.

arcticum. Arctic C. Per. to 15 in., more or less decumbent at base: fls. aster-like, to 2 in. across, white to lilac. Arctic regions.—Border plant.

asiaticum: listed name.

atratum (*C. coronopifolium*). Per. 6–12 in., mostly 1-headed: lower lvs. 1-divided, the segms. 5–7-toothed, those on st. lanceolate or linear: rays white. Alps.

atrococcineum: *C. carinatum.*

Balsamita (*Tanacetum Balsamita*). Costmary. Per. 2–3 ft.: lvs. serrate: heads many, ¼–⅜ in. across, with very short white rays; commonly rayless and then known as var. **tanacetoides.** W. Asia.—Persistent plant sometimes grown for its sweet-smelling herbage, and erroneously called "lavender"; also known as "mint-geranium."

bicolor: *C. carinatum.*

Broussonetii (*Ismelia Broussonetii*). Per. 2–3 ft.: lvs. ovate or obovate, pinnatifid, the narrow segms. pinnatifid or toothed: heads long-peduncled, to 3 in. across, rays lilac, yellowish at base. Canaries.

Burridgeanum: *C. carinatum.*

carinatum. Tricolor C. Glabrous ann., 2–3 ft., nearly simple or somewhat forking: lvs. pinnatifid into linear lobes: heads large, 2½ in. or less, rays white, red, purple, yellow, disk purple, colored ring at base of rays. Morocco.—Flower-garden; cult. also as *C. atrococcineum, C. bicolor, C, Burridgeanum, C. Dunettii, C. tricolor.*

caucasicum (*Pyrethrum caucasicum*). Per., st. erect from the rhizome, 1-headed: lvs. parted into linear-awl-like lobes: head long-peduncled, 1½ in. across, rays white. Caucasus.

cinerariæfolium. Dalmatian C. or Pyrethrum. Per., 12–24 in., producing many slender sts., herbage silvery: heads white, 1 in. or more across, on very long sts. Dalmatia.—A source of insect powder.

coccineum (*Pyrethrum roseum. P. carneum. P. atrosanguineum*). Pyrethrum. Per., nearly or quite simple, 1–2 ft.: lvs. bipinnatifid, fern-like: heads large and showy, terminating the sts., red in various shades, pink, lilac, white, sometimes double. Caucasus, Persia.—Used by florists.

coreanum: hort. name for a form with single white fls.

coronarium. Garland C. Crown Daisy. Stout branchy ann., 3–4 ft., with lvs. divided nearly to the midrib, the segms. less than ¼ in. broad and again cut or toothed: heads many, 1–1½ in. across, yellow or whitish, often double; achenes with prominent straight parallel ridges on back. Medit. region.—Flower-garden; young shoots eaten in Japan. Var. **spatiosum.** To 2 ft. or more, stout and very leafy, glaucous: lvs. broad-spatulate, mostly 1 in. or more across, lobed or cut half way or less to midrib or with deeper lobes on narrow lower part: fls. light yellow: grooves on achenes not prominently parallel or deep. China.—Grown for the young shoots which are eaten, and not unknown in this country; known as "boong-hau-ts'ai," "shungiku" and "chop suey greens."

coronopifolium: *C. atratum*; sometimes *C. coccineum* is meant.

corymbosum (*Pyrethrum corymbosum*). Per., 2–4 ft.: lvs. bipinnatifid: heads many on terminal branches, 1 in. or less across, white. Caucasus.—Border.

Dunettii: *C. carinatum.*

Fontanesii (*Hymenostemma Fontanesii*). Ann., slender, much branched, 12–18 in.: lvs. spatulate, toothed or almost lobed: heads small, about ½ in. across, rays white. W. Medit. region.—Flower-garden.

frutescens. Marguerite. Paris Daisy. Per., to 3 ft., much branched, becoming woody: lvs. not glaucous, coarsely divided, rather fleshy: heads many, on straight sts., 1½–2½ in. across, white or lemon-yellow. Canaries.—Florist's subject.

hortorum: *C. morifolium.*

indicum. Per., 2–3 ft., much branched, soft-foliaged: lvs. divided, felty gray beneath: heads numerous, short-stemmed in clusters, ½–1 in. across, yellow, showy only in mass. China.—Border; very little known in cult.

inodorum: *Matricaria inodora.*

lacustre. Portuguese C. or Daisy. Tall per., 3–6 ft., branched at top: lvs. narrow, serrate-dentate: heads long-stemmed, 2–3 in. across, white. Portugal.—Border.

Leucanthemum (*Leucanthemum vulgare. L. grandiflorum*). Whiteweed. Ox-eye Daisy. Per., slender, 1–2 ft., simple or little branched: lvs. simple, notched or cut: heads terminal and long-stemmed, 1–2 in. across, white. Eurasia, and an abundant weed in E. U. S.—Sometimes planted in borders.

macrophyllum (*Tanacetum macrophyllum*). Tansy C. Per., 2½ to 3½ ft., erect, branching: lvs. coarsely pinnatisect: heads numerous in terminal corymbs, ¼ in. or less across, with small white or yellowish rays. S. E. Eu. to Caucasus.—Border.

maximum. Max C. or Daisy. Short-lived per., often treated as bien., erect, simple or only sparingly branched, 1–2 ft.: lvs. long and narrow, serrate-dentate: heads terminal and large, 2–4 in. across, with many white rays. Pyrenees.—Border plant, known in many forms, as King Edward VII, Chrysanthemum Daisy, Shasta Daisy, Glory of the Wayside, *C. Robinsoni* and erroneously as *C. Leucanthemum.*

morifolium (*C. sinense. C. hortorum*). Florists C. Per., 2–4 ft., branched: lvs. broad, lobed, gray-pubescent, strong-scented: heads many terminating branches, of various sizes and greatly modified in shape, fashion and color. Cultigen, probably of Chinese origin.—Under glass, and some of the kinds in the permanent border.

Myconis. Ann., 18–30 in., branched above: lower lvs. spatulate-obtuse, small-toothed, upper narrow-oblong to linear: heads long-peduncled, rays yellow, broad. S. Eu.—Plants cult. under this name may be *C. segetum.*

nipponicum. Nippon C. or Daisy. Per., shrubby at base, 1½–2 ft., leafy above, sts. simple or little branched: lvs. thick, spatulate and obtuse, serrate at end: heads terminating sts., 1½–3½ in. across, white. Japan.—Border.

pallens. Per., st. erect, hispid, simple or nearly so, 10–16 in.: lower lvs. obovate, obtuse, crenate, petiolate, upper ones ligulate and somewhat clasping and become entire toward top of st.: heads solitary, rays white. Mts., France.

Parthenium (*Pyrethrum Parthenium* and *P. partheniifolium. Matricaria parthenoides, M. capensis*, and *M. eximia*). Feverfew. Bushy per., 1–2 or 3 ft., very leafy: lvs. variable, pinnatisect, often yellowish (var. **aureum**), sometimes crisped (var. **crispum**): heads many in open terminal clusters, ¾ in. and less across, white-rayed, sometimes rays absent. Eurasia.—Border; there are dwarf very compact forms.

Robinsoni: *C. maximum.*

rotundifolium. Per., st. glabrous, simple, erect, to 18 in.: lower lvs. ovate to broad-cordate, petiolate, mucronate-dentate, upper ones becoming narrower: head solitary, 1 in. and more across, white. Hungary.

segetum. Corn-Marigold. Ann., 1–2 ft., much branched: lvs. notched or shallowly pinnatifid: heads terminating branches, to 2½ in. across, yellow to whitish. Old World.—Flower-garden cult. forms with more divided lvs. are supposed to belong here, as Morning Star, Evening Star, Gold Star, Northern Star, White Glory, although different things may be grown under one or another of these varietal names.

serotinum: uncertain name in lists.

sinense: *C. morifolium.*

Tchihatchewii: *Matricaria Tchihatchewii.*

tricolor: *C. carinatum.*

uliginosum. High or Giant Daisy. Tall and much-branched per., 4–7 ft.: lvs. narrow, long-pointed and cut-toothed: heads terminating branches, 1½–3 in. across, white. Eu.—Border.

viscosum. Ann., somewhat viscid, st. fleshy, mostly branched above: lower lvs. oblong, narrowed at base, pinnatifid with short obtuse denticulate lobes, upper ones oblong-lanceolate and clasping: rays long-oblong, yellow. S. Spain, N. Afr.

vulgare: *Tanacetum vulgare.*

CHRYSOBACTRON: *Bulbinella Hookeri.*

CHRYSOBALANUS. *Rosaceæ.* Shrubs or small trees with alternate simple leathery lvs., small white or greenish fls. in cymes or panicles, and fr. a pulpy drupe; native in Amer. and Afr. and planted somewhat in S. U. S.

Icaco. Coco-Plum. To 30 ft., evergreen: lvs. broad-obovate or nearly orbicular, to 3 in. long, obtuse or emarginate, shining above: fls. white, in short cymes: fr. to 1½ in. long. S. Fla. to N. S. Amer.

CHRYSOBOTRYA: *Ribes aureum* and *odoratum.*

CHRYSOGONUM. *Compositæ.* One per. herb native from S. Pa. to Fla. and Ala. and sometimes transferred to gardens. **C. virginianum.** Golden-Star. To 1 ft., hairy: lvs. basal and opposite, ovate or oblong, to 3 in. long, toothed: heads yellow, to 1½ in. across, long-stalked, of ray- and disk-fls., Apr.–July; pappus a short crown.

CHRYSOPHYLLUM. *Sapotaceæ.* Trop. evergreen trees, one in S. Fla., with alternate entire lvs., small 5-lobed fls. in clusters, and fr. a berry; one species grown for ornament and the edible fr.

The star-apple requires tropical temperatures and a humid atmosphere. It has been grown successfully in southern Florida. It is not particular as to soil. Propagated by seed, by cuttings of ripe wood over heat, and probably by budding.

Cainito. Star-Apple. To 50 ft.: lvs. oval or oblong, to 6 in. long, shining above, golden-brown and silky beneath: fls. purplish-white: fr. globular, to 4 in. across, smooth, purple or light green, with 3–8 shining seeds embedded in white translucent pulp. Trop. Amer.

CHRYSOPSIS. Golden Aster. *Compositæ.* N. American per. herbs with alternate entire sessile lvs. and yellow heads of ray- and disk-fls.; pappus of bristles or scales. Sometimes transferred to the border. Propagated by seeds and division.

falcata. To 1 ft., woolly-pubescent: lvs. linear, to 4 in. long, stiff: heads ½ in. across, in corymbs. Mass. to N. J.

graminifolia. To 3 ft., silvery-pubescent: lvs. linear, grass-like, to 1 ft. long: heads ½ in. across, in few-fld. corymbs. Del. to Fla. and Mex.

mariana. To 2½ ft., pubescent: lvs. oblong or spatulate, to 4 in. long: heads to 1 in. across, numerous, in panicled corymbs. S. N. Y. to Fla. and La.

villosa. To 2 ft., pubescent: lvs. oblong to lanceolate, to 2 in. long: heads 1 in. or more across, in few-fld. corymbs. Minn. to B. C. and New Mex.

CHRYSOSPLENIUM. GOLDEN SAXIFRAGE. *Saxifragaceæ.* Semi-aquatic little creeping or prostrate paludose herbs with very small greenish fls., sometimes employed as a cover on moist ground or in bog-gardens.

alternifolium. To 6 in.: lvs. alternate, orbicular-reniform, coarsely toothed: fls. in early spring. Eu., N. Asia.

americanum. Sts. creeping, to 8 in. long: lvs. opposite or the upper alternate, ovate or orbicular, to ¾ in. long: fls. solitary in the axils, in spring. N. S. to Minn. and Ga.

oppositifolium. To 4 in.: lvs. opposite, orbicular: fls. May–June. Eu., N. Asia.

CHRYSOTHAMNUS. *Compositæ.* Low shrubs of W. N. Amer. with linear entire mostly alternate lvs. and heads of yellow disk-fls.; pappus of bristles. Sometimes transferred to grounds in dry regions.

nauseosus. To 3½ ft., white-tomentose: lvs. to 2½ in. long: heads in cymes. B. C. to Mont. and Calif.

CHRYSURUS: *Lamarckia.*

CHUCHU: see *Chayote.*

CHUFA: *Cyperus esculentus.*

CHUSQUEA. *Gramineæ.* Bamboo-like shrubby or climbing grasses with rather small lvs. and spikelets borne in terminal panicles, stamens 3; native in the Andean region from Mex. to Chile. See *Bamboo.*

tessellata. Shrub: lvs. to 3 in. long and ¼ in. wide, toothed, tessellated: panicle spike-like, to 6 in. long. Colombia.

CHYSIS. *Orchidaceæ.* Cent. American epiphytes with pseudobulbs or spindle-shaped sts. and fleshy fls. in racemes, the petals and dorsal sepal similar, the side sepals forming an extension with the foot of the column, the lip of 3 lobes; grown in the trop. greenhouse. See *Orchids.*

aurea. Lvs. elliptic-lanceolate, to 6 in. long: fls. about 2 in. across, in 8–13-fld. racemes to 6 in. long; sepals and petals golden-yellow, whitish near base; lip yellow marked with red, keeled at base, the limb wavy, May–June. Venezuela, Mex.

bractescens. Fls. to 3 in. across, in 3–5-fld. partially drooping racemes, ivory-white with yellow lip marked with red, Apr.–May. Mex.

Chelsoni. Hybrid between *C. lævis* and *C. Limminghei*: sepals and petals yellow with a large red-brown spot; lip white finely spotted with purple.

CIBOTIUM. *Cyatheaceæ.* A small group of stout tree-ferns, often grown under glass in juvenile form, with mostly 3-pinnate lvs., sori at tips of veinlets; native in Cent. Amer., Mex. and Polynesia. See *Ferns.*

Barometz. SCYTHIAN LAMB. Trunkless: lvs. fragrant, segms. linear-oblong, to 6 in. long, glaucous beneath. China, Malaya.—Sometimes grown for its historic interest.

princeps: probably a mistake for *Cyathea princeps* which is a synonym of *C. insignis.*

regale. Trunk to 30 ft. high: lvs. to 12 ft. long, with falcate deeply cut segms., glaucous beneath. Mex.

Schiedei. Trunk to 15 ft.: lvs. to 5 ft. long, gracefully drooping, segms. to 8 in. long, deeply cut, glaucous beneath, on stout brown-hairy stipes. Mex., Guatemala.

CICCA DISTICHA: *Phyllanthus acidus.*

CICER. *Leguminosæ.* Herbs with pinnate toothed lvs., small inconspicuous papilionaceous fls., and short inflated pods; native in W. Asia, one species grown for the edible seeds which may be planted 8–12 in. apart in drills 2 ft. apart.

arietinum. CHICK-PEA. GARBANZO. Ann. to 2 ft.: fls. white or reddish, solitary in the axils: pods to 1 in. long and ½ in. wide, containing 1 or 2 seeds.—Long cult. in S. Eu. and Asia for human food.

CICHORIUM. *Compositæ.* Herbs of the Old World, mostly with deep hard roots, alternate lvs. usually near base of plant, and blue, purple or white heads of ligulate or ray-fls. See *Chicory* and *Endive.*

Endivia. ENDIVE. Ann. or bien. to 3 ft.: lvs. many at base, brittle, oblong, lobed or much cut and curled: heads purple, subtended by leafy bracts usually longer than heads. Probably India.

Intybus. CHICORY. SUCCORY. Per. to 6 ft.: lvs. broad-oblong or lanceolate: heads bright azure-blue, 1½ in. across, opening in forenoon, in some races pink or white, subtended by bracts shorter than heads. Eu.; extensively nat. in N. Amer.

CICUTA. WATER-HEMLOCK. *Umbelliferæ.* Per. heavy-scented herbs with poisonous roots and decompound lvs., very small white fls. in terminal compound umbels, and slightly flattened frs.; sometimes transplanted to the wild- or bog-garden.

maculata. MUSQUASH-ROOT. To 6 ft.: lvs. 2- or 3-pinnate into lanceolate segms. to 5 in. long. N. B. to Fla. and New Mex., in swamps.

CIGAR-FLOWER: *Cuphea platycentra.*

CILIATE: bearing hairs on the margin; fringed with hairs.

CIMICIFUGA. BUGBANE. *Ranunculaceæ.* Tall herbaceous perennials, mostly of rich woods, sometimes planted in the back of the border or in partially shaded places in the wild-garden: lvs. 2-compound, rather large: fls. small, white, in racemes: native in north temp. zone. Closely allied to Actæa but fr. a follicle instead of a berry.

Bugbanes thrive best in rich soil. Propagated by seed or division of roots in early spring or fall.

acerina: *C. japonica.*

americana. To 5 ft.: lfts. ovate to oblong, to 3 in. long: fl.-pedicels with minute bracts; pistils 3–8, stalked; Aug.–Sept. N. Y. to Ga.

cordifolia (*C. racemosa* var. *cordifolia*). To 6 ft.: lvs. broad-ovate, to 7 in. wide, cordate at base: fl.-pedicels bracted; pistil 1, sessile; Aug. Va. to N. C. and Tenn.

davurica. To 4 ft.: lvs. cordate: fls. creamy-white, pedicels bracted; pistils 5; autumn. Asia.

fœtida. To 6 ft.: lfts. ovate or lanceolate, to 3 in. long: fl.-pedicels with minute bracts; pistils 4–8; summer. E. Eu., Siberia.

japonica (*C. acerina. Pityrosperma acerinum*). To 3 ft. but true st. almost none, the scapes and lvs. arising from near the ground: lvs. ternate, lfts. thin, to 6 in. long and nearly or quite as broad, lobed and dentate, with the look of foliage of *Anemone japonica*: fls. sessile, without bracts, in slender spikes, dull-colored; stamens about 6. Japan.—Variable, in several forms.

racemosa. Black Cohosh. Black Snakeroot. To 8 ft.: lfts. ovate or oblong: fl.-pedicels bracted; pistils 1–2, sessile; July–Aug. Me. to Ga. and Mo.

simplex (*C. racemosa* var. *simplex*). To 3 ft.: fls. in slender dense racemes, pedicels with minute bract or none; pistils 2–3, stalked; in autumn. Kamtschatka.

CINCHONA. *Rubiaceæ.* Trees and shrubs native in the Andes, the bark yielding quinine for which they are cult. in trop. regions and known as Peruvian bark trees: lvs. opposite: fls. small, rose or yellowish-white, tubular, 5-lobed, in terminal panicles: fr. a caps. with winged seeds.

A few species are grown for ornament and economic interest in southern California, and sometimes under glass. Propagated by seeds.

Calisaya. Tall tree: lvs. oblong to obovate, to 7 in. long, shining, purplish-green below: fls. rose or whitish: caps. ovate, scarcely as long as fls. Bolivia, Peru.

officinalis. Tall tree: lvs. oblong, to 5 in. long: fls. rose, ½ in. long, in panicles to 6 in. long: caps. oblong, ½ in. long. Peru, Bolivia. Var. **condaminea** has ovate caps.

succirubra. Tall tree: lvs. ovate or oval, to 9 in. long, pale beneath: fls. rose with purplish-red calyx: caps. lanceolate. Ecuador.

CINERARIA of florists is a Senecio, supposed to be the issue of *S. cruentus* either directly or in hybridization with other species. It is much grown under glass for the profuse bloom in many colors except yellows, well set off by the heavy attractive foliage. The plant is perennial but it is commonly grown as an annual inasmuch as the bloom from strong well-grown new stock is most profuse. The single-flowered kinds are mostly preferred, being raised each year from seeds. For bloom in autumn and early winter seeds may be sown in May: for winter and spring bloom in late summer or early autumn. The main lot is usually started in midsummer. The young plants are pricked off into pots and afterwards shifted to maintain a continuous growth, and not allowed to bloom until in their final 5-or 6-inch pots or 8-inch for very large specimens. The double-flowered kinds are propagated by cuttings of strong shoots that arise after the flowering tops are removed. Cinerarias must be grown cool or they will not give good results, as cool as carnations. If broad bushy plants are desired, the center may be pinched out when the flower-buds begin to show. The cineraria is subject to greenfly or aphis; if fumigation cannot be practiced, the pots may be stood on tobacco stems or tobacco preparations may be employed. Cineraria is adapted to window-garden culture if not grown too hot or neglected and stunted.

Other plants known as cinerarias are some of the dusty millers: see *Senecio Cineraria* and *S. leucostachys.*

CINEREOUS: ash-colored; light gray.

CINNAMOMUM. *Lauraceæ.* Evergreen aromatic trees and shrubs from Asia and Australia, with coriaceous lvs. strongly 3-nerved from base except in *C. Camphora,* small bisexual or unisexual fls. in panicles, and fr. a berry; grown somewhat far S. for ornament and for medicines and spice, and likely to be seen as specimens in collections of economic plants.

A sandy loam soil is good for them. Propagated by seeds and the seedlings early transplanted into pots preparatory to permanent planting out; also cuttings of half-ripened wood in spring with heat.

Burmanni. Tree: lvs. opposite or sometimes alternate, ovate-oblong, acuminate. Malaya.

Camphora (*Camphora officinarum. Laurus Camphora*). Camphor-Tree. Tree to 40 ft., the buds inclosed by large imbricated scales: lvs. alternate, ovate-elliptic, acuminate, to 5 in. long, whitish beneath: fls. yellow, in panicles shorter than lvs. China, Japan.—Wood furnishes commercial camphor; thrives in S. Calif. and in southernmost states, as a street tree.

Cassia. Cassia-Bark-Tree. Tree to 40 ft.: lvs. opposite, oblong to lanceolate, long-acuminate, to 6 in. long: fls. in panicles as long as lvs. China.—Bark used as substitute for cinnamon.

glanduliferum (*Laurus glandulifera*). Tree: lvs. alternate, elliptic or lanceolate, to 5 in. long, caudate-acuminate: fls. in panicles 2 in. long. Himalayas.

Loureirii. Cassia-Flower-Tree. Medium-sized tree: lvs. alternate or opposite, elliptic to oblong, to 5 in. long. China, Japan.

pedunculatum. Tree: lvs. alternate, oblong-lanceolate, acuminate, to 5 in. long: fls. in corymbs about length of lvs. Japan.

zeylanicum. Cinnamon-Tree. Tree to 30 ft.: lvs. ovate to ovate-lanceolate, obtuse or acute, to 7 in. long: fls. yellowish-white, in panicles as long as lvs. India, Malaya.—Bark yields commercial cinnamon.

CINNAMON-TREE: *Cinnamomum zeylanicum.* **-Vine:** *Dioscorea Batatas.* **Wild:** *Canella Winterana.*

CINQUEFOIL: *Potentilla.*

CIPURA. *Iridaceæ.* Trop. American bulbous herbs with white or blue fls. having short tube and 3 inner petals much shorter than 3 outer; grown under glass or out-of-doors in S. Propagated by offsets and seeds.

martinicensis: *Trimeza martinicensis.*

paludosa. Lvs. linear, to 1 ft. long: fls. in clusters, white, ¾ in. long, opening in morning and soon withering. Trinidad, S. Amer.

CIRCÆA. *Onagraceæ.* A few species of small soft erect per. herbs, mostly in woods of the northern hemisphere, not regular hort. plants but sometimes raised in shaded or moist rock-gardens: lvs. opposite, ovate, dentate or angled: fls. whitish, very small, 2-petalled, in terminal raceme: fr. bristly.

lutetiana. Enchanters-Nightshade. Soft closely pubescent herb to 2 ft. or more, branched, with thick stolons: lvs. broad-ovate: petals broad-obovate, longer than broad. Eu.—An American plant that has mostly passed under this name is *C. latifolia,* with sts. glabrous below the infl., stolons very slender, lvs. oblong-ovate, petals sometimes as broad as long. N. B. to Tenn. and Okla., and E. Asia.

CIRCASSIAN SEEDS: *Adenanthera pavonina.*

CIRRHOPETALUM: *Bulbophyllum.*

CIRSIUM. Plumed Thistle. *Compositæ.* Prickly coarse herbs with basal or alternate very spiny lvs. and purple, yellow or white heads of disk-fls., the bracts of involucre densely imbricated and often spiny-tipped; pappus plumose, this differing from Carduus. A few species are grown for ornament, being adapted to bold effects.

acaule: *Carlina acaulis.*

ciliatum. Bien. to 3 ft.: lvs. pinnate into linear-lanceolate segms., hairy above, gray-tomentose below: heads purple. S. Russia.

Diacantha (*Chamæpeuce Diacantha*). FISHBONE THISTLE. Bien. to 3 ft.: lvs. linear-lanceolate, slightly toothed, glabrous above, white-tomentose beneath: heads purplish. Asia Minor.

discolor. Bien. or per. to 7 ft.: lvs. pinnately cut into linear toothed segms. white-tomentose beneath: heads pale purple or pink, to 2 in. across. N. B. to Ga. and Mo.

Hillii. Per. to 2 ft.: lvs. oblong, lobed or pinnatifid into broad obtuse toothed segms., green both sides: heads purple, to 3 in. across. Ont. to Pa. and Ia.

lanceolatum. Bien. to 5 ft.: lvs. pinnatifid into lanceolate toothed segms., hairy above, brown-tomentose beneath: heads dark purple, to 2 in. across. Eu., Asia; nat. in N. Amer.

occidentale. Bien. to 3 ft., the herbage mostly white-floccose: lvs. lanceolate to oblong, to 10 in. long, dentate or pinnatifid, more or less prickly: heads to 2 in. high, reddish or purple. S. Ore., Calif. Var. **candidissimum** is very stout and prominently white-tomentose. Var. **Coulteri** has long branches bearing single heads. Var. **venustum** has heads webby rather than woolly or tomentose.

syriacum (*Notobasis syriaca*). Ann. to 3 ft. or more: lvs. oblong, lobed, spiny-toothed, the upper pinnate into narrow segms., pubescent beneath: heads lilac, to 1 in. long. Medit. region.

CISSUS. *Vitaceæ.* Mostly tendril-climbing shrubs often with fleshy sts., lvs. simple or compound, deciduous or persistent, fls. with parts in 4's, bisexual or unisexual, in cymes; fr. a berry. Grown under glass, and out-of-doors in warm regions. Propagated by cuttings, and by seeds when obtainable.

acida (*Vitis acida*). Low somewhat succulent climber: lvs. stiff, of 3 lfts.: fls. in compound umbel-like clusters: fr. enlarged above middle. S. Fla., Ariz., and south.

antarctica (*Vitis antarctica*). Lvs. ovate to oblong, to 4 in. long, entire or slightly toothed, shining above. Australia.

arborea: *Ampelopsis arborea.*

capensis (*Vitis capensis*). Roots tuberous: lvs. evergreen, orbicular or kidney-shaped, to 8 in. across, wavy-toothed, rusty-tomentose beneath. S. Afr.—Much planted in S. Calif.

discolor. Lvs. ovate, to 6 in. long, finely toothed, purplish beneath, tinged above with white, pink and purple. Java.—An old greenhouse "foliage plant."

gongylodes (*Vitis gongylodes* and *pterophora*). Sts. 4-angled and -winged, the branches bearing a terminal tuber to 6 in. long: lvs. of 3 lfts. which are often 3-lobed. Brazil.

hypoglauca (*Ampelopsis* and *Vitis hypoglauca*). Rusty-tomentose when young: lvs. of 5 obovate leathery lfts. to 3 in. long, toothed toward the apex, pale beneath. Australia.

incisa (*Vitis incisa*). MARINE IVY. Long climber, fleshy: lvs. of 3 ovate lfts. to 1 in. long, coarsely toothed or lobed: fls. in 3-parted clusters: fr. thickened below middle. Mo. to Fla. and Ariz.

oblonga (*Vitis oblonga*). Bushy tree: lvs. oblong, to 2½ in. long, entire, very obtuse. Australia.

quadrangularis (*Vitis quadrangularis*). Sts. 4-angled and -winged: lvs. ovate, entire or deeply 3-lobed, to 1½ in. long. Trop. Asia and Afr.

rhombifolia (*Vitis rhombifolia*). Lvs. evergreen, of 3 rhombic-ovate lfts. to 4 in. long, sharp-toothed, rusty-hairy on veins beneath. N. S. Amer.

striata. Lvs. evergreen, of 3–5 obovate or spatulate lfts. usually about 1 in. long, toothed at apex. S. Amer.—Has been cult. as *Vitis sempervirens.*

CISTACEÆ. ROCK-ROSE FAMILY. Shrubs or herbs of about 8 genera, characterized by simple entire lvs., regular bisexual fls. with 5 sepals of which 2 are small, 5 petals which usually fall early, numerous stamens, superior 1-celled ovary, and capsular fr.; mostly in the Medit. region and N. Amer. Only the genera Cistus and Helianthemum are known to general hort.

CISTUS. ROCK-ROSE. *Cistaceæ.* Low Mediterranean shrubs with opposite simple entire lvs., and showy wide-open white or purple fls. in terminal cymes or solitary; grown in the rock-garden; mostly evergreen or partially so.

Rock-roses prefer well-drained limestone soil and sunny exposures and will not stand many degrees of frost. Propagated by seeds which should be sown in pots as seedlings do not transplant well. Also increased by layers or cuttings under glass. The species are useful in California and stand in the southern states. They are plants long known to horticulture.

acutifolius: *C. corbariensis.*

albidus. To 6 ft.: lvs. ovate-oblong, to 2 in. long, densely white-tomentose: fls. lilac or rosy, 2½ in. across.

algarvensis: *Helianthemum ocymoides.*

canescens. Hybrid between *C. albidus* and *C. villosus*: lvs. oblong-lanceolate, tomentose: fls. dark purple.

corbariensis (*C. acutifolius*). Hybrid between *C. populifolius* and *C. salvifolius*: lvs. ovate, to 2 in. long: fls. white, 1½ in. across.

creticus: *C. villosus* var.

crispus. To 2 ft.: lvs. oblong-elliptic, 1 in. long, wrinkled: fls. deep rose, to 2 in. across. S. W. Eu.

cyprius. Hybrid between *C. ladaniferus* and *C. laurifolius*: to 6 ft.: lvs. oblong-lanceolate, to 3 in. long, white-tomentose beneath: fls. white with purple spot at base, 3 in. across.

florentinus. Hybrid between *C. monspeliensis* and *C. salvifolius*: lvs. lanceolate, to 1½ in. long: fls. white, 2 in. across.

halimifolius: *Helianthemum halimifolium.*

hirsutus. To 3 ft., hairy: lvs. elliptic-lanceolate, to 2½ in. long: fls. white, 1½ in. across. S. W. Eu.

ladaniferus. To 5 ft.: lvs. lanceolate, to 4 in. long, dark green and viscid above, white-tomentose beneath: fls. white, petals with purple spot at base, to 3½ in. across. Var. **albiflorus** has white fls. yellowish at base. Var. **maculatus** has a brownish-crimson spot above base. Var. **roseus** is a hort. name, probably referable to *C. villosus.*

laurifolius. To 8 ft.: lvs. ovate to ovate-lanceolate, to 2½ in. long, white- or brown-tomentose beneath: fls. white, petals with yellow spot at base, to 3 in. across.

Loretii. Hybrid between *C. monspeliensis* and *C. ladaniferus*: lvs. linear-lanceolate, to 2½ in. long, sticky, gray-pubescent beneath: fls. white with crimson spot at base, to 2½ in. across.

monspeliensis. To 5 ft.: lvs. lanceolate, to 2 in. long, wrinkled: fls. white, to 1 in. across.

populifolius. To 6 ft.: lvs. cordate-ovate, to 3½ in. long: fls. white, 2 in. across.

purpureus. Hybrid between *C. ladaniferus* and *C. villosus*: lvs. lanceolate, to 2 in. long: fls. purple, yellow at base with maroon spots, 3 in. across.

salvifolius. To 2 ft.: lvs. oval to oblong, to 1¾ in. long, wrinkled and tomentose: fls. white, petals with yellow spot at base.

tauricus: *C. villosus* var.

villosus. To 3 ft.: lvs. ovate-oblong, to 2½ in. long, gray-tomentose beneath: fls. purple or rose, to 2½ in. across. Var. **creticus** (*C. creticus*), lvs. smaller, fls. purple. Var. **tauricus** (*C. tauricus*), lvs. from roundish to lanceolate.

CITHAREXYLUM. *Verbenaceæ.* Shrubs or small trees with opposite simple lvs. and small fragrant yellow or white fls. in racemes; fr. a little drupe: planted out-of-doors in the lower S. They have something the look of wild cherry-trees, and are frequently seen in warm countries.

ilicifolium. Low shrub: lvs. leathery, to 2 in. long, entire or spiny-toothed: fls. white, in short racemes. Ecuador.

spinosum. Fiddle-Wood. Tree to 50 ft.: lvs. to 8 in. long, entire or coarsely toothed: fls. white, in slender racemes to 1 ft. long. W. Indies.

CITRANGE: see *Citrus Fruits* (page 156).

CITRANGEQUAT: see *Citrus Fruits* (page 156).

CITRON: *Citrus medica*; name also applied to a form of watermelon, for which see *Citrullus*.

CITRONELLA: *Collinsonia canadensis*.

CITROPSIS. African Cherry-Orange. *Rutaceæ*. Several trop. African small spiny trees mentioned as stocks for citrus frs. and for hybridizing, and of interest to cultivators: lvs. with 3, 5 or 7 lfts. and winged rachis and petiole: fls. large and white, borne in the lf.-axils; stamens 8: fr. small, in clusters. C. **Schweinfurthii** has 3–5 narrow-lanceolate acute lfts.: fr. like limes, 1½ in. diam., sweet.

CITRULLUS. *Cucurbitaceæ*. Tendril-bearing ann. and per. vines of a few species in S. and trop. Afr. and probably Asia, one extensively cult. for its edible frs. and also run wild in the western hemisphere: monœcious: fls. medium-size, solitary in axils, corolla 5-parted nearly to base.

vulgaris. Watermelon, which see. Ann., long-running, hairy; lvs. pinnately divided or dissected: fls. about 1½ in. across: fr. globular to oblong to cylindric, mottled or striped green, flesh red. Trop. and S. Afr. Var. **citroides.** Citron or Preserving Melon. Fr. small, with white hard flesh, used only for preserving: seeds not marked or marbled (as they usually are in watermelon).

CITRUS. *Rutaceæ*. Small or medium-sized evergreen sometimes spiny trees of trop. and subtrop. Asia and regions beyond, comprising several much-prized citrus frs., as orange, lemon, lime, citron: lvs. compound but reduced to a single lft. (developed lfts. may appear on young strong shoots): fls. clustered in the axils or in cymes or sometimes solitary, white or pink and usually very fragrant; stamens 15 or more: fr. mostly thick-skinned, 8–15-celled, juicy, pulpy and aromatic, the kind known as a hesperidium. Propagated by seeds and by grafting on seedlings. For cult. see *Citrus Fruits*.

aurantifolia (*C. Limetta* in part). Lime. Small very tender tree with sharp spines: lvs. small, petiole narrowly winged: fls. white: fr. oval, 1½ in. or less diam., thin-skinned and smooth, greenish-yellow, very acid. Probably India and S. E. Asia.—Much grown in W. Indies.

Aurantium (*C. Bigaradia. C. vulgaris*). Sour or Seville Orange. Medium tree with rather blunt spines: petioles broadly winged: fls. white: fr. sour, with a hollow core when ripe, usually with loose skin, globose and somewhat flattened, to 3¼ in. diam. Probably Cochin-China.—*C. myrtifolia* is a short-jointed narrow-lvd. form, useful as a pot plant.

Bergamia. Bergamot. Small spiny tree: lvs. oblong-oval, petiole winged: fls. small, white: fr. pyriform, sour, thin-skinned, 3–4 in. diam.—Grown in Eu. for the essential oil and perfume, and sometimes for curiosity here.

Bigaradia: *C. Aurantium*.

decumana: *C. maxima*.

deliciosa: *C. nobilis* var.

grandis: *C. maxima*.

ichangensis. Small slender-spined tree from S. W. (Ichang region) China, grown somewhat as an ornamental Fla. to Miss.: lvs. narrow-oblong, not much broader than the winged petiole: fls. white: fr. lemon-form, 3–4 in. long, acid.

japonica: *Fortunella japonica*.

Limetta: *C. aurantifolia*.

Limonia. Lemon. Small tree with short spines: lvs. long-ovate, petiole not winged: fls. reddish-tinted in bud: fr. oval or oblong with a terminal nipple, 3–5 in. long, very sour. Probably farther Asia.

maxima (*C. decumana. C. grandis*). Shaddock. Pummelo. Pompelmous. Very tender tree 15–30 ft. high: lvs. large, 4–8 in. long, somewhat pubescent underneath, petiole widely winged: fr. very large, borne singly, flesh coarse-grained and the segms. often separating readily, oil-glands of rind few and large. See *C. paradisi*. Scarcely known in U. S.; native probably of Malaya and Polynesia.

medica. Citron. Large thorny shrub or small tree: lvs. oblong, 4–7 in. long, serrate, petiole wingless: fls. large, clustered, reddish in bud: fr. oval or oblong, 6–10 in. long, rough or warty, with scant acid pulp. Probably farther Asia.—Grown in S. Eu. for the peel which is candied; sometimes planted in Fla. and Calif. for interest, being a striking fr.

mitis. Calamondin or Panama Orange. Small thick-topped tree, spineless or with few very short prickles: lvs. broad-oval, petiole very narrowly winged: fls. small: fr. borne on tips of branches, globose or oblate, to 1¼ in. diam., with loose skin and acid pulp. Philippines.—One of the hardiest comestible citrus frs.: used same as limes and lemons.

myrtifolia: see *C. Aurantium*.

nobilis. King Orange. Small tree, thornless or nearly so, with small lanceolate to oval lvs. and short petioles nearly or quite wingless: fls. small and white: fr. oblate, orange or reddish, with rather loose peel and hollow pith, sweet or subacid, segms. separating from each other and from the rough rind. Cochin-China. Var. **deliciosa.** Mandarin and Tangerine Oranges. Lvs. willow-like: fr. small, depressed-globose, with nearly or quite smooth loose thin skin, yellow to reddish, all parts separating freely. Sometimes called kid-glove orange. Var. **unshiu.** Satsuma Orange. Lvs. broad, large, rounded at apex: fr. medium, depressed-globose, pulp orange, of fine quality. Hardiest of the sweet oranges.

paradisi (*C. maxima* var. *uvacarpa*). Pomelo. Grapefruit. Larger and hardier tree than the pummelo (*C. maxima*) with smooth lvs.: frs. large and borne close together forming clusters, relatively fine-grained, with many small oil-glands in the rind. Much grown in U. S.; origin unknown.

sinensis. Common or Sweet Orange. Medium tree, with rather blunt spines or none: lvs. oblong-ovate, more or less acuminate, petiole narrowly winged: fls. white: fr. subglobose or oval, with solid core and sweet pulp. China or Cochin-China.—The Navel orange is a form with supernumerary carpels.

taitensis. Otaheite Orange. Small, usually a little bush, of unknown origin, sometimes grown as a pot plant: lvs. oblong to elliptic, finely crenulate, petiole narrowly winged: fls. pink outside, fragrant: fr. lemon-shaped, about 2 in. long, ornamental.

trifoliata: *Poncirus trifoliata*.

vulgaris: *C. Aurantium*.

CITRUS FRUITS. The genus Citrus, with its allies, yields several fruits of major importance in semi-tropical regions of the world. The present article presents a general discussion of citrus fruits from the pomological point of view, and then separate discussions of certain ones of them as follows (see also *Citrus*):

Sweet oranges, page 154
Sour orange, page 155
Calamondin, page 155
Kumquat, page 155
Trifoliate orange, page 155
Citrange, page 156
Grapefruit, page 156
Shaddock, page 156
Lemon, page 156
Lime, page 156
Limequat, page 157

Among subtropical fruits those belonging to the citrus group are the most important and they are grown the world around in regions suited to them. In the continental United States they are produced most largely in California and Florida, and to a lesser extent in the Rio Grande Valley in Texas, in Arizona, and the warmer sections of the Gulf states.

None of these citrus regions is free from the effects of frost, and the extension of culture northward is definitely limited by winter temperatures. Within the group, which includes the lime, lemon, grapefruit, orange, tangerine or mandarin, satsuma, calamondin and kumquat there is a marked variation in their cold resistance. Roughly they are hardy in the order named and while the lime requires an almost frostless climate and succeeds well in the tropics, the kumquat has withstood temperatures down to about 12° or 15° F. Indeed it is doubtful whether the best citrus fruits of some kinds can be grown outside those regions in which frosts occur at intervals during their ripening season.

Soils varying from very light sand to heavy sticky clay are capable of producing citrus fruits. A careful survey of older plantings, however, makes it plain that many soils on which groves are planted are not satisfactory and should have been avoided. If soils are too light and sandy, it is more difficult and expensive to maintain fertility and the optimum of organic matter so necessary to the welfare of the trees. On the other hand, those that are too heavy and sticky are difficult to handle and are likely to be poorly drained. The necessity for adequate drainage must be emphasized, as nothing is more inimical to the welfare of the trees than the presence of stagnant water. A deep mellow rather open soil is desirable.

Propagation of citrus trees for orchard planting is by shield-budding desired varieties on two- or three-year seedling stocks of the same or other species. Seedling sweet orange, sour orange, grapefruit, rough lemon and trifoliate orange have all been employed, but propagation is now limited mostly to sour orange, rough lemon and trifoliate orange. Sour orange is used for lands of good quality, rough lemon for light sandy soils, and trifoliate orange for heavier soils with good moisture supply in the colder districts. Rough lemon is the most tender of the three. Seeds are sown in rows or drills much as are garden peas. They are liberally supplied with fertilizer and usually the seed-beds are irrigated. At the end of twelve to eighteen months, the seedlings are large enough to plant out in the nursery rows. About 8000 are set to an acre. Selection is made at time of transplanting and only the most vigorous seedlings saved. In the nursery rows they are grown for one or two years, when they are budded.

Best results follow dormant budding in autumn, thus giving a full growing season when the buds start in spring. Just before the buds push out, the stocks are cut off with a sloping cut. As soon as the buds are started, a stake is set against each one and the growing shoot trained and tied to it until a height of 24 to 30 inches is reached, where the top of the bud growth is cut off to force branching. At the end of the season's growth they are ready for transplanting or they may be allowed to remain a year or two longer.

Planting of nursery trees in the grove is usually in winter, but to a limited extent they are also set during the early summer season in the Southeast. If rains are sufficient and frequent enough, this can be undertaken successfully. The usual planting distances are 25 to 30 feet for oranges and grapefruit, 20 to 25 feet for tangerines and lemons and 15 feet for kumquats. It is important that trees should be set no deeper than they grew in the nursery, with earth well packed about the roots and in the drier districts watered copiously.

Cover-crops and tillage must receive careful attention. The maintenance of an adequate supply of organic matter in citrus soils is important. It is impossible to keep a planting in good condition unless the humus is adequate. In California and other irrigation districts this is accomplished by growing cover-crops in winter, while in the southern and southeastern sections they are commonly grown in the summer season. In the first instance they are raised in winter because water is then available, while in the latter they do the useful work of using up the surplus moisture supplied by summer rains. In the West the favorite cover-crops are vetch, Canada field peas and bur clover, while in the East cowpeas, velvet beans, beggarweed and crotalaria are used. Occasionally groves are grown in sod, grass in the East and alfalfa in the West.

Citrus groves or orchards are usually clean-tilled in the eastern districts from early spring, when growth starts after the winter dormant season until about the first of July, when the summer rainy season starts; and in the western irrigation sections throughout the summer. Once every week or ten days is usually sufficient to keep down weed growth and maintain a dust blanket for the conservation of moisture. Disk, spring-tooth or acme harrows are employed. In autumn the groves are either plowed or disked to incorporate the summer cover-crop in the soil and as a safeguard against cold and fire.

Irrigation is essential in the western districts, with an insufficient rainfall of about 25 inches; sufficient water is added to meet the requirements of the trees. Thus a total of 40 to 45 inches is secured. Irrigation and cultivation are alternated. In the southeastern districts irrigation is seldom practiced.

Fertilizers are applied to citrus plantings to supply nitrogen, phosphorus, and potash. In some sections, as in Florida, the use of commercial fertilizer is an important part of successful citrus culture. Indeed, there are few locations in that area where their judicious and continued use is not necessary, and results are usually in direct proportion to their liberal use. In California, on the other hand, soils commonly contain sufficient phosphorus and potash and only fertilizers containing nitrogen are useful.

The common practice in Florida is to make three applications each year, February, June, September or October. Young trees receive applications containing relatively higher amounts of nitrogen or ammonia, while bearing trees receive larger amounts of phosphorus or phosphoric acid and potash. A standard formula for young trees in Florida contains 6 per cent phosphoric acid, 5 per cent potash and 4 per cent ammonia, while a mixture for fruiting trees will contain about 8 per cent phosphoric acid, 10 per cent potash and 3 per cent ammonia. The amount required will depend on the size and age of the trees and the crop carried. It will vary from 4 or 5 pounds each for young trees to 50 or more pounds for old trees in full bearing. Application may be made by machinery, but fertilizer is more frequently scattered by hand, being evenly distributed fairly close to and around young trees and over the whole surface of the ground in old established groves. Immediately after being applied the ground is usually cultivated.

Pruning nursery trees, one to three years old, is by cutting back to 18 to 24 inches at time of planting, thus insuring low branched heads. No further pruning is undertaken for a year or two unless to remove sprouts that have come from below the bud union. The first pruning after the trees are well established consists in removing all branches from the original stem except four or five chosen to form the framework of the tree.

It is the habit of citrus trees to grow with shapely symmetrical heads and comparatively little pruning is required to secure this end. Too numerous sprouts are removed from time to time. Dead branches are taken out. If these are the result of frost injury it is best to allow sufficient time for new shoots to grow before pruning away the dead parts; by so doing much unnecessary labor is avoided. Neglected or out-of-condition trees can often be rejuvenated by heading back.

Harvesting, marketing, yields vary greatly in different regions. Citrus fruits are in the markets in quantity the year around. The Florida crop, consisting of oranges and grapefruit, is marketed from October 15th to July 1st. California oranges are shipped the year around, the navel orange crop moving from November to May and the Valencia oranges from June to October. Lemons are harvested in California to some extent every month in the year, the heaviest cropping season being in February, March and April. Limes are harvested in greatest quantity in the summer months. Oranges and grapefruit are allowed to mature on the trees. If picked green, maturity is checked and the product is unsatisfactory. The shipment of green fruit is prohibited by law. Lemons and limes are picked when still green although they must have reached a certain size and degree of maturity. Lemons are cured and ripened before shipment. Limes are shipped while still green but have usually colored wholly or in part when seen on the markets.

Citrus fruits of all kinds are gathered carefully to prevent bruising or injury to the rind, each individual fruit being cut closely with short stems and smooth cuts. Special clippers are used for the purpose. As a rule the crop is prepared for packing in large centralized packing-houses by washing and polishing, graded by hand and sized by machinery, wrapped and packed by hand in standard boxes. When loaded in cars for shipment the boxes are stood on end and securely cleated or braced in place to prevent shifting. The bulk of the American crop is sold through cooperative marketing agencies. The total crop approximates 60,000,000 boxes annually. An average of three boxes a tree for oranges and five boxes for grapefruit is a good yield at ten to twelve years.

Insects and diseases are numerous, although many of them are of minor importance. The greater portion of the damage from year to year is credited to purple scale, red scale, black scale, whitefly and rust mite among insects, and stem-end rot, scab, melanose, anthracnose and brown-rot among diseases. The fungus diseases are more troublesome in moist climates than in dry ones and insects more difficult to control in dry climates than in moist ones. In damp climates insects are held in check to a considerable extent by the attacks upon them by friendly parasitic fungi.

In the Florida and other southern districts insect and disease control is almost entirely by spraying with bordeaux mixture and lime-sulfur wash, while in California fumigation with hydrocyanic acid gas is the favorite method against most insects. The popular sprays against insects are miscible oil and lime-sulfur wash. In all sections powdered sulfur in different combinations is employed for dusting to control red-spider and rust or silver mite.

Sweet oranges

The sweet oranges of grove cultivation and the markets are botanically *Citrus sinensis*, of numerous varieties. Products of these plants far surpass all other citrus fruits in quantity produced and the esteem in which they are held. The crop for 1928 produced in Florida was 13,000,000 boxes and 31,000,000 boxes in California. Its cultivation in these states goes back to the earliest beginnings of fruit-growing, and orange culture with its related industries has become a commercial enterprise of vast proportions. Interest in planting and cultivation has had much to do with the development of those sections in which oranges are grown. American markets are supplied almost entirely from domestic sources.

Orange culture in America was started with trees raised from seed, and many seedling plantings are still in bearing. The product of these groves still makes up a large part of the Florida midseason crop, while a relatively smaller amount is still marketed from California. Many seedling trees have been topworked. Numerous seedling varieties have been selected, propagated by budding and planted, but in later years the number has been greatly reduced.

A large number of varieties, such as Valencia, Majorca, Jaffa and Ruby were introduced from Mediterranean countries and elsewhere. Few of these have gained a permanent place in grove plantings. As the growing of citrus fruits has become a great commercial enterprise, the standardization of cultural practices and marketing procedure has made it necessary to limit more recent plantings to a smaller number of varieties of proved merit.

Climatic conditions in California make it possible to cover a twelve-month shipping season with two varieties, the Bahia or Washington Navel (from Brazil) covering the period from November to April and May, and the Valencia (from Spain) covering the season from May or June to November. A miscellaneous crop of seedling and other varieties is marketed in May and June.

It is necessary to use a larger number of varieties in Florida to cover the shipping season from October to July. In order of their ripening from early to late the varieties commonly planted are Hamlin and Parson Brown, Homasassa, Pineapple, Valencia and Lue Gim Gong. All except Valencia are seedlings of local origin.

Of the Nobilis oranges, Dancy is grown in California and Dancy and King in Florida; the tangerine is also popular with growers in places. Temple, a very excellent variety when grown on sour orange stock, has been planted to a considerable extent in Florida in recent years. Satsuma, an early hardy variety, is cultivated in northern and western Florida, and the coastal sections of Alabama, Mississippi, Louisiana and Texas.

Sour orange

In Spain the sour orange, *Citrus Aurantium*, is grown for its fruit and some of the most beautiful plantings in that country are of this species. In America, however, the sour orange is not a cultivated fruit in the usual accepted sense of the term. Such trees as occur here and there are either those that are feral on the shores of lake and river or in similar locations, as in Florida, or are to be found in plantings of sweet oranges when the top variety has died out and the stock has sprouted and taken its place. Under these conditions the trees are usually neglected and ill-kept. The fruit of the sour orange is valuable in the making of orangeade and marmalade. For the latter purpose it is widely and largely employed and the quality of the product is scarcely surpassed by that secured from any other citrus. Seedlings are largely used for stock on which to grow many other kinds of citrus. The stock is adapted to heavy and moist soils of good depth; it is very hardy, remarkably resistant or immune to foot-rot and gum diseases. On it a high quality fruit is produced and in a world-wide way it is more commonly used than any other stock.

Calamondin

The calamondin, *Citrus mitis*, is unique among citrus fruits in being the hardiest of the acid species now grown in America. Its dense head with bright green leaves, upright habit, and small fruits resembling tangerines in shape and color make it one of the most ornamental of the citrus allies. The fruits are bright orange-red, 1–1½ inches in diameter, with deep orange flesh. The juice is well flavored and very acid. It is a valuable garden fruit adapted to those sections where the Satsuma orange and kumquat are grown. Among ade-making fruits it is unsurpassed.

Kumquat

The kumquats, the smallest both in size of plant and fruit among the citrus in cultivation in America, are closely related to the genus Citrus. Commonly they are grown as shrubs, the largest reaching a height of 12 feet or so with a head diameter of about 8 feet. The tops are dense and when well fruited the plants are very ornamental.

Three kinds representing as many species are grown. These are Nagami (*Fortunella margarita*), Marumi (*Fortunella japonica*), Meiwa (*Fortunella crassifolia*). The fruits of Nagami are oblong, 1¼ by 1½ inches, with acid juice; those of Marumi are round, 1¼ inch in diameter, acid; those of Meiwa are round, 1½ inch in diameter, with sweet rind and almost juiceless pulp. They are grown as ornamental shrubs, the fruits are used for decorations and in the making of jellies and fine marmalades. They are propagated on trifoliate orange and rough lemon stocks and commonly planted 15 feet apart when grown in orchards.

Trifoliate orange

The trifoliate or three-leaved orange is *Poncirus trifoliata* (formerly known as *Citrus trifoliata*). The fruit is not eaten, but the plant is prized for its hardiness as an ornamental and hedge plant, as far north as Washington and Philadelphia; for use as stocks on which to work sweet oranges; and as a parent in hybridization in the procuring of hardy races and of fruits superior for the making of ades (see *Citrange*, next page). Trifoliate seedlings are extensively grown as orange stocks, to be employed on the northern limits of orange culture and for moist deep rich soils.

Citrange

Citranges are hybrids between sweet oranges and the trifoliate orange. They are hardier than oranges and are adapted to northern Florida and southern Georgia and warmer parts of the cotton-belt; the fruits are prized for culinary uses and in the making of beverages or ades. Usually the fruit is small, 2–3 inches in diameter, but in some cases is much like a sweet orange in external appearance. Varieties Colman, Morton, Rusk, Rustic, Savage are as yet the most prominent. They are also ornamental plants with fragrant flowers. They are propagated on trifoliata stock.

Citrangequats are secondary hybrids, produced by crossing citranges and kumquats. They are hardy north of the usual citrus-belt. The fruits are yellow to orange and reddish, 1½–2 inches diameter, useful to ades and culinary uses. They are worked on trifoliata stocks.

Grapefruit

Once considered to be of the same species as the shaddock, the grapefruit or pomelo is now regarded as a distinct species, *Citrus paradisi*. The culture of grapefruit, essentially an American enterprise, has been developed in Florida to a greater extent than in other citrus districts of the continental United States, although also grown in southern Texas and California. The fruit was unknown to early European citrus growers; there is evidence that it originated as a seedling sport in the West Indies and its introduction into the United States, probably about 1809, was much more recent than that of the sour or sweet orange. The first fruit was marketed from Florida about 1880 or 1885. Plantings have been increased greatly, and it has seemed, at times, that there was certain to be over-production. The market outlook, however, has been improved greatly by the use of very considerable amounts of fruit in canning the pulp and juice. It appears that this disposal of part of the crop will be greatly extended and that canneries will assist materially in returning a profit to the growers.

Here and there small seedling grapefruit groves are to be found, but in a large way the fruit marketed is the product of budded trees. The varieties are of Florida origin, selections from earlier plantings of seedling trees. The number of varieties introduced from time to time is much less than that of sweet oranges. Present plantings are usually made with Duncan, McCarty, or Marsh. Other varieties are Walters, Hall, and occasionally Triumph. The last is a small-sized early sort. Marsh is the favorite variety in California. When varieties containing seeds are held late on the trees, the seeds sprout and the flavor of the fruit is impaired. Marsh is favored as a late variety because it is seedless. Duncan is hardy and unsurpassed in quality. Two pink-fleshed varieties, Foster and Thompson, are grown somewhat in groves and as garden fruits.

Shaddock

This fruit, *Citrus maxima*, has taken its name from Captain Shaddock who is credited with having brought it to Barbados some time prior to 1707. It is also properly called pummelo. In the far East it is known as pompelmous. By some writers it has been regarded as the progenitor of the grapefruit. It is of no commercial importance in N. America but is occasionally found in the warmer citrus districts where its large glossy foliage and huge fruits (sometimes weighing several pounds) make it an interesting and valued garden plant. Since it is tender, its cultural range is limited.

Lemon

Of the acid citrus fruits, the lemon (*Citrus Limonia*) is the most widely and largely grown in commercial plantings. The success achieved in the culture of the lemon in California is one of the outstanding horticultural developments of recent years. Elsewhere in American citrus districts it is grown only as a garden fruit. At one time considerable quantities of lemons were raised in Florida, but a combination of difficulties, among which may be mentioned cold weather, scab and other diseases, and troubles in curing, led to the abandonment of the plantings.

The lemon is hardier than the lime but less hardy than the orange and, consequently, unless adequate protection can be given, its cultivation is limited to warmer locations than are required for that fruit. In addition to this lack of hardiness the lemon is perhaps less resistant to certain diseases than either the orange or grapefruit. Lemons are picked green when they have reached a diameter over 2¼ inches. This is determined by passing them through a ring of that size. Those that pass through are allowed to remain and increase in size. They are cured to shrivel the rind and become light yellow in color before marketing. The greater care in picking and curing add materially to the cost of handling. Losses sometimes occur in curing.

The principal varieties planted in California are Lisbon and Eureka. The latter is the favorite. In Florida the variety usually planted is Villa Franca.

Lime

The acid lime (*Citrus aurantifolia*) is a distinctly tropical fruit. It is grown in the tropics the world around and, because it is very tender, its culture does not extend far outside that region. In southern California it is grown as a home garden fruit, while in extreme southern Florida it is a crop of considerable importance. It is also grown in the latter state as a garden fruit for considerable distances north of the commercial areas.

The greater part of the lime crop that finds its way into the markets both from Florida and from the tropics is the product of seedling trees. Usually this fruit is named for the point of origin, as Key, West Indian, or Mexican lime. The trees are very thorny and very thick-headed and receive a minimum of attention in pruning, cultivation and fertilizer; they are much like wild trees. The fruit is thin-skinned, small, and very acid. It is produced to some extent the year around but the season of heaviest production is the summer months. Named varieties, as Tahiti in Florida, propagated on rough lemon stock, and Bearss in California, are commonly planted in gardens or in small groves for home use and local market. They are the size of large-fruited lemons. Rangpur from India is not a true lime and is much hardier. It is orange-red in color and very acid.

Limequat

In an effort to secure a hardy acid fruit, Walter T. Swingle in 1909 crossed the Marumi kumquat on the West Indian lime. This cross gave rise to a new citrus fruit named "limequat" of which three varieties were described. Only one, Eustis, has come into cultivation. Its color is a very light yellow, like that of a grapefruit, oval in outline, 1⅞ inches long, with a sweet rind and very acid pulp. The flavor is distinct and agreeable. It is very prolific. In hardiness it surpasses the sweet orange and its cultural range is about the same as that of the kumquat and Satsuma orange. Even though frozen back partially it grows out rapidly and usually bears fruit the following season. Plantings have proved profitable and there is no reason why it cannot be used in extending the area in which acid citrus may be grown. Limequat can be propagated satisfactorily on rough lemon and trifoliate orange stock.

CLADANTHUS. *Compositæ.* One herbaceous strong-smelling ann. native in S. Spain and Morocco and sometimes grown in the flower-garden. **C. arabicus** (*C. proliferus. Anthemis arabica*). To 3½ ft.: lvs. alternate, finely divided: heads solitary and others arising from beneath them, yellow, of ray- and disk-fls.; pappus none.

CLADRASTIS. Yellow-Wood. *Leguminosæ.* Deciduous trees native in N. Amer. and E. Asia, with pinnate lvs., white papilionaceous fls. in usually panicled racemes, and flattened pods; planted for ornament. See *Maackia*.

Propagated by seeds in spring, and by root-cuttings kept over winter in moderately cool and moist sand or moss.

amurensis: *Maackia amurensis.*

lutea (*C. tinctoria. Virgilia lutea*). To 50 ft.: lvs. of 7–9 ovate lfts.: fls. 1 in. long, fragrant, in June: pods to 4 in. long. S. E. U. S.

platycarpa (*Sophora platycarpa*). To 60 ft.: lvs. of 7–15 ovate lfts.: fls. ½ in. long, white with yellow spot at base: pods to 3 in. long, winged all around. Japan.

sinensis. To 80 ft.: lvs. of 9–13 oblong lfts.: fls. ½ in. long, June–July: pods to 3 in. long. China.

tinctoria: *C. lutea.*

CLARKIA. *Onagraceæ.* Ann. herbs with alternate lvs., rose or purple showy fls. in racemes or solitary, and linear capsular frs.

Grown in flower-gardens and latterly as greenhouse subjects for winter and spring bloom. Of easy cultivation in sunny situations. Propagated by seeds sown where plants are to stand in the open.

Breweri: *Eucharidium Breweri.*

concinna: *Eucharidium concinnum.*

elegans. To 3 ft. (more under glass), with reddish glaucous sts.: lvs. ovate to ovate-lanceolate: fls. purple or rose or white in var. **alba**, sometimes double; claws of petals not toothed or notched. Calif.

grandiflora: *Eucharidium concinnum.*

pulchella. To 1½ ft.: lvs. linear to linear-lanceolate: fls. lilac varying to white in var. **alba**, the claws of petals toothed. B. C. to Calif. Var. **holopetala** (var. *integripetala*) has entire petals.

CLARY: *Salvia Sclarea.*

CLASPING: leaf partly or wholly surrounding stem.

CLAUSENA. *Rutaceæ.* Several species of spineless trees in trop. Asia, Australia and Afr., with pinnate lvs. and small fls. in racemes or terminal panicles; stamens 8–10: fr. berry-like, small and globose, 4–5-celled. **C. punctata** (*C. Lansium. C. Wampi*). Wampi. Small tree sometimes planted far S. for ornament or interest: lfts. 5–9, ovate-elliptic, more or less punctate: fr. ovate-globose, about 1 in. long. China, where it is sometimes cult. as a fruit-tree; can be grafted on Citrus.

CLAVATE: club-shaped; said of a long body thickened toward the top.

CLAVEL DE LA INDIA: *Ervatamia coronaria.*

CLAVIJA. *Theophrastaceæ.* Evergreen trees or shrubs with unbranched trunk bearing at top a cluster of stiff simple lvs. with spike-like racemes of unisexual fls. in the axils; fls. white, yellow or orange; native in trop. Amer. and one intro. in S. Calif. Propagated by seeds and cuttings of half-ripe wood.

longifolia (*C. ornata*). Diœcious tree to 20 ft.: lvs. to 2 ft. long and 6 in. wide, with few spiny teeth: fls. small, deep orange, the staminate fragrant, in drooping racemes to 10 in. long. Trinidad, S. Amer.

ornata: *C. longifolia.*

CLAW: the long narrow petiole-like base of petals or sepals in some flowers.

CLAYTONIA. Spring Beauty. *Portulacaceæ.* Succulent little spring-blooming perennials having deep-seated hard corm or tuber, 2-lvd. sts., white or rose fls. in terminal racemes, and capsular frs.; sometimes transplanted from the wild to moist shady positions and rock-gardens.

caroliniana. Per. to 1 ft.: lvs. broad in middle, to ¾ in., obtuse, those on st. with distinct petiole. E. N. Amer.

perfoliata: *Montia perfoliata.*

virginica. Per., sts. to 1 ft. long: lvs. linear or linear-lanceolate, about ½ in. broad: fls. white tinged with pink, ¾ in. across. E. N. Amer.

CLEISTOCACTUS. *Cactaceæ.* Slender erect or clambering plants known by the fl. remaining closed or the perianth-limb not expanding, of S. S. Amer.: spines many and slender and very sharp; ribs many, not prominent, the areoles close together: fls. orange-red. See *Cacti.*

Baumannii (*Cereus Baumannii. C. colubrinus*). St. columnar and flexuose, to 6 ft. and 1½ in. diam., with few erect branches and fascicled spines most of them about ¼ in. long. Uruguay, Paraguay, Argentina.

CLEISTOGAMOUS FLOWERS: small closed self-fertilized flowers, as in some violets; they are mostly on or under the ground.

CLEISTOYUCCA: *Yucca.*

CLEMATIS. CLEMATIS. VIRGINS-BOWER. *Ranunculaceæ.* Per. herbs or woody climbing vines with opposite usually compound lvs., solitary or panicled fls. without petals but with petal-like sepals and numerous stamens (unless otherwise stated the fls. open wide and flat), and fr. an achene with commonly a long feathery style; mostly native in the north temp. zone, and many of them much prized for ornament.

Clematis prospers in fertile light loamy soil which is well drained. Propagated by stratified seeds, layers, division, and cuttings under glass in summer. Varieties may be grafted on roots of *C. Flammula* or *C. Viticella*; roots should be taken from plants out-of-doors to avoid nematode infection, and cions from those grown in a greenhouse.

Some of the clematises are perennial herbs and should be treated as such in the border. Others are small-flowered woody vines not much modified by domestication, planted for permanent cover of fences, arbors and porches. Others are large-flowered highly developed hybridized kinds, usually not very woody, as *C. Jackmani*, grown specially on trellises and posts; they bloom on wood of the season and should be pruned when dormant; in fact, they may be cut back to the ground each year; where the ground freezes about the roots, the nematode disease is not prevalent.

apiifolia. Climbing to 10 ft.: lvs. of 3 toothed or lobed lfts., sometimes biternate: fls. white, about ½ in. across, in axillary panicles, Sept.–Oct. Japan.

Armandi. Evergreen, climbing to 15 ft.: lvs. of 3 entire leathery lfts.: fls. white, to 2½ in. across, in axillary leafless panicles, in spring. China. Var. **Farquhariana** has light pink fls.

Baldwinii (*Viorna Baldwinii*). PINE-HYACINTH. Erect herb to 1½ ft.: lvs. simple or the upper ones of 3 lfts.: fls. urn-shaped, purple or pinkish, about 1 in. long, solitary and nodding, in early spring. Fla.

balearica. Climbing: lvs. of 3 toothed or 3-lobed lfts.: fls. greenish-yellow spotted with red inside, in spring. S. Eu., Asia Minor.

brevicaudata. Climbing: lvs. bipinnate, lfts. toothed or entire: fls. white, to ¾ in. across, in axillary cymes, Aug.–Oct. Manchuria, W. China.

Catesbyana (*C. holosericea*). Climbing: lvs. mostly biternate, lfts. lobed or entire: fls. white, 1 in. across, in panicles, spring and summer. S. C. to Fla. and Miss.

chinensis. Climbing to 10 ft.: lvs. of usually 5 entire lfts.: fls. white, to ¾ in. across, in axillary leafless panicles. China to Indo-China.

chrysocoma. Erect or climbing to 20 ft.: lvs. of 3 coarsely toothed or 3-lobed lfts., yellow-pubescent: fls. white or pinkish, 2 in. across, in clusters, June–Sept. China. Var. **sericea** (*C. Spooneri*). Fls. to 3½ in. across, from old wood.

cirrhosa. Climbing to 10 ft.: lvs. simple, toothed or sometimes lobed: fls. yellowish-white, to 2 in. across, 1–2 in the axils, Mar.–May. S. Eu., Asia Minor.

coccinea: *C. texensis.*

columbiana: the western representative of *C. verticillaris*: fls. blue or purple, with narrow pointed sepals and narrow mostly entire lfts.

crispa (*C. cylindrica. Viorna crispa*). Climbing to 10 ft.: lvs. of 3–7 thin entire or lobed lfts.: fls. urn-shaped, bluish-purple, to 1½ in. long, solitary and nodding, fragrant, June–Sept.: achenes without plumose styles. Va. to Fla. and Tex.

cylindrica: *C. crispa.*

Davidiana: *C. heracleæfolia.* var.

dioscoreæfolia: *C. paniculata* var.

Douglasii. Erect herb to 2 ft.: lvs. 2- or 3-pinnate into linear or linear-lanceolate lfts.: fls. tubular, purple inside, paler outside, to 1½ in. long, solitary, May–July. Colo. to Wash.

erecta: *C. recta.*

eriophora (*Viorna eriophora*). Erect white-hairy herb to 1½ ft.: lvs. 2-pinnate into linear lfts.: fls. bell-shaped, purple, about 1 in. long, solitary and nodding, May–June. Wyo. to New Mex.

eriostemon (*C. Hendersonii. C. intermedia*). Hybrid between *C. Viticella* and *C. integrifolia*: subshrub to 10 ft. with blue fls. to 2½ in. across.

Flammula. Climbing to 15 ft.: lvs. 2-pinnate, the lfts. entire or lobed: fls. white, fragrant, about ¾ in. across, in many-fld. panicles, Aug.–Oct. Medit. region to Persia.

florida. Climbing to 12 ft.: lvs. usually biternate, the lfts. entire or lobed: fls. creamy-white with green band on back and purple stamens, to 4 in. across, solitary, June–July: styles not plumose. Cent. China. In var. **plena** the fls. are double. In var. **Sieboldii** (*C. Sieboldii*) part of the stamens are changed to purple staminodia.

Fortunei: *C. patens* var.

Fremontii (*Viorna Fremontii*). Erect herb to 1½ ft.: lvs. simple, leathery and reticulated, sessile: fls. bell-shaped, purple, 1 in. long, solitary and nodding, spring and summer. Mo. to Neb.

grata. Climbing: lvs. usually of 5 coarsely toothed lfts.: fls. white, to ¾ in. across, in panicles, Sept.–Oct. Himalayas.

graveolens: *C. orientalis.*

Hendersonii: *C. eriostemon.*

Henryi: *C. Lawsoniana* var.

heracleæfolia. Erect herb to 4 ft., woody at base: lvs. of 3 large coarsely toothed lfts.: fls. tubular, polygamous, to 1 in. long, blue, in axillary clusters, Aug.–Sept. China. Var. **Davidiana** (*C. Davidiana*) has diœcious fragrant deep blue fls.

holosericea: *C. Catesbyana.*

indivisa. Climbing, with thick woody sts.: lvs. of 3 leathery entire or lobed lfts.: fls. diœcious, white, to 4 in. across, in axillary panicles, in spring, or winter when grown indoors. New Zeal.

integrifolia. Erect herb or subshrub to 3 ft.: lvs. thin, simple and entire, sessile: fls. urn-shaped, blue, to 1½ in. long, solitary and nodding, June–July. Eu., Asia.

intermedia: *C. eriostemon.*

Jackmani. A group of hybrids between *C. lanuginosa* and *C. Viticella*: climbing to 10 ft.: lvs. pinnate or the upper simple: fls. violet-purple, to 6 in. across, usually in 3's and forming terminal panicles.

koreana. Prostrate: lvs. of 3 toothed lfts. which are lobed or parted: fls. yellow or violet, solitary and nodding. Korea.

lanuginosa. Climbing to 6 ft.: lvs. simple or of 3 entire lfts.: fls. lavender or white, to 8 in. across, 1–3 together, July–Sept. China.

lasiantha. PIPESTEM C. Climbing: lvs. of 3 coarsely toothed or lobed lfts: fls. polygamous, white, to 2½ in. across, fragrant, 1–3 together, Apr.–May. Calif.

Lawsoniana. A group of hybrids between *C. lanuginosa* and *C. patens*: lvs. usually ternate: fls. rose-purple with darker veins, to 6 in. across, solitary. Var. **Henryi** (*C. Henryi*) has creamy-white fls.

ligusticifolia. Climbing to 20 ft.: lvs. of 5–7 coarsely toothed or 3-lobed lfts.: fls. diœcious, white, ¾ in. across, in cymes, Aug.–Sept. B. C. to Calif. and New Mex.

mandschurica: *C. recta* var.

montana. Climbing to 25 ft.: lvs. of 3 cut-toothed lfts.: fls. white turning pink, with yellow stamens, to 2 in. across, in 1–5-fld. clusters, fragrant, May–June Himalayas, China. Var. **grandiflora** has fls. to 3 in. across. Var. **rubens**, fls. rose or pink, lvs. purplish Var. **undulata** is a cross between *C. montana* and *C. gracilifolia*, with large bluish-white fls. Var. **Wilsoni** has fls. to 3 in. across.

ochroleuca (*Viorna ochroleuca*). Erect herb to 2 ft. lvs. simple and entire, sessile: fls. bell-shaped, yellow ¾ in. long, solitary and nodding, May–June. N. Y. to Ga.

orientalis (*C. graveolens*). Climbing to 20 ft.: lvs pinnate or bipinnate, the lfts. coarsely toothed or lobed: fls. yellow, to 2 in. across, solitary or in few-fld clusters, Aug.–Sept. Persia to Himalayas.

ovata (*Viorna ovata*). Erect herb to 2 ft.: lvs. simple and entire: fls. bell-shaped, purple, about 1 in. long, solitary and nodding, May–June. Va. to S. C.

paniculata. Climbing to 30 ft.: lvs. of 3–5 entire or lobed lfts.: fls. white, about 1 in. across, fragrant, in many-fld. panicles, Sept.–Oct. Japan. Var. **dioscoreæfolia** (*C. dioscoreæfolia*) has heart-shaped lfts. and broader sepals.

patens. Climbing to 12 ft.: lvs. of 3–5 entire lfts.: fls. violet to white, to 6 in. across, solitary, May–June. Japan. Var. **Fortunei** (*C. Fortunei*). Fls. creamy-white turning pink, to 5 in. across. Var. **grandiflora** has larger fls. Var. **Standishii.** Fls. lilac-blue: lfts. 3.

Pitcheri: *C. Simsii.*

pubescens. Climbing: lvs. of 3 slightly toothed or entire lfts.: fls. white, in panicles. Mex.

recta (*C. erecta*). Erect or ascending herb to 3 ft.: lvs. of 5–9 entire lfts.: fls. white, to 1 in. across, fragrant, in many-fld. terminal panicles, in summer. S. Eu. Var. **mandschurica** (*C. mandschurica*) is taller with terminal and axillary panicles. Var. **plena** has double fls.

reticulata (*Viorna reticulata*). Climbing to 10 ft.: lvs. of 3–7 entire leathery reticulated lfts.: fls. urn-shaped, yellowish outside, pale violet within, about ¾ in. long, solitary and nodding, July. S. C. to Fla. and Tex.

Scottii (*Viorna Scottii*). Erect herb to 1½ ft.: lvs. bipinnate, the petioles often twisted: fls. urn-shaped, purplish-brown, to 1¼ in. long, solitary, May–July. Wyo. to New Mex.

serratifolia. Climbing to 10 ft.: lvs. biternate, the lfts. toothed or lobed: fls. yellow with purple stamens, 2 in. across, 1–3 together, Aug.–Sept. Korea.

Sieboldii: *C. florida* var.

Simsii (*Viorna Simsii. C.* and *Viorna Pitcheri*) Climbing: lvs. of 3–7 entire or lobed lfts., the terminal one sometimes a tendril: fls. urn-shaped, purplish, to 1 in. long, solitary, in summer: achenes without plumose style. Ind. to Neb. and Tex.

Spooneri: *C. chrysocoma* var. *sericea.*

stans. Erect herb to 6 ft.: lvs. of 3 large coarsely toothed or lobed lfts.: fls diœcious, tubular, white or bluish, about ½ in. long, in long terminal panicles and axillary clusters, Sept.–Oct. Japan.

tangutica. Golden C. Climbing to 10 ft.: lvs. pinnate or bipinnate, the lfts. toothed or lobed: fls. bright yellow, to 4 in. across, usually solitary, June and again in autumn. Mongolia, N. China.

texensis (*C.* and *Viorna coccinea*). Scarlet C. Climbing to 6 ft.: lvs. of 4–8 rather thick glaucous lfts.: fls. urn-shaped, scarlet, about 1 in. long, solitary and nodding, July–Sept. Tex.

versicolor (*Viorna versicolor*). Climbing to 12 ft.: lvs. pinnate, the lfts. entire, glaucous beneath: fls. urn-shaped, ¾ in. long, purplish, solitary and nodding, July. Mo., Ark.

verticillaris (*Atragene americana*). Climbing or trailing to 10 ft.: lvs. of 3 entire or coarsely toothed lfts.: fls. purple, to 4 in. across, solitary, May–June. N. Amer.

Viorna (*Viorna Viorna*). Climbing to 10 ft.: lvs. of 5–7 entire or lobed lfts.: fls. urn-shaped, reddish-purple, about 1 in. long, solitary and nodding, May–Aug. Pa. to Ga. and Ala.

virginiana. Climbing to 20 ft.: lvs. of usually 3 coarsely toothed lfts.: fls. diœcious, white, to 1 in. across, in leafy panicles, Aug.–Sept. N. S. to Ga. and Kans.

Vitalba. Travelers-Joy. Old-Mans-Beard. Climbing to 30 ft.: lvs. of 5 entire, toothed or 3-lobed lfts.: fls. greenish-white, to 1 in. across, fragrant, in panicles, July–Sept. Eu., N. Afr., S. W. Asia.

Viticella. Climbing to 12 ft.: lvs. pinnate or bipinnate, the lfts. entire or 3-lobed: fls. blue, purple or rose-purple, the stamens yellow, to 2 in. across, 1–3 together, June–Aug.: achenes without plumose styles. S. Eu., W. Asia. Var. **kermesina** has wine-red fls.

CLEMENTSIA: *Sedum rhodanthum.*

CLEOME. *Capparidaceæ.* Trop. or warm-country herbs and subshrubs with simple or palmately compound lvs., white, green, yellowish or purplish fls. solitary or in racemes, petals narrow and stamens long, the ovary long-stalked (on a gynophore), and narrow capsular frs.

One annual species is commonly cultivated as a flower-garden and border subject for its rose-purple or white flowers; it is raised from seeds sown usually where the plants are to stand.

arborea. Pubescent white-fld. shrub of Venezuela; the *arborea* of the trade is sometimes (perhaps always) *C. spinosa.*

gigantea: *C. spinosa.*

grandis: see under *C. spinosa.*

integrifolia: *C. serrulata.*

pungens: *C. spinosa.*

serrulata (*C. integrifolia*). Glabrous ann., 2–3 ft., sometimes planted, formerly as a bee-plant: lfts. 3: fls. pink or white. N. Amer.

speciosa: *Gynandropsis speciosa.*

spinosa (*C. gigantea* of the trade. *C. pungens*). Spider-Flower. Pubescent erect strong-scented ann. to 4 ft., with short strong spines on the sts. and very long stamens and stalked pods: lfts. 5–7. Trop. Amer., sometimes run wild.—Some of the stock raised as *C. gigantea* and *C. grandis* is *Polanisia trachysperma* (which see).

CLERODENDRUM (*Volkameria*). Glory-Bower. *Verbenaceæ.* Trees, shrubs or herbs with opposite or whorled simple lvs. and white, violet or red fls. in terminal cymes or panicles, the stamens long-exserted; grown in the greenhouse or out-of-doors in the S. Propagated by seeds or cuttings of half-ripened wood kept in a temperature of about 70°.

Balfouri: *C. Thomsonæ.*

fallax: *C. speciosissimum.*

Fargesii: *C. trichotomum* var.

fœtidum. Shrub to 6 ft.: lvs. broadly ovate, to 1 ft. long, coarsely toothed, reddish pubescent beneath: fls. rose-red, ¾ in. across, in a head-like cluster to 8 in. across. China, adapted only to southern parts, as Fla., Gulf Coast, Calif.

fragrans. Shrub 5 to 8 ft.: lvs. broadly ovate, to 10 in. and more long, coarsely toothed, pubescent: fls. white or pale pink, 1 in. across, in terminal clusters resembling the hydrangea, fragrant, with exserted stamens and pistils. China, Japan; adapted Fla. to Calif.—The single-fld. form is seldom seen, the common one both in cult. and run wild being var. **pleniflorum,** with double fls. in a very compact head.

glabrum. Shrub or small tree, glabrous except sometimes on veins of lvs., which are opposite or whorled, oblong-ovate, to 5 in. long, mostly pointed, entire, glossy above: fls. small, white or pinkish, fragrant, in dense broad terminal cluster. S. Afr.; adapted to S. Calif., S. Fla.

japonicum (*C. squamatum*). Shrub to 10 ft.: lvs. oval, cordate at base, entire or toothed: fls. bright scarlet, in panicles. China.

Siphonanthus: *Siphonanthus indica.*

speciosissimum (*C. fallax*). Shrub to 4 ft.: lvs. ovate, heart-shaped at base, to 1 ft. long, entire or toothed, densely pubescent: fls. bright scarlet, to 2 in. across, in panicles to 1½ ft. long. Java.

speciosum. Hybrid between *C. Thomsonæ* and *C. splendens,* having dull red fls.

splendens. Twining shrub: lvs. oblong or elliptic, to 6 in. long: fls. bright scarlet or yellow, 1 in. across, in many-fld. cymes. Trop. Afr.—Grown under glass.

squamatum: *C. japonicum.*

Thomsonæ (*C. Balfouri*). Twining evergreen shrub, favorite in greenhouses: lvs. ovate, to 5 in. long, entire: fls. crimson with large white calyx, in branching racemes. W. Afr. Var. **delectum** has very large clusters of rose-magenta fls. Var. **variegata** is a variegated form.

trichotomum. Shrub to 10 ft.: lvs. ovate, to 5 in. long, entire or toothed, pubescent: fls. white with conspicuous reddish-brown calyx, in panicles. Japan; hardy N. Var. **Fargesii** (*C. Fargesii*) has smaller nearly glabrous lvs.

CLETHRA. White-Alder. *Clethraceæ.* Shrubs or small trees with alternate simple toothed deciduous or persistent lvs. and fragrant white or pink fls. in terminal racemes or panicles in late summer. Allied to Ericaceæ; species in E. Asia, E. N. Amer., Madeira, and in tropics; most of those listed below are hardy in northern or north-central states.

Propagated by seeds sown in pans in spring, greenwood cuttings under glass, layers, and division.

acuminata. To 15 ft.: lvs. oval or oblong, to 8 in. long, acuminate: racemes nodding, usually solitary. Va. to Ga.

alnifolia. Sweet Pepperbush. Summer Sweet. To 10 ft.: lvs. obovate, to 4 in. long, obtuse or acute: racemes erect, usually panicled. Me. to Fla. Var. **rosea** has pink fls.

arborea. To 20 ft., evergreen: lvs. narrow-elliptic, to 4 in. long, acuminate, shining above: racemes panicled; fls. fragrant. Madeira; not hardy N.

barbinervis. To 30 ft.: lvs. obovate, to 5 in. long, acuminate, pubescent: racemes panicled; fls. fragrant. Japan.

tomentosa. To 8 ft.: lvs. obovate, to 4 in. long, acute or acuminate, tomentose beneath: racemes erect, solitary or few. N. C. to Fla. and Ala.

CLETHRACEÆ. White-Alder Family. Only one genus, Clethra, which is grown for ornament. Family is characterized by regular bisexual fls. having 5-parted calyx, 5 separate petals, 10 stamens, superior 3-celled ovary, and capsular frs.

CLEYERA JAPONICA: *Eurya ochnacea.*

CLIANTHUS. *Leguminosæ.* Shrubs partially trailing and often trained on rafters in greenhouses or grown out-of-doors in the S., with pinnate lvs. of many small lfts., large papilionaceous fls. in pendulous axillary racemes, the keel petal long and beak-like, and cylindrical inflated pods. Propagated by seeds and cuttings and *C. Dampieri* by grafting on roots of *Colutea arborescens.*

Dampieri. Glory-Pea. To 4 ft., grayish-pubescent: fls. scarlet with a large purplish-black blotch at base of standard, to 3 in. long: pods to 2½ in. long. Australia.

puniceus. Parrots-Bill. Parrot-Beak. Red Kowhai. To 6 ft.: fls. crimson, to 3 in. long: pods to 3 in. long. New Zeal. Var. **albus** has white fls.

CLIFF-BRAKE: *Pellæa.*

CLIFTONIA MONOPHYLLA (*C. ligustrina*). Buckwheat-Tree. Titi. *Cyrillaceæ.* An evergreen shrub or small tree, native in swamps Ga., Fla. to La., may sometimes be transplanted to grounds. It has narrow simple lvs. to 2 in. long and terminal racemes of white-blush fls. in spring, and winged fr.

CLINOPODIUM: *Satureja.*

CLINTONIA. *Liliaceæ.* Herbs spreading by long underground rhizomes, having broad basal lvs. and fls. in umbels or solitary at end of scape, the perianth-segms. distinct; native in N. Amer. and E. Asia. There is another Clintonia which is properly Downingia, comprising the species *elegans* and *pulchella.*

Clintonias should be planted in moist shady and woodsy places. Propagated by division of roots in spring; attractive for colonizing.

Andrewsiana. To 1½ ft.: fls. rose-purple, ½ in. long, in umbels: berries blue. Calif.

borealis. To 1½ ft.: fls. greenish-yellow, ¾ in. long, nodding, in 3–6-fld. umbels: berries blue. E. N. Amer.

umbellata. To 1½ ft.: fls. white often spotted with purple, ⅓ in. long, in many-fld. umbels: berries black. N. Y. to Ga. and Tenn.

CLITORIA. Butterfly-Pea. *Leguminosæ.* Per. herbs or shrubs, often climbing, with pinnate lvs., showy papilionaceous fls., solitary or in axillary racemes, and flattened pods; grown for ornament far S. and also under glass. Propagated by seeds or cuttings under glass.

cajanifolia. Herb to 2 ft.: lfts. 3, gray-pubescent beneath: fls. pale violet, to 1½ in. long: pods to 2½ in. long. Trop. Amer., trop. Asia.—Grown as a cover-crop in the tropics.

mariana. To 3 ft., often twining: lfts. 3: fls. light blue, 2 in. long, June–July: pods to 2 in. long. N. J. to Fla. and Tex.

ternatea. Slender twiner: lfts. 5–7: fls. bright dark blue with lighter markings, 2 in. long: pods to 4½ in. long. Spread in the tropics, probably Asian.—An attractive climber, hardy only in southern parts. Fls. sometimes more or less double.

CLIVIA. Kafir-Lily. *Amaryllidaceæ.* S. African herbs with fleshy roots, the expanded lf.-bases forming bulb-like parts, narrow evergreen lvs., and showy reddish-yellow or scarlet fls. in terminal umbels, the perianth-tube short.

Clivias are good greenhouse or house subjects. Well-grown plants should be kept in the same pots for several years, giving applications of liquid manure. Water should be practically withheld during resting period. In subtropics they are grown in shady places. Propagated by division.

cyrtanthiflora (*Imantophyllum cyrtanthiflorum*). Hybrid between *C. miniata* and *C. nobilis.*

miniata (*Imantophyllum miniatum*). Lvs. to 1½ ft. long and 2 in. wide, thick and glossy: fls. erect, scarlet, yellow inside, to 3 in. long: berries bright red, 1 in. long.—The usual species in cult.

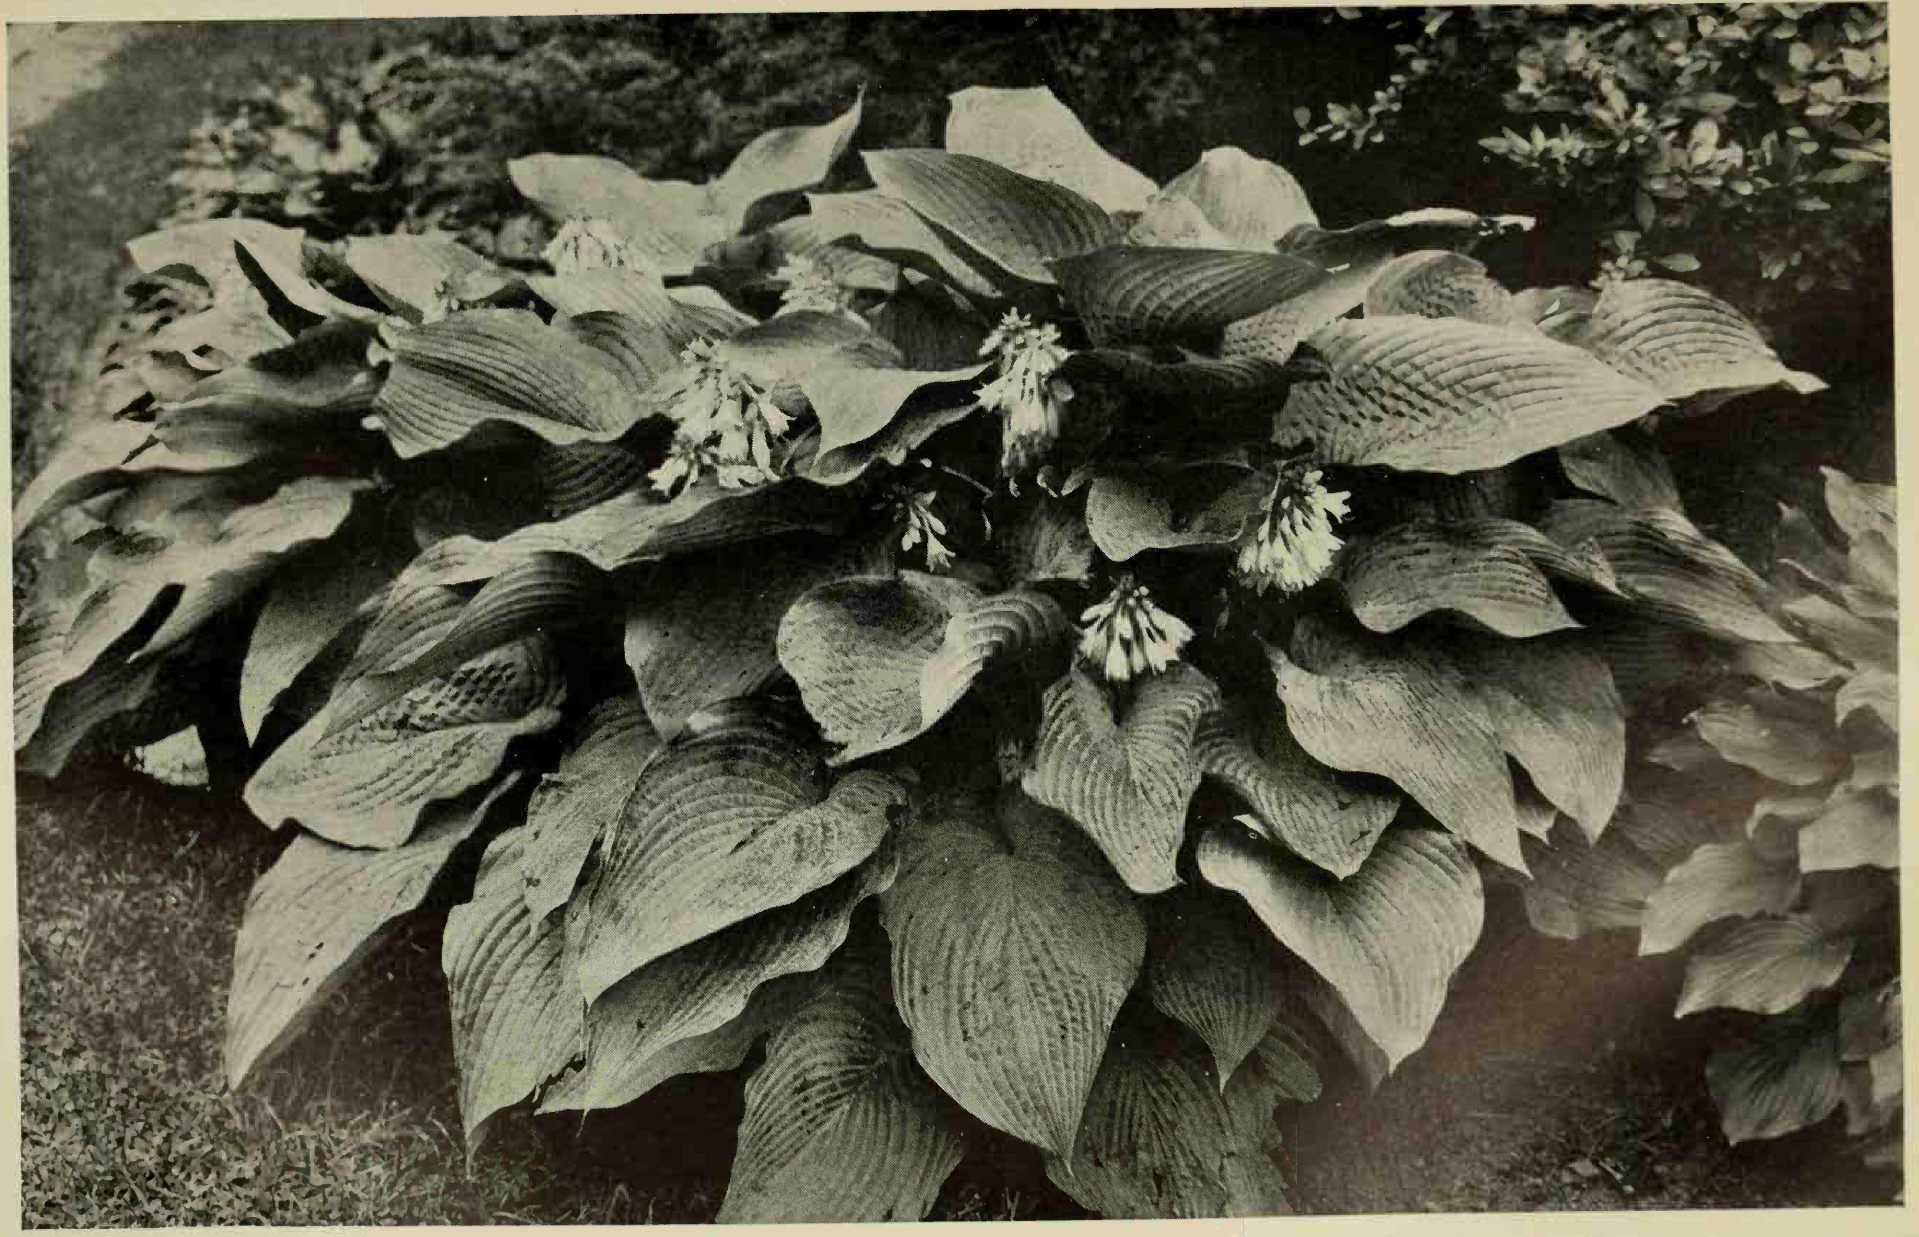
nobilis. Fls. many, drooping, narrower and shorter than in *C. miniata*, red and yellow and tipped green.

CLOCK-VINE: *Thunbergia.*

CLON. A variety or group or variation propagated only by asexual or vegetative parts. Such races do not "come true" from seeds. The horticultural varieties of roses, apples, oranges, strawberries, carnations are clons, also the cultivated forms of day-lilies and plantain-lilies that do not produce seeds. Clon is a horticultural rather than taxonomic term.

CLOUDBERRY: *Rubus Chamæmorus.*

CLOVER. Species of Trifolium. The clovers are primarily hardy forage and meadow plants and do not come within the range of this Hortus. Many of the species are interesting and showy in the garden, as for example *Trifolium rubens, T. incarnatum, T. alpestre, T. hybridum;* some of the small kinds are useful in the rock-garden. Clovers are best propagated by seeds; some of them are annuals but even the perennials are likely to be short-lived. *T. repens* may be increased by the rooting runners, but as a constituent of lawns it is started from seeds. See *Trifolium.*



V. A PLANTAIN-LILY. — *Hosta Sieboldiana*, a hardy perennial with heavy glaucous-green foliage, and nearly white flowers in late spring or early summer

CLOVER: *Trifolium, Medicago.* **Bokhara:** *Melilotus alba.* **Bur:** *Medicago.* **Bush:** *Lespedeza.* **Holy:** *Onobrychis viciæfolia.* **Hubam:** *Melilotus alba* var. *annua.* **Japan:** *Lespedeza striata.* **Mexican:** *Richardia scabra.* **Musk-:** *Erodium moschatum.* **Owls:** *Orthocarpus.* **Prairie:** *Petalostemum.* **Sweet:** *Melilotus.* **Tick:** *Desmodium.*

CLOVE-TREE: *Eugenia aromatica.*

CLUB-MOSS: *Lycopodium.*

CLUSIACEÆ: see *Guttiferæ.*

CLYTOSTOMA. *Bignoniaceæ.* Evergreen climbing shrubs with lvs. of 2 entire lfts. and a terminal tendril (or simple on blooming twigs), large attractive funnelform fls. in panicles, and prickly capsular frs.; native in S. Amer.

Clytostomas are grown under glass in the North and in the open in warm regions. They thrive in fertile soil. Propagated by cuttings.

callistegioides (*Bignonia speciosa*). Lfts. oval-oblong, to 3 in. long, wavy-margined: fls. lavender and streaked, to 3 in. long and 3 in. across. Brazil, Argentina.

purpureum (*Bignonia purpurea*). Lfts. ovate-oblong, to 3 in. long, usually entire: fls. mauve with white throat, 1 in. long. Uruguay.

CNEORIDIUM. *Rutaceæ.* Stiff-twiggy evergreen shrub 2–4 ft. high, on hills in S. Calif., with abundant very fragrant pedicelled fls. in upper axils or in very short clusters, nearly white inside and pinkish outside: lvs. linear, about 1 in. long, obtuse, dotted: fr. globose, drupe-like, reddish-brown, about ¼ in. diam. C. **dumosum** is the only species; adapted to cult. in its region.

CNEORUM, the only genus of *Cneoraceæ.* Shrubs with alternate leathery entire lvs. and solitary or cymose fls. having 3–4 sepals, petals and stamens, and fr. a 3-parted drupe; native in the Medit. region and Canary Isls.; to be grown in mild climates.

tricoccon. SPURGE-OLIVE. Evergreen, to 4 ft., glabrous: lvs. oblong, to 2 in. long, shining: fls. deep yellow, 1–3 in the axils: fr. greenish-black. S. Eu.

CNICUS. BLESSED THISTLE. *Compositæ.* One branching thistle-like ann. in the Medit. region and Caucasus, suitable for rock- and wild-gardens. Easily grown from seed. C. **benedictus** (*Carduus benedictus. Centaurea benedicta*). To 2 ft.: lvs. oblong, pinnately cut and toothed, spiny: heads yellow, 1 in. across, terminal, surrounded by leafy bristly bracts. See *Cirsium* and *Carlina* for other species advertised as Cnicus.

CNIDOSCOLUS: *Jatropha texana.*

COACH-WHIP: *Fouquieria splendens.*

COAT-FLOWER: *Tunica Saxifraga.*

COBÆA (*Rosenbergia*). *Polemoniaceæ.* Trop. American climbing shrubs with pinnately compound lvs. terminating in a branched tendril and bell-shaped violet or bright green fls. solitary in the axils, the calyx large, inflated and leaf-like; grown under glass and in the open. Treated as annuals. Propagated by seeds.

macrostoma. Climbing to 10 ft.: lvs. of 6 obovate lfts.: fls. yellowish-green, on long stalks. Guatemala.

scandens. Climbing to 25 ft.: lvs. of 4–6 oval or oblong lfts.: fls. violet or greenish-purple, 2 in. long and 1½ in. across, on very long stalks. Mex. Var. **alba** has white fls. and **purpurea** deeper purple.

COBNUT: *Corylus Avellana* var. *grandis.*

COCA: *Erythroxylon Coca.*

COCAINE-PLANT: *Erythroxylon Coca.*

COCCINIA (*Cephalandra*). *Cucurbitaceæ.* Slender tendril-bearing vines from the Asian and African tropics, perhaps a score of species, one of which is rarely seen under glass and is somewhat run wild in trop. Amer.: lvs. angled or lobed: plants mostly diœcious, the pistillate fls. solitary and staminate solitary or racemose: fr. roundish to oblong and somewhat berry-like, small, indehiscent.

cordifolia (*C. indica*). IVY GOURD. Climbing or prostrate, to 6 ft. or more, smooth, root per.: lvs. broadly triangular-ovate and angled, 2–4 in. across: fls. white, bell-shaped, corolla about 1½ in. long with sharp lobes: fr. ovoid or oblong, smooth, scarlet. Asia, Afr.

indica: *C. cordifolia.*

COCCOCYPSELUM (*Tontanea*). *Rubiaceæ.* Prostrate herbs of trop. Amer. with opposite simple lvs. and funnelform fls. in heads; one suitable for ground-cover or basket-plant.

guianense. Lvs. ovate, to 2½ in. long, hairy: fls. purplish, small: fr. a blue berry about ¾ in. long. Trinidad, N. S. Amer.

COCCOLOBIS (sometimes spelled *Coccoloba*). *Polygonaceæ.* Trop. and subtrop. American trees and shrubs with alternate entire often very large lvs., greenish fls. in racemes or spikes and fleshy berry-like frs.

Grown out-of-doors in warm and frostless climates, and under glass northward. They do best in rich sandy soil. Propagated by seeds, cuttings of ripe wood and layering.

floridana (*C. laurifolia*). PIGEON-PLUM. Small tree near coast in S. Fla.: lvs. oblong, entire, 2–4 in. long: racemes short bearing edible pear-shaped fr. about ½ in. long.

grandifolia (*C. pubescens*). Tree to 80 ft.: lvs. orbicular, to 3 ft. across, rusty-pubescent below and with prominent veins: fls. greenish, in erect terminal racemes to 2 ft. long.—Grown in its juvenile stage as a pot-plant for the great ornamental lvs.

laurifolia: *C. floridana.*

pubescens: *C. grandifolia.*

uvifera. SEA-GRAPE. Tree to 20 ft. or more: lvs. orbicular, to 8 in. across, cordate at base, leathery, glossy and veined red: fls. white, in dense racemes to 10 in. long: frs. purple, resembling bunches of grapes, used for jelly. A characteristic native tree on coasts from S. Fla. southward.

COCCOTHRINAX. *Palmaceæ.* Ten or a dozen small or slender unarmed hermaphrodite fan-palms of Fla., W. Indies, Cent. Amer., distinguished from Thrinax by the spadix mostly shorter than petioles (and often curling or incurving with age), stamens mostly 9–12, fr. dark colored inside and out, berry-like, albumen ruminate and outside of seed furrowed to correspond, and usually more pliable lvs. with more drooping segms. See *Palm.*

argentea (*Thrinax argentea. Thrincoma alta*). Variable palm, known under several Latin names, to 30 ft. high but sometimes almost stemless: lvs. nearly orbicular, 2–3 ft. across, shining green above and silvery-white underneath, cleft beyond middle into about 60 rather narrow segms.: spadix commonly shorter than petioles; stamens mostly 9: fr. globose, about ⅜ in. diam., and seed about ¼ in. Bahamas to Trinidad; in S. Fla.—*C. jucunda* is probably not separable, and in the northern limits of its range, as about Miami, it is very low or almost stemless (*C. Garberi*). The palm sometimes planted as *Thrinax altissima* may belong here. An attractive palm.

barbadensis (*Thrinax barbadensis*). Large palm, for the genus, with straight trunk to 40 or 50 ft.: lvs. relatively large, green on both sides but with slight silvery down beneath, deeply cut into 30 or more segms. which are 2 in. or so broad: spadix long, to 18 or 20 in.; stamens 12: fr. spherical, nearly ½ in. diam.; seed about ¼ in. diam. Lesser Antilles.

Garberi: *C. argentea.*

jucunda: *C. argentea.*

Miraguano. Slender palm to 20 ft., with small head, the trunk soon becoming bare: lvs. stiff, silvery-white underneath, the 20–30 deep segms. of the orbicular blade very stiff, base of petiole fibrous-reticulate: fls. small, pedicelled. Plains and hillsides, Cuba.

COCCULUS (*Cebatha. Epibaterium*). Snailseed. *Menispermaceæ.* Shrubs, erect or twining, with alternate, entire or lobed lvs., small unshowy unisexual fls. in racemes or panicles, and drupaceous frs.; of wide distribution. Easily cult. in moist soil. Propagated by seeds or cuttings of half-ripened wood under glass.

carolinus. Carolina Moonseed. Twining: lvs. ovate, to 4 in. long, entire or 3–5-lobed, pubescent beneath: panicles to 5 in. long: fr. red. Va. to Fla. and Tex.; hardy well N.

laurifolius. Evergreen shrub to 15 ft.: lvs. oblong, to 6 in. long, leathery and shining: panicles to 2 in. long: fr. black. Himalayas; adaptable only in warm climates.

trilobus. Twining: lvs. ovate, to 3½ in. long, entire or 3-lobed, pubescent on both sides: fls. in axillary cymes: fr. black. Japan, China, Philippines; hardy N.

COCHEMIEA. *Cactaceæ.* A few small cylindric tubercled cacti of Lower Calif. with tubular slender scarlet fls. bearing petal-like sepals, formerly included in Mammillaria and treated the same under cult. See *Cacti.*

Halei (*Mammillaria Halei*). Cespitose, sts. nearly upright to 20 in., densely covered with spines, tubercles short with woolly axils, radials 10–20, centrals 3 or 4: fls. to 2 in. long.

Poselgeri (*Mammillaria Poselgeri* and *M. Roseana*). Sts. numerous, sometimes creeping or hanging, often 6 ft. long and 1½ in. thick, tubercles far apart and somewhat flattened, radials 7–9, central 1 and hooked: fls. about 1¼ in. long.

setispina (*Mammillaria setispina*). Sts. ascending, to 1 ft. high, axils woolly; radials 10–12 and white with black tips, centrals 1–4: fls. not described.

COCHINEAL PLANT: *Nopalea cochenillifera.*

COCHLEARIA. Scurvy-Grass. *Cruciferæ.* One little bien. or per., C. officinalis, of high northern regions, is a medicinal plant, and has been grown as a salad plant but the tarry flavor is against it for most persons. For salad, it is grown as an ann., lvs. being ready two to three months after sowing; succession sowings may be made. The plant prefers a cool position, or one partially shaded. It grows 1 ft. high, less or more, when in bloom; the early basal lvs. are heart-shaped or kidney-shaped; fls. small, white, in spring; pod or silicle ¼ in. or less long. Other species of Cochlearia inhabit the colder parts of north temp. zone but are not cult. For *C. saxatilis* see *Kernera.*

COCHLOSPERMACEÆ. Cochlospermum Family. Two genera of woody plants native in trop. regions, separated from Bixaceæ on technical characters of fls. and capsules. Cochlospermum is treated below.

COCHLOSPERMUM (*Maximilianea*). *Cochlospermaceæ.* Trop. trees or shrubs with palmately lobed or divided lvs., fls. in racemes or panicles appearing at end of dry season before the lvs., and capsular fr.; one species grown in tropics and intro. in S. Calif.

vitifolium. Tree to 40 ft.: lvs. alternate, deeply 5-lobed, to 1 ft. across, the lobes toothed: fls. bright yellow, 4 in. and more across, in terminal clusters, with numerous stamens: caps. to 3 in. long, velvety-pubescent. Mex., Cent. and S. Amer.

COCKSCOMB: *Celosia argentea* var. *cristata.*

COCKS-EGGS: *Salpichroa rhomboidea.*

COCKS-FOOT: *Dactylis glomerata.*

COCONUT. The fruit of *Cocos nucifera*, a widespread palm. The products of the coconut tree are mainly four: toddy or beverage derived from the sap obtained from incising the flower-clusters and which may also be a source of sugar; coir, the fiber from the husk of the nut, much used in cordage and in the making of brushes and mats and otherwise; copra, the dried meat of the nut, employed in the making of oil; the mature edible nut itself.

Coconuts thrive in the tropics, but not necessarily on the seacoast, and grow well in southern Florida but the nuts are there less an article of commerce than for propagating purposes; that is, in Florida they are planted for ornament and home use. The tree is grown only from seeds, which are ordinarily planted in a shaded seed-bed with the nut not completely covered and preferably once or more transplanted before being set in permanent place. When only a few trees are desired, the nut may be planted where the plant is to grow if quick effects are not desired. For fruit-bearing, the trees are planted when perhaps three or four years old. About 25 feet apart each way is a good spacing for a commercial grove. Ordinarily coconuts receive little attention in tillage or fertilizing but they respond to good treatment as well as other plants. A few fruits may be borne in four or five years but no important yield is to be expected before about ten years. Beyond twenty years the grove should be in full bearing. A good tree on fertile ground should yield 75 or more nuts a year, but the average is probably not more than one-third of this number. There are many varieties of coconuts; and in any case the grower should choose nuts from trees producing abundantly of choice fruits if he expects the best product.

COCONUT, DOUBLE: *Lodoicea.*

COCOS. *Palmaceæ.* As now defined, a monotypic genus including only the coconut, C. nucifera, the nativity of which is in doubt but by most authorities considered to be of Asiatic or Polynesian origin. Ubiquitous practically unarmed tree in trop. littorals, reaching 60–80 ft. or more, with a more or less crooked or inclined trunk, the spadices from the lower axils of the crown; spathe striate on the outside but not plicate-sulcate: lvs. pinnate, to 15 or more ft. long; pinnæ many, linear-lanceolate and long-pointed, of firm texture: staminate fls. numerous and borne on the upper part of the branches of the spadix, the few large pistillate fls. near the base; stamens 6; sepals and petals of pistillate fls. convolute-imbricate: fr. very large, 1-seeded, with an interior cavity containing nutrient liquid. An abundant tree in southern part of peninsular Fla., apparently spontaneous on some of the Keys. See *Coconut.*

The breaking up of the old genus Cocos places the kinds planted in the U. S. or in our literature under the following genera: Arecastrum, Arikuryroba, Butia, Rhyticocos, Syagrus. Following are the Cocos names likely to be met in lists:

Alphonsei: unrecognized name.

amara: *Rhyticocos amara.*

Arechavaletana: *Arecastrum Romanzoffianum* var. *australe.*

argentea: *Syagrus argentea*, apparently not cult., and probably the hort. name belongs with another palm.

australis: *Butia capitata*; of botanists, *Arecastrum Romanzoffianum* var. *australe.*

Blumenavia: see *Butia eriospatha.*

Bonneti: *Butia Bonneti.*

botryophora: *Arecastrum Romanzoffianum* var. *botryophorum.*

braziliensis: unidentified name.

campestris: *Syagrus campestris*, probably not in cult. here, but the name has been attached to a Butia.

capitata: *Butia capitata.*

comosa: *Syagrus comosa*, apparently not in cult., but name has been associated with a Butia.

coronata: see *Butia capitata.*

Datil: *Arecastrum Romanzoffianum* var. *australe.*

eriospatha: *Butia eriospatha.*

flexuosa: *Arecastrum Romanzoffianum* var. *australe*; of botanists, a Syagrus apparently not in cult.

Gaertneri: *Butia Bonneti.*

humilis: unidentified name; has been applied to a Butia.

insignis: *Syagrus insignis.*

lapidea: confused name; has been attached to a Butia.

littoralis: unidentified name; has been used for a Butia.

macrocarpa: *Syagrus macrocarpa.*

Mariæ-Reginæ: unidentified name.

maritima: unidentified name.

Maximiliana: probably a Syagrus.

Nehrlingiana: *Butia Nehrlingiana.*

Normanbyi: *Normanbya Normanbyi.*

odorata: *Butia capitata* var. *odorata.*

paraguayensis: *Butia Yatay* var.

petræa: *Syagrus petræa.*

plumosa: *Arecastrum Romanzoffianum.*

Procopiana: *Syagrus macrocarpa.*

pulposa: *Butia capitata* var. *pulposa.*

Romanzoffiana: *Arecastrum Romanzoffianum.*

rupestris: *Syagrus petræa.*

sapida: *Syagrus sapida*, probably not grown here; the hort. name may mean *Rhopalostylis sapida.*

schizophylla: *Arikuryroba schizophylla.*

vinifera: applied to an undetermined Butia.

Weddelliana: *Syagrus Weddelliana.*

Yatay: *Butia Yatay.*

Yurumaguas: see *Butia Yatay* var. *paraguayensis.*

CODARIOCALYX: *Desmodium gyrans.*

CODIÆUM (*Phyllaurea*). CROTON (of florists). *Euphorbiaceæ.* Shrubs from the Old World tropics with thick alternate simple or lobed lvs., small monœcious fls. in axillary racemes, and capsular fr.; extensively grown in southern regions and under glass for the colored ornamental foliage, exceedingly variable.

Any good soil is suitable for crotons. They develop better coloring if planted in sunny situations. Propagated by seeds, but named sorts should be increased by cuttings of half-ripened wood over bottom heat. Separate plants may be produced from large branches by air-layering; a cut is made in the stem below the leaves and tied with moss; roots will form in about three weeks and the part may be cut and potted as an independent plant.

variegatum var. **pictum**. To 6 ft. and more: lvs. ovate-lanceolate to linear, entire or lobed, sometimes cut almost to midrib, variously marked with white, yellow or red: fls. white.—Runs into numerous named forms of which the following are the best known: **amabile** with bright-colored lanceolate lvs.; **anatomense** with narrow lvs.; **Andreanum** with broad yellow lvs.; **aucubæfolium** with broad yellow red-blotched lvs.; **aureo-maculatum** with green lvs. spotted yellow; **Bergmanii** with broad cream-yellow lvs. blotched with green; **brilliantissimum** with narrow lvs.; **bruxellense** with broad lvs.; **Chantrieri** with narrow red lvs.; **Chelsoni** with yellow red-mottled lvs.; **Childsoni** with narrow lvs.; **cornutum** with mottled yellow lvs. and projecting midribs; **Craigii** with 3-lobed lvs.; **Cronstædii** with spirally twisted lvs. variegated yellow; **Davisii** with narrow lvs. variegated white; **edmontense** with narrow bright-colored lvs.; **elegantissimum** with narrow yellow dotted lvs. and red petiole; **Evansianum** with 3-lobed yellow lvs. veined and mottled with red; **fasciatum** with broad lvs. veined yellow; **filifolium aureum** with narrow lvs.; **Hammondii** with narrow lvs.; **Hanburyanum** with narrow yellow lvs. marked with rose; **illustre** with 3-lobed lvs. variegated with yellow; **inimitable**, lvs. yellow veined with red; **interruptum**, lvs. yellow with red midrib, sometimes twisted; **irregulare** with irregular lvs. and yellow spots and midrib; **Jamesii** with broad lvs. irregularly blotched with yellow or white; **macrophyllum** with large lvs.; **montefontainense** with slightly 3-lobed red lvs. veined with yellow; **Mortii**, lvs. broad, green and yellow; **musaicum** with yellow and green lvs.; **Newmannii** with broad dark crimson lvs.; **nobile** with linear yellow lvs. variegated with red; **picturatum** with richly colored lvs.; **Pucciana** with broad lvs.; **punctatum aureum** with narrow lvs.; **Reidii**, lvs. yellow variegated with red; **roseo-pictum**, lvs. variegated with yellow and red; **ruberrimum**, linear crimson lvs. marked with creamy white; **rubro-lineatum** with yellow lvs. shaded with crimson; **Sanderi** with broad irregularly blotched lvs. **Schattii** with broad lvs.; **Sinitzianum** with narrow lvs. spotted with yellow or white; **superbum**, narrow lvs. mottled green and yellow; **Thomsonii**, lvs. prominently yellow marked; **tortile** with spirally twisted lvs. variegated with red; **trilobum** with 3-lobed yellow blotched lvs.; **undulatum**, broad wavy lvs. veined with red or purple; **variabilis** with narrow lvs.; **Veitchii** with broad lvs. variegated with red; **volutum** with narrow lvs.; **Warrenii**, lvs. yellow variegated with red; **Weismanii** with narrow wavy-margined lvs. variegated with yellow and with red petiole.

CODONOPSIS. *Campanulaceæ.* Asian per. herbs, upright or climbing, with mostly alternate lvs., 5-lobed bell-shaped fls., and capsular frs.; the first species sometimes grown in the rock-garden, and requires winter protection in the N.

clematidea (*Glosocomia clematidea*). To 3 ft.: lvs. ovate: fls. white tinged with blue. Mts. of Asia.

ovata. To 1 ft., sts. decumbent: lvs. ovate, to ¾ in. long: fls. pale blue spotted inside, to 1¼ in. long, solitary and terminal. Himalayas.

silvestris. Climbing: lvs. ovate, wavy-toothed, glaucous beneath: fls. pale yellowish-purple, solitary. Manchuria.

viridiflora. Climbing: lvs. ovate, wavy-toothed: fls. greenish-yellow. W. China.

CŒLIA. *Orchidaceæ.* Epiphytes native in Cent. Amer. and W. Indies having pseudobulbs bearing 2–4 lvs. and fls. in dense racemes, the column produced into a foot to which the lateral sepals are attached at base. For cult. see *Orchids.*

Baueriana: *C. triptera.*

macrostachya. Lvs. lanceolate, to 14 in. long: fls. rose, on scapes as long as lvs., the lip with 2 small sacs below, Aug.–Sept. Mex.

triptera (*C. Baueriana*). Lvs. broad-linear, 4 in. and more long: fls. white, on scapes as long as lvs., the ovary sharply winged, Feb.–Apr. Mex., W. Indies.

CŒLOGLOSSUM: *Habenaria bracteata.*

CŒLOGYNE. *Orchidaceæ.* Epiphytes from the eastern hemisphere having pseudobulbs bearing 1–2 lvs. and showy fls. in racemes, the sepals and petals similar, the lip 3-lobed and keeled; grown under glass, often suspended, mostly in intermediate temperatures. See *Orchids.*

asperata. Lvs. to 2½ ft. long and 5 in. wide: fls. white, fragrant, 3 in. across, in many-fld. drooping racemes to 16 in. long, the lip marked with yellow-brown and wavy at margins, Apr.–July. E. Indies, Philippine Isls.

barbata. Lvs. to 16 in. long and 2 in. wide: fls. white, in a dense raceme longer than lvs., with brown fringed lip, Oct.–Dec. Himalayas.

corrugata: *C. nervosa.*

cristata. Lvs. to 1 ft. long and 1 in. wide: fls. in drooping racemes, snow-white with 5 yellow keels on lip, Jan.–Apr. Himalayas. Var. **hololeuca** (var. *alba*) has white keels. Var. **Lemoniana** has keels fringed with citron-yellow. Var. **maxima** has very large fls.

Dayana. Lvs. to 20 in. long and 4 in. wide: fls. to 2½ in. across, in drooping racemes to 3 ft. long, cream-white, with the lip chocolate-brown inside and with 6 white keels, Apr.–June. Malaya.

elata. Lvs. to 1 ft. long and 2½ in. wide: fls. in 4–10-fld. racemes on scapes to 20 in. long, pure white with orange-red spot on lip and 2 yellow keels, Apr.–June. Himalayas.

fimbriata. Lvs. to 5 in. long and ¾ in. wide: fls. in 1–2-fld. racemes, greenish-yellow with lip marked with brown and fringed, Aug.–Oct. China.

flaccida. Lvs. to 1 ft. long and 1 in. wide: fls. in 7–12-fld. racemes to 10 in. long, white with lip yellow in middle and with 3 orange-brown keels, Mar.–Apr. Himalayas.

fuliginosa. Lvs. to 6 in. long and 1 in. wide: fls. in 2–3-fld. racemes shorter than lvs., brownish-yellow with fringed lip spotted with brown, Nov.–Dec. Himalayas.

Huettneriana. Lvs. to 1 ft. long and 2 in. wide: fls. in 2–5-fld. racemes, white with lip citron-yellow at base, Apr.–June. Burma. Var. **lactea** (*C. lactea*) has white lip.

lactea: *C. Huettneriana* var.

Lawrenceana. Lvs. to 10 in. long, and 1 in. wide: fls. in 1–3-fld. racemes to 10 in. long, large, brownish-white, the lip with brownish side lobes and middle lobe with large brown spot and yellow spot at base, Mar.–Apr. Cochin-China.

lentiginosa. Lvs. to 7 in. long and 1½ in. wide: fls. in 4–6-fld. racemes to 4 in. long, bright straw-yellow with side lobes of lip edged with brown and middle lobe spotted with orange-yellow, Mar.–May. Burma.

Massangeana. Lvs. to 20 in. long and 5 in. wide: fls. in many-fld. drooping racemes to 2 ft. long, cream-white with lip marked with yellow and brown and white keels, June–July. Malaya.

Mayeri. Lvs. to 8 in. long and 1 in. wide: fls. in 3–5-fld. racemes to 6 in. long, green with lip marked with dark brown, Aug.–Sept. Singapore.

Mooreana. Lvs. to 20 in. long and 1½ in. wide: fls. in 3–8-fld. racemes to 16 in long, snow-white with lip spotted with golden-yellow, Apr.–May. Cochin-China.

nervosa (*C. corrugata*). Lvs. to 6 in. long and 1 in. wide: fls. in 7–12-fld. racemes, white with lip marked yellow, July–Sept. India.

nitida (*C. ocellata*). Lvs. to 6 in. long and 1 in. wide: fls. in 3–5-fld. racemes, white with golden-yellow spots on lip, Feb.–Mar. Himalayas. Var. **maxima** has larger fls.

ocellata: *C. nitida.*

pandurata. Lvs. to 14 in. long and 2½ in. wide: fls. in 3–8-fld. arching racemes to 8 in. long, green with warty lip marked with dark brown, Aug.–Oct. Borneo.

prolifera. Lvs. to 7 in. long: fls. in many-fld. racemes, greenish-yellow. Himalayas.

Sanderiana. Lvs. to 14 in. long and 2½ in. wide: fls. in 5–9-fld. racemes to 1 ft. long, white with side lobes of lip marked with brown, the middle lobe yellow with 5 yellow keels, Apr.–May. India.

sparsa. Lvs. to 4 in. long and 1½ in. wide: fls. in 3–5-fld. arching racemes to 3 in. long, white with side lobes of lip brown and 3 yellow keels, June–July. Philippine Isls.

speciosa. Lvs. to 10 in. long and 2½ in. wide: fls. in 2–3-fld. racemes, greenish-yellow, the lip brown inside with 2 long brown ridges, Apr.–July. Malaya.

tomentosa. Lvs. to 14 in. long and 3 in. wide: fls. in pendulous racemes to 20 in. long, yellow with side lobes of lip edged with brown and yellow keels, Apr.–May. Malaya.

COFFEA. Coffee. *Rubiaceæ.* Evergreen shrubs and trees with usually opposite lvs., cream or white salverform fls. in axillary clusters, and a small 2-seeded colored berry; native in Asia and trop. Afr. and widely grown in the tropics for the coffee "beans" which are really the seeds within the pulpy fr.

In the United States coffee is grown only occasionally as an ornamental subject and for its general interest, and is sometimes seen under glass. Propagated by cuttings of ripe wood, and in the tropics by seeds from which the pulp is removed.

arabica. Common or Arabian C. Shrub to 15 ft.: lvs. oval, to 6 in. long, shining dark green: fls. pure white, fragrant, 5-lobed, ¾ in. long: fr. red, ½ in. long. Trop. Afr.

liberica. Liberian C. Shrub: lvs. obovate, to 1 ft. long, shining: fls. 6–7-lobed, 1 in. long: fr. black, ¾ in. long. Trop. Afr.

Zanguebariæ. Zanzibar C. Tree to 6 ft.: lvs. oval or obovate, to 4 in. long: fls. 6–7-lobed: fr. red turning black, ½ in. long, nerved longitudinally. Trop. Afr.

COFFEE: *Coffea.* **-Berry:** *Rhamnus californica.* **Tree, Kentucky:** *Gymnocladus dioica.* **Wild-:** *Psychotria.*

COGSWELLIA: *Lomatium.*

COHERENT: two or more similar parts or organs joined.

COHOSH: *Actæa.* **Black:** *Cimicifuga racemosa.* **Blue:** *Caulophyllum thalictroides.*

COIR: see *Coconut.*

COIX. *Gramineæ.* Tall grasses with broad lvs., grown for the peculiar bead-like involucre which contains the pistillate spikelets, the staminate spikelets deciduous and borne on the axis projecting from the bead; source of a cereal food (adlay) in Asia. See *Grasses.*

Lacryma-Jobi. Jobs-Tears. Per. but grown as an ann. and not winter-hardy in cold countries, to 4 ft.: lvs. to 2 ft. long and 1½ in. wide: beads from pearly white to lead color, to 1½ in. across, hard and shining. Trop. Asia, but nat. elsewhere. Var. **aurea zebrina** has lvs. striped yellow.

COLA. *Sterculiaceæ.* Trop. African trees with alternate entire or lobed lvs., unisexual or polygamous fls. without petals borne in axillary panicles, and fr. of 4–5 leathery or woody carpels; grown in the tropics for the kernel of the fr. which is used in making drinks and in medicine.

Colas do best on sandy loam soil. Propagated by seeds, preferably singly in pots and then set out permanently, as they do not transplant well; also by cuttings of mature wood over heat.

acuminata. Cola or Goora Nut. To 40 ft. evergreen: lvs. entire, obovate, to 8 in. long, leathery: fls. yellow: fr. to 6 in. long.

COLCHICUM. Autumn-Crocus. *Liliaceæ.* Mostly autumn-blooming cormous herbs with broad basal lvs. the following spring, and very long-tubed purple or white fls. arising from the ground without sts.

Adapted to the sunny border and a loamy soil. Bulbs should be planted 2–3 inches deep in August or September, and not lifted until they show signs of deterioration. Propagated by separation of bulbs and by seeds.

autumnale. To 4 in.: lvs. to 2 in. wide: fls. purple or white, sometimes double, to 4 in. across, in autumn. Eu., N. Afr. Var. **album** has white fls., **atropurpureum** purple. Var. **major** is more robust.

Bornmuelleri. To 8 in.: lvs. to 2 in. wide: fls. rose or lilac turning purple, the tube white, 5 in. across, in autumn. Asia Minor.

byzantinum. To 6 in.: lvs. to 4 in. wide: fls. lilac-purple, to 4 in. across, many from a spathe, in autumn. S. E. Eu.

giganteum: hort. form with pink fls.

speciosum. To 1 ft.: lvs. to 4 in. wide: fls. violet with white throat or pink, to 6 in. across, in autumn. Caucasus. Var. **album** has white fls. Var. **illyricum** is listed.

variegatum. To 3 in.: lvs. 1 in. wide: fls. rose with white tube, checkered, to 4 in. across, in autumn. Greece, Asia Minor.

COLE, COLEWORT. A general name for what may be called the true Brassicas as distinguished from the mustards. The term covers the blue-leaved species, mostly biennial, as the cabbage tribe, kohlrabi, rutabaga, rape.

COLEONEMA. *Rutaceæ.* S. African shrubs with scattered linear lvs., fls. solitary in the axils, and capsular frs.; two species sometimes planted in warm climates and grown under glass in pots. For cult. see *Diosma.*

album (*Diosma alba*). To 1 ft. or more, much branched: lvs. ½ in. long: fls. white, about ⅛ in. across.

pulchrum. Taller than *C. album*, with longer lvs. and larger red fls.

COLEOSANTHUS: *Brickellia.*

COLEUS. *Labiatæ.* Ann. or per. showy-lvd. herbs grown in the window-garden, greenhouse, porch boxes, and to some extent for bedding-out: lvs. toothed: fls. small or medium-sized, usually blue or lilac, in terminal spike-like racemes; native in tropics of Old World.

Coleus is very easily propagated from short cuttings taken at any time; seeds produce many interesting variations. New plants from cuttings every year give best results.

amboinicus (*C. aromaticus*). Per. to 3 ft., hairy-pubescent: lvs. broad-ovate, to 2 in. long, coarsely round-toothed, fleshy: fls. pale purplish. India, E. Indies.—Cult. in trop. Amer. and shoots sometimes seen in market as "Spanish thyme"; aromatic.

aromaticus: *C. amboinicus.*

Blumei. The common cult. coleus, in many forms: per. to 3 ft., erect: lvs. ovate, acuminate or pointed, obtusely toothed, 4 in. or more long, variously colored with yellow, dull red and purplish, sometimes deeply cut: fls. dark blue or whitish, the whorls nearly sessile in the spike. Java. Var. **Verschaffeltii** is more branching and brilliantly colored.

lanuginosus. Herb, the root bearing tubers: lvs. ovate, to 3 in. long, densely pubescent: fls. in short-stalked clusters in long loose panicles. Cent. Afr.

ornatus: hort. name for a large-lvd. form of *C. Blumei.*

Persoonii. Erect herb: lvs. ovate, wrinkled and soft-pubescent, in many-fld. nearly sessile clusters. Madagascar.

pumilus. Sts. lax, more or less decumbent and rooting at lower joints: lvs. small, mostly 2 in. or less long, broad and obtuse, coarsely toothed, sometimes lighter colored along rib and nerves: fls. small, in long racemes. Philippines; sometimes cult., and somewhat escaped in S. Fla.

shirensis. Per. to 3 ft.: lvs. ovate, to 3 in. long, deeply toothed, pubescent beneath: fls. dark blue, in stalked clusters in large erect terminal panicles. Cent. Afr.

thyrsoideus. Bush C. Shrub to 3 ft.: lvs. cordate-ovate, to 7 in. long: fls. bright blue, the clusters in the spike-like racemes long-stalked. Cent. Afr.

COLEWORT: see *Cole.*

COLIC-ROOT: *Dioscorea villosa.*

COLLARD, COLLARDS. A large kale, *Brassica oleracea* var. *acephala*, grown in the South for greens. It is biennial or potentially perennial, producing a hard stock 1–2 feet high and bearing a loose crown of cabbage-like leaves which are eaten. Sometimes collards are grown as a winter annual for spring use; and sometimes the leaves are taken as needed and the plant allowed to stand for a year or more, where winters are very mild. The usual procedure is to sow seeds in spring in a seed-bed, transplant to 3 or 4 feet apart in the field, till through the season, and harvest the crop in autumn; the plant endures hot weather better than cabbage. If seed is wanted, the stocks may be allowed to stand where climate permits, or they may be stored for the winter and planted out the next year as are cabbage stumps.

Sometimes young cabbage plants, or related things, are erroneously called collards when used for greens.

COLLETIA. *Rhamnaceæ.* Spiny stiff S. American shrubs with thickened often flattened branchlets, the lvs. very small or usually wanting, yellowish or white fls., and fr. a leathery 3-lobed caps.; grown out-of-doors in warm regions or under glass as a curiosity. Propagated by seeds or cuttings of half-ripened wood.

armata. Branches and spines usually pubescent, spines straight or slightly curved, to ¾ in. long, lvs. small: fls. Sept.–Dec. Chile.

cruciata. Anchor-Plant. To 4 ft., with very broad-spiny flattened branches and few small lvs.: fls. yellowish-white, in autumn. S. Brazil, Uruguay; seen in Fla. and S. Calif.

Ephedra. Small shrub with flattened branches: fls. white, in spring. Chile.

horrida: a synonym of the true *C. spinosa* but in hort. applied either to *C. cruciata* or *C. infausta.*

infausta. To 10 ft., the stiff green branches with cylindrical spines to 1 in. long and small lvs.: fls. greenish-white, in early spring. Chile.

spinosa of gardens is *C. infausta* or *C. armata;* the true *C. spinosa* from Peru is not in cult.

COLLINSIA. *Scrophulariaceæ.* Hardy herbaceous attractive annuals with lvs. opposite or in whorls of 3's, the bell-shaped 2-lipped fls. in the axils of the lvs. either solitary or in umbel-like clusters, blooming in midsummer, the colors ranging from white, lilac, rose to violet and clear bright blue; mostly native in W. N. Amer.

Collinsias require only the usual treatment for annuals; the seed may be sown outdoors in autumn, if well protected in winter, but preferably in spring in the North.

bartsiæfolia. SEASIDE C. To 1 ft., sticky: lvs. ovate to linear, 1 in. long: fls. nearly sessile, whitish, marked with lilac or purple, with short upper lip. Calif.

bicolor. To 2 ft., glabrous or sticky: lvs. oblong, toothed, to 2 in. long: fls, nearly sessile, to 1 in. long, lower lip violet or rose-purple, upper lip white. Calif. Var. **candidissima** has all white fls. Var. **multicolor** (*C. multicolor*) has variegated fls.

candidissima: *C. bicolor* var.

grandiflora. BLUE-LIPS. To 15 in.: lvs. oblong to linear, to 1¾ in. long, entire: fls. to ¾ in. long, with pedicels length of fls., lower lip deep blue or violet, upper lip purple or white. Calif. to B. C.

multicolor: *C. bicolor* var.

tinctoria. To 2 ft., sticky, giving off an iodine-like stain: lvs. ovate to lanceolate, to 4 in. long: fls. nearly sessile, pale purplish or nearly white and streaked, the upper lip very short. Calif.

verna. BLUE-EYED MARY. To 2 ft.: lvs. ovate to oblong, to 2 in. long: fls. ½ in. long, long-stalked, lower lip bright blue, upper white or purplish. N. Y. to Wis. and Ky.

COLLINSONIA. HORSE-BALM. HORSE-WEED. STONE-ROOT. *Labiatæ.* Aromatic per. herbs of E. N. Amer., with large opposite lvs. and small yellowish fls. in panicled racemes, the 2 stamens long-exserted; one sometimes grown in the wild-garden in moist woodsy places.

canadensis. CITRONELLA. To 5 ft., with thick clumpy root: lvs. ovate or ovate-oblong, to 10 in. long, coarsely toothed: fls. ½ in. long, lemon-scented, in panicles to 1 ft. long. Que. to Fla. and Ark.

COLLOMIA. *Polemoniaceæ.* Herbs from W. N. Amer. and Chile, allied to Gilia but differing in technical characters, with alternate lvs. and red, yellow or white tubular fls. often borne in heads subtended by leafy bracts.

Of easy cultivation in any garden soil. Propagated by seeds sown where plants are to stand, in open exposures.

biflora (*C.* and *Gilia coccinea*). Ann. to 2 ft.: lvs. linear, toothed or cut near end: fls. scarlet tinged outside with buff. Bolivia, Chile, Argentina.

coccinea: *C. biflora.*

grandiflora (*Gilia grandiflora*). Variable ann. to 2½ ft.: lvs. linear-lanceolate, entire: fls. buff or salmon-color. Rocky Mts. to Calif.

linearis (*Gilia linearis*). Ann. to 16 in.: lvs. linear to linear-lanceolate, entire: fls. red-purple or pink. B. C. to Calif. and Colo.

COLOCASIA (*Leucocasia*). ELEPHANTS-EAR. *Araceæ.* Trop. Asian herbs grown for ornament or the edible tubers, having peltate heart- or arrow-shaped lvs. and unisexual fls. borne on spadices which are shorter than the spathes.

Colocasias are usually planted out-of-doors for subtropical foliage effects, tubers having been started indoors. They should have damp rich soil. The dasheen is grown for the edible roots in warm climates. Tubers may be planted in hills 3 feet apart in rows 4 feet apart. In about seven months the tubers will be ready for harvesting. The young shoots of dasheen forced and blanched are used as a winter vegetable. Taro is also widely grown for food in the Hawaiian and other Pacific Islands, particularly in the form of "poi."

antiquorum. Lvs. ovate-cordate, to 2 ft. long, green, the petioles to 5 ft. long: spathes pale yellow, to 15 in. long; spadix with very long sterile appendage. E. Indies.—Runs into several forms, a few of which are: Var. **euchlora** having dark green lvs. with violet margins and petioles; var. **Fontanesii** with dull green lvs. margined and veined with purple and purplish petioles; var. **illustris** has lvs. spotted with dark green between the veins and violet petioles.

esculenta (*Caladium esculentum*). TARO. EDDO. DASHEEN. Closely resembling the above but having large edible tubers and the spadix with very short sterile appendage.

indica. Lvs. ovate-cordate, to 1½ ft. long, the petioles to 3 ft. long: spathes glaucous, to 6 in. long; spadix with short sterile appendage. Malaya.

monorhiza: hort. name.

multiflora: hort. name.

neo-guineensis: *Schismatoglottis neo-guineensis.*

COLPOTHRINAX. *Palmaceæ.* One species of fan-palm in Cuba, sometimes referred to Pritchardia but differing in the singularly swollen trunk and in technical floral characters as well as in its range. **C. Wrightii** (*Pritchardia Wrightii*). BOTTLE or BARREL PALM, endemic in Pinar del Rio and Isle of Pines. Tree to 40 ft., the trunk much swollen at or below the middle, slender above: lvs. more or less circular in outline, to 5 ft. or more across, with many segms.: fls. sessile, fleshy: fr. globose, ½ in. or more diam.

COLQUHOUNIA. *Labiatæ.* Tender erect or twining shrubs with all parts of the plants white-woolly when young, the fls. scarlet and yellow; native to S. Asia, one cult. somewhat in the S. Propagated by cuttings of growing tips in summer and rooted under glass.

vestita. To 4 ft., permanently white-woolly: lvs. oval or ovate, to 2½ in. long, wavy-toothed: fls. orange-scarlet, ¾ in. long, in whorls, autumn and winter.

COLTSFOOT: *Tussilago Farfara.* **Sweet:** *Petasites fragrans.*

COLUMBINE: *Aquilegia.*

COLUMBO: *Frasera.*

COLUMN: body formed of union of stamens and pistil in orchids, or of stamens, as in mallows.

COLUMNEA. *Gesneriaceæ.* Trop. American shrubs or vines with opposite lvs., 2-lipped tubular red or yellow fls. solitary or clustered in the axils, and fr. a berry; grown in the greenhouse. Propagated by cuttings.

gloriosa. Per., epiphytic, hairy: lvs. ovate to ovate-oblong, to 1¼ in. long, strongly nerved: fls. scarlet and yellow, to 3 in. long, 2-lipped, solitary. Costa Rica.

COLUTEA. BLADDER SENNA. *Leguminosæ.* Shrubs from the Medit. region to the Himalayas, with deciduous pinnate lvs., papilionaceous fls. in axillary few-fld. racemes, and inflated bladder-like pods; planted for ornament and hardy N. Propagated by seeds, cuttings in autumn, or choice varieties by grafting on *C. arborescens.*

arborea is *arborescens.*

arborescens. To 15 ft.: fls. yellow, the wings about as long as keel: pods to 3 in. long. S. Eu., N. Afr. Var. **bullata** is a dwarf form with small lfts. Var. **crispa** has wavy-edged lvs.

cilicica (*C. longialata*). Differs from *C. arborescens* in the wings being longer than the keel. Asia Minor.

cruenta: *C. orientalis.*

halepica: *C. istria.*

istria (*C. halepica*). To 6 ft.: fls. orange-yellow, the wings longer than keel. Asia Minor.

longialata: *C. cilicica.*

media. Hybrid probably between *C. arborescens* and *C. orientalis*: to 10 ft.: fls. orange or reddish-yellow.

orientalis (*C. cruenta*). To 6 ft.: fls. brownish-red with yellow spot at base of standard, the wings shorter than keel: pods 1½ in. long. S. E. Eu., Asia.

COLVILLEA. *Leguminosæ.* One African tree rarely planted in semi-trop. regions for the showy bloom. Propagated by seeds. C. racemosa. To 50 ft., with thick trunk: lvs. 2-pinnate into segms. ½ in. long: fls. scarlet with yellow stamens, in dense drooping racemes to 1½ ft. long: pods round.

COLZA: *Brassica Napus.*

COMAROSTAPHYLIS: *Arctostaphylos diversifolia.*

COMARUM: *Potentilla palustris.*

COMBRETACEÆ. Combretum Family. Trees and shrubs of about 15 trop. genera, in eastern and western hemispheres, characterized by simple lvs., mostly small bisexual fls. having 4–8-lobed calyx, 4–5 petals or none, 4–10 stamens, inferior 1-celled ovary, and dry often winged fr. Combretum, Quisqualis and Terminalia are cult. for ornament and fr.

COMBRETUM. *Combretaceæ.* Trop. trees and shrubs, often climbing, with mostly opposite entire lvs., polygamous fls. in spikes or racemes, the stamens long-exserted, and leathery 4–6-winged frs.

coccineum (*Grislea coccinea*). Vine to 20 ft.: lvs. oblong, to 4 in. long: fls. bright red, ½ in. long, in terminal panicled racemes. Madagascar.

secundum. Vine: lvs. oval-oblong, to 6 in. long: fls. scarlet, 1½ in. long, in dense terminal spikes. Trinidad, N. S. Amer.

COMESPERMA. *Polygalaceæ.* Australian herbs or shrubs, often twining, with small alternate lvs. and irregular fls. in terminal racemes; one planted in Calif.

spinosum. Much branched leafless shrub with thorny branches, the lvs. reduced to scales: fls. small, solitary and scattered.

COMFREY: *Symphytum.*

COMMELINA. Day-Flower. *Commelinaceæ.* Widely distributed herbs with jointed sts., alternate entire lvs. and irregular mostly blue short-lived fls. in cymes subtended by a leafy bract; grown in greenhouses or out-of-doors, often as ground-cover. Propagated by seeds, cuttings over heat, or division of the tubers when produced.

angustifolia. Sts. erect or diffuse, to 2 ft. or more long: lvs. nearly or quite linear, to 5 in. long: sheaths often purplish: fls. blue. S. U. S.

cœlestis. Per. with fibrous or tuberous roots, to 1½ ft. high: fls. deep blue, to 1 in. across. Mex.—A frequent greenhouse plant. Var. alba has white fls. and variegata blue and white.

nudiflora (*C. Sellowiana*). Creeping per. with sts. rooting at joints: fls. blue, to ½ in. across. N. Amer., S. Amer., Asia, Afr., growing natively as far north as N. J.—Employed as an open-garden plant.

Sellowiana: *C. nudiflora.*

tuberosa. Branching and diffuse per. with tuberous roots: fls. deep blue, about 1 in. across. Mex.—Produces fls. first season from seed; tubers or roots may be lifted and stored over winter, or it may be treated as a greenhouse plant.

COMMELINACEÆ. Spiderwort Family. Herbs of about 26 genera widely scattered, particularly in the tropics, with simple, alternate, parallel-veined, mostly sheathing and entire lvs., bisexual fls. in cymes subtended by leafy bracts (spathes), having 3 sepals and petals, mostly 6 stamens, superior 2–3-celled ovary and capsular or sometimes berry-like frs. The family provides many ornamental subjects, the larger part of which are grown under glass in the N. The genera known to hort. are Commelina, Cyanotis, Dichorisandra, Palisota, Pollia, Rhœo, Spironema, Tinantia, Tradescantia, Zebrina.

COMPASS-PLANT: *Silphium laciniatum.*

COMPOSITÆ. Composite Family. Over 800 widely dispersed genera of herbs and sometimes shrubs characterized by the fls. being assembled in involucrate heads and with the anthers joined around the pistil; corolla gamopetalous, often of 2 kinds in one head, regular and 4–5-lobed, and ligulate or produced into a long limb on one side; stamens 4–5; ovary inferior, 1-celled: fr. an achene mostly crowned by a pappus of scales, barbs or hairs. The family contains numerous ornamental subjects and others grown as vegetables. Most of them are sun-loving plants of simple cultural requirements; the predominant types are summer- and autumn-blooming. The genera known to hort. are Achillea, Ageratum, Amberboa, Amellus, Ammobium, Anacyclus, Anaphalis, Antennaria, Anthemis, Aphanostephus, Arctium, Arctotis, Arnica, Artemisia, Aster, Baccharis, Baeria, Balsamorhiza, Bellis, Bellium, Berlandiera, Bidens, Boltonia, Brachycome, Brachyglottis, Brickellia, Buphthalmum, Calendula, Calimeris, Callistephus, Calocephalus, Carduus, Carlina, Carthamus, Cassinia, Catananche, Celmisia, Centaurea, Charieis, Chrysanthemum, Chrysogonum, Chrysopsis, Chrysothamnus, Cichorium, Cirsium, Cladanthus, Cnicus, Coreopsis, Corethrogyne, Cosmos, Cotula, Craspedia, Crepis, Crupina, Cryptostemma, Cynara, Dahlia, Dimorphotheca, Diotis, Doronicum, Echinacea, Echinops, Emilia, Encelia, Ericameria, Erigeron, Eriocephalus, Eriophyllum, Erlangea, Eupatorium, Felicia, Gaillardia, Galactites, Gamolepis, Garberia, Gazania, Gerberia, Gnaphalium, Grindelia, Guizotia, Gynura, Helenium, Helianthella, Helianthus, Helichrysum, Heliopsis, Helipterum, Heterospermum, Hidalgoa, Hieracium, Humea, Hypochœris, Inula, Krigia, Kuhnia, Lactuca, Lasthenia, Layia, Leontopodium, Lepachys, Leptosyne, Leucheria, Leuzea, Liatris, Ligularia, Linosyris, Lonas, Madia, Malacothrix, Matricaria, Melampodium, Microglossa, Mikania, Montanoa, Moscharia, Mutisia, Myriocephalus, Notonia, Olearia, Onopordum, Othonna, Pachystegia, Parthenium, Perezia, Petasites, Picris, Piqueria, Podochænium, Podolepis, Polypteris, Prenanthes, Pulicaria, Raoulia, Reichardia, Rudbeckia, Santolina, Sanvitalia, Saussurea, Scolymus, Scorzonera, Senecio, Sericocarpus, Serratula, Silphium, Silybum, Solidago, Sonchus, Spilanthes, Stephanomeria, Stevia, Stokesia, Tagetes, Tanacetum, Taraxacum, Thelesperma, Tithonia, Tolpis, Townsendia, Tragopogon, Tridax, Trilisa, Tussilago, Uropappus, Ursinia, Venidium, Verbesina, Vernonia, Vittadinia, Wedelia, Wyethia, Xanthisma, Xeranthemum, Zinnia.

COMPOSITE: compound; said of an apparently simple or homogeneous organ or structure made up of several really distinct parts; applied to the heads of the family Compositæ.

COMPOUND: of two or more similar parts in one organ, as a leaf of 2 or more leaflets, a fruit of 2 or more carpels.

COMPRESSED: flattened, especially sidewise.

COMPSOA: *Tricyrtis.*

COMPTONIA. *Myricaceæ.* One fragrant deciduous shrub native in E. N. Amer., adapted for covering banks or dry sandy soil. **C. asplenifolia** (*C. peregrina. Myrica asplenifolia*). Sweet-Fern. To 5 ft.: lvs. fern-like, linear-oblong, deeply pinnately cut, pubescent: fls. unisexual, in catkins.—Propagated by seeds, layers, and division of the clumps.

CONANDRON. *Gesneriaceæ.* One stemless tuberous-rooted herb native in the mts. of Japan and suitable for rock-gardens in S. U. S. **C. ramondioides.** Lvs. basal, to 7 in. long, oblong, wrinkled and toothed; fls. white or pink with purple eye, 1 in. across, in drooping clusters on scapes to 1 ft. long.

CONCHITA: *Centrosema.*

CONDALIA. *Rhamnaceæ.* Shrubs and trees inhabiting the New World, mostly in warm regions, with alternate usually entire lvs. and fls. in umbels, with or without petals; one species is grown out-of-doors in Calif.

lineata. Spiny shrub: lvs. spatulate or obovate, ⅓ in. long, leathery, without veins above: fls. whitish, without petals: fr. an oblong drupe ¼ in. long. Patagonia.

CONE: a dense and usually elongated collection of flowers or fruits borne beneath scales, the whole with scales and axis forming a detachable homogeneous fruit-like body; some cones are of short duration, as those of araucaria, and others become dry, woody and durable.

CONEFLOWER: *Echinacea, Lepachys, Rudbeckia.*

CONE-PLANT: *Conophytum.*

CONFEDERATE-ROSE: *Hibiscus mutabilis.*

CONFEDERATE-VINE: *Antigonon leptopus.*

CONGEA. *Verbenaceæ.* Malayan climbing shrubs with opposite entire lvs., fls. in head-like cymes subtended by leaf-like bracts and borne in large panicles, and fr. a small drupe; one species sometimes grown out-of-doors in S. Calif. and other mild climates.

tomentosa. Lvs. ovate, to 3 in. long, tomentose beneath: fls. white, the oval bracts to 1 in. long, white or lilac. tomentose. India.

CONICOSIA. *Aizoaceæ.* S. African segregate from Mesembryanthemum (which see for cult.), per. with erect or procumbent sts., alternate crowded long narrow 3-sided soft lvs. without dots, and large yellow pedicelled fls.; stigmas 10–20.

elongata (*M. elongatum*). St. ann., prostrate, 1 ft. or more, from a tuberous root: lvs. to 6 in. long and ¼ in. thick, semi-cylindrical: fls. solitary on peduncles to 6 in. long, the petals linear.—Somewhat escaped in Calif.

pugioniformis (*M. pugioniforme*) has a tall thick st. to 2 ft.: lvs. to 6 in. long, glaucous, 3-angled, gradually tapering from base to apex (pugioniform or dagger-shaped): petals as long as calyx-lobes.—Plants passing under this name may be *C. capensis*, a weak not erect plant and petals shorter than calyx-lobes. *C. Muirii* may be involved: it has a long fleshy radish-like tuber crowned by the tuft of lvs., whereas *C. capensis* has a fibrous root and a st. 2–3 ft. long.

CONIFERS. A general term employed for cone-bearing trees of the pine, spruce and cypress kind, but sometimes used as the English equivalent of Coniferæ a technical family name for plants now segregated in the three families Ginkgoaceæ, Taxaceæ and Pinaceæ. These three families may be briefly distinguished as follows: Ginkgoaceæ, lvs. fan-shaped and deciduous, fr. a drupe; Taxaceæ, lvs. mostly broadly needle-shaped or scale-like or at least not fan-shaped, persistent, fr. soft and berry-like or drupe-like; Pinaceæ, lvs. mostly narrowly needle-like, persistent (except the larches and bald cypress), fr. typically a dry cone but the parts sometimes more or less fleshy and cohering into a berry-like body as in the junipers.

The conifers are gymnosperms, representative of a class of plants with ovules naked rather than borne in a sac or ovary as in the angiosperms; other living gymnosperms are the cycads, of about 10 genera. Gymnosperms and angiosperms together comprise the spermatophytes (phenogams or "flowering plants"). The conifers, in a broad usage to include also ginkgo, the junipers and yews, are about 300 species, in about 40 genera, widely spread over the globe but most prominent in temperate regions; they are all woody plants, many of them shrubs and others majestic trees that give character to extensive areas. They are well represented in the native flora of North America. To cover the families Taxaceæ and Pinaceæ, the word conifer has a definite connotation even though some of the kinds bear berry-like fruits rather than true cones; but the characters of foliage and of woody structure, and the balsamic odors, are such as to show the similarities of most of them even to uncritical observers. A few species, as the larches, bear deciduous leaves, but the group as a whole is known as "the evergreens" and it has a horticultural unity. The conifers are treated in their various relations and adaptabilities for American conditions in "The Cultivated Evergreens," published by the Macmillan Company.

Conifers are grown for ornament as single specimens, for shelter-belts, the smaller ones for foundation-planting about buildings and in private grounds, and the arboreous species for groves and forests. The timber trees among the conifers constitute the main large forestry plantings in this country. All the kinds abound in interest, because of their evergreen character and their strong individuality. Although lacking showy flowers, the striking habit, interesting cones, details of foliage and color of new growths give them an ornamental quality quite their own. They are particularly striking in the winter landscape. These qualities vary widely between the different genera. Most of the genera are known in cultivation somewhere in the United States and Canada. They are listed under the entries *Pinaceæ* and *Taxaceæ;* and each genus also finds its alphabetic place in the book.

The conifers are mostly high-land plants. Many of them do well on rather thin land, yet the best results are to be expected, in private grounds, when the soil is good or well enriched for much of the beauty depends on the verdurous growth. For low grounds, the larches, taxodiums, and chamæcyparis may be chosen. The common arbor-vitæ is particularly valuable in low and even swampy places. For effects in large trees, the pines, spruces and firs are generally most adaptable, particularly in cold climates, but cryptomeria, Douglas fir, and sequoias are majestic in milder climates. Of the smaller and shrubby kinds, selections may be made among the true cypresses, junipers, chamæcyparis, thuja, yews; the retinisporas are juvenile states of chamæcyparis and thuja. Inasmuch as so many species of conifers are available for cultivation from so many parts of the world and of such varied characteristics, it follows that the successful planter of them is the one who notes with much care the requirements of each as to climate, soil and exposure.

Seedlings of many conifers vary widely, as in Thuja, Juniperus, Chamæcyparis, and even in some species of Picea. The dwarf forms originating in this way, propagated often by cuttings and layers, are specially interesting for small places and for rock-gardens, and they have the charm of special form and variety of color.

Transplanting of conifers is best performed, as a rule, in spring just before the active new growth begins or about when the buds begin to swell. Early autumn planting is satisfactory in mild climates and with small potted or pruned stock if the land is moist and in good condition and the exposure protected so that they do not dry out seriously before making a roothold. August planting, after the main growth is completed, is often successful if the rainfall is adequate or sufficient water can be supplied. The younger the tree the greater is the likelihood of success in transplanting; but the usual height for the arboreous species is 2 to 3 feet; any additional height is likely to entail greater care in the transplanting. Very large conifers should be moved only by those skilled in the work. Experience shows that moving large conifers with a frozen ball of earth large enough to include all the roots is usually successful.

The top is not pruned, as a rule, at transplanting. Therefore the roots should be kept intact as much as possible, special care being exercised in the digging, and they should not be allowed to dry out. Plants from shady positions should not be transplanted to the open sun. If the hemlock, for example, is wanted in a sunny exposed place, young trees occupying such positions in the wild should be found. Better results, however, with all conifers, are to be expected from well-handled nursery-grown plants. Newly planted trees may be mulched the first year with straw or similar material to retain the moisture. All the conifers, and especially the hemlocks, should be well guyed after transplanting, for loss is certain if the newly planted tree is racked by the wind.

The after care of conifers requires no peculiar attention except to meet the attacks of the special insects and fungi, and for this work the most recent authoritative books or bulletins should be consulted. Probably the most serious of the diseases at present, since it involves natural forests, is the white pine blister-rust, due to an imported fungus. It attacks the five-leaved or white pines, appearing on the twigs and extending into the trunk. Thorough removal of the blistered or cankered twigs from valuable trees as soon as the injury appears may save the specimen. But the main procedure is to destroy the alternate host on which the fungus lives. These other hosts are currants and gooseberries, and none of these plants should be allowed to stand within 200 to 300 yards of white pines; the cultivated black currant is particularly amenable to the disease. For aphis and scale insects, thorough spraying is the proper safeguard. The five-needle pines also suffer from the white pine weevil, which attacks the leading shoots.

Conifers require the minimum of pruning inasmuch as most of them are symmetrical growers. Pines seldom give satisfactory results when clipped. To keep spruces, firs and some of the smaller kinds within bounds or to make them compact and to delay the death of the lower limbs, the tips of the shoots may be pinched back in spring or early summer.

Propagation of conifers is accomplished by means of seeds, cuttings, grafting on other stocks. Seeds are the usual means for the raising of forest stock and for the propagation of the species in general. The horticultural varieties, however, must be increased by cuttings, for seedlings may not come true. Species of which seed is not available, and also certain of the named cultivated varieties, are grafted on other stocks.

Seeds are gathered as soon as ripe and kept in bags or boxes in a dry place until the following spring or else stratified over winter. The seeds are planted in rows in a mellow well-prepared seed-bed, and covered one-half inch or less depending on the size. Small seeds may be broadcast. Rows are usually as close together as 6 inches, and the bed is strewn with pine needles or other mulch.

The young seedlings require protection under lath screens or brush and plenty of moisture, although the seeds themselves may be kept fairly free from water until germination takes place; seed-beds therefore should be in well-drained soil. If mice, squirrels or birds are likely to be troublesome, the beds may be covered with wire netting; the beds would better be protected from washing by a border of boards. Care must be taken to avoid damping-off under the screens. The plants will need protection the first winter. Care should be taken to keep the young seedlings constantly lightly mulched to prevent rain from spattering them with soil, which adheres to the young plants and causes considerable loss. In eighteen months or more, when making the first set of rough leaves, the seedlings may be transplanted; and the subsequent process will determine itself for each species. Conifer seeds may also be stratified the first autumn in boxes or flats, and the seedlings allowed to grow in these boxes the first year; this is a good method for small quantities or for garden practice, and for tender species. Seedlings of some of the rarer species, as of Abies, are so small that it is inadvisable to transplant them until the end of the second year.

Cuttings are made from firm tip shoots late in the season, representing one-year wood and a two-year base, the bottom third or half being trimmed of leaves. These are set in clean sand or peat in flats or a greenhouse bench, close together in rows and the soil firmed tightly about them. Mild bottom heat should be given at first, and raised to perhaps 70° later. In four to eight months, depending on the kind of conifer and the conditions, the cuttings should be rooted and ready for transplanting. Taxus, cedrus, thujas, retinisporas, chamæcyparis, junipers, and the like are the kinds most commonly grown from cuttings, although the piceas and others are amenable. Piceas and others that contain a large amount of resin are the most difficult to root, and removal of the resin by dipping the lower end in hot water has been recommended.

Cuttings may also be rooted in outdoor summer frames, with bottom heat provided by a little fermenting manure or other means; a fair percentage of some kinds will root without other bottom heat than that supplied by the sun. (Fig. 18, page 497.)

Grafting of conifers is performed on stocks of the same genus, usually in spring when the roots begin to start. The stocks may be grown from seeds or cuttings, usually the former. The stock in any case represents the most abundant or most easily propagated or most seedful species of the genus, as red-cedar for the other junipers, native arborvitæ for the other thujas, Norway spruce for the other piceas, white pine for related species, and so on. When large enough for grafting, the stocks are potted and the cion is side-worked near the root and firmly tied. The grafted plants are kept in frames or a propagating house, and in four to six weeks union should have taken place. (Pages 283, 284.)

CONIOGRAMME (*Dictyogramma*). *Polypodiaceæ.* Strong-growing conservatory ferns, useful as specimen plants; lvs. 1–2-pinnate; sori naked, following the veins; native in Japan and Pacific Isls. Sometimes cult. under glass, requiring a rather cool or moderate atmosphere and a well-drained soil. See *Ferns.*

japonica (*Gymnogramma japonica*). BAMBOO-FERN. Lvs. mostly 1-pinnate, to 2 ft. long, segms. to 1 ft. long and 1 in. wide, finely toothed. Japan, Formosa.

CONIUM. *Umbelliferæ.* Poisonous herbs with pinnately decompound lvs., small white fls. in compound umbels, and ovate somewhat flattened frs.; one species grown for medicinal purposes. Propagated by seeds.

maculatum. POISON-HEMLOCK. Bien. to 4 ft.: lvs. finely cut into ovate toothed segms., dark green, sometimes known as "winter-fern." Eu.; nat. in N. and S. Amer.

CONNATE: united or joined; in particular, like or similar structures joined as one body or organ, as opposite leaf-blades united about a stem.

CONNECTIVE: the filament or tissue connecting the two cells of an anther, particularly when the cells are distinctly separated.

CONNIVENT: coming together or converging, but not organically connected.

CONOCLINIUM: *Eupatorium.*

CONOPHYTUM. CONE-PLANT. *Aizoaceæ.* One of the groups separated from the old polymorphous genus Mesembryanthemum (which see). Species of this genus are growing in test collections but which ones, if any, are in popular cult. in N. Amer. is not yet understood. They are very small succulent plants with abbreviated roots, several or many growths in a clump but stemless at least when young. Each of the growths consists of 2 lvs. completely joined into one body which is globose, obconic, or depressed, 2-lobed or notched at apex and with a small orifice at the center; from this orifice arises a solitary fl., the corolla having a slender tube, color white to rosy, magenta, red, yellow. They are strange condensed little objects, with only a plant body and a fl.; they should appeal to fanciers.

CONVALLARIA. LILY-OF-THE-VALLEY. *Liliaceæ.* One per. herb (or the variations considered as distinct species), having horizontal rootstocks, the upright parts called "pips." **C. majalis.** Lvs. 2, basal, oblong-oval: fls. bell-shaped, white, fragrant, nodding, in a one-sided raceme terminating the scape. Eu., Asia, E. N. Amer. Var. **Fortunei** has larger foliage and fls.

The lily-of-the-valley is hardy out-of-doors in shady places and persists for many years without removal. It is often forced from pips planted in benches of sand in the greenhouse and kept at a temperature of about 65°. The pips are often held in cold storage.

CONVOLVULACEÆ. MORNING-GLORY FAMILY. Twining herbs as usually known, but often shrubs or even trees, of nearly or about 50 widely distributed genera: juice often milky: lvs. alternate, simple or compound: fls. regular and bisexual, often large and bright-colored, with 5-parted calyx, funnelform gamopetalous corolla, 5 stamens, superior prevailingly 2-celled ovary: fr. a caps. or berry. Many species have medicinal properties and other kinds are grown for ornament, as Argyreia, Calonyction, Convolvulus, Evolvulus, Ipomœa, Jacquemontia, Lettsomia, Porana, Quamoclit.

CONVOLVULUS. Bindweed. *Convolvulaceæ.* Herbs, mostly twining or trailing, pubescent, with simple or lobed lvs., bell-shaped or funnelform fls. something like those of morning-glory, having a plaited 5-angled limb, and capsular frs. *C. arvensis* is a persistent weed in cult. grounds.

Bindweeds are of easy cultivation but should be planted with care as they are likely to become troublesome weeds. They are grown out-of-doors as covering for fences and banks and the tender kinds in the greenhouse. Propagated by seeds, cuttings of young wood, and by division.

althæoides. Per., sts. twining to 3 ft.: lower lvs. ovate-cordate, upper pinnatifid: fls. 1–2, pink, about 1 in. long. Medit. region.

arvensis. Per. vine with deep persisting roots, glabrous or nearly so: lvs. oblong to ovate with sagittate or hastate base, to 2 in. long: fls. pink or whitish, to 1 in. across. Eu.; nat. and a troublesome weed, but has been used in hanging baskets and elsewhere.

aureus superbus. Per. but grown as ann., sts. twining or trailing to 5 ft.: lvs. cordate-ovate: fls. golden-yellow. Of uncertain origin and botanical position.

Cantabrica. Erect or prostrate, to 2 ft.: lvs. oblong or lanceolate: fls. in clusters, rose or pink, about ½ in. long. Medit. region.

Cneorum. To 4 ft., erect or ascending: lvs. lanceolate or spatulate, persistent: fls. 1–6, white or pinkish. S. Eu.

Cupanianus: *C. tricolor.*

elongatus. Ann.: lvs. cordate-ovate: fls. solitary, white, small. Canary Isls.

floridus (*Rhodorhiza florida*). To 6 ft., woody: lvs. linear-lanceolate: fls. in many-fld. terminal clusters, white or pale pink, small. Canary Isls.

incanus. Finely pubescent usually gray per., trailing or decumbent, to 3 ft.: lvs. ovate, lanceolate, linear, with diverging lobes at base, to 2 in. long: fls. rose to white. Neb. west and south.

japonicus (*Calystegia pubescens*). California-Rose. Per., sts. twining to 20 ft.: lvs. narrow-arrow-shaped: fls. solitary, bright pink, to 2 in. across. E. Asia; a sterile double form is nat. in E. U. S.

luteolus. Per. somewhat woody below, climbing to 10 ft. or more: lvs. triangular to lanceolate with sagittate base, to 3 in. long, glabrous and glaucous above: fls. purplish and white, to 2 in. long. Calif.

mauritanicus. Per., sts. prostrate, woody at base: lvs. round-ovate, small: fls. 1–6, blue or violet-purple with pale throat, to 2 in. across. Afr.—Useful in baskets and vases.

pentapetaloides. Ann., sts. prostrate: lvs. oblong or linear-lanceolate: fls. solitary, blue. S. Eu., W. Asia.

sepium. Rutland Beauty. Per., sts. trailing to 10 ft.: lvs. ovate-cordate or arrow-shaped: fls. solitary, white, rose or pink striped with white, 2 in. long. Eu., Asia, N. Amer.

siculus. Ann., sts. prostrate, to 1½ ft.: lvs. ovate-cordate: fls. solitary, pale blue, small. Medit. region.

Soldanella. Per., sts. prostrate. to 1½ ft.: lvs. kidney-shaped: fls. solitary, pink, to 2½ in. across. Seashores around the world.

tricolor (*C. Cupanianus*). Dwarf Morning-Glory. Ann., sts. erect or ascending to 1 ft. and often much branching: lvs. linear-oblong: fls. 3, blue with yellow throat margined white, to 1½ in. across. S. Eu.—An old flower-garden subject.

undulatus. Ann., sts. ascending: lvs. ovate-oblong, undulate: fls. in nearly sessile clusters, blue. Medit. region.

COONTIE: *Zamia floridana, Z. pumila.*

COOPERIA. Rain- or Prairie-Lily. *Amaryllidaceæ.* Bulbous night-blooming herbs with basal grass-like lvs. and fragrant white salverform fls. solitary at end of scapes, the perianth-tube long.

Sometimes planted. Of easy cultivation. The bulbs should be stored over winter in dry soil. Much like Zephyranthes; flowers in spring and summer, with the narrow leaves.

Drummondii. Fls. white tinged with red outside, to 6 in. long, the tube to 5 in. long. Tex., New Mex., Mex.

pedunculata. Fls. white tinged red outside, to 3 in. long, the tube to 1½ in. long. Tex.

COPAIFERA (*Copaiva*). *Leguminosæ.* Trees of trop. Amer. and Afr., yielding balsam of copaiba: lvs. pinnate, leathery: fls. small, usually white, not papilionaceous, borne in panicles.

officinalis. To 70 ft.: lvs. of 1–5, usually 3, pairs of ovate lfts. to 3 in. long: pods ovoid-globose, slightly flattened. Trinidad, N. S. Amer.

COPAIVA: *Copaifera.*

COPERNICIA. *Palmaceæ.* Tall or middle-sized hermaphrodite fan-palms of about 9 species Cuba to Argentina, unarmed except on petioles: spadices very long, much branched, borne among the lvs. and often surpassing them; fls. solitary or glomerated on the slender branches, numerous; stamens 6, inserted in tube of perianth and connate at base: fr. globose or ovoid, more or less succulent, of 1 carpel, small. One or 2 species sometimes planted in S. Calif. and S. Fla., but little known in the continental U. S. See *Palm.*

australis. To 70 ft. or perhaps more: lf.-blade orbicular, 2–2½ ft. long, whitish underneath, bearing many rusty dots, deeply divided into about 48 narrow acuminate bifid segms. with very small deciduous filaments; petiole strongly armed: fr. ovoid-olive-form, ¾ in. or less long. Paraguay, Argentina.

cerifera. Carnauba Palm. To 30 or 40 ft., with globose dense head, lower part of trunk long retaining the lf.-bases: lf. 4–6 ft. long, nearly orbicular, light colored with a waxy covering, divided to the middle or beyond into about 60 narrow segms. that are bifid into long very narrow points; petiole with remote spines: fr. ovoid to globose-ovoid, about 1 in. long. Brazil.

COPPERLEAF: *Acalypha Wilkesiana.*

COPPERTIP: *Crocosmia aurea.*

COPRA: see *Coconut.*

COPROSMA. *Rubiaceæ.* Shrubs or small trees native from Hawaii to Australia and Borneo, one in Chile, with opposite persistent lvs., small diœcious white or greenish fls. in clusters or solitary, the corolla bell-shaped or funnelform and 4–5-lobed, and fr. a fleshy drupe.

Coprosmas are grown for ornament in the open ground in California and other warm regions, for the attractive foliage and fruit, and some of them for hedges. Propagated by cuttings of ripe wood.

areolata. To 15 ft.: lvs. orbicular-spatulate, to ⅔ in. long, acute or apiculate: fr. black, globose, ⅙ in. across. New Zeal.

Baueri (*C. Stocki*). To 25 ft., withstanding clipping and useful in hedges: lvs. ovate or oblong, to 3 in. long, obtuse or notched, thick and shining: fr. orange-yellow, ovoid, ⅓ in. long. New Zeal. Var. **variegata** has lvs. blotched with yellowish-green.—The usual species in cult.

cuneata. To 10 ft., very leafy: lvs. linear- or cuneate-oblong, to ¾ in. long, usually clustered, stiff and leathery: fr. red, globose, ⅙ in. across. New Zeal.

Cunninghamii. To 15 ft.: lvs. linear or linear-lanceolate, to 2 in. long, acute, leathery: fr. pale and translucent, oblong, ¼ in. long. New Zeal.

Kirkii. To 4 ft. or procumbent, much branched: lvs. linear or linear-oblong, to 1 in. long, obtuse: fr. oblong, ⅙ in. long. New Zeal.

lucida. To 15 ft.: lvs. obovate, to 5 in. long, obtuse or acute, leathery and shining: fr. reddish-orange, oblong, ½ in. long. New Zeal.

macrocarpa. To 12 ft.: lvs. ovate-oblong, to 7 in. long, obtuse or acute, leathery and glossy: fr. ovoid, to 1 in. long. New Zeal.

microcarpa. To 12 ft.: lvs. linear, to ⅓ in. long: fr. globose, 1/10 in. across. New Zeal.

parviflora. To 15 ft.: lvs. obovate, to ¾ in. long, usually clustered, leathery: fr. bluish or black, globose. ⅛ in. across. New Zeal.

Petriei. Creeping, making mats and useful for rock-work: lvs. about ¼ in. or less long, narrow-oblong or obovate, hairy: fls. solitary on short branchlets: fr. purplish, to ½ in. diam. New Zeal.

ramulosa. To 4 ft., prostrate or decumbent: lvs. linear-obovate, ⅓ in. long: fr. dark red, globose, ⅙ in. across. New Zeal.

rhamnoides. To 6 ft.: lvs. orbicular to narow-oblong, to ¾ in. long: fr. red or rarely black, globose, ⅙ in. across. New Zeal.

rigida. To 15 ft.: lvs. obovate, to ¾ in. long: fr. yellow, oblong, to ⅓ in. long. New Zeal.

robusta. To 15 ft.: lvs. oval, to 5 in. long, acute, leathery, dark green and shining above, pale beneath: fr. orange, oblong, ½ in. long. New Zeal.

rotundifolia. To 12 ft.: lvs. orbicular or ovate-oblong, to 1 in. long: fr. red, globose, ⅙ in. across. New Zeal.

rugosa. To 10 ft.: lvs. narrow-linear, to ¾ in. long: fr. pale blue, oblong or nearly globose, ⅓ in. long. New Zeal.

spathulata. To 5 ft.: lvs. orbicular, to 1½ in. long, with winged petiole, obtuse or notched: fr. black, globose, ¼ in. across. New Zeal.

Stocki: *C. Baueri.*

tenuicaulis. To 8 ft., much branched: lvs. orbicular, ½ in. long, obtuse: fr. black and shining, globose, ⅛ in. diam. New Zeal.

tenuifolia. To 15 ft.: lvs. ovate to ovate-lanceolate, to 4 in. long, brownish-green above, pale beneath: fr. ovoid, ⅓ in. long. New Zeal.

COPTIS. Goldthread. *Ranunculaceæ.* Little per. herbs with slender rootstocks which yield a yellow dye and have medicinal properties: lvs. basal, compound: fls. white or yellow, borne on scapes, with petal-like sepals, small hood-like petals and numerous stamens; native in north temp. zone.

One or two species sometimes planted in the border or rock-garden. The plants thrive in shady damp situations in peaty soil. Leaves remain green all winter if given some protection. Propagated by seeds which should be covered with leaves or paper and kept moist.

grœnlandica. To 6 in., the rootstocks yellow: lvs. shining, long-stalked, of 3 broadly obovate coarsely toothed petiolulate lfts.: fls. white, usually solitary, about ½ in. across, the petals broader than long, May–Aug. N. E. N. Amer., in bogs and damp mossy woods.—Until recently confused with the following species.

trifolia. Lfts. sessile or essentially so: petals rather narrow, mostly rhombic and as long as broad. N. E. Asia, Alaska.

CORAL-BELLS: *Heuchera sanguinea.*

CORAL-BERRY: *Symphoricarpos orbiculatus.*

CORAL-BLOW: *Russelia.*

CORAL-BUSH: *Templetonia retusa.*

CORALLITA: *Antigonon leptopus.* **White:** *Porana paniculata.*

CORAL-PLANT: *Jatropha multifida, Russelia equisetiformis.*

CORAL-TREE: *Erythrina.*

CORAL-VINE: *Antigonon leptopus.*

CORCHO: *Microcycas calocoma.*

CORCHORUS. *Tiliaceæ.* Trop. herbs or subshrubs with alternate simple toothed lvs., very small yellow fls., and capsular frs.; grown for the fiber contained in the inner bark and the young shoots eaten as pot-herbs.

Jute requires a warm moist climate and loam soil. Seed may be sown broadcast in spring and the crop will be ready to harvest in about three months. The fiber is grown from Egypt to Japan.

capsularis. Jute. Ann., to 15 ft.: lvs. oblong, to 4 in. long: fr. globose and wrinkled. India.

japonicus: *Kerria japonica.*

olitorius. Jews-Mallow. Differs from *C. capsularis* only in its elongated and beaked fr. India.

CORDATE: heart-shaped; ovate in general outline, with a sinus and rounded lobes at base.

CORDIA. *Boraginaceæ.* Trop. trees and shrubs, sometimes partially climbing, in Old and New Worlds, with alternate simple lvs. and white or orange mostly 4-merous fls. in forking bractless clusters or coiled cymes, bisexual or polygamous, the corolla tubular or bell-shaped. The genus is polymorphous and is divided by some authors; some of the species bear very small fls., others large and showy ones: fr. a drupe.

Grown in the greenhouse, and out-of-doors in warm regions, for ornament. Propagated by seeds and cuttings.

alba. Tree to 30 ft.: lvs. broad-ovate to roundish, rough, to 4 in. long: fls. papery, white, ½ in. across, in large open clusters: fr. an oblong drupe about ½ in. long. American tropics.

Boissieri. Evergreen shrub or tree to 25 ft.: lvs. ovate or oblong-ovate, to 5 in. long, velvety-tomentose, wavy: fls. white with yellow center, 1½ in. long, in terminal clusters. Tex. to Mex.

Myxa. Deciduous tree to 40 ft.: lvs. broad-ovate, stiffish, to 5 in. long, glabrous, entire or wavy-toothed: fls. white, polygamous, ½ in. or less long, in large clusters: fr. tan-colored, ¾ in. diam., mucilaginous and used in medicine. India to Australia; planted in Calif. and American tropics.

Sebestena (*Sebesten Sebestena*). Geiger-Tree. Evergreen shrub or tree to 30 ft.: lvs. ovate, to 8 in. long, rough-hairy, margins entire or wavy: fls. orange or scarlet, to 2 in. long, in large terminal clusters. Fla. keys and south.

thyrsiflora: *Ehretia thyrsiflora.*

CORDULA. Lady-Slipper. *Orchidaceæ.* Stemless epiphytic or terrestrial orchids native in trop. Asia and Malaya, with leathery lvs. and fls. solitary or few on a stalk, the lateral sepals united and the lip sac-like; here belong most of the greenhouse cypripediums which have formerly been listed under Paphiopedilum. For cult. see *Orchids.*

Actæus: *C. Simoni.*

Albertiana: a form of *C. Leeana.*

Alexandræ. Hybrid between *C. Godefroyæ* and *C. nitens.*

Appletoniana. Lvs. to 6 in. long and 1½ in. wide: fls. solitary on stalks to 20 in. high, about 4 in. across; sepals yellow-green; petals green at base and rose at tip; lip greenish-brown, spring. Siam.

Argus. Lvs. to 7 in. long and 1½ in. wide: fls. solitary on stalks to 16 in. high; sepals white veined with dark color; petals red at tip; lip dark purple marked with light green, Apr.–July. Philippine Isls.

Arthuriana. Hybrid between *C. insignis* and *C. Fairieana.*

Ashburtonæ. Hybrid between *C. barbata* and *C. insignis.*

augusta. Hybrid between *C. Haynaldiana* and *C. villosa.*

aurea. Hybrid between *C. nitens* and *C. Spiceriana.* There are many named forms of this hybrid.

barbata. Lvs. to 6 in. long and 1 in. wide: fls. to 4 in. across, solitary on stalks to 10 in. high; sepal white or pale green veined with red-brown; petals greenish and purple at tip with black warts; lip brown-purple, Apr.–Aug. Malaya.

Beeckmani. Hybrid between *C. bellatula* and *C. villosa* var. *Boxallii.*

bellatula. Lvs. to 6 in. long and 1½ in. wide, purple beneath: fls. 2 in. across, solitary on short stalks, white spotted with purple, in spring. Burma.

Boxallii: *C. villosa* var.

Bragaiana: *C. Godseffiana.*

Brandtiæ. A cross between two hybrids, *C. Iva* and *C. Youngiana.*

Bruniana. Hybrid between *C. Leeana* and *C. œnantha.*

callo-Rothschildiana: *C. Fowleri.*

callosa. Lvs. to 10 in. long and 2 in. wide: fls. about 4 in. across, solitary on stalks to 1 ft. high; sepal white lined with purple; petals greenish, purple at tip; lip brown-purple, Mar.–July. Siam, Cochin-China. Var. **gigantea** has sepal shaded with emerald-green. Var. **Sanderæ** has white fls. lined with green.

Calypso. Hybrid between *C. villosa* var. *Boxallii* and *C. Spiceriana.*

Canhami. Hybrid between *C. superbiens* and *C. villosa.*

Chamberlainiana. Lvs. to 1 ft. long and 2 in. wide: fls. to 4 in. across, in 4–8-fld. racemes to 16 in. long; sepal greenish marked with brown; petals greenish-rose with small brown spots, twisted and wavy; lip green spotted with red. Sumatra.—Blooms all year.

Charlesiana. Hybrid between *C. nitens* and *C. Leeana.*

Charlesworthii. Lvs. to 10 in. long and 1 in. wide: fls. 2½ in. across, solitary on stalks to 6 in. high; sepal rose; petals and lip greenish marked with brown, Sept.–Oct. Bengal.

ciliolaris. Lvs. to 6 in. long and 2 in. wide: fls. 3 in. across, solitary on stalks to 10 in. high; sepal white striped with green and brown at base; petals drooping, reddish with dark purple spots; lip greenish-brown, Apr.–June. Philippine Isls.

Clarki. Hybrid between *C. Charlesworthii* and *C. Swaniana.*

concolor. Lvs. to 6 in. long and 1½ in. wide: fls. 3 in. across, solitary on stalks to 4 in. high, bright yellow finely spotted with violet, May–June. Siam, Burma.

Crossiana. Hybrid between *C. insignis* and *C. venusta.*

Curtemanni. A cross between two hybrids, *C. Schlesingeriana* and *C. Beeckmani.*

Curtisii. Lvs. to 8 in. long and 3 in. wide: fls. to 4 in. across, solitary on stalks to 8 in. high; sepal green edged with white and lined with purple; petals greenish-rose finely spotted with dark purple; lip greenish-brown, Apr.–July. Sumatra.

Cymatodes. Hybrid between *C. Curtisii* and *C. superbiens.*

Dauthieri: *C. Harrisiana.*

Dayana. Lvs. to 7 in. long and 2 in. wide: fls. to 6 in. across, solitary on stalks to 10 in. high; sepal white, lined with green; petals white lined with red-brown; lip greenish-violet, May–June. Borneo.

Deedmaniana. Hybrid between *C. Chamberlainiana* and *C. Spiceriana.*

Dicksoniana. Cross between *C. Hera* (hybrid) and *C. villosa.*

Druryi. Lvs. to 10 in. long and 1½ in. wide: fls. to 3 in. across, solitary on stalks to 10 in. high, golden-yellow with a dark red stripe on dorsal sepal, in spring. India.

Edwardi. Hybrid between *C. Fairieana* and *C. superbiens.*

enfieldensis. Hybrid between *C. Lawrenceana* and *C. Hookeræ.*

exul. Lvs. to 10 in. long and ¾ in. wide: fls. 3 in. across, solitary on stalks to 5 in. high; sepal green edged with white and spotted brown; petals yellow lined with purple; lip yellow, June–July. Siam.

Fairieana. Lvs. to 6 in. long and 1 in. broad: fls. about 3 in. across, solitary on long st.; sepals greenish and striped violet; petals green and violet; lip white at base, green at top. E. Himalayas.

Fowleri (*C. callo-Rothschildiana*). Hybrid between *C. callosa* and *C. Rothschildiana.*

fulshawensis: *C. Schlesingeriana.*

Germinyana. Hybrid between *C. hirsutissima* and *C. villosa.*

gigas (*C. Prewetti*). Hybrid between *C. Lawrenceana* and *C. Harrisiana.*

glaucophylla. Lvs. to 10 in. long and 1½ in. wide: fls. many, on stalks to 16 in. high; sepal whitish-yellow, green at base; petals twisted, thickly spotted with red; lip dull violet. Java.—Blooms all year.

Godefroyæ. Lvs. to 6 in. long and 1¼ in. broad, marbled: fls. white or pale yellow, sparingly pubescent; lip small, spotted. Cochin-China.

Godseffiana (*C. Bragaiana*). Hybrid between *C. villosa* var. *Boxallii* and *C. hirsutissima.*

Gratrixiana. Hybrid between *C. bellatula* and *C. enfieldense.*

Grovesiana. Hybrid between *C. Lathamiana* and *C. Leeana.*

Hanseni. Hybrid between *C. Haynaldiana* and *C. villosa.*

Harrisiana (*C. Dauthieri. C. hybrida*). Hybrid between *C. villosa* and *C. barbata.*

Harveyana. Hybrid between *C. Stonei* and *C. Leeana.*

Haynaldiana. Lvs. to 10 in. long and 1 in. wide: fls. to 6 in. across, in 2–6-fld. racemes to 20 in. high; sepals and petals rose, green at base and with large brown spots at tip; lip greenish marked with brown. Philippine Isls.

hirsutissima. Lvs. to 6 in. long and ¾ in. wide: fls. 4½ in. across, solitary on stalks to 8 in. high; sepal green marked with violet; petals green at base and violet at tip, spotted with brown; lip brown marked with violet, Apr.–June. India.

Hitchensiæ. Hybrid between *C. Charlesworthii* and *C. insignis.*

Hookeræ. Lvs. to 1 ft. long and 1½ in. wide: fls. 4 in. across, solitary on stalks to 1 ft. high; sepal yellow-green; petals green at base, rose at tip, spotted with red; lip green marked with brown, Apr.–June. Borneo.

Horniana. Hybrid between *C. Spiceriana* and *C. superbiens.*

hybrida: *C. Harrisiana.*

ingens. Hybrid between *C. insignis* and *C. Rothschildiana.*

insignis. Lvs. to 10 in. long and 1 in. wide: fls. to 4 in. across, solitary on stalks to 8 in. high; sepal white at tip, yellow-green at base, spotted with brown; petals and lip yellow-green veined with brown, Oct.–Mar. Himalayas.—Runs into many named forms, a few of which are: **Amesiana** with unspotted fls. and sepal with broad white margin; **Balliæ**; **brugensis**; **Chantini** with deeper coloring and larger white area on sepal; **Cobbiana**; **corrugata** with corrugated lip; **Coulsoniana** with larger fls.; **Dominaiana**; **Edeniana**; **Ernesti** with yellow fls., the sepal brown spotted; **Fostermanni**, sepal with broad white border; **gigantea**; **Gravesiana**, sepal with broad white border and brown spots arranged in regular lines; **heatonensis**; **Hurrelliana**, sepal greenish-yellow, reddish-brown at base and tipped with white; **immaculata nigra**; **Lageræ**, sepal dark brown in center margined with white; **Leopardina**; **Lindeniæ**; **Luciani** with bright yellow fls. tinged green and sepal with broad white border; **luteo-alba** has sepal two-thirds white, yellowish-green at base; **Macfarlanei**, with clear yellow fls. and sepal with broad white border; **maxima** with large deep green sepal; **punctatissima** has the sepal covered with brown spots; **rutherfordensis**; **Sadleri**; **Sanderæ** with bright yellow fls. white at tips; **Sanderiana** with yellowish-green fls. veined with dark green, sepal with broad white border; **sylhetensis**, sepal with large dark spots; **Watsoni**; **westgatensis**; **xanthina**; **Youngiana**; **zebrina**.

javanica. Lvs. to 6 in. long and 2 in. wide: fls. to 5 in. across, solitary on stalks to 1 ft. high, green, the sepal veined with dark green, July–Sept. Java.

Josephiana. Hybrid between *C. Druryi* and *C. Sementa.*

Kamili. Hybrid between *C. villosa* var. *Boxallii* and *C. Chamberlainiana.*

lævigata: *C. philippinensis.*

Lairessei. Hybrid between *C. Curtisii* and *C. Rothschildiana.*

Lathamiana (*C. Thompsoni*). Hybrid between *C. Spiceriana* and *C. villosa.*

Lawrenceana. Lvs. to 6 in. long and 2 in. wide: fls. to 3 in. across, solitary on stalks to 1 ft. high; sepal white veined with violet-red; petals bright green tipped with purple-brown; lip brown-purple, in spring and summer. Borneo. Var. **Hyeana** has white sepals and petals marked with green and olive-green lip.

Leeana. Hybrid between *C. insignis* and *C. Spiceriana.* There are many named forms of this hybrid.

Leonæ. Hybrid between *C. insignis* and *C. callosa.*

longwoodense. Hybrid between *C. Charlesworthii* and *C. Leeana.*

Lowii: form of *C. bellatula.*

lurida. Hybrid between *C. Lawrenceana* and *C. villosa* var. *superba.*

Mabeliæ. Hybrid between *C. superbiens* and *C. Rothschildiana.*

macroptera. Hybrid between *C. Lowii* and *C. superbiens.*

Mahleræ. Hybrid between *C. Rothschildiana* and *C. Lawrenceana.*

Mastersiana. Lvs. to 8 in. long and 2 in. wide: fls. 4 in. across, solitary on stalks to 16 in. high; sepals green with brighter margins; petals brown; lip copper-brown, Apr.–July. Malaya.

Matthewsi. Hybrid between *C. Lawrenceana* and *C. Mastersiana.*

Maudiæ. Hybrid between *C. Lawrenceana* var. *Hyeana* and *C. callosa* var. *Sanderæ.*

Morganiæ. Hybrid between *C. Stonei* and *C. superbiens.*

nitens (*C. Sallieri*). Hybrid between *C. villosa* and *C. insignis* var. *Maulei.*

nivea. Lvs. to 6 in. long and 1½ in. wide, purple beneath: fls. to 3 in. across, solitary on stalks to 5 in. high, white spotted with red, Apr.–Aug. Malaya.

œnantha. Hybrid between *C. Harrisiana* and *C. insignis* var. *Maulei.*

Osbornei: *C. Savangeana.*

Parishii. Lvs. to 1 ft. long and 2 in. wide: fls. 3 in. across, in 3–7-fld. racemes to 2 ft. high, yellow-green, the petals spotted with brown, Apr.–Aug. Burma.

philippinensis (*C. lævigata*). Lvs. to 1 ft. long and 1½ in. wide: fls. 2 in. across, in 3–5-fld. racemes to 2 ft. high; sepal yellow veined with violet; petals brown-violet; lip yellow veined with green, July–Sept. Philippine Isls.

Polletiana. Hybrid between *C. calophylla* and *C. œnantha* var.

Prewetti: *C. gigas.*

purpurata. Lvs. to 4 in. long and 1½ in. wide: fls. solitary on stalks to 6 in. high; sepal white striped purple; petals green at base, purple; lip red-brown, June–Sept. China.

regalis. Hybrid between *C. purpurata* and *C. insignis* var. *Maulei.*

Rolfei magnifica. Hybrid between *C. bellatula* and *C. Rothschildiana.*

Rothschildiana. Lvs. to 2 ft. long and 1½ in. wide: fls. 5 in. across, in 2–5-fld. racemes to 2½ ft. high; sepal yellow lined with dark purple; petals green spotted with red-purple, wavy; lip dark purple tipped with yellow, July–Sept. Sumatra, Borneo.

Sallieri: *C. nitens.*

Sanderi. A cross between two hybrids, *C. Calypso* and *C. nitens.*

Sanderiana. Lvs. to 1 ft. long and 1½ in. wide: fls. in 3–5-fld. racemes to 2 ft. high; sepal yellow, green at base, with broad purple stripes; petals yellow tipped with red-brown and edged with red; lip brown-purple, July–Sept. Philippine Isls.

Savangeana (*C. Osbornei*). Hybrid between *C. Harrisiana* and *C. Spiceriana.*

Schlesingeriana (*C. fulshawensis*). Hybrid between *C. villosa* var. *Boxallii* and *C. insignis* var. *Maulei.*

Selligera. Hybrid between *C. barbata* and *C. philippinensis.*

Simoni (*C. Actæus*). Hybrid between *C. Leeana* and *C. insignis* var. *Sanderæ.*

Spiceriana. Lvs. to 10 in. long and 1 in. wide: fls. 2 in. across, solitary on stalks to 8 in. high; sepal snow-white with a purple band in center; petals greenish-brown, wavy-margined; lip violet-brown edged with green, Oct.–Feb. India.

Stevensi. Cross between the hybrids *C. Calypso* and *C. Lathamiana.*

Stonei. Lvs. to 16 in. long and 1 in. wide: fls. 5 in. across, in 3–5-fld. racemes to 2 ft. high; sepal white striped with purple; petals yellow spotted with brown; lip yellow below, above bright brown or rose, July–Oct. Borneo.

superbiens. Lvs. to 6 in. long and 2 in. wide: fls. 3½ in. across, solitary on stalks to 10 in. high; sepal white lined with green; petals whitish lined with green and spotted with purple-brown; lip brown-purple, Mar.–July. Malaya.

superciliaris. Hybrid between *C. barbata* and *C. superbiens.*

Swaniana. Hybrid of *C. barbata* and *C. Dayana.*

Swinburnei magnifica. Hybrid between *C. insignis* var. *Maulei* and *C. Argus.*

Thompsoni: *C. Lathamiana.*

tonsa. Lvs. to 6 in. long and 1½ in. wide: fls, to 5 in. across, solitary on stalks to 10 in. high; sepal white or greenish striped with red; petals bright green veined with darker, red at tip; lip greenish shaded with brown, Mar.–July. Sumatra.

triumphans. Hybrid between *C. nitens* and *C. œnantha.*

Truffautiæ. Hybrid between *C. ciliolaris* and *C. Stonei.*

venusta. Lvs. to 6 in. long and 1½ in. wide, purple beneath: fls. 3 in. across, solitary on stalks to 6 in. high; sepal whitish striped with green; petals brownish, at base reddish or greenish; lip yellow-green marked with red and green, Nov.–Jan. Himalayas.

vexillaria. Hybrid between *C. barbata* and *C. Fairieana.*

Victoriæ-Mariæ. Fls. to 4 in. across; sepal green lined with red-brown; petals green edged with red; lip purple-brown, Apr.–July. Sumatra.

villosa. Lvs. to 16 in. long and 1½ in. wide: fls. 6 in. across, solitary on stalks to 1 ft. high; sepal olive-brown edged with white; petals brownish-yellow, wavy-margined; lip brownish-yellow with lighter veins, Nov.–May. Burma. Var. **Boxallii** has sepal spotted with dark brown.

CORDYLINE. DRACENA. *Liliaceæ.* Trees or shrubs with leathery or stiff narrow lvs. usually crowded at top of branches, often variegated, and greenish or yellowish fls. in panicles on solitary pedicels; grown under glass and out-of-doors in warm climates for the foliage; often more or less palm-like in appearance. *C. terminalis* has foliage in many color combinations. See *Dracæna.*

Propagated by seeds, cuttings and root-layering. The leaves may be removed from ripened stems, these stems cut into 2–4-inch lengths and laid in sand in propagating bed with bottom heat. When the eyes have developed growth of about six leaves, the shoots should be cut off with an eye and put in propagating-bed until rooted and then transplanted into pots.

amabilis. A form of *C. terminalis* having shining deep green lvs. becoming spotted with rose and white.

australis (*Dracæna australis*). To 40 ft.: lvs. to 3 ft. long and 2½ in. across: fls. white, fragrant, in large terminal panicles. New Zeal. Var. **atropurpurea** has base of lf. and midrib beneath purple. Var. **Veitchii** is bright crimson on midrib and base of lf.

Banksii. To 10 ft.: lvs. to 6 ft. or more long and 3½ in. across: fls. white, in drooping much branched panicles to 5 ft. long. New Zeal.

Baptistii. A form of *C. terminalis* having deep green lvs. striped with pink and yellow.

Bruantii. A garden form of *C. rubra.*

cannæfolia. A var. of *C. terminalis* with oblanceolate lvs. about 1 ft. long.

congesta: *C. stricta.*

Doucetii. A form of *C. australis* having lvs. edged and striped with white.

hybrida. A form of *C. terminalis* having deep green lvs. margined with rose.

imperialis. Lvs. deep metallic green marked with crimson or pink; form of *C. terminalis.*

indivisa (*Dracæna indivisa*). To 25 ft.: lvs. to 6 ft. long and 6 in. wide: fls. white, in drooping panicles to 4 ft. long. New Zeal.

metallica. A form of *C. terminalis* becoming purple-bronze in age.

nigro-rubra. Lvs. narrow, dark brown with rosy centers; form of *C. terminalis.*

norwoodiensis. A *terminalis* variant having lvs. striped with yellow, green and crimson.

pumilio. Stemless or with st. to 3 ft.: lvs. to 3 ft. long and ⅔ in. across: fls. white or bluish, in slender panicles to 3 ft. long. New Zeal.

Robinsoniana. Lvs. light green striped with bronze and brownish-crimson; form of *C. terminalis.*

rubra. To 15 ft.: lvs. to 15 in. long and 2 in. across: fls. lilac, in nodding lateral panicles. Country unknown.

stricta (*C. congesta*). To 12 ft.: lvs. to 2 ft. long and 1¼ in. across: fls. lilac, in terminal or lateral panicles. Australia. Var. **grandis** is a large highly colored form.

terminalis. To 10 ft.: lvs. to 2½ ft. long and 5 in. across: fls. yellowish, white or reddish, in panicles to 1 ft. long. E. Asia.—Runs into many foliage forms, and some of them have been given Latin names as if species.

tricolor: color form of *C. terminalis.*

Youngii. A form of *C. terminalis* with bright green lvs. streaked with red, bronze in age.

COREMA. *Empetraceæ.* Evergreen heath-like small shrubs with diœcious fls. in terminal heads, without sepals or petals; native in N. Amer. and Eu. Propagated by cuttings.

Conradii. BROOM CROWBERRY. To 2 ft.: lvs. linear, to ¼ in. long: staminate fls. with long purple stamens. Newf. to N. J. in rocky and sandy places.—Useful for colonizing and for ground-cover.

COREOPSIS (*Calliopsis. Leptosyne*). TICKSEED. *Compositæ.* Ann. and per. herbs, seldom shrubby, with mostly opposite lvs. that are entire or variously lobed or cut: heads solitary or loosely panicled, yellow, brown or rose, blooming in summer and autumn, of ray- and disk-fls.; pappus of teeth or scales or none. Grown in the flower-garden and border.

Coreopsis grows well in any garden soil. The annuals are started from seed sown indoors in early spring or in the open when the ground is warm, the perennials from seed, or by cuttings of growing wood in summer, and by division. The annual kinds are well-known flower-garden subjects, as *C. Atkinsoniana, Drummondii, tinctoria.* See *Thelesperma.*

Atkinsoniana. Ann. or per. to 4 ft.: lvs. 1–2-pinnate into linear lobes: heads to 1½ in. across, on long stalks, rays with brown-purple base, toothed or lobed, disk purple or brownish: achenes narrow-winged. B. C. to N. D.

atrosanguinea. A flower-garden ann., probably *Thelesperma Burridgeanum.*

auriculata. Per. to 1½ ft.: lvs. oval, simple or with few basal lobes: heads 2 in. across, rays yellow, toothed: achenes narrow-winged. Va. to Fla.—*C. auriculata* of the trade is *C. pubescens.*

bicolor: *C. tinctoria.*

calliopsidea (*Leptosyne calliopsidea*). Ann. to 2 ft. or less, sts. leafy: lower lvs. narrow or ligulate, the upper ones pinnately parted; heads to 3 in. across; pappus of scales. Calif., on moist hillsides.

cardaminefolia. Ann. to 2 ft.: lvs. 1–2-pinnate into ovate to linear lobes: heads about 1 in. across, rays brown-purple at base, toothed, disk dark purple: achenes winged. Kans. to Ariz.

coronata (*C. nuecensis* in part). Ann., glabrous or sparsely pubescent, branched, to 2 ft.: lvs. obovate or spatulate-oblong, to 3 in. long, entire or lower ones 3-parted: rays yellow, dark-lined, the heads to 2 in. across. Tex.

delphinifolia. LARKSPUR C. Per. to 5 ft.: lvs. to 3 in. long, palmately 3-parted and middle segm. again cut into linear lobes: heads to 2½ in. across, disk purple-brown, rays yellow, entire: achenes narrowly winged. Va. to Ga. and Ala.

Douglasii (*Leptosyne Douglasii. L. californica*). Ann. to about 1 ft.: lvs. all basal, filiform to linear and entire or pinnately parted: heads 1¼ in. across; pappus none or a little cup. S. Calif., Ariz.

Drummondii (*C. picta*). GOLDEN-WAVE. Ann. to 2 ft.: lvs. pinnate into ovate to linear lobes: heads to 2 in. across, long-stalked, rays yellow, brownish-purple at base, toothed or lobed, disk dark purple: achenes with thick margin. Tex.

elegans: *C. tinctoria.*

floribunda: *C. grandiflora.*

gigantea (*Leptosyne gigantea*). Succulent shrub to 6 ft., leafy only towards top: lf.-divisions nearly or quite filiform: heads to 3 in. across, on clustered peduncles 3–6 in. long; pappus none. Coasts, S. Calif.

grandiflora (*C. floribunda. C. lanceolata* var. *grandiflora*). Per. to 2 ft.: lvs. narrow and entire but mostly 3–5-parted: heads to 2½ in. across, on long stalks, rays yellow, lobed, disk yellow: achenes with broad wings. Ga. to New Mex.

lanceolata. Per. to 2 ft.: lvs. usually entire, mostly near the base: heads to 2½ in. across, very long-stalked, rays yellow, lobed, disk yellow: achenes broad-winged. Ont. to Fla. and La. Var. **flore-pleno** has double fls.

major (*C. senifolia*). Per. to 3 ft.: lvs. lanceolate and entire or palmately cut into 3 lanceolate segms.: heads to 2 in. across, rays yellow, entire, disk yellow: achenes winged. Va. to Fla. and Ala.

maritima (*Leptosyne maritima*). SEA-DAHLIA. Per. to 3 ft., sts. leafy and hollow: lf.-divisions linear or broader: heads to 3½ in. across, solitary on sts. to 1 ft. long; pappus none. Coasts, S. Calif.

marmorata: *C. tinctoria.*

nigra: *C. tinctoria* var. *atropurpurea.*

nuecensis: see *C. coronata.*

oculata: hort. name.

palmata. FINGER C. Per. to 3 ft.: lvs. palmately 3-cleft to below middle: heads to 2½ in. across, rays bright yellow, toothed, disk yellow: achenes narrow-winged. Ind. to Neb. and La.

picta: *C. Drummondii.*

pubescens. Per. to 4 ft.: lvs. oval, entire or with small lateral lobes: heads to 2½ in. across, rays yellow, lobed, disk yellow: achenes winged. Va. to Fla. and La.

radiata: hort. name for a form with rolled-up ray-fls.

rosea. Per. to 2 ft. with slender creeping rootstocks: lvs. linear, entire or 3-parted: heads to 1 in. across, short-stalked, rays rose-color, slightly toothed, disk yellow: achenes not winged. Mass. to Ga.

senifolia: *C. major.*

Stillmanii (*Leptosyne Stillmanii.*) Ann. to 1 ft., slightly fleshy, sts. leafy: lvs. with long linear lobes: heads 1½ in. or more across; pappus a cup. Calif.

tenuifolia: *C. verticillata.*

tinctoria (*C. bicolor. C. elegans. Calliopsis marmorata*). Ann. to 3 ft.: lvs. divided into lanceolate or linear segms.: heads to 2 in. across, long-stalked, rays yellow, crimson-brown at base, toothed, disk brownish-purple: achenes wingless. Minn. to Neb. and Ariz. Var. **atropurpurea** (*C. nigra*) has rays crimson-brown throughout. Var. **flore-pleno** has double fls. Var. **nana** is dwarf.

trichosperma: *Bidens trichosperma.*

tripteris. Per. to 8 ft.: lvs. lanceolate and entire or lower 3-parted: heads 1½ in. across, rays yellow, entire, disk yellow: achenes narrow-winged. Ont. to Fla. and La.

verticillata (*C. tenuifolia*). Thread-leaf C. Per. to 3 ft.: lvs. ternately divided into thread-like segms.: heads to 2 in. across, rays deep yellow, entire, disk yellow: achenes narrow-winged. Md. to Ark. and Neb.

CORETHROGYNE. *Compositæ.* A few per. herbs of Calif., somewhat like Aster and differing in technical characters, the herbage cottony-white when young: lvs. sessile, entire or serrate: heads with yellow disk and rays in the purple series.

californica. To 1½ ft. high, the sts. prostrate or decumbent at base and then ascending: lvs. linear to spatulate or obovate, the lowest few-toothed: heads solitary on peduncles, to ⅓ in. high, rays purple to lilac.

CORIACEOUS: leathery, as of leaves that are thick and stiff.

CORIANDER: *Coriandrum sativum.*

CORIANDRUM. *Umbelliferæ.* Ann. herbs with pinnately compound lvs., small white fls. in compound umbels, and ovoid frs.; one species grown for the frs. or seeds which are used as seasoning. It is of easy cult. in any garden soil. Propagated by seeds sown in autumn or spring, the latter time in the N.

sativum. Coriander. To 3 ft., strong-smelling: lvs. decompound, the upper divided into narrowly linear segms., the lower lvs. with ovate deeply cut segms. S. Eu.

CORIARIA, the only genus in the family *Coriariaceæ.* Herbs or shrubs with opposite or whorled lvs., small greenish fls. in racemes, with 5 sepals and 5 petals, 10 stamens, superior ovary, and berry-like fr.; the following species grown in S. U. S. and Calif. Propagated by seeds, cuttings of green wood, suckers and layers.

japonica. Shrub to 6 ft. or more: lvs. ovate to ovate-lanceolate, to 4 in. long, acute, 3-nerved: fls. greenish or reddish, in racemes: fr. red to blackish. Japan; hardy south of Washington.

myrtifolia. Shrub to 10 ft.: lvs. ovate, to 2½ in. long: racemes 1 in. long: fr. black. S. Eu., N. Afr.

ruscifolia (*C. sarmentosa*). Shrub or small tree to 25 ft.: lvs. ovate, to 3 in. long: racemes to 1 ft. long, drooping: fr. purple-black. New Zeal.

sarmentosa: *C. ruscifolia.*

terminalis. Herb or subshrub to 3 ft.: lvs. ovate, to 3 in. long: racemes 10 in. long: fr. black. China.

CORKSCREW-FLOWER: *Phaseolus Caracalla.*

CORK-TREE: *Phellodendron.*

CORM: a solid bulb-like part, usually subterranean, as the "bulb" of crocus and gladiolus.

CORMEL: a corm arising from a mother-corm.

CORN as a horticultural subject implies sweet or sugar maize (*Zea Mays* var. *rugosa*) as distinguished from the field or agricultural corns, and also certain kinds grown for the striped ornamental foliage.

Sweet corn, grown for the edible immature ear, is a tender annual, requiring warm "quick" land and full sun exposure. The first planting should be made in the home garden as soon as frost is past. It is well to plant early, intermediate and late varieties at the same time, then at intervals of two weeks until early summer, thus having a succession from the first crop until October. For late crop, corn may be started in pots and transplanted when peas and other crops are off. The soil for corn should be fertile, and the coarser manure left from the preparation of the ground for small crops may be used to good advantage. Corn for the garden is better planted in drills, the drills 3 to 4 feet apart, dropping the seed 10 to 12 inches apart in the drills. Some gardeners prefer to plant in "hills" 2–3 feet apart, of 3–5 stalks each. One quart of seed will plant 200 hills. Give frequent tillage. Golden Bantam (8-rowed) is now the leading variety for the home table, but Evergreen is popular and a good market kind. Some of the "green corn" in markets is not sweet corn.

Pop corn (*Z. Mays* var. *everta*) is grown the same as sweet corn.

CORNACEÆ. Dogwood Family. Shrubs and small trees, sometimes practically herbaceous, of about 10 genera most abundant in the northern hemisphere, having simple lvs., small bisexual or diœcious fls. sometimes surrounded by a showy corolla-like involucre, with 4–5-lobed calyx, 4–5 petals or none, 4–5 stamens, inferior 1–4-celled ovary, and fr. a drupe or berry. The genera Aucuba, Cornus, Corokia, Griselinia, Helwingia, are grown for ornament.

CORN, BROOM-: *Holcus Sorghum* var. *technicus.* **Chicken-:** *Holcus Sorghum* var. *Drummondii.* **Cockle:** *Agrostemma.*

CORNFLAG: *Gladiolus segetum.*

CORNFLOWER: *Centaurea Cyanus.*

CORN-SALAD: *Valerianella.*

CORNUS. Dogwood. *Cornaceæ.* Mostly shrubs and small trees with simple entire usually opposite and mostly deciduous lvs., small white or greenish-white fls. in a terminal infl., and little drupaceous frs., sometimes with large showy involucre like a corolla.

Dogwoods are useful for shrubberies and sometimes as single specimens. They are of easy cultivation in any usual soil. Propagated by cuttings of mature wood, layers, or varieties by budding and grafting on common stocks. The following species are hardy in the North unless otherwise stated.

alba. Tatarian D. To 10 ft., with blood-red branches: lvs. ovate or elliptic, to 5 in. long, glaucous below: fls. in cymes to 2 in. across: fr. whitish or tinted blue. Siberia, N. China. Var. **argenteo-marginata** (*elegantissima variegata*) has lvs. edged with white. In var. **Gouchaultii** the lvs. are variegated with yellowish-white and pink. Var. **sibirica** (*C. sibirica*) has bright coral-red branches. In var. **Spaethii** the lvs. are broadly edged with yellow.

alternifolia. Pagoda D. To 25 ft.: lvs. alternate, oval or ovate, to 4 in. long, pale beneath: fls. in cymes about 2½ in. across: fr. dark blue, rarely yellow. N. S. to Ga. and Mo.

Amomum (*C. sericea. C. cærulea*). Silky D. To 10 ft., with purplish branches: lvs. ovate to ovate-lanceolate, to 4 in. long, usually silky-pubescent beneath: fls. in cymes to 2½ in. across: fr. pale blue. Newf. to Fla. and Tex.

asperifolia. Rough-leaved D. To 15 ft., with reddish-brown branches: lvs. ovate to oval, to 4 in. long, rough above and pale beneath: fls. in cymes to 3 in. across: fr. white. Ont. to Fla. and Tex.

australis. Branches purplish or greenish: lvs. ovate, to 3 in. long, rough and hairy beneath: fls. in small dense cymes: fr. purplish-black. W. Asia.

Baileyi. To 10 ft., with reddish branches: lvs. ovate to lanceolate, to 5 in. long, white beneath: fls. in cymes to 2 in. across: fr. white. Ont. and Pa. to Minn., mostly on shores.

brachypoda: *C. macrophylla.*

cærulea: *C. Amomom.*

canadensis (*Chamæpericlymenum canadense*). Bunchberry. Woody per. herb to 9 in.: lvs. whorled, oval to obovate, to 3 in. long: fls. in dense heads subtended by an involucre of 4–6 large white petal-like bracts: fr. bright red. Newf. to Alaska, south to W. Va., and E. Asia.

capitata (*Benthamia fragifera*). To 40 ft., partially evergreen: lvs. leathery, oval-lanceolate, to 4 in. long: fls. in dense heads subtended by 4–6 large creamy-white petal-like bracts: fr. scarlet. Himalayas; to be grown only far S.

circinata: *C. rugosa.*

coloradensis: *C. stolonifera* var.

controversa. To 60 ft.: lvs. alternate, ovate, to 5 in. long, whitish beneath: fls. in cymes to 4 in. across: fr. bluish-black. Himalayas to Japan. Var. **variegata** has lvs. edged with white.

Dunbarii. Hybrid between *C. asperifolia* and *C. macrophylla*: lvs. ovate, to 6 in. long: fls. in corymbs to 2½ in. across: fr. blue.

femina (*Cornus* and *Svida stricta*). To 15 ft., with purplish branches: lvs. ovate to ovate-lanceolate, to 3 in. long: fls. in cymes to 2½ in. across: fr. pale blue. Va. to Fla. and Tex.; not hardy far N.

florida (*Cynoxylon floridum*). Flowering D. To 40 ft.: lvs. ovate, to 6 in. long: fls. in dense heads subtended by 4 large white petal-like bracts: fr. scarlet. Me. to Fla. and Tex. Var. **pendula** has drooping branches. Var. **plena** has double fls. In var. **rubra** the bracts are pink or rose.

Hemsleyi. To 12 ft.: lvs. ovate, to 3 in. long, hairy and pale beneath: fr. bluish-black. China; not hardy N.

Kousa (*Benthamia japonica*). Kousa. To 20 ft.: lvs. ovate, to 4 in. long, glaucous beneath: fls. in dense heads subtended by creamy-white petal-like bracts: frs. grown together into a head. Japan, China.

macrophylla (*C. brachypoda*). To 50 ft.: lvs. elliptic-ovate, to 6 in. long, glaucous beneath: fls. in panicle-like cymes to 6 in. across: fr. bluish-black. Himalayas, China, Japan; to be planted in north-central regions.

mas (*C. mascula*). Cornelian-Cherry. To 20 ft.: lvs. ovate, to 4½ in. long: fls. yellow, before the lvs., in umbels about ¾ in. across: fr. scarlet, edible. S. Eu., Orient. In var. **aureo-elegantissima** the lvs. are variegated with pink or yellow.

mascula: *C. mas.*

Nuttallii. To 75 ft.: lvs. ovate to obovate, to 5 in. long, glaucous beneath: fls. in dense heads subtended by white or pinkish bracts: fr. red or orange. B. C. to S. Calif.; hardy only far S.

obliqua. To 10 ft., the branches purple or yellowish-red: lvs. ovate to oblong, to 3 in. long, glaucous beneath: fls. in cymes 2 in. across: fr. blue to nearly white. Que. to Kans.

officinalis. To 15 ft.: lvs. elliptic, pale beneath: fls. before lvs., in umbels to about ¾ in. across: fr. scarlet. Japan, China.

paniculata: *C. racemosa.*

paucinervis. To 6 ft.: lvs. narrowly oval, to 4 in. long, more or less persistent: fls. in cymes to 3½ in. across: fr. black. China; hardy in north-central parts.

pubescens (*Svida pubescens*). To 18 ft., the branches purple: lvs. elliptic, to 4 in. long, tomentose and glaucous beneath: fls. in cymes 2 in. across: fr. white. B. C. to Calif; not hardy N.

racemosa (*C. paniculata*). To 15 ft.: lvs. ovate-lanceolate or lanceolate, to 4 in long, pale beneath: fls. in panicles: fr. white. Me. to N. C. and Neb.

rugosa (*C. circinata*). To 10 ft.: lvs. broadly ovate or orbicular, to 6 in. long, pale and pubescent beneath: fls. white, in dense cymes to 2½ in. across: fr. light blue. N. S. to Va. and N. D.

sanguinea. Bloodtwig D. To 12 ft., with purple or red branches: lvs. ovate, to 3 in. long: fls. in cymes to 2 in. across: fr. black. Eu., Orient. Var. **variegata** has lvs. variegated with yellowish-white. In var. **viridissima** the branches and fr. are green.

sericea: *C. Amomum.*

sibirica: *C. alba* var.

stolonifera. Red-Osier D. To 10 ft., with dark red branches, spreading by underground sts.: lvs. ovate or ovate-lanceolate, to 5 in. long: fls. in cymes to 2 in. across: frs. white or bluish. N. Amer. Var. **coloradensis** has brownish-red branches and bluish fr. Var. **flaviramea** has yellow branches.

stricta: *C. femina.*

utahensis: listed name.

COROKIA. *Cornaceæ.* Evergreen shrubs or trees native in New Zeal., with alternate entire small lvs., small yellow axillary fls. usually clustered, and drupaceous frs.; grown out-of-doors in Calif.

buddleoides. To 12 ft., much branched: lvs. lanceolate or linear-lanceolate, to 6 in. long, white-tomentose beneath: fls. in terminal panicles: fr. dark red. Var. **linearis** has narrower lvs.

Cotoneaster. To 10 ft., the branches numerous and interlaced: lvs. ovate, to 1 in. long, white-tomentose beneath: fr. red.

macrocarpa. To 20 ft.: lvs. oblong, to 4 in. long, white-tomentose beneath: fr. dark red.

COROLLA: inner circle of floral envelopes; if the parts are separate, they are petals; if not separate, they are teeth, lobes or divisions. The corolla is commonly the colored showy part of the flower.

CORONA: crown, coronet; any appendage or intrusion that stands between the corolla and stamens, or on the corolla, as the cup of a daffodil, or that is the outgrowth of the staminal part or circle, as in the milkweeds.

CORONARIA: *Lychnis.*

CORONILLA. *Leguminosæ.* Herbs and shrubs with odd-pinnate lvs., papilionaceous fls. in long-stalked axillary umbels, and cylindrical or angled pods constricted between the seeds; grown out-of-doors and in the greenhouse. Propagated by seeds and division, or by cuttings under glass.

Emerus. Scorpion Senna. Shrub to 9 ft.: lfts. 7–9: fls. yellow, ¾ in. long, the claw of the petals much longer than the calyx: pods 2 in. long. S. Eu.; hardy N.

glauca. Shrub to 4 ft.: lfts 5–7: fls. yellow, ½ in. long, the claw of the petals about length of calyx. S. Eu. Var. **variegata** has variegated foliage.

juncea. Shrub to 3 ft., gray-green, with nearly naked branches: lfts. 3–7: fls. golden-yellow, the claw of petal about length of calyx. Medit. region.

montana. Tall per.: lfts. 11–13: fls. yellow. Caucasus.

Securidaca: *Securigera Coronilla.*

valentina. Shrub to 3 ft.: lfts. 7–13: fls. deep yellow, fragrant. S. Eu.

varia. Crown Vetch. Straggling herb to 2 ft.: lfts. 11–25: fls. pinkish-white, ½ in. long, the claw of petals about length of calyx. Eu.; nat. in northeastern states.

CORONOPUS (*Senebiera*). Wart-Cress. *Cruciferæ.* A few more or less weedy diffuse or procumbent small ann. and bien. herbs with strong odor, sometimes listed, perhaps useful for ground-cover: lvs. commonly pinnatifid: fls. minute, whitish, in little racemes: fr. or silicle very small, twin. C. **procumbens** (*Carara Coronopus*) is tufted and prostrate, glabrous, glaucous, the sts. a few in. long: foliage finely cut: pods crested. Eu.; sometimes escaped.

CORREA. *Rutaceæ.* Australian shrubs or trees with opposite simple lvs., red, white or yellowish-green fls., 4-parted ovary and single style, and fr. of 4 carpels. Marked by the scurfy lvs. and branches.

Grown under glass or in the open in warm regions. Propagated by cuttings, or some species by grafting on *C. alba*. Shoots should be pinched back to induce bushy growth.

alba. To 4 ft.: lvs. orbicular to ovate, white-tomentose beneath: fls. white, bell-shaped, ½ in. long.

bicolor: *C. speciosa.*

speciosa (*C. bicolor*). To 3 ft.: lvs. ovate to lanceolate, white-tomentose beneath: fls. red or yellowish-green, tubular, 1–1½ in. long.

CORTADERIA. Pampas-Grass. *Gramineæ.* Large per. grasses with mostly basal foliage forming great clumps: lvs. rough on edges: spikelets diœcious or sometimes bisexual, borne in panicles which are usually large, plume-like and very decorative; native in S. Amer.; not hardy N. See *Grasses.*

argentea: *C. Selloana.*

jubata: *C. rudiuscula.*

Quila: *C. rudiuscula.*

rudiuscula (*C. Quila. C. jubata. Gynerium jubatum*). To 6 ft.: lvs. to 4 ft. long and ½ in. wide: panicle yellowish or purplish, to 2 ft. long, branches drooping. Ecuador to Chile and Argentina.

Selloana (*C. argentea. Gynerium argenteum*). To 20 ft.: lvs. many ft. long and to ¾ in. wide: panicles white or pink, silky-hairy, to 3 ft. long. Argentina.

CORTUSA. *Primulaceæ.* Per. hairy herbs with long-petioled orbicular lobed lvs. and rose or yellow fls. in umbels terminating the scape; a few species planted in rock-gardens. They do well in any good soil but require winter protection in the N. Propagated by division of roots.

Matthioli. To 6 in.: fls. rosy-purple, nodding. Eu., N. Asia. Var. **pubens** (*C. pubens*) has deeply lobed lvs., the lobes coarsely toothed. Var. **villoso-hirsuta** is hairy with deeply lobed lvs.

pubens: *C. Matthioli* var.

CORYDALIS (*Capnoides*). *Fumariaceæ.* Herbs with pinnately cut lvs., irregular yellow, blue, purple or rose dicentra-like fls. in terminal racemes, and capsular frs.; sometimes grown for ornament. Of easy cult. in any garden soil. Propagated by division or seed; sometimes tuberous-rooted.

bracteata. Per. to 9 in.: fls. sulfur-yellow, 1 in. long. Siberia.

bulbosa. Erect, to 6 in., with solid root: fls. purplish. Eu.

cheilanthifolia. Nearly stemless per. to about 8 in. high: fls. yellow, ½ in. long. China.

glauca: *C. sempervirens.*

lutea. Ann. to 8 in.: fls. pale yellow, ½ in. long. S. Eu.; nat. in England.

montana. Bien. to 1½ ft., glaucous: fls. golden-yellow, to ¾ in. long. S. D. to Mex.

nobilis. Per. to 9 in.: fls. white tipped with yellow and with purple spot, 1 in. long. Siberia.

ochotensis. To 2 ft.: fls. pale violet striped with black at apex, to 1 in. long. Siberia.

ochroleuca. To 1 ft.: fls. yellowish-white with yellow spur. Italy.

ophiocarpa. Ann. or bien. to 3 ft.: fls. yellow. Himalayas.

pallida. To 1½ ft., per.: fls. golden-yellow with brown patch, in racemes. China, Japan.

rosea. Per. to 2 ft.: fls. rose, 1 in. long. China.

rupestris. Per., small, alpine: fls. yellow, with short sac or spur, in simple racemes. Persia.

sempervirens (*C. glauca*). Ann. to 2 ft.: fls. pink tipped with yellow, rarely white, to ¾ in. long. N. Amer.

thalictrifolia. Per. to 1 ft. or more, with woody rootstocks: fls. yellow, 1 in. long. China.

tuberosa. Per. to 6 in., with tuberous roots: fls. purple. Eu.

Wilsonii. Per., with basal rosette of lvs.: fls. canary-yellow, 1 in. long. China.

CORYLOPSIS. Winter Hazel. *Hamamelidaceæ.* Asian deciduous shrubs with alternate toothed strongly veined lvs. and fragrant yellow fls. in nodding racemes before the lvs., caps. with 2 beaks; planted for ornament.

They thrive in a soil of peat and sand, and require protection in the North. Propagated by seeds, by greenwood cuttings under glass and by layers.

Gotoana. To 20 ft.: lvs. to 3 in. long, pubescent on veins beneath: racemes 1 in. long. Japan.

pauciflora. To 6 ft.: lvs. to 3 in. long, glaucous beneath and pubescent on veins: fls. to ¾ in. long, 2–3 together. Japan.

spicata. To 6 ft.: lvs. to 4 in. long. pubescent and glaucous beneath: racemes to 1½ in. long. Japan.

Veitchiana. To 6 ft.: lvs. to 5 in. long, glaucous and glabrous beneath: racemes to 2 in. long. China.

Willmottiæ. To 12 ft.: lvs. to 3 in. long, glaucous and pubescent on veins beneath: racemes to 3 in. long. China.

CORYLUS. Hazelnut. Filbert. *Betulaceæ.* Deciduous monœcious shrubs and small trees native in the north temp. zone, with alternate toothed generally ovate lvs., unisexual fls. before the lvs., the staminate in drooping catkins, and fr. a nut with leafy involucre borne in clusters at ends of branches; grown for ornament and the edible nuts. For cult. see *Filbert.*

americana. American H. To 10 ft.: lvs. to 5 in. long, pubescent beneath: frs. 2–6, the involucre about twice length of nut, with deep irregular lobes. E. N. Amer.

Avellana. European H. To 15 ft.: lvs. to 4 in. long, pubescent beneath: frs. 1–4, the involucre shorter than nut or only slightly longer, with deep irregular lobes. Eu. Hort. vars. are: **aurea**, lvs. yellow; **contorta**, branches twisted; **fusco-rubra** (var. *atropurpurea*, var. *purpurea*), lvs. dull purple or brownish-red; **grandis**, Cobnut, nuts large; **heterophylla** (var. *laciniata*), lvs. pinnately lobed; **pendula**, branches drooping; **quercifolia**, lvs. with broad lobes resembling an oak.

chinensis. Chinese H. To 120 ft.: lvs. to 7 in. long, pubescent: frs. 4–6, the involucre contracted above the nut into a tube, and divided into linear lobes. China.

Colurna. Turkish H. To 80 ft.: lvs. to 5 in. long, pubescent on veins beneath: frs. in clusters, the involucre divided into linear lobes. S. E. Eu., W. Asia.

cornuta (*C. rostrata*). Beaked H. To 10 ft.: lvs. to 4 in. long, pubescent on nerves beneath: frs. 1–2, the tubular bristly involucre much contracted above the nut into a long beak. Que. to Ga. and Mo.

maxima. Filbert. To 30 ft.: lvs. to 5½ in. long: frs. 1–3, the tubular involucre lobed at top and about twice as long as nut. S. E. Eu. Var. **purpurea** has dark purple lvs.

rostrata: *C. cornuta.*

Sieboldiana. Japanese H. Large bush to 15 ft.: lvs. elliptic to obovate, to 4 in. long, hairy on veins underneath: frs. 1–3 in tubular-constricted setose involucre. E. Asia.

CORYMB: short and broad more or less flat-topped indeterminate flower-cluster; outer flowers opening first.

CORYNOCARPUS. The only genus in *Corynocarpaceæ.* Evergreen trees with alternate simple lvs., small bisexual fls. in terminal panicles having 5 sepals and petals, 5 stamens, 5 staminodia, and drupaceous fr. The following species, with poisonous seed (unless steamed, or steeped in salt water) but the pulpy part edible, is planted in Calif. In Melanesia are two other species.

lævigata. To 50 ft.: lvs. oblong, to 8 in. long: fls. greenish, the panicles to 8 in. long: drupe 1½ in. long, orange. New Zeal.

CORYPHA. *Palmaceæ.* About 8 ponderous hermaphrodite fan-palms in trop. Asia, monocarpic (flowering and fruiting once and then dying at the age of 20–80 years), unarmed except for the spiny petioles, the immense panicled spadices terminal (above the crown): lvs. very large, stiff and heavy, deeply divided into many ridged segms.; petioles long, hard and stiff with strong spines or hooks on the margins: fls. small, produced in prodigious quantity; stamens 6: fr. a globose drupe size of a cherry. The true Coryphas are little planted within the limits of the U. S., the palms generally known under this name being Livistonas (a practice so far out of date that it should be discontinued). For cult. see *Palm.*

australis: *Livistona australis.*

elata (*C. Gebanga*). To 60 or 70 ft., the trunk bearing strong rough spiral ridges and furrows: lvs. 8–10 ft. diam., cut to about half the depth into 80 or 100 smooth hard segms. with rather obtuse bifid apex; petiole broad, 8–12 ft. long with black margins and widely spaced strong straight or curved spines: spadix much narrower than crown: fr. about 1 in. diam., olive-colored. Bengal and Burma.—The lvs. wither and fall when the plant begins to bloom.

Gebanga: *C. elata.*

rotundifolia: *Livistona rotundifolia.*

umbraculifera. Talipot Palm. To 40–80 ft., stocky, trunk ringed after lf.-bases fall: lvs. to 12 or 16 ft. broad, cleft to center into 80 or 100 linear-lanceolate stiff ridged acute or bifid segms.; petiole to 10 ft., narrowly channelled, with rather short compressed spines often in pairs: spadix equalling or exceeding crown: fr. about 1½ in. diam. Ceylon and Malabar Coast.

CORYPHANTHA. *Cactaceæ.* Ball-like or cylindric solitary or cespitose small cacti, Cent. Mex. to S. Canada, covered with spine-bearing tubercles which (except when very young) are grooved on upper face: fls. mostly yellow but sometimes red or purple, showy, expanding, borne near top of plant, the perianth long-persistent. Sometimes grown as little pot specimens, mostly known in cult. as Mammillarias. See *Cacti.*

aggregata (*Mammilaria aggregata. Cereus* and *Echinocereus aggregatus*). Solitary or in clumps, body globular or nearly so and very spiny, the radial spines many and appressed, centrals several and more erect: fls. showy, 2–3 in. across, purplish. New Mex., Ariz., Mex.—Very showy when in clumps.

arizonica (*Mammillaria arizonica*). Sometimes in clumps 3 ft. across, each head or body globose or ovoid and to 4 in. diam., the tubercles deeply grooved, spines many, stiff and straight: fls. 2–3½ in. across, rose-colored. N. Ariz.

clava (*Mammillaria clava*). Club-shaped, deep green, woolly in axils and red gland at base of groove, central spine 1, radials about 7: fls. 3 in. or more across, pale yellow, outer parts tinged red. Mex.

cornifera (*Mammillaria cornifera*). Body globose and pale green, with short broad tubercles, the radial spines 16 or 17 and central spine 1: fls. yellow tinged red, nearly 3 in. broad. Mex.

echinus (*Mammillaria echinus*). Globose to somewhat conic, 1–2 in. diam., with many closely appressed spines, the radials white, centrals often blackish: fls. 1–2 in. long, yellow. W. Tex.

elephantidens (*Mammillaria elephantidens*). Nearly globose, to 5 in. high and somewhat broader, tubercles obtuse and to 2 in. long, densely woolly in axils, spines 8 and all radial: fls. about 4 in. across, rose-colored. Mex.

erecta (*Mammillaria erecta*). Cylindric, yellowish-green, to 12 in. long, tubercles obliquely conic, spines 8–14, awl-like: fls. large and yellow, with very narrow segms. Mex.

macromeris (*Mammillaria macromeris*). Branching at base, body more or less cylindrical, to 8 in. long, the tubercles soft and several in. long, grooved two-thirds their length, radials many and white, centrals black: fls. to 3 in. broad, purple. Mex., W. Tex.

missouriensis: *Neobesseya missouriensis.*

Muehlenpfordtii (*Mammillaria Scheeri*). Body nearly globular and commonly simple, to 8 in. long and 6 in. thick, tubercles to 1 in. long and very woolly when young, radials 6–16 and straight, centrals 1–4: fls. yellow, about 2¼ in. long. W. Tex., New Mex., Mex.

neo-mexicana (*Mammillaria neo-mexicana*). Body globular or short-oblong, to about 4 in. long, covered with spines, the radials needle-like and white, centrals stouter and brown or black toward apex: fls. to 2 in. broad, greenish, purplish inside. New Mex., W. Tex.

Nickelsæ (*Mammillaria Nickelsæ*). Globular and cespitose, to about 3 in. high, pale green and glaucous, becoming purplish, tubercles almost hidden by overlapping radial spines: fls. bright yellow with red center, 2–3 in. broad. S. Tex., Mex.

octacantha (*Mammillaria octacantha*). Cylindric, to 1 ft. high and 6 in. diam., white-woolly in axils, the long tubercles with 1 or 2 red glands, radials 8 and rigid, centrals 1 or 2 and stouter: fls. straw-colored, 2 in. or more broad. Mex.

pectinata (*Mammillaria pectinata*). Globose, 1–2¼ in. diam., tubercles spiral, spines 16–24 and all radial some of them arched over apex of areole and yellowish-white with black tip: fls. yellow, 2 in. long. S. Tex., Mex.

radians (*Mammillaria radians*). Globose, about 3 in. diam., tubercles ovoid, the axils glabrous, spines 16–18 all radial and white or yellowish: fls. lemon-yellow, tinged red outside, 4 in. broad. Mex.

radiosa: *C. vivipara.*

recurvata (*Mammillaria recurvata* and *recurvispina*). Body depressed-globose, 4–8 in. diam., often making large masses, tubercles not prominent, radial spines about 20 yellow and recurved, centrals 1 or 2: fls. about 1–1⅜ in. long, brownish outside and lemon-yellow inside. Ariz., Mex.

robustispina (*Mammillaria robustispina* and *M. Brownii*). Solitary or clustered, body globular or nearly so, 2–6 in. high, almost hidden by spines, the radial 12–15 and 3 lower very stout, central solitary: fls. salmon, about 2 in. long. Ariz., New Mex., Mex.

Scheeri: *C. Muehlenpfordtii.*

vivipara (*Mammillaria vivipara, M. radiosa*). Solitary or in mound-like clusters, body globular and to 2 in. diam., tubercles prominent and woolly, radials about 16 and white, centrals 4–6: fls. nearly 2 in. long, purple, sepals fringed. Minn., Man., Alberta to Colo. and N. Tex.

CORYTHOLOMA. *Gesneriaceæ.* Trop. American herbs with tuberous roots, lvs. opposite or in 3's, fls. tubular and often 2-lipped, solitary or clustered in the axils, and fr. a caps.; one species grown under glass.

cardinalis (*Gesneria cardinalis. G. macrantha*). To 1 ft., hairy: lvs. ovate-cordate, to 6 in. long, toothed: fls. red, to 3 in. long. Habitat unrecorded.

COSMIDIUM: *Thelesperma Burridgeanum.*

COSMOS. *Compositæ.* Showy late-flowering ann. or per. herbs with opposite usually pinnately cut lvs. and heads solitary or in panicles, rays variously colored; pappus of awns or crown; native in trop. Amer. Closely allied to Dahlia.

Cosmos is cultivated in the flower-garden and is easily grown from seed but in the North it may be sown indoors in early spring if bloom is desired in late summer and early forms should be chosen. Sandy soil is preferred as the plants do not bloom well in rich soil in short-season climates.

bipinnatus. Ann. to 10 ft.: lvs. 2-pinnate into linear segms.: heads to 3 in. or more across, rays white, pink, crimson, disk yellow: achenes beaked. Mex.—In the anemone- or double-fld. forms the disk is replaced by a compact crowded mass of petal-like parts the same color as the rays. Early and late flowering strains of both the single and double forms are now sold.

diversifolius (*Bidens atrosanguinea. B. dahlioides. Dahlia Zimapani*). BLACK C. Per. to 16 in., grown as ann., with tuberous roots: lvs. entire or pinnately parted into 5–7 lfts.: heads to 2 in. across, long-stalked, disk red, rays dark velvety-red, sometimes tinged dark purple: achenes angled, not beaked. Mex.

sulphureus. YELLOW C. Ann. to 7 ft.: lvs. 2–3-pinnate into lanceolate lobes: heads to 3 in. across, rays pale or golden-yellow, disk yellow: achenes beaked. Mex.

COSTMARY: *Chrysanthemum Balsamita.*

COSTUS. SPIRAL FLAG. *Zingiberaceæ.* Stout trop. per. herbs, the sts. often spirally twisted, having leafy sts. and yellow, red or white fls. in dense spikes, the 1 staminode or lip petal-like.

They require tropical temperatures and rich moist soil. Propagated by cutting the stalks into about one-inch lengths and planting in sand and sifted moss or peat; also by division of the rootstocks. The plants are not often seen under glass as they require too much room. See *Zingiberaceæ.*

elegans: *C. Malortieanus.*

igneus. To 3 ft. high: lvs. to 6 in. long, oblong-lanceolate: fls. orange-red. Brazil.

Malortieanus (*C. elegans. C. zebrina*). To 3 ft. high: lvs. to 14 in. long and 7 in. wide, obscurely banded with green above: fls. yellow, the lip marked with red, in spikes to 2½ in. long. Cent. Amer.

speciosus. To 10 ft.: lvs. to 8 in. long and 2½ in. wide: fls. white with yellow center, in spikes to 5 in. long. E. Indies.

zebrina: *C. Malortieanus.*

COTINUS. *Anacardiaceæ.* Two woody deciduous species, one native in N. Amer. and the other S. Eu. to Cent. Asia and China, with simple lvs., small polygamous fls. in large loose terminal panicles, the sterile pedicels of the Old World species lengthening and clothed with spreading hairs and producing the "smoky" effect that gives the plant its common name, 5 stamens, fr. a small compressed drupe with style on one side.

Cotinus requires well-drained and not too rich soil. Propagated by seeds, root-cuttings and layers.

americanus (*Rhus americana* and *R. cotinoides*). Small tree to 30 ft. or more, with lvs. mostly obovate and cuneate or tapering at base: taller tree than the following and probably not as hardy, the panicles not showy but autumn lf.-color attractive. Tenn., Ala., to Tex.—Little planted.

coggygria (*Rhus Cotinus*). SMOKE-TREE. Bushy shrub to 15 ft.: lvs. oval, to 3 in. long: panicles much branched, to 8 in. long, usually purplish, June-July. S. Eu. to Asia. Var. **purpureus** (var. *atropurpureus*) has purplish lvs. and panicles with dark purple hairs. Var. **pendulus** has drooping branches.—Hardy N.

COTONEASTER. *Rosaceæ.* Shrubs or rarely small trees native in temp. regions of Old World, with alternate entire deciduous or persistent lvs., small white or pink fls. solitary or in clusters, and fr. a small red or black drupe. Some of them are more or less evergreen.

The genus has many ornamentals of first-class value in home gardens and landscape work, of attractive habit, interesting bloom and showy often persistent fruit. Most of them (unless otherwise noted) are hardy in the northern parts of the United States. Cotoneasters prefer sunny positions in well-drained soil. Propagated by seeds sown when ripe or stratified, by layers in autumn, by cuttings of young wood under glass late in summer, and rare kinds by grafting on stock of *C. integerrima* and the common quince or hawthorn.

acuminata. To 12 ft., deciduous: lvs. to 2½ in. long, pubescent on both sides: fls. pinkish, in 2–5-fld. clusters: fr. bright red. Himalayas.

acutifolia. To 12 ft., deciduous: lvs. to 2 in. long, pubescent on both sides when young: fls. pinkish, in 2–5-fld. clusters: fr. black. China. Var. **villosula,** lvs. densely pubescent beneath.

adpressa. Prostrate, deciduous: lvs. to ½ in. long, usually wavy at margins: fls. pinkish, 1–2 together: fr. bright red. China.

affinis. Tall deciduous shrub: lvs. to 3 in. long, pubescent beneath when young: fls. white. in many-fld. corymbs: fr. brown or nearly black. Himalayas; adapted to S. Var. **bacillaris** (*C. bacillaris*) has lvs. soon glabrous.

ambigua. To 6 ft., deciduous: lvs. to 2 in. long, pubescent beneath: fls. pinkish, in 5–10-fld. clusters: fr. black. China.

amœna. To 5 ft., densely branched, deciduous: lvs. about ½ in. long, densely pubescent below: fls. pinkish, in 6–10-fld. clusters: fr. orange-red. China.

angustifolia: *Pyracantha angustifolia.*

apiculata. To 6 ft., deciduous: lvs. to ½ in. long, pale and nearly glabrous below: fls. unknown: fr. bright red. China.

applanata: *C. Dielsiana.*

bacillaris: *C. affinis* var.

bullata. To 6 ft., deciduous: lvs. to 3 in. long, rugose, slightly pubescent: fls. pinkish, in 3–7-fld. clusters: fr. red. China. Var. **floribunda,** clusters many-fld. Var. **macrophylla,** lvs. to 5 in. long.

buxifolia. Low, densely branched: lvs. about ½ in. long, densely tomentose beneath, margins revolute: fls. white, in 2–6-fld. clusters: fr. red. India. Var. **vellæa** has smaller lvs. and often solitary fls.—The material usually cult. under this name is *C. prostrata* var. *lanata.*

congesta: *C. microphylla* var. *glacialis.*

crenulata: *Pyracantha crenulata.*

Dammeri (*C. humifusa*). Prostrate, the branches often rooting, evergreen: lvs. about 1 in. long, dark and shining above, pale beneath: fls. white, solitary: fr. bright red. China. Var. **radicans** has smaller lvs. and 1–2 fls. together.

Davidiana: *C. horizontalis.*

Dielsiana (*C. applanata*). To 8 ft., deciduous: lvs. to 1 in. long, tomentose beneath: fls. pinkish, in 3–7-fld. clusters: fr. bright red. China. Var. **elegans** has smaller half-evergreen lvs.

divaricata. To 6 ft., deciduous: lvs. to ¾ in. long, dark and shining above, pale beneath: fls. pinkish, in 3-fld. clusters: fr. bright red. China.

foveolata. To 10 ft., deciduous: lvs. to 4 in. long, pubescent and with prominent veins beneath: fls. pinkish, in 3–6-fld. clusters: fr. black. China.

Francheti. To 10 ft., evergreen or partially so: lvs. to 1¼ in. long, tomentose beneath: fls. pinkish, in 5–11-fld. clusters: fr. orange-red. China; not hardy N. Var. **cinerascens** is more vigorous.

frigida. To 25 ft., deciduous or semi-evergreen: lvs. to 5 in. long, tomentose beneath when young: fls. white, in dense tomentose clusters to 2½ in. across: fr. bright red. Himalayas; for southern states.

Gibbsii: *Pyracantha Gibbsii.*

glabrata. Evergreen: lvs. to 3 in. long, glaucous and nearly glabrous beneath: fls. white, in dense corymbs 1 in. across. China; not hardy N.

Harroviana. To 6 ft., semi-evergreen: lvs. to 2 in. long, leathery, densely tomentose beneath when young: fls. white, in dense clusters to 1½ in. across. China.

hebephylla. To 8 ft., deciduous: lvs. to 1 in. long, glaucous and becoming glabrous beneath: fls. white, in 6–16-fld. corymbs. China.

Henryana. To 12 ft., semi-evergreen, the branches drooping: lvs. to 5 in. long, gray-tomentose beneath when young: fls. white, in loose clusters to 2 in. across: fr. red. China; not hardy N.

horizontalis (*C. Davidiana*). To 3 ft., semi-evergreen, the branches spreading horizontally: lvs. to ½ in. long, slightly pubescent beneath: fls. pinkish, 1–2 together: fr. bright red. China. Var. **perpusilla** has lvs. ¼ in. or less long. Var. **variegata** has lvs. variegated with white.

humifusa: *C. Dammeri.*

hupehensis. To 6 ft., deciduous, the branches arching: lvs. to 1½ in. long, gray-tomentose beneath: fls. white, in 6–12-fld. clusters: fr. bright red. China.

integerrima (*C. vulgaris*). To 6 ft., deciduous: lvs. to 2 in. long, tomentose beneath: fls. pinkish, in nodding 2–4-fld. clusters: fr. red. Eu., N. Asia.

lactea. To 10 ft., evergreen or partially so: lvs. to 2 in. long, white- or yellow-tomentose beneath: fls. white, in corymbs 2 in. across: fr. red. China.

laxiflora: *C. melanocarpa* var.

Lemoinei: listed name.

Lindleyi. Similar to *C. racemiflora* but with longer lvs. and black fr. Himalayas.

lucida (*C. sinensis*). To 10 ft., deciduous: lvs. to 2 in. long, shining above, pubescent beneath when young: fls. pinkish, in 3–8-fld. clusters: fr. black. N. Asia.

melanocarpa (*C. nigra*). To 6 ft., deciduous: lvs. to 2 in. long, dark green above, white-tomentose beneath: fls. pinkish, in nodding 3–8-fld. clusters: fr. black. Eu., Asia. Var. **laxiflora** (*C. laxiflora*) has larger lvs. and many-fld. clusters.

microphylla. To 3 ft., evergreen, the branches spreading: lvs. to ⅓ in. long, dark and shining above, gray-pubescent beneath: fls. white, usually solitary: fr. bright red. Himalayas. Var. **glacialis** (*C. congesta*) has glabrous lvs. and pinkish fls. Var. **thymifolia** (*C. thymifolia*) has narrower lvs. and 2–4-fld. clusters.

moupinensis. To 15 ft., deciduous: lvs. to 4 in. long, pale and pubescent beneath, the veins conspicuous: fls. pinkish, in many-fld. clusters: fr. black. China; needs protection N.

multiflora (*C. reflexa*). To 6 ft., deciduous: lvs. to 2 in. long, becoming glabrous: fls. white, in many-fld. loose clusters: fr. red. Asia. Var. **calocarpa** has larger lvs. and fr.

nigra: *C. melanocarpa.*

nitens. To 4 ft., deciduous, the branches spreading: lvs. to ¾ in. long, dark green and shining above, becoming glabrous beneath: fls. pink, in 3-fld. clusters: fr. purplish-black. China.

nummularia: *C. racemiflora.*

obscura. Deciduous, to 10 ft.: lvs. elliptic to obovate or somewhat rhombic, to 2 in. long, gray underneath: fls. pinkish, in short clusters of 3–7: fr. somewhat pyriform, dark red. China.

pannosa. To 10 ft., semi-evergreen, the branches arching: lvs. to 1 in. long, white-tomentose beneath: fls. white, in 6–20-fld. clusters: fr. red. China; not hardy N.; common in Calif.

praecox: a listed name.

prostrata (*C. microphylla* var. *Uva-ursi*). To 12 ft., evergreen, the branches arching: lvs. to ¾ in. long, dark and shining above, slightly hairy beneath: fls. white, in 1–3-fld. clusters: fr. red. Himalayas; probably not hardy N. Var. **lanata** (*C. Wheeleri*), lvs. tomentose beneath.

Pyracantha: *Pyracantha coccinea.*

racemiflora (*C. nummularia*). To 8 ft., deciduous: lvs. to 1¼ in. long, gray-tomentose beneath: fls. white, in 3–12-fld. clusters: fr. red. S. Eu., N. Afr., Asia. Var. **Royleana** (var. *orbicularis*) is a low form with broad lvs. Var. **songarica** has less pubescent lvs.

reflexa: *C. multiflora.*

rhytidophylla. Evergreen: lvs. to 3 in. long, wrinkled above, white- or yellow-tomentose beneath: fls. white, in dense corymbs 1 in. across: fr. orange-red. China; not hardy N.

Rogersiana: *Pyracantha crenulata* var.

rotundifolia. To 8 ft., semi-evergreen: lvs. to ½ in. long, slightly pubescent when young: fls. white tinged pink, usually solitary: fr. bright red. Himalayas, China.—Some of the material passing under this name is *C. prostrata.*

salicifolia. To 15 ft., evergreen or partially so: lvs. to 3 in. long, rugose, tomentose beneath: fls. white, in tomentose clusters to 2 in. across: fr. bright red. China. Var. **floccosa** has lvs. shining above and var. **rugosa** dull green above.

serotina. Small tree, young shoots silky-pubescent: lvs. to 3 in. long, becoming glabrous: fls. in clusters to 3 in. across: fr. red. China.

Simonsii. To 10 ft., semi-evergreen: lvs. to 1¼ in. long, pubescent beneath: fls. white, in 2–4-fld. clusters: fr. bright red. Himalayas.

sinensis: *C. lucida.*

songarica: *C. racemiflora* var.

thymifolia: *C. microphylla* var.

tomentosa. To 10 ft., deciduous: lvs. to 2½ in. long, gray-tomentose beneath: fls. pinkish, in nodding 3–12-fld. clusters: fr. brick-red. S. E. Eu., W. Asia.

turbinata. To 6 ft., semi-evergreen: lvs. to 1¾ in. long, silky-pubescent beneath: corymbs many-fld., white-tomentose: fr. bright red. China.

vulgaris: *C. integerrima.*

Wheeleri: *C. prostrata* var. *lanata.*

Wilsoni. To 4 ft.: lvs. pale and pubescent below: fls. white, in panicled clusters. Japan.

Zabeli. To 6 ft., deciduous: lvs. to 1¼ in. long, gray-tomentose beneath: fls. pinkish, in nodding 3–9-fld. clusters: fr. bright red. China.

COTTON: *Gossypium.* **Lavender-**: *Santolina Chamæcyparissus.*

COTTON-WEED: *Diotis candididissima.*

COTTONWOOD: *Populus.*

COTULA (*Leptinella*). *Compositæ.* Ann. and per. herbs, mostly of low stature and creeping or tufted, in the southern hemisphere but a few of them nat. elsewhere and one of them listed in this country as a rock-garden foliage subject: lvs. alternate, pinnatifid or rarely entire: heads small, peduncled, without rays; pappus lacking.

aurea: *Matricaria aurea.*

squalida. Per. a few in. high, the branches creeping 12 in. or more, soft-hairy: lvs. narrow, to 2 in. long, deeply pinnatifid and fern-like, the segms. also cut: heads ⅓ in. or less diam. New Zeal.

COTYLEDON: seed-leaf; the primary leaf or leaves in the embryo; in some plants the cotyledon always remains in the seed-coats and under ground and in others (as common bean) it emerges on germination.

COTYLEDON. *Crassulaceæ.* Succulents with simple basal or st.-lvs. and white, yellow, red or greenish fls. in terminal racemes or cymes, characterized by tubular corolla that is much longer than the calyx; natives of the Old World, particularly S. Afr. and Medit. region, seldom cult. with us in greenhouses or rock-gardens. Cult. as for Sedum and Sempervivum; see *Succulents.*

agavoides: *Urbinia agavoides.*

cæspitosa: *Dudleya cæspitosa.*

Cooperi. A little plant, to 12 in., scarcely caulescent: lvs. 5–6 near base, spatulate, 2 in. long, spotted: fls. 6–10, red and greenish, tubular, about ⅝ in. long. S. Afr.

densiflora: *Stylophyllum densiflorum.*

elegans: *Oliveranthus elegans.*

farinosa: *Dudleya farinosa.*

gibbiflora: *Echeveria gibbiflora.*

Hoveyi: *Echeveria Hoveyi.*

lanceolata: *Dudleya lanceolata.*

laxa: *Dudleya laxa.*

lurida: *Dudleya lurida.*

orbiculata. To 4 ft.: lvs. opposite, oblong to roundish, to 4 in. long, entire: fls. red, drooping. S. Afr.

Pachyphytum: *Pachyphytum bracteosum.*

paraguayensis: *Byrnesia Weinbergii.*

Plattiana: *Dudleya Plattiana.*

pulverulenta: *Dudleya pulverulenta.*

secunda: *Echeveria secunda.*

Semenovii (*Umbilicus Semenovii*). To 18 in.: lvs. all linear and somewhat spinescent, the middle ones 1½ in. long: fls. white becoming reddish, in a terminal raceme. Temp. Asia.

septentrionalis: *Dudleya septentrionalis.*

simplicifolia. To 6 in.: lvs. roundish, irregularly and coarsely toothed: fls. yellow, drooping.

Umbilicus (*Umbilicus pendulinus*). NAVELWORT. PENNYWORT. To 1 ft.: lvs. orbicular, peltate, coarsely toothed: fls. yellowish-green, drooping. W. Eu. to W. Asia and trop. Afr.

COUTAREA. *Rubiaceæ.* Trees and shrubs, native Mex. to S. Amer., bearing opposite simple stalked lvs., and large (2–4 in. long) white or yellowish funnelform-campanulate pedicillate fls. mostly in small cymes; stamens 5–8; style filiform: fr. an ovoid or obovoid caps.

hexandra. To 15 ft. or more: lvs. ovate to oval, to about 5 in. long, sharp-pointed, entire: fls. mostly in 3's, the corolla white or yellowish and tinged purple toward base. Mex. to Argentina.

COVER-CROP. A crop grown primarily for the covering and protecting of land, particularly in orchards, after the final tillage in summer until the following spring when tillage recurs. It may be a green crop not killed by the winter as crimson clover, or a one-season crop that is killed by frost but remains on the land till spring, as peas. The crop is turned under in spring and then acts as an amendment to the soil. Many kinds of plants may be employed as cover-crops; crimson clover, vetch, rape, wheat, winter oats, soybean, cowpea, buckwheat, beggarweed, crotalaria, peas, barley, millet are some of them. In this sense the term cover-crop was first employed in 1892 (Cornell Bulletin 59), suggested by the author's observations of "cover" for game in Ireland.

COVILLEA: *Larrea.*

COWAGE: *Stizolobium pruritum.*

COWANIA. *Rosaceæ.* Evergreen shrubs or small trees of Mex. and S. W. U. S., with leathery sticky lvs., solitary fls., and achenes with long feathery tails; not showy, but sometimes planted in native or similar regions.

Stansburiana. Shrub to 12 ft.: lvs. to ½ in. long, 3–5-parted into toothed lobes: fls. white or pale yellow, ¾ in. long. Colo. to Mex.

COWBERRY: *Vaccinium Vitis-idæa.*

COW-HERB: *Saponaria Vaccaria.*

COWITCH: *Stizolobium pruritum.*

COWPEA: *Vigna sinensis.*

COW POISON: *Delphinium trolliifolium.*

COWSLIP: *Primula veris*; also *Caltha palustris, Mertensia virginica.* **American**: *Dodecatheon.* **Cape-**: *Lachenalia.*

CRAB-APPLE: *Pyrus.*

CRACCA: *Tephrosia.*

CRAMBE. *Cruciferæ.* A score of herbs, sometimes woody at base, ann., bien. and per., mostly in Eurasia, sometimes grown for ornament and one as an esculent: lvs. mostly thick or fleshy, glaucous, often very large, lobed, cut, lyrate or pinnatifid: fls. small but numerous, in panicles: fr. a 2-pointed indehiscent pod or silicle, the upper joint 1-seeded and globular.

cordifolia. Stout striking per. to 7 ft.: radical lvs. cordate, to 2 ft. and more across, somewhat lobed and stout-dentate, long-stalked, more or less hispid-hairy: fls. ⅓ in. across, white, in great terminal leafless panicle. Caucasus.

hispanica. Hispid much branched ann. to 3 ft.: lvs. with oval to nearly orbicular terminal part and lobed or lyrate below, to 3 in. across, margins sinuate: fls. small, white, in long open racemes. Medit. region.

maritima. SEA-KALE (which see). Stout stocky per. to 3 ft., with fleshy large glaucous-blue foliage: radical lvs. to 2 ft. or more long and nearly as broad, notched and shallowly lobed, stout-stalked: fls. white, in panicles: fr. a pea-like body. Seacoasts, W. Eu. to Asia Minor.

CRANBERRY. The trailing swamp cranberry, *Vaccinium macrocarpon*, is cultivated extensively, particularly in Massachusetts, New Jersey and Wisconsin, in artificial or developed bogs. The small or European cranberry, native in the northern parts of America, is a distinct species, *Vaccinium Oxycoccus*, not cultivated here; the mountain cranberry, brought to market from the wild in the northern parts of America and Europe is still another Vaccinium, *V. Vitis-idæa.*

The American cranberry is grown in acid peat bogs, which may be flooded. The area is kept under water during winter, largely to protect the plants from winter injury by the heaving and thawing of the bogs. Flooding may also be employed at other intervals to drown insects, mitigate drought, and protect against frost and fires. Every good cranberry bog should have facilities for flooding. The ordinary practice is to choose a bog with a creek running through it, or through which a creek or ditch may be diverted. At the lower side of the bog flood-gates are provided, so that when the gates are shut the water backs up and covers the area. It is best that the bog be comparatively flat, so that the water will be of approximately equal depth over the whole area. At the shallowest places the water should stand about a foot above the plants. The water is usually let on the bog early in December and kept on until April or early May. No flooding is provided at other times unless there is some particular occasion therefor.

Before the vines are set all the wild and turfy growth should be taken off the bog. This is accomplished either by digging it off and removing it bodily, or by drowning it out by a year's flooding. The latter method is generally considered to be the better. After the turfy growth is removed, the bog is smoothed and covered 2 or 3 inches deep with clean sand. The vines are then set, the lower ends of them being shoved through the sand into the richer earth. To prevent too rapid and tangled growth, it is customary to re-sand the bog every three or four years to a depth of ¼ or ½ inch. When sanding is not practicable, the vines may be mown off when they become too luxuriant.

Plants for setting are merely cuttings or branches of the vines. These cuttings may be 5 to 10 inches long. They are inserted into the ground in a hole made by a crowbar or stick. They are usually planted at distances of 12 to 18 inches each way, and the vines allowed to cover the entire ground as with a mat. In three years a good crop should be secured, if the weeds and wild growth are kept down. A crop ranges 50 to 100 barrels to the acre.

CRANBERRY-BUSH: *Viburnum Opulus* and *trilobum.*

CRANESBILL: *Geranium.*

CRANTZIA: *Alloplectus.*

CRAPE-MYRTLE: *Lagerstrœmia.*

CRASPEDIA. *Compositæ.* Per. herbs with alternate or basal entire lvs. and small heads of disk-fls. crowded in dense compound involucral heads; pappus of plumose hairs; native in New Zeal., Australia and Tasmania, sometimes planted in Pacific region.

uniflora. To 1½ ft., usually tomentose: lvs. mostly basal, oblong or spatulate, to 8 in. long: compound heads to 2 in. across, solitary and terminal.

CRASSINA: *Zinnia.*

CRASSOCEPHALUM: *Gynura.*

CRASSULA. *Crassulaceæ.* Old World succulent herbs and shrubs, mostly S. African, with opposite fleshy lvs. and white, rose or yellow fls. in cymes or clusters, the petals little if at all united, sepals, petals and stamens 5 or sometimes 4; grown in greenhouses and windows and out-of-doors in warm regions. In Calif. and similar climates other species may be found in the collections of fanciers. For cult. see *Succulents.*

arborescens. Shrub to 10 ft.: lvs. roundish-ovate, to 2½ in. long, nearly joined at base, glaucous: fls. rose-red. S. Afr.

Bolusii: *C. Cooperi.*

centauroides. Sts. more or less prostrate and rooting at nodes, to 3 ft. long, forking, glabrous: lvs. connate, ovate to cordate-ovate or obovate, rather thin, nearly or quite entire: fls. slender-pedicelled, petals crimson at apex and shading to white at base. S. Afr.

coccinea: *Rochea coccinea.*

Cooperi (*C. Bolusii*). Tufted, to 5 in. high: lvs. opposite, elliptic-lanceolate, acute, to 1 in. or less long, with black blotches: fls. very small, in little terminal clusters, calyx red, petals pale flesh-color. S. Afr.—See also *C. monticola.*

cordata. Shrubby, to 3 ft.: lvs. opposite, petiolate, cordate-kidney-shaped and obtuse, to 1 in. across, entire: fls. white or reddish, small, in peduncled cymes. S. Afr.—See *C. spathulata.*

dejecta: see *C. obvallata.*

elata. White-pubescent, to 2 ft.: lvs. opposite, oblong to nearly lanceolate, to 1½ in. long, somewhat acute: fls. small, white or whitish, in small dense sessile clusters. S. Afr.

falcata. Shrub to 8 ft.: lvs. oblong, falcate, nearly or quite obtuse, to 4 in. long, joined at base, glaucous: fls. bright crimson, rarely white. S. Afr.

gigantea: see *C. perfoliata.*

impressa (*C. Schmidtii*). Dwarf, to 4 in. high: lvs. opposite, linear-lanceolate, thick, convex on back, to 1¾ in. long, acute: fls. small, rose-colored, in terminal little clusters. S. Afr.—Much like *C. Cooperi.* Said to be grown erroneously as *C. rubicunda.*

lactea. Shrubby, to 2 ft.: lvs. connate, narrow-obovate, to 3 in. long, more or less acute or acuminate: fls. white. S. Afr.—Belongs in group with *C. portulacea* and *C. arborescens.*

longifolia: see *C. perfoliata.*

lycopodioides. Sts. 1–2 ft. long, lopping or spreading, lycopodium-like, with slender brittle branches covered with appressed scale-like lvs. in 4 ranks: fls. minute, purplish, 1 or few in axils. S. Afr.

marginalis: form of *C. centauroides* with lvs. subsessile rather then connate.

monticola. To 1 ft. or more, glabrous: lvs. connate, ovate-acute, to ¾ in. long, glaucous: fls. small, pinkish, in short-peduncled terminal clusters. S. Afr.—Said to be grown sometimes under the name *C. Cooperi.*

multicava (*C. quadrifida*). Low herb: lvs. oval. to 3 in. long, the bases of the petioles joining: fls. white. S. Afr.—Frequent in S. Calif. and in conservatories.

obvallata. St. to 6 in., leafy, simple: lvs. lance-oblong or knife-shaped, obtuse or nearly so, to 2½ in. long, glabrous, ciliate: peduncle scape-like, bearing a panicle of small green fls. S. Afr.—Said to be sometimes grown improperly as *C. dejecta.*

perfoliata. Like *C. falcata* but lvs. longer, lanceolate and acuminate, to 6 in. long, concave above: fls. crimson or white. S. Afr.—Said to be grown as *C. gigantea* and *C. longifolia.*

perfossa. Shrub to 2 ft.: lvs. roundish or ovate, to 1 in. long, joined at base, glaucous. S. Afr.

portulacea. Shrub to 10 ft. with opposite branching or forking habit: lvs. oval to oblong-spatulate, to 1½ in. long, distinct at base, very thick and shining, obtuse: fls. rosy-red. S. Afr.—Known sometimes under the erroneous names *Sedum dendroideum, S. arboreum* and *S. spectabile;* popular as a fleshy shrub in S. Calif. where it blooms freely; frequent as a pot plant in the N. but seldom blooms.

purpurascens: see *Sempervivum arboreum.*

quadrifida: *C. multicava.*

rosularis. Herbaceous with radical lvs., which are in a rosette, oblong-lanceolate to strap-shaped, to 5 in. or more long, acute, flat, ciliate: fls. small, white, in branching panicle. S. Afr.

rubicunda: see *C. impressa.*

Schmidtii: *C. impressa.*

spathulata. Shrubby, with trailing sts.: lvs. broadly cordate, wavy-margined, petioled: fls. pink. S. Afr.—Sometimes erroneously called *C. cordata.*

tetragona. Shrub to 2 ft.: lvs. 3-sided, to 1¾ in. long, nearly joined at base: fls. white. S. Afr.

CRASSULACEÆ. ORPINE FAMILY. Succulent herbs or pliable shrubs of about 20 widely distributed genera in temp. and trop. regions of both hemispheres, characterized by bisexual regular fls. having 4–5 sepals and petals which are free or united, 4–10 stamens, and superior ovary of 4–5 carpels free or united below. Several genera are grown in the greenhouse or rock-garden or regularly in the open, as Æonium, Aichryson, Bryophyllum, Byrnesia, Cotyledon, Crassula, Dudleya, Echeveria, Graptopetalum, Greenovia, Kalanchoe, Oliveranthus, Pachyphytum, Rochea, Sedum, Sempervivum, Stylophyllum, Urbinia.

CRATÆGOMESPILUS. HAW-MEDLAR. *Rosaceæ.* A group of hybrids between the genera Cratægus and Mespilus, of which a few forms are known; deciduous shrubs or small trees.

grandiflora (*Cratægus grandiflora*). Hybrid between *C. Oxyacantha* and *M. germanica:* shrub or tree: lvs. to 3 in. long, toothed, pubescent beneath: fls. white, 1 in. across, 1–3 together, May–June; fr. about ½ in. diam., nearly globose, pubescent. Old plant of European origin. Hardy N.

CRATÆGUS. Hawthorn. Thornapple. *Rosaceæ.* Spiny deciduous shrubs or small trees, often horizontally branched, with alternate toothed or lobed lvs., white or rarely red fls. in corymbs in spring and early summer, and fr. a small pome with 5 or fewer 1-seeded nutlets; native in north temp. zone. The species of hawthorn are numerous and most of them are desirable ornamental subjects. In this account only those kinds are included that are most planted or are in trade-lists. The native American species should have greater attention from planters. Nearly all of them are hardy N. The English hawthorn, considerably planted in this country, is two species, *C. monogyna* and *C. Oxyacantha.*

Hawthorns are very ornamental and any of them are likely to be transplanted from the wild. They are attractive in habit, in bloom and in fruit. They prefer sunny locations and limestone or rich loamy soils. Propagated by seeds sown when ripe or stratified; the seeds should be separated from the pulp by allowing the fruit to decay or by soaking the fruit in water. Seeds will take two years or more to germinate, and should be sown in flats and kept in a cool cellar. Rare sorts may be budded or grafted on stock of *C. Oxyacantha* or other species.

acicularis: perhaps *Sorbopyrus acicularis.*

apiifolia (*C. Marshallii*). To 20 ft., spines about 1 in. long: lvs. to 1½ in. long, pinnately 5–7-lobed: fls. ½ in. across: fr. scarlet, about ¼ in. long. Va. to Fla. and Tex.

arkansana. To 20 ft., spines to ½ in. long or wanting: lvs. to 3 in. long, with shallow lobes: fls. 1 in. across: fr. bright red, to 1 in. long. Ark.

Arnoldiana. To 20 ft., spines to 3 in. long: lvs. to 3 in. long, shallowly lobed, shining above: fls. to ¾ in. across: fr. bright red, ¾ in. long. Mass. to N. Y.

Azarolus. Azarole. To 30 ft., spines small or wanting: lvs. to 3 in. long, deeply 3–5-lobed, pubescent beneath: fls. ½ in. across: fr. orange-red or yellow, to ¾ in. long. S. Eu., N. Afr., W. Asia.

Barryana. Shrub to 15 ft., with slender spines: lvs. broad-ovate, slightly lobed, double-serrate, glaucous below, to 3 in. long: fls. ¾ in. across, anthers purple: fr. crimson, pale-dotted. W. N. Y.

Carrierei: *C. Lavallei.*

cerronis (*C. erythropoda*). To 15 ft., spines 1 in. long: lvs. 2 in. long, coarsely toothed: fls. ½ in. across: fr. black or brown. Colo., Wyo.

chippewaensis. To 25 ft., spines to 1½ in. long: lvs. to 3 in. long, shallowly lobed: fls. ¾ in. across: fr. crimson, ¾ in. long. S. Ont.

coccinea: *C. intricata.*

coccinoides. Tree to 20 ft., thorny: lvs. broad-ovate, broadly lobed, double-serrate, to 3½ in. long: fls. ¾ in. across: fr. nearly globose, dark crimson and shining. Ind. west.

coloradensis. To 15 ft., spines to 2 in. long: lvs. to 2 in. long, toothed: fls. about ½ in. across: fr. scarlet, about ½ in. long. Colo.

cordata: *C. Phænopyrum.*

crenulata: *Pyracantha crenulata.*

Crus-galli. Cockspur Thorn. To 25 ft. or more, spines several in. long: lvs. to 3 in. long, toothed: fls. ½ in. across: fr. dull red, ½ in. long. Que. to N. C. and Mich.

diffusa. To 30 ft., spines to 1½ in. long: lvs. to 2 in. long, shallowly lobed, pale beneath: fls. ½ in. across: fr. dull red, about ½ in. long. N. H. to N. Y.

Douglasii. To 30 ft., spines to 1 in. long: lvs. to 3 in. long, toothed, shining above: fls. ½ in. across: fr. black, shining, ½ in. long. B. C. to Calif. and Minn.

dsungarica. Spines to ¾ in. long: lvs. to 3 in. long, 3–5-lobed: fls. ½ in. across: fr. black, shining, ½ in. long. N. Asia.

Dunbari. To 12 ft., spiny: lvs. nearly orbicular, slightly lobed: fls. ½ in. across: fr. crimson, ½ in. across. W. N. Y.

Ellwangeriana. To 20 ft., spines to 2 in. long: lvs. to 4 in. long, shallowly lobed: fls. 1 in. across: fr. bright red, shining, 1 in. long. Ont. to Pa. and Mich.

erythropoda: *C. cerronis.*

flava. To 20 ft., spines about 1 in. long: lvs. 2 in. long, coarsely toothed: fls. ¾ in. across: fr. dark orange-brown, ½ in. long. Ga., Fla.

florentina: *Pyrus florentina.*

Fontanesiana. Closely resembling *C. Crus-galli* but with thinner lvs. and brick-red frs. Pa.

formosa. To 10 ft., spines to 1¼ in. long: lvs. to 2 in. long, doubly toothed, pale below: fls. 1 in. across: fr. bright red, ½ in. long. N. Y.

glabra: *Photinia serrulata.*

grandiflora: *Cratægomespilus grandiflora.*

Heldreichii. Lvs. to 1 in. long, with nearly entire lobes, pubescent beneath: fr. red. Greece.

intricata (*C. coccinea*). To 10 ft., spines few: lvs. to 3 in. long, shallowly lobed: fls. 1 in across: fr. reddish-brown. Mass. to N. C.

Lalandi: the plant advertised under this name is undoubtedly *Pyracantha coccinea* var. *Lalandi.*

Laneyi. To 10 ft., spines to 2 in. long: lvs. to 3 in. long, doubly toothed: fls. 1 in. across: fr. dark orange-red, shining. N. Y.

Lavallei (*C. Carrierei*). Hybrid probably between *C. Crus-galli* and *C. pubescens*: to 20 ft., spines 2 in. long: lvs. to 4 in. long, toothed, pubescent beneath: fls. with red disk, ¾ in. across: fr. brick-red, ½ in. long.

Marshallii: *C. apiifolia.*

mexicana: *C. pubescens.*

mollis. To 30 ft., spines to 2 in. long: lvs. to 4 in. long, doubly toothed, pubescent beneath: fls. with red disk, 1 in. across: fr. scarlet, to 1 in. long. Ohio to S. D. and Kans.

monogyna. English H. To 30 ft., spines to 1 in. long: lvs. to 2 in. long, deeply 3–7-lobed and margins nearly or quite entire: fls. ½ in. across; style prevailingly 1: fr. bright red, ½ in. long, with 1 stone or seed. Eu., N. Afr., W. Asia.—Often confused with *C. Oxyacantha.* Var. **pendula** has drooping branches. Var. **pteridifolia** (*C. Oxyacantha* var. *filicifolia*), lvs. deeply lobed. Var. **stricta,** habit fastigiate. Some of the vars. advertised under *C. monogyna* belong to *C. Oxyacantha.*

nitida. To 30 ft., spines to 1½ in. long: lvs. to 3 in. long, coarsely toothed, shining above: fls. ¾ in. across: fr. dull red, ½ in. long. Ill. to Ark.

Oxyacantha (*C. oxyacanthoides*). English H. To 15 ft., spines 1 in. long: lvs. to 2 in. long, with 3–5 broad serrate lobes: fls. ½ in. across; styles prevailingly 2: fr. bright red, ½ in. long, with 2 stones. Eu., N. Afr. Var. **Paulii** (var. *splendens*), fls. bright scarlet, double. Var. **plena** (*C. monogyna* var. *albo-plena*), fls. white, double. Var. **punicea,** fls. dark red. Var. **rosea,** fls. rose.

pentandra. Tree to 15 ft., with many thorns: lvs. oval to ovate, to 2½ in. long, with many short sharp lobes: fls. to ¾ in. across, anthers red-purple: fr. short-oblong, dark crimson and shining. Vt., Conn., N. Y.

peregrina. Tree: lvs. with 4–6 pairs of narrow lobes, pubescent beneath: fr. dull purple, about ½ in. long. Probably W. Asia.

persistens. Like *C. Crus-galli* and perhaps a hybrid, the stamens more numerous (15–20): tree to 12 ft. or more, thorny: lvs. oblong to obovate, to 3 in. long, serrate, glossy above and remaining green to winter: fls. ¾ in. across: fr. persistent.

Phænopyrum (*C. cordata*). Washington Thorn. To 30 ft., spines to 3 in. long: lvs. to 3 in. long, 3–5-lobed, shining above: fls. ½ in. across: fr. bright red, ¼ in. long. Va. to Ala.

pinnatifida. To 20 ft., spines small or lacking: lvs. to 4 in. long, pinnately 5–9-lobed, dark and shining above: fls. ½ in. across: fr. red, ¾ in. long edible. N. E. Asia. Var. **major** has larger lvs. and fr.

procera. To 20 ft., spines 1 in. long: lvs. to 2 in. long, doubly toothed: fls. to 1 in. across: fr. bright red, ½ in. across. N. Y.

pruinosa. To 20 ft., spines to 1½ in. long: lvs. to 2 in. long: shallowly lobed: fls. 1 in. across: fr. dark purple, ½ in. long. Vt. to Va. and Ill.

prunifolia. To 30 ft.: lvs. to 3 in. long, doubly toothed: fls. with pink anthers: fr. red. Origin unknown.

pubescens (*C. mexicana*). To 30 ft., spines to 1½ in. long or wanting: lvs. to 3 in. long, finely toothed, pubescent beneath: fls. ¾ in. across: fr. greenish-yellow or orange, 1 in. long. Mex.

punctata. To 30 ft., sometimes unarmed: lvs. to 4 in. long, toothed, pubescent beneath: fls. ½ in. across: fr. dull red, to ¾ in. long. Que. to Ga. and Ill.

Pyracantha: *Pyracantha coccinea.*

rivularis. To 20 ft., spines to 1½ in. long: lvs. to 3 in. long, doubly toothed, pale beneath: fls. ½ in. across: fr. dark red, becoming black and shining, to ½ in. long. Wyo., Colo., Utah.

rotundifolia. Bushy, to 15 ft. or more, with slender thorns: lvs. broad-ovate to obovate, to 2 in. long, double-serrate: fls. ¾ in. across: fr. nearly globular, red, yellow-fleshed. N. S. west, south to Va.

saligna. To 20 ft., spines to 1½ in. long: lvs. to 2 in. long, dark and shining above, pale beneath: fls. ½ in. across: fr. dark red and shining, ¼ in. long. Colo.

Sargentii. To 20 ft., spines to 1½ in. long: lvs. to 3 in. long, shallowly lobed, pale beneath: fls. to 1 in across: fr. yellow flushed with red, ½ in. long. Ga. to Ala.

spathulata. To 25 ft., spines 1 in. long or wanting: lvs. to 2 in. long, often 3–5-lobed at apex: fls. ½ in. across: fr. bright red, shining, ⅛ in. across. Va. to Fla. and Tex.

stipulosa. Tree: lvs. to 3 in. long, finely toothed, pale and pubescent beneath: fls. ½ in. across: fr. orange-red, to 1 in. long. Mex.

succulenta. To 15 ft., spines to 2 in. long: lvs. to 3 in. long, coarsely toothed, shining above: fls. ½ in. across: fr. bright red, ½ in. across, pulpy. Que. to Ill.

tomentosa. To 20 ft., spines to 1½ in. long or wanting: lvs. to 5 in. long, sometimes slightly lobed, pubescent beneath: fls. ½ in. across: fr. dull orange-red, ½ in. long. Ont. to Ga. and Kans.

yunnanensis: plants cult. under this name are unundoubtedly *Pyracantha Gibbsii* var. *yunnanensis.*

CREAM-CUPS: *Platystemon californicus.*

CREEPER: a trailing plant or shoot that takes root mostly throughout its length; sometimes applied to a tight-clinging vine.

CREEPING CHARLEY: *Pilea nummulariæfolia.*

CREEPING CHARLIE: *Lysimachia Nummularia.*

CREEPING JENNIE: *Lysimachia Nummularia.*

CRENATE: shallowly round-toothed or obtusely toothed, scalloped.

CREOSOTE BUSH: *Larrea.*

CREPIS. Hawks-Beard. *Compositæ.* Herbs with pinnate toothed or lobed lvs. and solitary or panicled heads of yellow, orange or red ray-fls.; pappus of soft white hairs; native mostly in the northern hemisphere, a few grown in the flower-garden. Propagated by seeds.

barbata: *Tolpis barbata.*

Dioscoridis. Ann., branching: basal lvs. obovate or oblong, toothed or lyrate, upper linear, entire: heads solitary, yellow. Greece.

grandiflora. Per. to 1 ft.: lvs. linear-lanceolate, toothed, white-hairy: heads 2–5, golden-yellow, 2 in. across. Eu.

rubra. Branching ann. to 1½ ft.: lvs. toothed or lobed, nearly glabrous: heads solitary on long peduncles, red. Italy, Greece. Var. **alba** has white or flesh-colored fls.

virens. Ann. to 1½ ft.: lvs. toothed or pinnate, glabrous: heads yellow, the outer florets tinged pink. Eu.

CRESCENTIA. *Bignoniaceæ.* Trop. American trees with simple usually clustered lvs., large tubular 5-lobed fls., and hard-shelled globose frs.; grown in the tropics for the fr. which is used for water-gourds, as well as for ornament.

Cujete. Calabash-Tree. To 40 ft., with long spreading branches and broad head: lvs. oblanceolate, to 6 in. long, nearly sessile: fls. yellowish-purple, 2 in. long, the lobes cut: fr. 1 ft. or more across, like a hard-shelled gourd, nearly or quite globular, smooth. Trop. Amer.

CRESS. *Cruciferæ.* Several plants are known as cress, the piquant basal leaves used as salad, seasoning, or garnishing, but the usual kinds are of three very unlike genera and they should not be confused. See also *Cardamine.*

The usual or common garden cress is a pepper-grass, *Lepidium sativum.* It is a quick-growing hardy upright annual, native in western Asia but now sometimes escaped as a weed. Seeds may be sown in the open as soon as the ground can be made ready, usually in drills about 1 foot apart; leaves may be had in five to eight weeks, and new ones arise if the cutting is not too close. New sowings may be made every two or three weeks for succession, although the product is not so much prized in midsummer and the plants quickly run to seed in hot weather. In August sowings may be begun for autumn use. The curled variety is most prized for garnishing, like parsley. Cress thrives in any good garden soils, those retentive of moisture being preferable.

Upland-cress, sometimes called winter-cress, is a hardy biennial, *Barbarea verna* (*præcox*), native in Europe and sometimes run wild in this country. Seeds of it may be sown in very early spring in the open, and considerable tufts of leaves are formed by midsummer or a little later; if left in the ground, the plant persists the winter even in the northern states and in the spring goes to seed. A closely related plant is the common weedy yellow-rocket (*B. vulgaris*) that is conspicuous in spring in fields with its light yellow flowers. Upland-cress is a rather coarse plant, and is not largely grown.

Water-cress is a prostrate or trailing plant whose brittle soft shoots root in the water and mud. It is *Nasturtium officinale* of botanists, although it carries other Latin names, as *Roripa Nasturtium-aquaticum* and *Sisymbrium Nasturtium-aquaticum.* It is native in Europe and is extensively naturalized in other parts of the world. The plant thrives in ditches, pools and stream margins, but it can be grown readily in frames or other places where the ground can be kept wet. It is usually propagated by planting pieces of the stems, although it is readily grown from seeds. It is perennial and hardy everywhere, and takes care of itself when once established. It may be colonized in a clear clean pool or stream.

CRESS, BITTER-: *Cardamine.* **Blister-**: *Erysimum.* **Indian**: *Tropæolum.* **Penny-**: *Thlaspi.* **Rock-**: *Arabis.* **Stone-**: *Æthionema.* **Wart-**: *Coronopus.*

CRESTED: bearing elevated and irregular or toothed ridge or protuberances.

CRINKLE-BUSH: *Lomatia silaifolia.*

CRINODENDRON (*Tricuspidaria*). *Elæocarpaceæ.* Two Chilean trees with simple toothed alternate or opposite lvs., solitary axillary fls. and leathery capsular frs.; grown for ornament in S. Calif. and sometimes under glass.

dependens. To 30 ft.: lvs. obovate or elliptic, to 2½ in. long: fls. white, about ¾ in. long.

Patagua (*T. lanceolata*). To 30 ft.: lvs. elliptic, to 5 in. long: fls. red, 1¼ in. long, urn-shaped, hanging.

CRINODONNA. Hybrids between Amaryllis and Crinum. **C. Corsii** was raised from seeds of *Amaryllis Belladonna* fertilized by *Crinum Moorei*, produced in Italy and probably not in cult. in N. Amer. but interesting as being an older name for the hybrid known here as Amarcrinum (which see): it is an evergreen autumn-blooming bulbous plant, the many attractive fls. rose-colored.

CRINUM. *Amaryllidaceæ.* Herbaceous plants from a large bulb, grown for the showy lily-like white, pink or red fls., native in trop. and warm-temp. regions in both hemispheres; mostly spring and summer bloomers, grown seldom indoors in the N. because they require much space but popular outdoors in the southernmost states, and two or three of them are hardy in protected ground as far north as N. Y. City. The fls. appear with the lvs. or after the foliage is well grown.

These plants are sometimes called "crinum lilies," although belonging to another family. They are of simple culture and usually remain without change for several years, often forming large clumps. Some of the species are evergreen, the leaves remaining all the year; in others the leaves perish in summer or autumn. The large showy flowers are borne in an umbel topping a strong solid scape or peduncle that arises at or near the ground. If taken up for the winter they are treated as dormant bulbs, or the evergreen species as semi-dormant in pots or boxes. In the early growing season they should have plenty of moisture and fertility. For the most part, crinums are merely planted out-of-doors in the South and allowed to remain.

Propagation is by the natural offsets from the bulbs. Sometimes the plants fruit, and seeds may then be employed although good flowering plants are not to be expected before two or three years.

The crinums bear a general resemblance to amaryllis and hippeastrum but are distinguished by the long slender flower-tube, which equals or exceeds the segments or "petals" of the flower.

amabile. Stout plant with rather small bulb with neck about 1 ft. long: lvs. many, 3–4 in. broad and 3–4 ft. long: fls. 20–30, powerfully fragrant, bright red outside and lighter within, tube 3–4 in. long, segms. nearly linear, ½ in. or so broad: scape 2–3 ft. high. Sumatra.

americanum. SOUTHERN SWAMP CRINUM. Scape 18–24 in., mostly preceding lvs. which are few and very narrow, bearing 2–6 white showy fls. with linear segms. Fla. to Tex.—Winter and spring.

asiaticum. POISON-BULB. Lvs. many and broad, forming a big clump: fls. many, white with greenish tube, fragrant, the very narrow segms. drooping. Trop. Asia.—Frequent in Fla. and Gulf Coast region, Calif.

augustum. Sturdy plant with bulb sometimes 6 in. thick and neck 1 ft. long: lvs. many, 3–4 in. broad: fls. many on scape 2–3 ft. high, differing from *C. amabile* in broader lanceolate segms. and deeper wine-red color outside and milder fragrance. Mauritius, Seychelles.

campanulatum. Lvs. linear, channelled, 3–4 ft.: fls. few, funnelform, light red, tube curved and 2 in. or less long, the bell-shaped limb of similar length and with connivent obtuse segms. S. Afr.

capense: *C. longifolium.*

erubescens. Lvs. many, thin, strap-shaped, slightly scabrous on edges: fls. a dozen or less, salverform, the erect tube 5–6 in. long, segms. half that length and recurving, white inside and purplish outside. Trop. Amer.

fimbriatulum. Lvs. rather narrow, 2–3 ft., ciliate on margins: fls. few, funnelform, greenish-white with red stripe in center of the broad segms., tube 4–5 in. long. Angola (Afr.).

floridanum: probably *C. americanum.*

giganteum. Lvs. lanceolate, 3–4 in. broad at middle, 2–3 ft. long: fls. pure white, mostly 4–6, sometimes more, the slender curved tube to 7 in. long. Trop. Afr.

hybridum: *C. asiaticum.*

Kirkii. Lvs. strap-shaped, 3–4 ft.: fls. a dozen or so, funnelform, tube somewhat curved and greenish and about 4 in. long, the segms. longer and keeled bright red. Zanzibar.

Kunthianum. Lvs. star-shaped, 2–3 ft.: fls. few, salverform, with slender tube 5–8 in., segms. lanceolate and about 2½ in. long, white or purple. Trop. Amer.

longifolium (*C. capense. Amaryllis longifolia*). Lvs. relatively narrow, usually less than 3 in. broad, rough to the finger and sometimes minutely denticulate on the edges: fls. a dozen or less, funnelform, white or pink, about 3 in. across, tube 3–4 in. long and curved, segms. of similar length and 1 in. or less broad. S. Afr. —Probably the commonest crinum in this country, hardy in parts of the N. and much planted S.

Moorei. Larger plant than *C. longifolium* with much broader smooth-edged lvs.: fls. 4 in. or more across, funnelform, rose-red. S. Afr. Var. **album** has white fls.

Powellii. An old hybrid between *C. longifolium* and *C. Moorei*, doubtfully in cult. in this country.

Sanderianum. Lvs. thin, 2 ft. or less long, crisped and denticulate on edges: fls. few, funnelform, white with red keels, the curved tube 5–6 in. long, segms. less than 1 in. broad and 3–4 in. long and not spreading. Trop. Afr.

scabrum. Lvs. narrow, 2 in. or less, with rough edges: fls. few, funnelform, white with crimson keels, the greenish curved tube 3–5 in. long and limb shorter. Trop. Afr.

virginicum: a name for a hort. var.

zeylanicum. Lvs. broad, often 4 in., with slightly rough edges: fls. many, funnelform, fragrant, whitish with broad red keels, the curved tube 3–4 in. or more long, segms. 1 in. broad. Trop. Asia and Afr.

CRISTARIA. *Malvaceæ.* Herbs, often prostrate, native in Chile and Peru, with lobed or dissected lvs. and usually violet fls. solitary or in racemes; one species intro. in S. Calif.

glaucophylla. To 2 ft. or more, glaucous: lvs. 3-lobed with middle lobe much larger than lateral ones, to 2¼ in. long, broadly toothed: fls. ¾ in. long, in panicles. Chile.

CRITHMUM. *Umbelliferæ.* One species, native on seashores of Eu., is sparingly grown as a salad plant or for ornament. **C. maritimum.** SAMPHIRE. Per. 1–2 ft.: lvs. 2–3-ternate into linear fleshy glaucous segms. ½ in. long: fls. very small, white or yellowish, in compound umbels: fr. ovoid, ¼ in. long.—Does best in sandy or gravelly soil. Propagated by seed sown as soon as ripe, and by division of roots.

CROCOSMIA. *Iridaceæ.* One African cormous herb, blooming in autumn, and grown like gladiolus. In the N. the corms should be set out after frost and stored over winter in peat or sphagnum. Propagated by offsets or seeds. **C. aurea.** COPPERTIP. To 4 ft., the sts. branching and with few lvs.: fls. bright orange-yellow, to 2 in long, in panicled spikes. See *Tritonia.*

CROCUS. *Iridaceæ.* Spring- and autumn-blooming cormous herbs with no evident st., basal grass-like lvs. and white, yellow or lilac fls., the expanded segms. raised above ground by the long slender perianth-tube.

Crocuses should be planted 3–4 inches deep in good well-drained soil. As new corms form on top of the old ones and so raise the plants out of the soil, it is well to replant every few years. Propagated by offsets and seeds, the latter blooming in about three years. They are of simple culture and popular; most of them are hardy, but a winter mulch is desirable.

aerius. Fls. lilac, segms. to 1 in. long, throat yellow, in winter. S. E. Eu.

Aitchisonii: *C. speciosus* var.

asturicus. Fls. lilac, segms. 1½ in. long, in autumn. Spain.

aureus: *C. mœsicus.*

Balansæ. Fls. orange-yellow, segms. to 1¼ in. long, outer tinged brown on back, in spring. Smyrna.

biflorus. Fls. tinged with purple, segms. 1½ in. long, the outer with 3 stripes of purple, throat tinged yellow, in spring. Italy to S. W. Asia. Var. **pusillus** is a smaller-fld. form and var. **Weldenii** has uniform slaty-purple segms.

Boryi. Fls. white or tinged lilac, segms. to 1½ in. long, throat yellow, in autumn. Greece. Var. **marathoniseus** has less divided style-branches. Var. **Tournefortii** has lilac fls.

byzantinus (*C. iridiflorus*). Fls. purple, segms. to 2 in. long, the inner ones lilac or white, in autumn. S. E. Eu.

Cambessedesii. Fls. lilac to white, segms. to 1 in. long, outer buff lined with purple, in autumn. Majorca, Minorca.

cancellatus. Fls. white or lilac, segms. to 1¾ in. long, throat yellow, in autumn. Asia Minor. Var. **cilicicus,** fls. lilac veined with purple.

caspius. Fls. white, segms. to 1¼ in. long, throat yellow, in autumn. Near Caspian Sea.

chrysanthus. Fls. orange-yellow, segms. to 1¼ in. long, in winter. Asia Minor.

etruscus. Fls. lilac or cream-colored, segms. to 1½ in. long, throat yellow, in winter. Italy.

Fleischeri. Fls. white striped lilac, segms. to 1¼ in. long, throat yellow, in winter. Asia Minor.

hadriaticus. Fls. pure white, segms. 1½ in. long, throat white or purple, bearded, in autumn. Greece. Var. **chrysobelenicus** has yellow throat. Var. **Wilhelmii** has purple markings.

hyemalis. Fls. white striped with purple, segms. 1½ in. long, throat yellow, in spring. Palestine.

Imperati. Fls. lilac or white with 3 dark purple stripes on outside, segms. 1½ in. long, in very early spring. Italy. Var. **albus** has white fls.

iridiflorus: *C. byzantinus.*

karduchorum. Fls. lilac, segms. to 1¼ in. long, in autumn. S. W. Asia.

Korolkowi. Fls. orange-yellow, segms. 1 in. long, in spring. S. E. Eu.

lævigatus. Fls. white, segms. 1 in. long and outer striped lilac, in autumn. Greece. Var. **Fontenayi** is tinted buff and later blooming.

longiflorus. Fls. bright lilac, segms. 1½ in. long, throat yellow, slightly bearded, in autumn. S. Eu. Var. **melitensis,** fls. veined yellow at base.

marathoniseus: *C. Boryi* var.

medius. Fls. bright lilac, segms. to 2 in. long, throat whitish, in autumn. S. France, Italy.

minimus. Fls. violet, segms. to 1 in. long, outer buff lined with purple outside, in spring. Corsica, Sardinia.

mœsicus (*C. aureus*). Fls. bright yellow, segms. 1½ in. long, in spring. S. E. Eu., Asia Minor.

nudiflorus. Fls. lilac, segms. to 2 in. long. S. W. Eu.

obovatus: a form of *C. vernus.*

ochroleucus. Fls. pale cream tinged with orange, segms. 1½ in. long, throat orange, slightly bearded, in autumn. Asia Minor.

Olivieri. Fls. orange-yellow, segms. to 1½ in. long, in spring. Greece to Asia Minor.

pulchellus. Fls. bright lilac, indistinctly striped, segms. 1½ in. long, throat bright yellow, in autumn. Greece to Asia Minor.

purpureus: *C. Sieberi* var.

Salzmanni. Fls. lilac, segms. to 2 in. long, throat yellowish, bearded, in autumn. Morocco. Var. **erectophyllus,** fls. clear purple-lilac.

sativus. SAFFRON C. Fls. lilac or white, segms. to 2 in. long, throat bearded, in autumn. Asia Minor. Var. **Pallasii** has a yellow throat. Var. **Cartwrightianus** is striped.

Sieberi. Fls. lilac, segms. 1½ in. long, throat yellow, in spring. Greece, Crete. Var. **purpureus** had darker purple fls.

speciosus. Fls. lilac tinged with purple, segms. 2 in. long, in autumn. S. E. Eu., Asia. Var. **Aitchisonii** is larger and has pale bluish-lilac fls. Var. **albus** has white fls. Var. **globosus** has dark blue fls.

susianus. CLOTH-OF-GOLD C. Fls. bright orange-yellow tinged with brown outside, segms. 1½ in. long, in spring. Crimea.

tauri. Fls. pale purple, to 1¼ in. long, throat yellow, in spring. Asia Minor.

Tomasinianus. Fls. pale reddish-blue, sometimes with dark spot at tip, segms. 1½ in. long, in spring. Dalmatia, Serbia.—Like *C. vernus,* but throat not bearded.

Tournefortii: *C. Boryi* var.

vernus. Fls. lilac or white often striped with purple, segms. 1½ in. long, throat bearded, in spring. Eu.

versicolor. Fls. purple sometimes striped with darker purple, segms. 1½ in. long, throat whitish or yellowish, in spring. S. France.

vitellinus. Fls. orange-yellow, segms. to 1 in. long and outer tinged brown, in winter. Asia Minor. Var. **graveolens** has outer segms. tinged black.

zonatus. Fls. rose-lilac veined with purple and spotted inside with orange, segms. 2 in. long, throat yellow, bearded, in autumn. Cilicia.

CROCUS, AUTUMN-: *Colchicum.*

CROSNES DU JAPAN: *Stachys Sieboldii.*

CROSSANDRA. *Acanthaceæ.* Herbs and shrubs with opposite or whorled lvs. and white, yellow or red tubular fls. with split limb, borne in dense bracted spikes; native in tropics of Old World. Grown under glass or out-of-doors in warm countries and the tropics. Propagated by cuttings over heat.

infundibuliformis (*C. undulæfolia*). Shrub to 3 ft.: lvs. ovate to lanceolate, to 5 in. long, somewhat wavy-margined: fls. scarlet-orange, ¾ in. long and 1 in. across, in an angled spike. India.

undulæfolia: *C. infundibuliformis.*

CROSS-VINE: *Bignonia capreolata.*

CROSSWORT: *Crucianella.*

CROTALARIA. RATTLE-BOX. *Leguminosæ.* A very large genus of herbs and shrubs mostly native in trop. regions, a few grown as cover- or green-manure crops in the S. and sometimes for ornament under glass: lvs. simple or compound: fls. papilionaceous, usually in racemes: pods inflated. Propagated by seeds which should first be soaked in warm water, and the shrubby species by cuttings under glass.

anagyroides. Shrub to 8 ft.: lvs. of 3 ovate or lanceolate lfts.: fls. yellow with darker lines, ¾ in. across: pods 1½ in. long. Trinidad, Venezuela.

candicans. Shrub covered with silky brown hairs: lvs. ovate-oblong, acute: fls. yellow, 1 in. and more long: pods to 1¼ in. long. India.

capensis. Shrub to 5 ft.: lvs. of 3 obovate obtuse lfts.: fls. bright yellow, 1 in. and more long. S. Afr.

laburnifolia. Low shrub: lvs. of 3 obovate-oblong acute lfts.: fls. bright yellow, 1 in. long: pods to 2 in. long. Trop. Asia.

lanceolata. Herb to 3 ft.: lvs. of 3–5 narrow-lanceolate acute lfts.: fls. yellow veined with purple, ⅓ in. long: pods 1 in. or more long. S. Afr.

retusa. Ann. to 3 ft., pubescent: lvs. oblanceolate, obtuse: fls. yellow with variegated standard, to 1 in. long: pods to 1½ in. long. Asia; nat. in trop. Amer.

Retzii. Woody per. to 8 ft.: lvs. obovate, obtuse: fls. yellow, 1 in. long: pods 2 in. long. E. Indies.

striata. Woody per. to 8 ft.: lvs. of 3 elliptical obtuse lfts.: fls. yellow striped with brown, ½ in. long: pods 1½ in. long. Tropics.—Much planted in Fla. for green-manuring.

CROTON: *Codiæum.*

CROWBERRY: *Empetrum.* Broom: *Corema Conradii.*

CROWFOOT: *Ranunculus.*

CROWN: corona; also, as a common-language word, that part of the stem at the surface of the ground; also a part of a rhizome with a large bud, suitable for use in propagation.

CROWN IMPERIAL: *Fritillaria imperialis.*

CROWN-OF-THORNS: *Euphorbia splendens.*

CRUCIANELLA. Crosswort. *Rubiaceæ.* Ann. and per. herbs from the Medit. region and W. Asia, with opposite or whorled lvs. and small tubular 4–5-lobed fls. having bracts at base; grown in rock-gardens where they thrive in partial shade. Propagated by division and by seeds.

herbacea. Ann. to 1 ft. or more: lvs. ovate-oblong or upper linear: fls. in dense linear spikes to 2 in. long. Egypt.

stylosa. Prostrate ann. with sts. to 9 in.: lvs. lanceolate: fls. deep rose, in globose heads ½ in. across, the styles long-exserted. Persia.

CRUCIFERÆ. Mustard Family. A large natural assemblage of herbaceous plants, a few of them subshrubs, probably upwards of 1800 species, distributed mostly in temp. and cold regions. They are of various habit, but agree in general in the 4-sepalled and 4-petalled fls. and stamens commonly 6 of which 2 are shorter than the others, and in the characteristic dry pod (silique when elongated, silicle when short and broad): lvs. prevailingly alternate, entire, dissected or essentially compound: fls. white, yellow, orange, lilac, purple, mostly not large but abundant. The family abounds in peppery and piquant qualities. It yields useful plants to the flower-garden and the vegetable-garden, and many of the species are cosmopolitan weeds. Genera entered in this book are Æthionema, Alyssum, Anastatica, Arabis, Armoracia, Aubrieta, Barbarea, Berteroa, Biscutella, Brassica, Cardamine, Cheiranthus, Cochlearia, Coronopus, Crambe, Dentaria, Diplotaxis, Draba, Eruca, Erysimum, Hesperis, Hutchinsia, Iberis, Ionopsidium, Isatis, Kernera, Lepidium, Lesquerella, Lobularia, Lunaria, Malcomia, Mathiola, Nasturtium, Peltaria, Petrocallis, Raphanus, Ricotia, Schivereckia, Schizopetalon, Stanleya, Thelypodium, Thlaspi, Vesicaria.

CRUPINA. *Compositæ.* Ann. herbs with pinnately cut lvs. and long-stalked few-fld. purple heads of ray- and disk-fls.; pappus of bristles and scales; native from S. Eu. to W. Asia. Sometimes grown in flower-gardens.

vulgaris (*Centaurea Crupina*). To 2 ft.: lvs. cut into fine linear segms.: heads 3–5-fld., the fls. scarcely longer than the pale acuminate bracts of involucre. S. Eu.

CRYOPHYTUM. *Aizoaceæ.* One of the genera separated from the old genus Mesembryanthemum: ann. and bien., often prostrate: lvs. opposite or scattered or sometimes alternate at base of plant: fls. solitary, white, yellow, or red, the petals many and very narrow; stigmas usually 5. Several species, in S. Afr., Medit. region, S. W. Asia, Calif., one of them commonly grown. For cult. see *Mesembryanthemum.*

Aitonis (*M. Aitonis. M. angulatum. M. lanceolatum*). Decumbent: lvs. lanceolate, flat, somewhat obtuse, the peduncles and calyx with shining watery pustules: fls. white. S. Afr.

crystallinum (*M. crystallinum*). Ice-Plant. Ann., readily grown from seeds in warm sunny exposure, fleshy, sts. spreading and prostrate, plant covered with glistening watery pustules: early lvs. broad-ovate, to 6 in. long and 3 in. or more broad, eventually perishing: lvs. on flowering shoots much smaller: fls. small, whitish to rose. S. Afr., Medit. region, coasts of S. and Lower Calif.—Grown in window-gardens and elsewhere for the glistening herbage, and sometimes used as a pot-herb.

nodiflorum (*M. nodiflorum*). Ann., somewhat crystalline: lvs. linear, nearly cylindric, to 1 in. long: fls. very small, white, axillary. S. Afr., Medit. region, S. W. Asia., S. Calif.

CRYPTANTHA. *Boraginaceæ.* Ann. hispid herbs mostly in W. N. Amer., with alternate, simple and entire lvs. and inconspicuous white fls. in coiled spikes or racemes, the throat of corolla commonly closed by scales; rarely sown in the wild-garden in the regions where they grow.

barbigera (*Eritrichium barbigerum. Krynitzkia barbigera*). To 1 ft., covered with long whitish stiff hairs: lvs. broadly linear, to 1½ in. long: fls. ⅕ in. long, calyx-lobes to ⅛ in. long. Utah to Calif.—The plant cult. as *C. barbigera* may be *C. intermedia.*

intermedia. To 1 ft., covered with spreading white hairs: lvs. lanceolate or linear, to 1 in. long: fls. ⅙ in. across, calyx-lobes 1/12 in. long. S. Calif.

CRYPTANTHUS. *Bromeliaceæ.* Epiphytic stoloniferous S. American herbs with flattened rosettes of stiff prickly-margined lvs. and white fls. borne in a little head amongst the foliage; grown as foliage plants under glass. Cult. as for *Bromeliaceæ.*

acaulis (*C. undulatus. Tillandsia acaulis*). Lvs. to 6 in. long and 1½ in. wide, with wavy prickly margins, in shades of green, white-scurfy beneath; small foliage plant in many vars. Brazil.

Beuckeri. Lvs. to 5 in. long and 2 in. wide, narrowed to a petiole about 2 in. long, brownish-green or rosy spotted or striped with light green. Brazil.

undulatus: *C. acaulis.*

zonatus. Lvs. to 9 in. long and 1½ in. wide, crinkly, with transverse bands of white, green or brown above, and white-scurfy beneath. Brazil.

CRYPTOCARYA (*Bellota*). *Lauraceæ.* Trees and shrubs mostly of the southern hemisphere, with leathery lvs. and small bisexual fls. in panicles, and small dry fr. inclosed in the calyx; sometimes planted in S. Calif.

Miersii. Tree to 50 ft.: lvs. opposite, oblong or oblong-ovate, entire, thin, glabrous, shining above, veins prominent beneath. Chile.

Peumus: *C. rubra.*

rubra (*C. Peumus*). Tree 50–60 ft.: lvs. nearly opposite or alternate, ovate, thick, glabrous, glaucous beneath. Chile.

CRYPTOGRAMMA. ROCK-BRAKE. *Polypodiaceæ.* Small alpine and boreal ferns of both hemispheres, the lvs. of two types, both compound, the segms. of the fertile ones pod-like due to the folding back of the edges over the fruit-dots; sometimes in rock-gardening and similar undertakings. See *Ferns.*

acrostichoides. AMERICAN PARSLEY-FERN. Lvs. clustered, many, on straw-colored stalks to 6 in. long, 2–3-pinnate, fertile with linear segms. Lake Huron and Lake Superior northward, southward in western mts.

densa: *Cheilanthes densa.*

Stelleri (*Pellæa gracilis*). SLENDER ROCK-B. Differs from *C. acrostichoides* in the creeping rootstocks, scattered lvs. and fertile lvs. with broader segms. High north in N. Amer. and Asia.

CRYPTOLEPIS. *Asclepiadaceæ.* Twining or erect shrubs in warm parts of Old World, one sometimes planted in Calif.: lvs. opposite: fls. in terminal or axillary umbel-like cymes or sometimes practically solitary; corolla tubular, with spreading limb, crown of 5 fleshy lobes: follicles smooth, mostly terete and spreading.

longiflora. Erect, 3 ft.: lvs. willow-like, long-pointed, to 5 in. long, clustered toward top of st., often tinted red: fls. white, among the foliage or just above it, very slender, 1 in. or more long. Nativity in doubt.

CRYPTOMERIA. *Pinaceæ.* One Japanese evergreen tree of pyramidal habit, magnificent when mature. **C. japonica.** To 125 ft. or more: lvs. to 1 in. long, keeled on both sides, bluish-green: staminate fls. yellow, in short racemes: cones globose, to 1 in. across, having thick wedge-shaped scales with pointed processes at apex. Hardy at Washington and somewhat northward, in S. New England the foliage usually browning in winter but may recover following season; grown mostly in warmer climates. Some of the hort. vars. are: **araucarioides,** branchlets drooping, lvs. small, bright green; **compacta,** of compact habit; **cristata** (var. *monstrosa*), branches cockscomb-like; **dacrydioides,** lvs. brownish, closely set; **elegans,** low tree with drooping branchlets and longer lvs.; **Lobbii,** compact form with lighter green lvs.; **nana,** dwarf, spreading or procumbent form; **pungens,** compact form with stiff sharp-pointed dark green lvs.; **spiralis,** shrub with lvs. twisted spirally. A form from China is var. **sinensis,** a tree of looser habit and longer lvs. For cult. see *Conifers.*

CRYPTOSTEGIA. RUBBER-VINE. *Asclepiadaceæ.* Three woody vines from trop. Afr. and Madagascar, with opposite large lvs. and large funnel-shaped fls. in terminal clusters, the calyx with many glands at base; follicles winged or angled; juice furnishes caoutchouc.

They are grown under glass in loamy soil, and in the open in warm countries as southern Florida. Propagated by cuttings over bottom heat.

grandiflora. Lvs. oblong, to 4 in. long, thick and glossy: fls. purplish, about 2 in. across. Afr.; cult. in India.

madagascariensis. Differs in its lvs. being pubescent below and the corolla-segms. of the pink or whitish fls. divided. Madagascar.

CRYPTOSTEMMA. *Compositæ.* Tomentose herbs with toothed or pinnatifid lvs. and solitary fl.-heads, the ray-fls. yellow and disk darker; pappus scale-like. They may be grown in the flower-garden.

calendulaceum (*Arctotis calendulacea*). Ann. to 2 ft. or sometimes prostrate: lvs. pinnatifid: fl.-heads 1 in. or more across. S. Afr., Australia.

CTENANTHE. *Marantaceæ.* Brazilian per. herbs with basal and st.-lvs. and fls. borne under bracts in terminal spikes or racemes; greenhouse foliage plants requiring the same treatment as Calathea, and differing in technical botanical characters.

Kummeriana. To 1½ ft., stoloniferous; lvs. 6 in. long and 2½ in. wide, green veined with white above, purple beneath.

Lubbersiana (*Phrynium Lubbersi*). To 2 ft.: lvs. to 9 in. long and 2½ in. wide, green variegated with yellow above, pale green beneath.

Oppenheimiana (*Calathea Oppenheimiana*). To 3 ft.: lvs. to 1½ ft. long and 5 in. wide, light green above, purple beneath.

setosa (*Phrynium setosum*). To 3 ft., stoloniferous: lvs. to 1½ ft. long and 4 in. wide, green.

CUBEB: *Piper Cubeba.*

CUCKOO-FLOWER: *Cardamine pratensis, Lychnis Flos-cuculi.*

CUCKOO-PINT: *Arum maculatum.*

CUCUMBER (*Cucumis sativus*). Fruit of an annual tendril-bearing vine, used for pickles in the young state or when small and also extensively eaten raw as a salad and in some countries from the hand without dressing. The cucumber is characteristically a summer plant, being frost-tender and making rapid growth. It requires a warm quick soil, with readily available fertility. The only particular difficulty in its culture out-of-doors is to control certain diseases and insects, and for the treatment of them the grower should have the latest issues of books and bulletins devoted to the subject. The striped beetle, which is most damaging when the plants are young, may be kept away in the home garden by covering the hills tightly at first with mosquito-netting; in fields the plants may be sprayed with an arsenical or nicotine dust. Some of the commoner diseases may be checked with bordeaux mixture.

Cucumbers are grown directly from seeds, and commonly planted in the field as soon as the weather is warm and reliable. They do not transplant well unless turned out of pots, berry-boxes, or started on inverted sods. Four or five plants are usually left at each stand or hill after the ravages of early pests are past; the hills are about 4 x 4 feet apart for early kinds and 4 x 6 feet for the later longer-running varieties. One ounce of seed plants fifty or more hills. Well-rotted manure may be worked into the hills if the garden soil is not fertile or well prepared. One hundred or more bushels of pickling cucumbers should be produced on an acre. The vines should be picked over frequently to prolong the bearing life.

The White Spine group of varieties is the main reliance for both field and garden work, but there are special small pickling kinds and also early varieties. The small pickling cucumbers are sometimes called gherkins; the West Indian or bur cucumber is another species, *Cucumis Anguria*, which is more grown in the United States for ornament than for pickles.

The growing of cucumbers under glass, or so-called forcing, is of two very distinct types, — the growing of a commercial crop of the ordinary or White Spine type and mostly following a winter crop of lettuce or other stock, and the raising of the long nearly or quite spineless English frame or forcing cucumber as a regular winter crop and usually for home use. The former or commercial practice usually produces the crop in spring and early summer. The plants are started in pots about a fortnight before the house is to be ready for them; they are then transplanted to the beds, and in six to eight weeks thereafter the plants should be bearing. They are set in rows about 3 feet apart, and 18–24 inches in the row. The vines are trained to cords or wires, so that the fruit hangs. Good soil and plenty of water are required. A good plant yields 100 or more cucumbers, if it is stocky and kept free of pests and diseases.

English frame cucumbers, as Telegraph, Sion House, Jasper Queen and others, may be grown for winter crop being started in autumn 80–100 days before fruit is wanted, or for spring and summer crop in frames and started in February or March. It is commonly necessary to hand-pollinate in winter when bees are not available.

CUCUMBER, BUR-: *Sicyos angulatus*. **Mock-**: *Echinocystis lobata*. **-Root, Indian**: *Medeola virginiana*. **Squirting-**: *Ecballium Elaterium*. **Star-**: *Sicyos angulatus*. **-Tree**: *Magnolia acuminata* and *macrophylla*. **Wild-**: *Echinocystis lobata*.

CUCUMIS. *Cucurbitaceæ*. Herbs of Afr. and S. Asia, ann. tender running species of which four are grown with us for the edible or interesting frs.: mainly monœcious: lvs. angled, lobed or divided: tendrils simple: fls. yellow or whitish, of good size, solitary in the axils or somewhat clustered.

Anguria (*C. grossulariæformis. C. erinaceus*). West India or Bur Gherkin. Sts. slender, angled, rough: lvs. to 3½ in. long, with 3 main rounded lobes and open sinuses: fr. ovoid or oblong, about 2 in. long, prickly, on long sts. Fla. and Tex., far S.—Frs. curious and used for pickles; the gherkins of mixed pickles are cucumbers; sometimes called "gooseberry gourd."

Chito: *C. Melo* var.

Conomon: *C. Melo* var.

dipsaceus. Hedgehog or Teasel Gourd. Slender, sts. prickly: lvs. broad-ovate to reniform-ovate, not lobed: fr. a hard bristly bur 1–2 in. long. Arabia.—Grown for curiosity and ornament.

Dudaim: *C. Melo* var.

erinaceus: *C. Anguria*.

flexuosa: *C. Melo* var.

grossulariæformis: *C. Anguria*.

Melo. Melon (which see), Muskmelon. Sts. trailing, soft-hairy: lvs. round-ovate to nearly reniform, obtuse, angled but not lobed as a rule: fls. about 1 in. across: fr. globular to oblong, pubescent or becoming glabrous, in many sizes, usually musky-flavored. Probably S. Asian, now widely cult. in many forms in N. Amer., mostly under the erroneous name "cantaloupe" which is properly applied to a race (var. **cantalupensis**) with hard and scaly or warty rinds and seldom grown with us. Var. **Chito**, Mango Melon, lvs. mostly smaller, fr. size and shape of lemon or orange and sometimes called "orange melon" and "lemon-cucumber," flesh white and firm and not fragrant, employed in the making of preserves and pickles. Var. **Conomon**, Oriental Pickling Melon, lvs. tending to be oblong and somewhat lobed on sides, fls. large, fr. globular to oblong-cylindric to club-shaped and sometimes constricted midway turban-shaped, flesh white or green and not fragrant, used in preserving; little grown by Americans. Var. **Dudaim** (*C. odoratissimus*), Dudaim Melon, plant small, fr. size of orange and more or less flattened endwise, marbled, highly perfumed and for this purpose sometimes grown. Var. **flexuosus**, Snake or Serpent Melon, fr. 1½–3 ft. or more long and 3 in. or less thick, mostly crooked or coiled; grown as a curiosity and perhaps used in preserves. Var. **inodorus**, Winter or Cassaba Melon, very strong vine, lvs. large and sometimes prominently lobed, fls. large, fr. large and only mildly scented, keeping late.

odoratissimus: *C. Melo* var. *Dudaim*.

sativus. Cucumber (which see). Rough-hairy trailing vine: lvs. triangular-ovate, pointed, often somewhat 3-lobed: fls. 1½ in. or less across, short-stalked: fr. globular to oblong to short-cylindric, prickly. S. Asia.—Cult. in many kinds for eating raw and for pickles; some of the small kinds are known as "gherkins" (see *C. Anguria*). Var. **anglicus**, English Forcing Cucumber, very strong grower, lvs. very large, fr. to 2 and 3 ft. long and nearly or quite spineless.

CUCURBITA. *Cucurbitaceæ*. Monœcious tendriliferous herbaceous plants, running and commonly rooting except in certain "bush" cultural vars., grown mostly for the great edible frs. but some of them for ornament and curiosity, with per. or ann. roots: lvs. large, simple but variously angled or lobed: fls. large, yellow, solitary or the staminate perhaps fascicled: eastern and western hemisphere. The origin of pumpkins and squashes is yet undetermined. There is a native gourd in Tex., *C. texana*, that may have some relation to prehistoric stocks; there is another, *C. okeechobeensis*, in the Everglades of Florida but it is not closely related to the cult. kinds. See *Gourd* and *Pumpkin*.

ficifolia: (*C. melanosperma.*) Malabar Gourd. Long-running, per. in warm countries: lvs. orbicular-ovate to nearly reniform, lobed and with obtuse sinuses or merely sinuate: corolla-lobes large and spreading: fr. oblong to nearly spherical, to 12 in. long, green with white stripes, flesh white; seeds black or nearly so. E. Asia.—Grown for ornament.

fœtidissima (*C. perennis*). Calabazilla. Per., long-running: lvs. cordate-triangular, stiff, grayish, crenate: fls. large: fr. size and shape of orange, green and yellow, not edible. Neb. to Calif. and Mex.

maxima. Autumn and Winter Squash. Ann. vine, only slightly prickly: lvs. orbicular or reniform, very obtuse, mostly not lobed: corolla-lobes soft and spreading or drooping and mostly obtuse: fr. spherical to oblong or turban-shaped, often very large, its st. spongy and not ridged nor prominently enlarged at apex. Nativity unknown.—Here belong Hubbard, Boston Marrow, Mammoth Chile, and similar squashes. Var. **turbaniformis** comprises the turban squashes, a "squash-within-a-squash."

melanosperma. *C. ficifolia*.

moschata. Cushaw, Canada and Winter Crookneck Pumpkins. Ann. vine, rather soft-hairy: lvs. broad-ovate to nearly orbicular-ovate, for the most part not lobed, often with whitish marks: corolla with wide spreading crinkly mostly acute lobes and often very large, calyx-lobes often leafy: fr. of many shapes, commonly oblong or big-crookneck, autumn and winter, its st. angled and much expanded at top. Nativity unknown.—Includes Sweet Potato, Quaker Pie, Japanese Pie pumpkins (or squashes).

Melopepo: *C. Pepo* var.

ovifera: *C. Pepo* var.

Pepo. Summer and Autumn Pumpkins. Harsh ann. with prickly sts. and petioles: lvs. triangular or ovate-triangular, often prominently lobed: corolla-lobes erect and sharp-pointed: fr. of many kinds, mostly orange, furrowed, mostly not long-keeping, its st. strongly angled and enlarging upward. Nativity unknown.—Here are found the common field pumpkins, Vegetable Marrow, and others. Var. **Melopepo** (*C. Melopepo. C. Pepo* var. *condensa*). Bush Pumpkins or Squashes. Mostly summer kinds, not running, including Pattypan, Scallop, Summer Crookneck, Cocozelle. Var. **ovifera.** Yellow-flowered Gourds (as distinguished from the white-fld. or Lagenarias). Running vines, producing many forms and colors of small hard-shelled ornamental durable frs.

perennis: *C. fœtidissima.*

CUCURBITACEÆ. Gourd Family. Cucurbits. An important hort. family including plants grown for edible frs. and as ornamental vines, as pumpkins, squashes, gourds, melons, watermelon, cucumbers and gherkins, chayote. The family includes some 90 genera and probably 700 species, mostly of trop. or subtrop. regions. The family comprises herbs and erect shrubs; but the hort. kinds are herbaceous and most of them tender annuals and all but one (Ecballium) are naturally running tendril-bearing vines. The plants of the Cucurbitaceæ are monœcious or diœcious: lvs. alternate, palmately veined, lobed or dissected: fls. prevailingly yellow or greenish, gamopetalous or the petals 5, the corolla sometimes large and showy but of short duration; stamens mostly 3: fr. a pepo, indehiscent or irregularly bursting, mostly fleshy in the cult. kinds and often large and edible. The species are of the easiest cult., but the pumpkins, gourds, melons and cucumbers are frost-tender and must make their growth rapidly in the northern parts of the country, requiring a warm quick soil. They come from seeds. The genera of Cucurbitaceæ included in this Hortus are Abobra, Benincasa, Bryonia, Bryonopsis, Citrullus, Coccinea, Cucumis, Cucurbita, Cyclanthera, Ecballium, Echinocystis, Lagenaria, Luffa, Melothria, Momordica, Sechium, Sicana, Sicyos, Trichosanthes.

CUDRANIA: *Vanieria.*

CULINARY HERBS are those employed in a secondary way in cookery, as for flavoring and seasoning, and also as garnishes for viands. They do not constitute a single cultural group. Some of the plants falling under this denomination are anise, caraway, chervil, chive, coriander, dill, fennel, parsley, as well as the sweet herbs, which are mostly of the mint family.

CULTIGEN: plant or group known only in cultivation, with no determined nativity; presumably originating under domestication; contrast with indigen.

CULTIVAR: a variety or race that has originated and persisted under cultivation, not necessarily referable to a botanical species, and which is of botanical or taxomonic importance.

CULVERS-ROOT: *Veronicastrum virginicum.*

CUMINUM. *Umbelliferæ.* One ann. herb native in the Medit. region, the frs. of which are used as flavoring. **C. Cyminum.** Cumin. To 6 in.: lvs. cut into thread-like divisions: fls. small, white or rose, in compound umbels: fr. narrowly oblong. Propagated by seeds in spring.

CUNEATE: wedge-shaped; triangular, with the narrow end at point of attachment, as of leaves or petals.

CUNILA. *Labiatæ.* Tufted per. herbs or small shrubs with small opposite lvs. and white or purplish 2-lipped fls. in whorls, the 2 stamens long-exserted; grown in the border and hardy.

mariana: *C. origanoides.*

origanoides (*C. mariana*). Maryland Dittany. Stone-Mint. To 1 ft.: lvs. ovate, to 1½ in. long, toothed, nearly sessile: fls. purplish-pink, ¼ in. long, in terminal cymose cluster, early autumn. S. N. Y. to Fla. and Tex.

CUNNINGHAMIA (*Belis*). China-Fir. *Pinaceæ.* Two evergreen trees native in E. Asia, allied to Cryptomeria, having stiff sharp-pointed flattened linear-lanceolate lvs. with broad white bands beneath, fls. in terminal clusters, and roundish cones with thick pointed scales. For cult. see *Conifers.* To be grown only in the lower S. and Calif., although in sheltered places *C. lanceolata* may persist as far north as Pa.

Konishii. To 100 ft.: lvs. to 1 in. long: cones to 1 in. long. Formosa.

lanceolata (*C. sinensis*). To 80 ft.: lvs. to 2½ in. long: cones to 2 in. long. China.

sinensis: *C. lanceolata.*

CUNONIACEÆ. Cunonia Family. Trees and shrubs of 21 genera native in the southern hemisphere, having opposite or whorled, entire or pinnate lvs., small bisexual or unisexual fls. with 4–5 sepals and petals, 4 or more stamens, 2-celled superior ovary, and usually capsular frs. Ackama, Callicoma, Ceratopetalum and Weinmannia are occasionally planted in Calif.

CUPANIA. *Sapindaceæ.* Trees and shrubs bearing alternate pinnate lvs., small fls. in panicles, and capsular frs.; one species sometimes planted for ornament in warm climates. They are native in trop. and semi-trop. regions, mostly in Amer.

anacardioides. Tree to 40 ft.: lvs. of 6–10 leathery very obtuse entire lfts. to 4 in. long: fls. white: fr. leathery, 3-lobed, about ⅔ in. across. Australia.

Cunninghamii: *Diploglottis Cunninghamii.*

sapida: *Blighia sapida.*

CUPHEA (*Parsonsia*). *Lythraceæ.* American herbs or shrubs with alternate or whorled lvs., irregular mostly axillary fls. that are often showy or in abundance, with corolla-like often gibbous or spurred calyx, the petals 2 or 6 on the calyx-tube or lacking, and capsular fr.

Cupheas are greenhouse subjects, or grown out-of-doors in the South. As glasshouse plants they are mostly treated as tender annuals and are of easy cultivation. Propagated by seeds or the shrubby kinds by cuttings.

compacta: *C. miniata* var.

cyanea (*C. strigulosa*). To 6 ft.: lvs. ovate, to 3 in. long: fls. with red and yellow calyx and 2 small petals, in racemes. Mex.

heterophylla. To 2 ft.: lvs. mostly ternate, ovate to oblong-lanceolate, to 4 in. long: fls. with purplish or reddish calyx and 6 red unequal petals, in racemes. Mex.

Hookeriana. To 2½ ft.: lvs. lanceolate or linear-lanceolate, to 4 in. long: fls. with reddish calyx, 2 large deep purple petals and 4 very small petals, in terminal racemes. Mex.

hyssopifolia. To 2 ft.: lvs. linear to lanceolate, about ¼ in. long, crowded: fls. with green calyx and 6 purple, pink or white petals, in axils. Mex. and Guatemala.

ignea: *C. platycentra.*

jorullensis (*C. tricolor*). To 3 ft.: lvs. lanceolate to ovate, to 2 in. long: fls. with red and green calyx and small whitish petals, in racemes. Mex.—The plant grown under this name may be *C. micropetala.*

lanceolata (*C. Zimapani. C. silenoides*). Sticky ann. to 4 ft.: lvs. lanceolate, to 3 in. long: fls. with purplish calyx and 2 large purple petals and 4 smaller ones, solitary. Mex.

Llavea: *C. miniata.*

micropetala. To 2 ft.: lvs. lanceolate, to 5 in. long: fls. with yellow and red calyx and 6 small petals, in terminal leafy racemes. Mex.

miniata (*C. Llavea*). Shrubby: lvs. ovate, to 3 in. long: fls. with green and purplish calyx and 2 large bright red petals, in racemes. Mex. Var. **alba** has white fls. Var. **compacta** is a compact form.

platycentra (*C. ignea*). CIGAR-FLOWER. To 1 ft.: lvs. lanceolate or broader, to 2½ in. long: fls. with slender bright red calyx with white mouth and dark ring at end, without petals, solitary. Mex.

Roezlii. To 3 ft.: lvs. elliptic-lanceolate, to 3 in. long: fls. with cinnabar-red and yellowish calyx and 2 very small petals, in racemes. Mex.

silenoides: *C. lanceolata.*

strigulosa: *C. cyanea.*

tricolor: *C. jorullensis.*

viscosa. Ann. to 1½ ft.: lvs. ovate-lanceolate, to ¾ in. long: fls. with 2 deep purple petals and 4 smaller whitish petals, in sticky-pubescent racemes. Mex.

Zimapani: *C. lanceolata.*

CUP-FLOWER: *Nierembergia.*

CUPIDS-DART: *Catananche.*

CUP-PLANT: *Silphium perfoliatum.*

CUPRESSUS. CYPRESS. *Pinaceæ.* Evergreen trees or shrubs with small scale-like lvs. or linear in young plants, minute fls. and globular cones with woody scales; native in N. Amer., Eu. and Asia; adaptable to mild or warm regions. For cult. see *Conifers.* These are the true cypresses, to which Chamæcyparis is closely related. Except *C. Macnabiana,* the species can be grown satisfactorily only in the lower S. and Calif.

arizonica. Tree to 40 ft. and more: lvs. pale or glaucous-green, acute: cones to 1 in. across, glaucous. Ariz., New Mex., Mex.; much planted in the S. W. Var. **bonita** (*C. glabra*) has larger cones and is very glaucous when young. Var. **compacta** is a low roundish form. Var. **glauca** is a juvenile silvery-gray stage.

Benthami: *C. lusitanica* var.

californica: *C. Goveniana.*

cashmeriana. Tree with drooping branchlets: cones ½ in. across. Kashmir.

Duclouxiana. Tree: lvs. obtuse, somewhat glaucous: cones 1 in. across. China.

excelsa: *C. lusitanica* var. *Benthami.*

funebris. MOURNING C. Tree to 60 ft., with drooping branches and flattened branchlets: lvs. acute, light green: cones to ½ in. across. China.

glabra: *C. arizonica* var. *bonita.*

glauca: *C. lusitanica.*

Goveniana (*C. californica. C. pygmæa*). Shrub or rarely tree to 75 ft.: lvs. acute, dark green: cones to ¾ in. across. Calif.

guadalupensis. Tree to 40 ft. or more, the branchlets bright red: lvs. acute, light bluish-green: cones to 1¼ in. across. Guadeloupe Isl., Calif., and Lower Calif.

horizontalis: *C. sempervirens* var.

Knightiana: *C. lusitanica* var.

Lambertiana: *C. macrocarpa.*

Lawsoniana: *Chamæcyparis Lawsoniana.*

Lelandii. Hybrid between *C. macrocarpa* and *Chamæcyparis nootkatensis.*

Lindleyi: *C. lusitanica.*

lusitanica (*C. glauca. C. Lindleyi*). PORTUGUESE C. Tree to 50 ft. with somewhat drooping branchlets: lvs. acute, glaucous-green: cones ½ in. across, glaucous. Mex. Var. **Benthami** (*C. Benthami. C. excelsa*). Branchlets pinnately and regularly branched in one plane. Var. **Knightiana** (*C. Knightiana*) is more regularly branched.

Macnabiana. Shrub or tree to 20 ft.: lvs. obtuse, fragrant, dark green or glaucous: cones 1 in. across. Calif., Ore.; hardy in parts of New England. In var. **sulphurea** the tips of the branchlets are golden.

macrocarpa (*C. Lambertiana*). MONTEREY C. Tree to 40 ft. and more: lvs. obtuse, dark or bright green: cones to 1½ in. across. Calif. Var. **Crippsii** is a juvenile form with tips of branchlets silvery-white and spreading sharp-pointed lvs. Var. **fastigiata** has a compact fastigiate head. Var. **lutea** has yellow lvs. when young.

nootkatensis: *Chamæcyparis nootkatensis.*

obtusa: *Chamæcyparis obtusa.*

pisifera: *Chamæcyparis pisifera.*

pygmæa: *C. Goveniana.*

Roylei: *C. sempervirens* var. *indica.*

Sargentii (*C. Goveniana* var. *Sargentii*). Shrub or tree to 16 ft.: lvs. acute, dark green, fragrant: cones to 1 in. across. Calif.

sempervirens. ITALIAN C. Tree to 80 ft.: lvs. obtuse, dark green: cones to 1½ in. across. S. Eu., W. Asia. Var. **horizontalis** (*C. horizontalis*) has horizontally spreading branches. Var. **indica** (*C. Roylei*). Columnar form with globose cones. Var. **stricta** (var. *pyramidalis* and *fastigiata*) is of columnar habit.

thyoides: *Chamæcyparis thyoides.*

torulosa. BHUTAN C. Tree to 150 ft., with drooping branchlets: lvs. somewhat acute, bright or bluish-green: cones to ¾ in. across. Himalayas. Var. **Corneyana** has drooping branches.

CURCAS: *Jatropha Curcas.*

CURCULIGO. *Amaryllidaceæ.* Stemless plants with short thick rootstocks and long plicate lvs. which conceal the small fls. borne near the ground in dense heads or spikes.

Greenhouse foliage plants, or grown out-of-doors in the South for the attractive clumps. They require abundant moisture and high temperatures. A good greenhouse soil is one of 2 parts loam to 1 of sand and rotted cow-manure. Propagated by division.

capitulata (*C. recurvata*). Lvs. to 3 ft. long and 6 in. wide, recurving: fls. yellow, ¾ in. across, in heads on brown-hairy scapes which are bent downward at end. Trop. Asia, Australia.

latifolia. Lvs. to 2 ft. long and 5 in. wide, curving: fls. bright yellow, in heads on short erect scapes. Asia.

recurvata: *C. capitulata.*

CURCUMA. *Zingiberaceæ.* Robust per. herbs with tuberous roots, short leafy sts. and bracted fls. in dense spikes topped by a tuft of colored bracts, the lateral staminodia and also filament of fertile stamen petal-like.

Grown in a warm greenhouse in rich moist soil and rested during the winter, and planted in the open in warm countries; sometimes seen in collections of economic plants, as they yield dyes and curry products. Propagated by division of tubers in spring. See *Zingiberaceæ.*

longa. Lvs. to 1½ ft. long and 8 in. broad: fls. pale yellow, in spikes to 7 in. long tipped by pale pink bracts. India.—Root yields turmeric used as a condiment and dye.

petiolata. Lvs. to 10 in. long and 6 in. broad: fls. yellowish-white, in spikes to 6 in. long tipped by purple bracts. E. Asia.

Zedoaria. Lvs. to 2 ft. long and 6 in. broad, with very long sheaths: fls. yellow with whitish sepals and green bracts, in spikes to 4 in. long. India.

CURMERIA: *Homalomena Wallisii.*

CURRANT AND GOOSEBERRY. These fruits are so similar in cultural requirements that they may be considered together in this Hortus. They belong to the same genus, Ribes, according to former prevailing usage, but latterly the gooseberries have been segregated by some writers in the genus Grossularia. The red and white currants are *Ribes sativum*, the black currant *R. nigrum;* the gooseberries of American origin, such as Houghton, Downing, Pale Red, are forms of the native *Ribes hirtellum* (*Grossularia hirtella*) or hybrids from it; and the European gooseberries, which are much subject to mildew in this country, are *Ribes Grossularia* (or *Grossularia reclinata*).

Currant and gooseberry are fruits of exceptional hardiness, their culture extending nearly to the Arctic circle. They reach their best development in a cool somewhat humid climate and, therefore, are not well adapted to the warmer or drier parts of the United States. Cool moist clay loams or silt loams of high fertility are more satisfactory for these fruits than the lighter soil types; but the land must be well drained. Because they are among the hardiest and most productive of fruits and able to live even under neglect, the currant or gooseberry patch is often allowed to become foul with grass, never thinned or trimmed, the worms eating the leaves until, in the course of time, the plants yield only a small and indifferent product; yet no fruits respond more readily to good care and sufficient fertilizing.

Propagation of currants and some gooseberries is by means of stem-cuttings. Vigorous shoots of the season's growth are cut from the bushes late in autumn and either planted in the nursery row immediately or stored in moist sand and planted in the spring. Gooseberries are usually propagated by mound-layering. Soil is heaped about the bases of the stems, which send out roots. The rooted shoots thus formed are removed and set in the nursery row. To succeed best with this method, the plant should have been cut back to the ground so that all the shoots are but one season old.

Planting may be either in early spring or late autumn except in the colder climates where spring planting is advisable. Gooseberries and currants may be planted in hills 5 x 5 or 6 x 6 feet, or in rows 6–7 feet apart, plants 4 feet apart in the row.

Clean tillage followed by cover-crops late in the season are advisable for these fruits. A thick mulch of straw or coarse manure is very valuable especially in the home planting, provided that mice do not cause serious damage. Stable manure is the best fertilizer, but when it is not available a complete commercial fertilizer may be applied. The partial shade afforded by a young orchard suits the currant well, and if the ground is in good condition no bad results will follow to the orchard provided the currants are removed before the trees need the entire feeding space. A currant or gooseberry patch should continue in good bearing for ten to twenty years, if properly handled.

The red and white currants and the gooseberry bear mostly on two-year-old or older wood. A succession of young shoots should be allowed to grow to take the place of the old bearing wood. It is very important to keep the old weak canes cut out, and a succession of three to seven new ones coming from the root each year. This results in a low bush, very different from the tall awkward bushes with spurry parts that one sees in old yards. The black currant makes a large and stronger plant. It bears mostly on wood of the previous year, and therefore it is important to have new wood constantly coming on. After a few years in neglected plantations that make little new growth the yield becomes small and poor.

Both currants and gooseberries are picked by hand, commonly into quart berry-boxes. Ripe gooseberries for the table are little known in the United States. Green gooseberries, as they are seen on the market, are stripped from the vines with the hands protected with leather mittens; they are then cleaned in a fanning mill and marketed in quart baskets or taken to the cannery. Yields of 2 to 4 tons an acre of currants and gooseberries may be expected.

Following are some of the prominent varieties, the most popular kinds being starred (*): *Varieties of currants* — *Cherry, Diploma, *Fay, London, *Perfection, Wilder, *White Grape, White Imperial. *European gooseberries* — Chautauqua, *Industry, Runge, *May Duke. *American gooseberries* — Carrie, *Downing, Red Jacket, Oregon, *Poorman.

Pests and diseases should receive prompt attention. Both currants and gooseberries should have a dormant spray of lime-sulfur 1–15 for the control of scale and mildew. When the fruit is well set, bordeaux mixture, 4–4–50 with 1½ pounds arsenate of lead powder added may be applied to control mildew and currant-worms.

CURRANT, INDIAN: *Symphoricarpos orbiculatus.*

CURUBA: *Sicana odorifera.*

CUSH-CUSH: *Dioscorea trifida.*

CUSTARD-APPLE: *Annona reticulata.*

CUTTINGS: see *Propagation.*

CYANOPHYLLUM: *Miconia magnifica.*

CYANOTIS. *Commelinaceæ.* Per. herbs with creeping or weak sts., sheathing lvs., and blue or reddish fls. in scorpioid cymes or clusters; native in warm parts of Old World, and grown in greenhouses. Propagated by cuttings.

somaliensis. Flowering sts. to 9 in. long; lvs. narrow-triangular, 1½ in. long, hairy: fls. in dense heads not longer than lf.-sheaths. Trop. Afr.

CYATHEA. Tree-Fern. *Cyatheaceæ.* Tree-ferns with trunks 50 ft or more high: lvs. evergreen, very large, usually 2–3-pinnate; sori on back of segms., the indusium bursting and persistent as a fringe: tropics and subtropics. Propagated by spores. See *Ferns.*

dealbata. Trunk to 30 ft. high and 1½ ft. diam.: lvs. spreading horizontally, to 12 ft. long and 4 ft. broad, yellowish-green above and powdery-white beneath. New Zeal., Lord Howe Isls.—Frequently cult.

Dregei. Lvs. bipinnate, glabrous. Afr.

insignis. Lvs. very large, pinnæ to 8 ft. long and secondaries to 8 in. and pinnatifid, the ultimate lobes oblong-obtuse and ¼ in. long. Jamaica.

medullaris. Sago-Fern. Trunk to 50 ft. high and 2½ ft. diam.: lvs. curving, to 20 ft. long and 5 ft. broad, dark green above, paler green beneath. New Zeal.

CYATHEACEÆ. Tree-Fern Family. About 7 genera of ferns with distinct trunks or sts., native in warm regions on both sides of the world: lvs. pinnately compound, with sori on backs or margins: differs from Polypodiaceæ in technical characters of the sporangia. A few genera are grown under glass, as Alsophila, Cibotium, Cyathea, Dicksonia, and planted in protected places in the open in the warm parts of the country.

CYATHODES. *Epacridaceæ.* Shrubs from Australia to Pacific Isls., having imbricated or scattered lvs. and small fls. solitary in the axils; one planted in Calif.

acerosa. To 15 ft.: lvs. linear or lanceolate, to ⅔ in. long, stiff and pungent-pointed, margins recurved, glaucous beneath.

CYCADACEÆ. Cycads. Stiff evergreen plants of slow growth and mostly with an unbranched trunk at least when young, and stiff pinnate or bipinnate lvs. in a basal rosette or crown at top, and diœcious fls. of which the staminate are in thick cones and the pistillate usually in heads. The family is rich in fossil species. There are 9 trop. and subtrop. genera of which the following are known to hort.: Ceratozamia, Cycas, Dion, Encephalartos, Macrozamia, Microcycas, Zamia. In morphology cycads are considered to be nearest the fern-allies of any of the sporophytes or flowering-plants. The classification is with the gymnosperms. They are of slow growth and maturity, and are grown for their interest as well as for ornament. They are more or less palm-like. In Cycas the seeds are mostly 4 or more to each carpophyll whereas in the other genera they are 2. Virgin plants in cult. may be difficult to determine.

CYCAS. *Cycadaceæ.* About 16 species in the eastern hemisphere, two of them well known in cult. for the stiff glossy evergreen long foliage which is pinnately divided and more or less fern-like; pinnæ with strong midrib. The lvs. are often cut and used for house decoration. See *Cycadaceæ.*

Cycads are grown in greenhouses or as specimen plants out-of-doors in warm regions. They should be given abundant moisture and partial shade. Propagated by suckers which are taken when dormant and the leaves removed; also by seeds sown in shallow boxes or benches and covered with sand and potted off after germination. Slanting sections of the trunk 2–3 inches thick may be used for propagation; they should be dried a few days, then planted, and when new plants form they should be repotted separately.

circinalis. Trunk to 12 ft. high: lfts. to 1 ft. long, flat on edges: fr. about size of walnut. Old World tropics.

Micholitzii. Trunk subterranean: lvs. to 10 ft. long, pinnæ 8–10 in., plane, twice forked. Cochin-China.—Has been grown as *Pseudocycas Micholitzii.*

Normanbyana. Trunk to 10 ft. or more: lfts. to 8 in. long, flat on edges. Australia.

revoluta. Trunk to 10 ft. high: lfts. revolute or rolled on edges: fr. about 1½ in. long, somewhat flattened, red. Japan.—Sometimes called "sago-palm," but it is not a palm.

CYCLAMEN. *Primulaceæ.* Herbs with large hard tuberous roots, heart-shaped basal lvs., solitary nodding fls. borne on scapes, with purple, rose or white corolla-lobes strongly reflexed; native in the Medit. region and Cent. Eu., one a popular florists plant and a few others sometimes grown out-of-doors.

Cyclamens respond best in a soil composed of 2 parts leaf-mold, 1 part sand, and 1 part loam. They are very sensitive to moisture conditions and will not thrive if allowed to dry out or if water stands around the roots. A moist atmosphere is beneficial. Red-spider may be eliminated by syringing the leaves on both sides several times a week.

Tubers large enough to flower the first year may be purchased from seedsmen. Seeds may be sown in September, wintered in a cool house, repotted in May, and in July transferred into 5- or 6-inch pots in a shaded frame. Before frost they should be taken indoors and grown in a cool house through the flowering period.

coum. Fls. purple with spotted throat, the corolla-lobes ovate, small, odorless, in autumn. S. Eu. to Persia.

europæum. Fls. bright red, the corolla-lobes oblong or ovate, very fragrant, on scapes 4–5 in. high, blooming in summer and autumn. Cent. and S. Eu.

hederæfolium: *C. indicum.*

ibericum. Lvs. sometimes marked with white above: fls. purple with darker throat, the corolla-lobes ovate. Caucasus.

indicum (*C. persicum. C. hederæfolium. C. macrophyllum*). Florists C. Lvs. usually variegated with white: fls. large, odorless, white or in shades of purple and rose, dark purple at the mouth, the corolla-lobes oblong-lanceolate, on scapes 6–8 in. high. Greece to Syria. Var. giganteum has larger fls. and many named forms are in the trade.

macrophyllum: *C. indicum.*

neapolitanum. Fls. red or white, appearing mostly before the lvs. in summer or autumn, the corolla-lobes ovate and eared at the base. Cent. and S. Eu.

persicum: *C. indicum.*

repandum. Fls. purple with darker throat, the corolla-lobes oblong or linear-oblong. Medit. region.

CYCLANTHACEÆ. Cyclanthus Family. Six trop. American genera comprise the family: more or less herbaceous palm-like plants, acaulescent or nearly so, with long-stalked lvs., unisexual fls. in dense spadices subtended by bract-like spathes resembling an aroid infl., and fr. composed of cohering carpels. Carludovica and Cyclanthus are grown in greenhouses in cold countries; the genera differ in technical botanical characters.

CYCLANTHERA. *Cucurbitaceæ.* Herbaceous vines, ann. or per., above 30 species in the warm parts of Amer. and extending north as far as Kans., two of which are sometimes grown for ornament and as screens, both ann. or grown as such: monœcious: lvs. lobed or compound: fls. very small, yellow, white or greenish, the pistillate solitary in axils and staminate racemose or paniculate: fr. small, scarcely fleshy, mostly spiny or setose. Grown from seeds, as for gourds.

explodens. To 10 ft. or so, nearly glabrous: lvs. ovate-triangular to broad-oblong, 2–3 in. long, 3-angled or -lobed: fr. 1 in. or more long, usually curved, stout-spiny on one side, bursting forcibly. N. S. Amer.

pedata. Glabrous, to 10 ft. and more: lvs. with 5–7 narrow crenate-dentate lfts.: fr. about 2 in. long, oblong, with scattering prickles. Mex. south.

CYCLANTHUS. *Cyclanthaceæ.* Stemless milky-juiced herbs resembling palms, the fls. fragrant; 4 species in trop. Amer. Cult. as for *Carludovica.*

bipartitus. Lvs. entire or 2-lobed to base, the stalks to 6 ft. long: spathes of 4 yellow lvs. Guiana.

CYCLOBOTHRA: *Calochortus flavus.*

CYCLOPHORUS. FELT-FERN. *Polypodiaceæ.* Asian and Malayan ferns with usually simple and entire lvs. tomentose on back, leathery; sori naked, covering back of lvs.; much like Polypodium and often so listed; for cult. see *Ferns.*

Lingua (*Niphobolus Lingua. Polypodium Lingua*). TONGUE-FERN. JAPANESE F. Lvs., including stipes, to 15 in. long, entire, lanceolate or ovate-lanceolate, rusty beneath. China, Japan and south. Var. **corymbiferus,** CRESTED F., has lvs. forked at the apex. Var. variegatus is variegated.

CYCNOCHES. SWAN ORCHID. *Orchidaceæ.* Trop. American epiphytes having pseudobulbs, plaited lvs. and fls. of 2 sexes, sometimes similar with narrow sepals and petals and entire lip, or often quite different, the male fls. with lip clawed and with fingerlike projections; grown in the warm greenhouse. See *Orchids.*

chlorochilon. Lvs. elliptic, to 16 in. long: fls. similar, about 6 in. across, yellow-green with darker spot at base of lip, May–June. Venezuela, Colombia.

CYDISTA. *Bignoniaceæ.* One woody climber native from W. Indies to Brazil and grown in subtrop. regions. **C. æquinoctialis** (*Bignonia æquinoctialis*). Lvs. of 2 ovate leathery wavy-margined lfts. to 6 in. long, and often a terminal tendril: fls. showy, white or purplish, to 3 in. long, funnelform with rounded lobes, in racemes: fr. linear, to 1 ft. long.

CYDONIA. QUINCE. *Rosaceæ.* One deciduous small much branching tree from Persia and Turkestan grown for its edible fr. For cult. see *Quince.* **C. oblonga** (*C. vulgaris. Pyrus Cydonia*). To 20 ft.: lvs. ovate to oblong, to 4 in. long, densely tomentose beneath: fls. white or pale pink, to 2 in. across, solitary at the end of leafy shoots of the season: fr. a pear-shaped or apple-shaped tomentose pome to 3 in. or more across, fragrant. For other names listed as Cydonia see *Chænomeles,* the Japanese or Flowering quince.

CYMBALARIA. *Scrophulariaceæ.* Creeping herbaceous perennials, native in the Old World, often united with Linaria but differing in the fls. axillary and solitary and the lvs. palmately veined; a few are grown as groundcover in the greenhouse or in the open, or in vases and hanging-baskets.

These plants are tender in the North but seed themselves freely; they thrive in moist and partially shaded positions, as in greenhouses and about yards. Propagated by division of the long stems, and by seeds.

æquitriloba (*Linaria æquitriloba*). Lvs. mostly opposite, entire or slightly 3–5-lobed: fls. pale mauve with reddish-purple throat. S. Eu.

hepaticæfolia (*Linaria hepaticæfolia*). Lvs. mostly opposite, with 3–5 short or indistinct lobes: fls. lilac-blue with yellowish throat, about ½ in. long: caps. shorter than sepals. Corsica.

muralis (*Linaria Cymbalaria*). KENILWORTH IVY. Sts. trailing and rooting at the nodes: lvs. mostly alternate, irregularly 3–7-lobed: fls. lilac-blue, throat yellowish, ⅓ in. long: caps. longer than sepals. Eu., nat. from Ont. to Pa.—Common about greenhouses. Var. **alba,** fls. white; **maxima** (*Linaria pallida*), fls. large; **rosea,** fls. pale pink.

pilosa (*Linaria pilosa*). Pubescent: lvs. opposite and alternate, 3–11-lobed: fls. lavender with yellow throat: caps. longer than sepals. Italy.

CYMBIDIUM. *Orchidaceæ.* Mostly epiphytes with or without pseudobulbs and fls. in racemes, the sepals and petals similar, the lip entire or 3-lobed and with 2 keels; cult. in greenhouse mostly with intermediate and often with cool temperature; sometimes planted out. See *Orchids.*

Alexanderi. Hybrid between *C. Veitchii* and *C. insigne.*

aloifolium. Lvs. linear, to 1½ ft. long: fls. in many-fld. pendulous racemes to 20 in. long; sepals and petals brownish-yellow; lip 3-lobed, brownish-red with bright yellow center and side lobes, edged with white, July–Aug. Ceylon, Indo-China.

Cooperi. Hybrid between *C. insigne* and *C. Schrœderi.*

eburneo-Lowianum: *C. Veitchii.*

eburneum. Lvs. to 2 ft. long and ½ in. wide: fls. 4 in. across, in 1–2-fld. racemes to 1 ft. long, fragrant, snow-white, the lip with yellow center and 3–5 hairy keels, Apr.–May. Himalayas.

ensifolium. Lvs. linear, to 1 ft. long: fls. in 3–7-fld. racemes to 1 ft. long, greenish-yellow sometimes veined with red, the lip with 2 white keels, May. China, Japan.

Finlaysonianum. Lvs. to 2 ft. long and 2 in. wide: fls. in many-fld. racemes to 2½ ft. long; sepals and petals brownish-yellow; lip 3-lobed, spotted and marked with red and with 2 white keels, May–June. Malaya. Var. **atropurpureum** has purplish sepals and petals.

giganteum. Lvs. linear, to 2 ft. long: fls. 4 in. across, fragrant, in 7–12-fld. arching racemes longer than lvs.; sepals and petals green- or brownish-yellow lined with dark brown; lip 3-lobed, yellow marked with brown, the middle lobe wavy-margined, Sept.–Oct. Himalayas.

Gottianum. Hybrid between *C. eburneum* and *C. insigne.*

grandiflorum. Lvs. to 2 ft. long: fls. to 6 in. across; sepals and petals olive-green; lip 3-lobed, bright yellow dotted with purple-brown, Nov. Himalayas.

Hamburyanum. Hybrid between *C. erythrostylum* and *C. Traceyanum.*

Holfordianum. Hybrid between *C. eburneum* and *C. grandiflorum.*

insigne. Lvs. to 3 ft. long and 1 in. wide: fls. 3½ in. across, in 10–15-fld. racemes to 5 ft. high; sepals and petals rose; lip 3-lobed, rose spotted with purple-red and with 2 yellow scales, Mar.–May. Cochin-China.

Lowianum. Lvs. linear, to 2½ ft. long: fls. about 4 in. across, in 10–20-fld. arching racemes; sepals and petals greenish-yellow; lip 3-lobed, yellow with scarlet midlobe, Feb.–July. Burma. Var. **concolor** lacks the scarlet.

Mastersii. Lvs. linear, to 2 ft. long: fls. in 4–8-fld. racemes to 1 ft. high; sepals and petals white tinged with brownish-rose; lip 3-lobed, white with yellow ridges, Nov.–Dec. Himalayas.

Pauwelsi. Hybrid between *C. Lowianum* var. *concolor* and *C. insigne.*

Schlegeli. Hybrid between *C. insigne* and *C. Wiganianum.*

Schroederi. Sepals and petals green marked with reddish-brown; lip bright yellow striped with brown. Cochin-China.

tigrinum. Lvs. to 4 in. long and ¾ in. wide: fls. in 4–6-fld. racemes to 8 in. high; sepals and petals olive-green; lip 3-lobed, white, the side lobes marked with red and midlobe spotted with red, May–June. Burma.

Traceyanum. Very similar to *C. giganteum* but with fls. to 6 in. across and darker colored, Oct.–Nov. Burma.

Veitchii. Hybrid between *C. eburneum* and *C. Lowianum.*

Wiganianum. Hybrid between *C. eburneum* and *C. Traceyanum.*

Winnianum. Hybrid between *C. giganteum* and *C. Mastersii.*

Woodhamsianum. Hybrid between *C. Lowianum* and *C. Veitchii.*

CYMBOPOGON. *Gramineæ.* Mostly per. grasses of tropics of Old World grown for the oil from herbage and roots and sometimes for ornament, differing from Andropogon in technical characters; aromatic. See *Grasses.*

citratus. Lemon-Grass. Differs from *C. Nardus* in the sterile spikelets linear rather than lanceolate. Known only in cult.

Nardus. Citronella-Grass. Per. to 6 ft.: lvs. fragrant, to 3 ft. long and ¾ in. wide, glaucous: infl. to 2½ ft. long. Trop. Asia; nat. in trop. Amer.

Schœnanthus. Camel-Hay. Per. to 2 ft.: differs from *C. Nardus* in the joints of the raceme hairy and concealing the spikelets. N. Afr., S. Asia.

CYME: a broad more or less flat-topped determinate flower-cluster; with central flowers opening first.

CYMOPHYLLUS: *Carex Fraseri.*

CYNANCHUM. *Asclepiadaceæ.* Per. herbs, often shrubby and twining, with opposite lvs., wheel- or bell-shaped fls. in clusters, and milkweed-like frs.; native in Eu., Asia and Afr. Propagated in spring by division of roots. Grown in any good garden soil.

acuminatifolium (*Vincetoxicum acuminatum. V. japonicum*). Mosquito-Trap. Erect, the tips of the sts. perhaps with a viney habit: lvs. arrow-shaped, gray-pubescent beneath: fls. white, in summer. Japan. Var. **violaceum** is a dwarfer form.

erectum: *Marsdenia erecta.*

CYNARA. *Compositæ.* Coarse herbaceous thistle-like per. or bien. herbs with large lobed or pinnately cut lvs. and large terminal heads of violet, blue or white disk-fls.; pappus plumose; native in Medit. region and Canary Isls.

Two species are grown as garden vegetables. They need rich soil and abundant moisture. The cardoon is blanched in much the same way as celery or endive. It is increased by seeds and by suckers. The artichoke is propagated also by division in early spring. Seeds give more variable results; if sown early enough edible heads may be obtained the same year, but usually not until the second year.

Cardunculus. Cardoon. To 6 ft. or more, cult. for its edible root and thickened lf.-stalks: lvs. grayish-green above, white-tomentose beneath, spiny: heads purple, the bracts of involucre spine-tipped. S. Eu

Scolymus. Artichoke. To 5 ft.: lvs. white-tomentose beneath, scarcely spiny: heads purple, the receptacle enlarged and fleshy and edible as are the thickened bases of the unarmed involucral bracts. Probably derivative of *C. Cardunculus.*

CYNODON (*Capriola*). *Gramineæ.* Per. grasses, creeping and stoloniferous, and valuable for pastures and lawns in warm regions: lvs. short: spikelets one-sided, in slender spikes borne in digitate clusters at ends of sts.: native in Eu., Asia and Australia but now widely spread and nat. See *Grasses.*

Dactylon. Bermuda-Grass. To 1 ft.: lvs. to 2 in. long and ⅙ in. wide, rough above: spikes to 2 in. long, spreading, in clusters of 3–5.—Much used for lawns in southern states.

CYNOGLOSSUM. Hounds-Tongue. *Boraginaceæ.* Rather weedy mostly stiff-hairy herbs, ann., bien. and per., mostly in the temp. zones, with alternate simple lvs. and blue, purple or white small fls. in terminal one-sided racemes: fr. a bur or "stick-tight": sometimes grown in the flower-garden. Propagated by seeds.

amabile. Bien. to 2 ft.: lvs. lanceolate-oblong: fls. blue, ¼ in. long. E. Asia.

cœlestinum: *Adelocaryum cœlestinum.*

furcatum: *C. zeylanicum.*

glochidiatum: *C. Wallichii.*

grande. Per. to 3 ft.: lvs. mostly basal, ovate or oval: fls. blue or purple with white center, ½ in. long. Wash, to Calif.

linifolium: *Omphalodes linifolia.*

nervosum. To 3 ft.: lvs. lanceolate or oblong: fls. blue, ⅔ in. across. Himalayas.

nobile: *Myosotidium hortensia.*

Wallichii (*C. glochidiatum*) Ann. to 2 ft.: lvs. oblong or lanceolate: fls. blue, ⅛ in. long. Asia.

zeylanicum (*C. furcatum*). To 3 ft.: lvs. oblong, silky-hairy: fls. blue, ⅛ in. long. India.

CYNOSURUS. *Gramineæ.* Old World ann. and per. tufted grasses with flat lvs. and spikelets in clusters forming a dense spike-like infl.; one species sometimes grown in pastures. See *Grasses.*

cristatus. Crested Dogs-Tail. Per. to 2½ ft.: lvs. to 5 in. long and ⅙ in. wide: spikes to 4 in. long, appearing crested because of the ciliate lemmas. Eu.; escaped in E. N. Amer.

CYNOXYLON: *Cornus florida.*

CYPELLA. *Iridaceæ.* Bulbous herbs with both basal and st.-lvs. and yellow, orange or blue fls. in clusters, the perianth-segms. free; native of S. Amer. Differs from Iris and Moræa in characters of stigma and anthers.

These bulbs may be grown in the greenhouse or set out in spring and stored indoors over winter. Propagated by offsets or seed.

Herberti. To 3 ft.: lvs. linear, 1 ft. long, plaited: fls. yellow, 3 in. across. Brazil, Uruguay, Argentina.

CYPERACEÆ. Sedge Family. Grass-like herbs with slender solid usually 3-angled sts., lvs. with closed sheaths, small green fls. borne in spikes, perianth when present represented by bristles or scales, 2–3 stamens, 1-celled ovary, and fr. an achene. Fls. not showy, but many of the plants are attractive in form and habit. The family comprises about 75 genera, many of them inhabiting swamps and low places. Only a few are cult., as Carex, Cyperus, Eriophorum, Scirpus.

CYPERUS. Galingale. *Cyperaceæ.* Ann. and per. herbs with grass-like lvs. and bisexual fls. borne in spikelets which are assembled in heads or racemes and these in turn often in large terminal umbels; about 600 species of wide distribution.

Grown in ponds, as pot-plants and the chufa for its edible tubers. Propagated by division or by seeds sown in spring or early fall. In *C. alternifolius* the crown of leaves may be cut off and set in sand or moss, and new plants will form from the leaf-axils. The species in cultivation are perennial.

adenophorus. Sts. to 2 ft., leafy below: spikelets stalked, on secondary or tertiary rays in the umbel. Brazil.

alternifolius. Umbrella Plant. Sts. to 4 ft., lvs. reduced to sheaths: spikelets sessile, on primary rays to 5 in. long, the umbels subtended by long lvs. giving an umbrella-like effect. Afr.; nat. in trop. Amer.—Requires much moisture at the root. Var. **gracilis** is a smaller plant with shorter involucral lvs. Var. **variegatus** has lvs. and sts. lined with white.

esculentus. Chufa. Earth-Almond. To 3 ft.: spikelets sessile, the large umbels subtended by long broad involucral lvs. N. Amer., Eu., Asia.—Propagated in spring by planting the little tubers or chufas; the tubers are eaten when dry and are food for chickens and pigs.

natalensis. Sts. to 2 ft., often nearly leafless: spikelets on rays to 7 in. long, the involucral lvs. short. Natal.

Papyrus (*Papyrus antiquorum*). Papyrus. Sts. to 8 ft., lvs. reduced to sheaths: spikelets sessile, with many drooping thread-like rays to 1½ ft. long which are longer than the involucral lvs. S. Eu., Syria, Afr.—This is the paper plant of the Egyptians; a stately plant for ponds, growing in shallow water.

virens. Sts. to 3 ft., with long lvs. to ½ in. wide: spikelets sessile, the rays from ½–8 in. long. S. U. S. to S. Amer.

CYPHOMANDRA. *Solanaceæ.* Herbs, shrubs or small trees with large entire 3-lobed or pinnately cut lvs., wheel- or bell-shaped fls. in racemes or cymes, and fr. a 2-celled many-seeded berry; native in S. Amer.

One species is grown for its edible fruit in the open in subtropical parts and occasionally in conservatories in the North. Propagated by seeds sown under glass and the plants treated as eggplants; also by cuttings of growing shoots.

betacea. Tree-Tomato. Somewhat woody tree-like shrub to 10 ft., mostly soft-hairy: lvs. cordate-ovate, to 1 ft. long: fls. pinkish, ½ in. across, fragrant: fr. egg-shaped, dull red, to 3 in. long, smooth, with slightly acid tomato-like flavor. S. Amer.

CYPRESS: *Cupressus, Taxodium.* **False-:** *Chamæcyparis.* **Standing-:** *Gilia rubra.* **Summer-:** *Kochia scoparia.* **-Vine:** *Quamoclit pennata.*

CYPRIPEDIUM. Lady-Slipper. Moccasin-Flower. *Orchidaceæ.* Terrestrial orchids native in the north temp. zone, with broad lvs., fls. solitary or in few-fld. terminal racemes, with an inflated sac-like lip; grown in rock-gardens or moist borders. The greenhouse cypripediums belong to other genera, as *Cordula* and *Paphiopedilum*, which see. For cult. see *Orchids*.

acaule (*Fissipes acaulis*). To 10 in. high, having 2 basal lvs. to 8 in. long and 3 in. wide: fls. solitary, to 5 in. across, sepals and petals greenish; lip rose veined with darker color, May–June. Newf. to N. C. and Minn.

californicum. To 2½ ft., with leafy sts.: lvs. to 4 in. long, ovate-lanceolate: fls. to 1½ in. across, in 6–12-fld. racemes, with brownish sepals and petals and white or rose lip spotted with brown, May. Ore., Calif.

fasciculatum. To 1 ft.: lvs. 2 to a st., to 4 in. long and 2½ in. wide: fls. about 1 in. across, in 4–6-fld. racemes; sepals and petals greenish veined with brown; lip greenish-yellow veined with brown, May–June. Calif. to Wash.

japonicum. To 16 in.: lvs. 2 to a st., to 5 in. long: fls. solitary, about 2½ in. across; sepals greenish spotted with red at base; petals white spotted at base with red-brown; lip white or rose spotted with red, May–June. Japan, China.

macranthum. To 16 in., the sts. with 3–4 lvs.: fls. solitary; sepals and petals purple; lip dark red, May–June. Siberia.

montanum. To 16 in., sts. leafy: lvs. to 6 in. long and 3 in. wide: fls. 4 in. across, in 1–3-fld. racemes; sepals and petals brown; lip white veined with purple, May–June. W. N. Amer.

parviflorum. To 16 in., sts. leafy: lvs. to 6 in. long, oval or elliptic: fls. 1–2 together; sepals and petals brown, the latter twisted; lip yellow veined with purple, May–June. N. Amer. Var. **pubescens** (*C. pubescens*) has white-hairy lvs.

pubescens: *C. parviflorum* var.

Reginæ (*C. spectabile*). To 2 ft., sts. leafy: lvs. to 7 in. long and 4 in. wide: fls. 3 in. across, 1–2 together; sepals and petals white; lip striped rose and white, May–June. E. N. Amer.

spectabile: *C. Reginæ.*

CYRILLA. *Cyrillaceæ.* One shrub or tree to 30 ft., native from Va. to W. Indies and S. Amer. and planted for ornament in the S. Propagated by seeds and cuttings under glass. **C. racemiflora.** Leatherwood. Deciduous or more or less evergreen: lvs. oblong, to 3 in. long, shining above: fls. small, white, in narrow axillary racemes to 6 in. long, June–July.

CYRILLACEÆ. Cyrilla Family. Three American genera of shrubs and trees bearing alternate entire lvs. and small bisexual fls. with 5 sepals and petals, 5 or 10 stamens, superior 2–4-celled ovary, and angled or winged frs. Apparently only Cyrilla is planted outside botanic gardens, although *Cliftonia monophylla* is to be expected.

CYRTOMIUM. *Polypodiaceæ.* Half hardy or greenhouse ferns with simply pinnate lvs.; sori large, scattered; native in Asia, Afr., Pacific Isls.; differs from Polystichum in venation. They are known with us mostly as glasshouse ferns of simple cult. See *Ferns*.

Butterfieldii: a form of *C. falcatum* with cut segms.

caryotideum (*Aspidium falcatum* var. *caryotideum*). Differs from *C. falcatum* in the drooping habit and larger toothed segms. Japan, India.

falcatum (*Aspidium falcatum. Polystichum falcatum*). Holly-Fern. Stiff, erect: lvs. dark green, glossy, to 2½ ft. long and 8 in. wide, segms. to 4 in. long, ovate, edges entire or slightly wavy. Asia, S. Afr., Polynesia; frequent in conservatories. Var. **compactum** is dwarf.

Fortunei (*Aspidium falcatum* var. *Fortunei*). Similar to *C. falcatum* but lvs. dull and with smaller lanceolate segms. Japan.

Rochefordianum: a form of *C. falcatum* with deeply cut segms.

CYRTOPODIUM. *Orchidaceæ.* Epiphytic or terrestrial orchids with long plaited lvs. and fls. in racemes or panicles, the sepals and petals nearly equal, the lip 3-lobed. For cult. see *Orchids*.

punctatum. Epiphyte, with pseudobulbs to 3 ft. long: lvs. to 2 ft. long and 2 in. wide: sepals and petals yellow spotted with red; lip yellow edged with red, with long claw, Apr.–June. Trop. Amer.

CYRTOSTACHYS. *Palmaceæ.* Cespitose unarmed monœcious ringed feather-palms mostly with showy red petioles, sometimes grown under glass and to be expected in S. Fla.; species about 5, Malaya and Pacific Isls.: spadices below the lvs., or with the lower ones, paniculately branched, the stout branches 1–2 ft. long; fls. in 3's, the 2 staminate at the sides; stamens 6–12–15: fr. small and ovoid or long-ovoid. Attractive as young specimens, making good clumps. See *Palm.*

Lakka. Trunks to 15 ft., slender, smooth: lvs. 4–5 ft. long, grayish or glaucescent underneath; pinnæ about 50, to 1½ ft. or more long, 1½ in. or less broad, gradually long-pointed, with strong midrib and secondary veins prominent; petiole and rachis red: drupe narrowly ovate-conic, attenuate, about ⅖ in. long, black with scarlet base; seed ovoid. Borneo.

Renda. To 30 ft.: fr. ovoid or scarcely elongate, ⅖ in. long; seed round; otherwise much like *C. Lakka.* Var. **Duvivierianum** has bright red rather than dark brownish-red petiole and rachis. Sumatra.

CYSTOPTERIS (*Filix*). BLADDER-FERN. *Polypodiaceæ.* Rock-ferns with delicate foliage useful for rockeries and damp rocky protected banks: lvs. 2–4-pinnate; sori on back on veins, the indusia disappearing with age: native of the north temp. zone. See *Ferns.*

bulbifera. BERRY B. BULBLET B. Lvs. to 2½ ft. long and 5 in. wide, dark green, 2–3-pinnate, long tapering, segms. deeply incised, bearing bulb-like bodies on under surface from which new plants may be propagated. Newf. to Ga. and Ark.

fragilis. BRITTLE-FERN. Lvs. gray-green, to 10 in. long, short-pointed, 2–3-pinnate, segms. deeply cut. Widely distributed and variable; Greenland to Ga. and Ala. and westward, and elsewhere.

CYTHEREA: *Calypso.*

CYTISUS. BROOM. *Leguminosæ.* Shrubs with simple or trifoliolate deciduous or persistent lvs., sometimes the branches almost leafless, papilionaceous mostly yellow but sometimes purple and white fls. usually in terminal racemes, and flattened pods; grown out-of-doors where hardy and some forced in the greenhouse for early spring bloom; many of them are very showy.

Brooms succeed in sunny positions in soil not too rich. In the greenhouse they should be kept cool until ready for forcing in January. Propagated by seeds, greenwood cuttings under glass, layers or grafting.

albus (*C. leucanthus. C. schipkaensis*). To 1 ft.: lfts. to ¾ in. long: fls. yellowish-white to white, in terminal heads, in summer. S. E. Eu.

alpinus: *Laburnum alpinum.*

Andreanus: *C. scoparius* var.

Ardoinii. Procumbent, to 1½ ft.: lfts. to ⅓ in. long: fls. golden-yellow, axillary along branches, Apr.–May. S. France.

Attleyanus: *C. canariensis* var. *ramosissimus.*

austriacus. To 3 ft.: lfts. to 1 in. long: fls. bright yellow, in terminal heads, July–Aug. S. E. Eu.

Beanii. Hybrid between *C. Ardoinii* and *C. purgans,* partly prostrate.

canariensis (*Genista canariensis*). GENISTA of florists. Evergreen, much branched, to 6 ft.: lfts. to ½ in. long: fls. bright yellow, fragrant, in terminal short racemes, spring and summer. Canary Isls. Var. **ramosissimus** (*C. ramosissimus, C. Attleyanus*) has very small lfts.—Common under glass.

capitatus: *C. supinus.*

Dallimorei. Hybrid between *C. multiflorus* and *C. scoparius* var. *Andreanus:* fls. yellow, tinted with pink, wings crimson.

dalmaticus: *Genista silvestris* var. *pungens.*

decumbens (*Genista prostrata*). Prostrate, to 8 in.: lfts. to ¾ in. long: fls. yellow, axillary along branches, May–June. S. Eu.

elongatus. To 5 ft.: lfts. to 1 in. long: fls. yellow marked with reddish-brown, axillary. Cent. and S. E. Eu.

filipes (*C. palmensis*). Branches thread-like: fls. white, fragrant, axillary along the branches, in spring. Teneriffe.

fragrans (*Genista fragrans. Spartocytisus nubigenus*). Lfts. densely pubescent: fls. white, fragrant, axillary, in spring. Teneriffe.

hirsutus (*C. leucotrichus*). To 2 ft.: lfts. to ¾ in. long: fls. yellow, axillary, May–June. S. E. Eu.

kewensis. Hybrid between *C. Ardoinii* and *C. multiflorus:* procumbent, to 1 ft. high: lvs. sometimes simple but usually of 3 linear-oblong soft-pubescent lfts.: fls. yellowish-white, ½ in. long, on slender branches.

Laburnum: *Laburnum anagyroides.*

leucanthus: *C. albus.*

leucotrichus: *C. hirsutus.*

linifolius. To 3 ft.: lfts. to 1 in. long, silvery-pubescent beneath: fls. bright yellow, in racemes, in spring. Spain, N. Afr., Canary Isls.

maderensis. Evergreen, to 20 ft.: lfts. to ¾ in. long: fls. bright yellow, slightly fragrant, in terminal and lateral racemes, spring. Madeira. Var. **magnifoliosus** (*C. stenopetalus*) has larger lvs. and racemes.

monspessulanus. Evergreen, to 10 ft.: lfts. to ¾ in. long: fls. bright yellow, fragrant, in short racemes at the tips of lateral branchlets, in spring. S. Eu.

multiflorus (*Spartium multiflorum*). To 3 ft.: lfts. to ½ in. long: fls. white, axillary, in spring. Spain, N. Afr. Var. **incarnatus** has fls. slightly blushed.

nigricans. To 4 ft.: lfts. to 1 in. long: fls. yellow, in long slender terminal racemes, July–Aug. Cent. and S. E. Eu. Var. **elongatus** (var. *longespicatus*) blooms again in fall.

palmensis: *C. filipes.*

pilosa: *Genista pilosa.*

præcox. Hybrid between *C. multiflorus* and *C purgans:* to 10 ft.: lfts. to ¾ in. long: fls. light yellow, numerous along the branches, in May.

proliferus. To 12 ft.: lfts. to 1¾ in. long: fls. white, axillary, spring and early summer. Canary Isls.

purgans. To 3 ft., much branched: lvs. simple, to ½ in. long: fls. yellow, fragrant, axillary, May–July. S. Eu., N. Afr.

purpureus. To 2 ft., procumbent: lfts. to 1 in. long: fls. purple, white or pink in some forms, axillary along the branches, in May. S. Austria. Var. **elongatus** (var. *pendulus*), branchlets long and slender. Var. **erecta**, upright habit.

racemosus (*Genista racemosa*). Evergreen, to 6 ft.: lfts. to ¾ in. long: fls. yellow, in long racemes, late spring. Probably hybrid.

radiatus: *Genista radiata.*

ramosissimus: *C. canariensis* var.

sagittalis: *Genista sagittalis.*

schipkaensis: *C. albus.*

scoparius (*Genista scoparia. Spartium scoparium*). SCOTCH B. To 10 ft.: lfts. to ½ in. long: fls. yellow, solitary or in pairs in the axils, spring and summer. Eu.; nat. in N. Amer. Var. **Andreanus** (*Genista Andreana*) has yellow fls. with dark crimson wings.

sessilifolius. To 6 ft.: lfts. to ¾ in. long: fls. bright yellow, in short racemes at tip of lateral branchlets, in June. S. Eu., N. Afr.

stenopetalus: *C. maderensis* var. *magnifoliosus.*

supinus (*C. capitatus*). To 3 ft., sometimes procumbent: lfts. to 1 in. long: fls. yellow fading brownish, in terminal heads, in summer. Eu.

triflorus. To 8 ft., much branched: fls. yellow, 1–3 in the axils, nodding, in spring. S. Eu.

Watereri: *Laburnum Watereri.*

D

DABOËCIA. *Ericaceæ.* One evergreen heath-like little shrub suitable for rock-gardens but requiring winter protection in the N. Does best in a peaty soil. Propagated by seeds and by cuttings of half-ripened wood under glass. **D. cantabrica** (*D.* and *Menziesia polifolia*). IRISH-HEATH. To 2 ft.: lvs. elliptic, to ½ in. long, shining above, white-tomentose beneath: fls. purple, ½ in. long, nodding, in terminal racemes from June–Oct. W. Eu. In var. **alba** the fls. are white, **atropurpurea** deep purple, **bicolor** striped with white and purple. Var. **nana** is dwarf with smaller lvs.

DACRYDIUM. *Taxaceæ.* Evergreen trees or shrubs with scale-like lvs. or linear on young specimens, diœcious fls., and nut-like seeds surrounded by an aril; about 16 species in the southern hemisphere; grown in Calif. For cult. see *Conifers.*

cupressinum. RIMU. Tree to 100 ft., with long graceful drooping branches when young: lvs. ¼ in. and less long and decurrent in young state, about ⅛ in. long on mature parts: nutlet about ⅛ in. long, in an aril. New Zeal.

Franklinii. HUON-PINE. Tree to 100 ft., with short horizontal branches and drooping branchlets: lvs. scale-like and imbricated, about $^1/_{24}$ in. long: cones very small, with 4–8 scales. Tasmania.

DACTYLIS. *Gramineæ.* Tall per. grasses with flat lvs. and spikelets in dense clusters borne in open branched panicles; native of Eu. and Asia and one grown as hay, forage and pasture grass. See *Grasses.*

glomerata. ORCHARD-GRASS. COCKS-FOOT. To 4 ft., tufted: lvs. to 9 in. long and ¼ in. wide: panicles to 8 in. long. Widely nat. in N. Amer. Var. **variegata** has lvs. striped with silver and may be grown for ornament.

DÆDALACANTHUS: *Eranthemum.*

DÆMONOROPS. *Palmaceæ.* About 80 climbing (one of ours erect) polygamo-diœcious tufted feather-palms, mostly trop. Asia and beyond, differing from Calamus in the fact that the spiny outer spathes are boat-shaped and deciduous and at first inclosing the inner, and the fls. often or usually more pedicillate. Tried in S. Fla., but too tender; they climb by sharp recurved hooks at intervals on the rachis and its prolongation beyond the pinnæ; fr. scaly. For cult. see *Palm.*

fissus. Lvs. not tendril-bearing or prolonged into whip-like part; segms. or pinnæ 8, nearly opposite, 10–14 in. long and 1½–3 in. broad, spinulose toward apex and on ribs, acuminate; petiole 3 ft. or more long, armed as is the rachis: fr. size of small cherry, in dense clusters. Borneo.

Jenkinsianus. Pinnæ many, 1–2 ft. long, with 2 strong side ribs and all three bearing long more or less appressed bristles and the margins also setulose; petioles very spiny: fr. globose, ⅔ in. diam., brown. India.

palembanicus. Erect: lvs. cinnamon-brown when young and attractive; pinnæ many, narrow, to 1½ ft. long; petioles spiny on back. Sumatra.

DAFFODIL: *Narcissus.*

DAHLIA (*Georgina*). *Compositæ.* Strong tender per. herbs, sometimes tall and tree-like in form, much branched, with large underground tubers, from mts. of Mex. and Guatemala, popular for the showy heads in red, purple, yellow and white, characteristic ornamentals of autumn and late summer: lvs. pinnate to 3-pinnate, differing on the same plant: rays large and showy, pistillate or neutral, now developed into narrow, rolled and quilled forms; heads often full double, compact and ball-like.

Dahlias require a full season's growth, and if the soil is very rich they may not give much bloom before frost in northern regions; rather open "quick" soil, as a light loam suitable for corn or general garden purposes, produces good results, and any fertilizer that may be employed in the year of cultivation should be quickly available. Water must be supplied freely.

The customary propagation by the home gardener is by planting separately each tuber in the cluster. Care must be taken not to injure the crown. Only one stalk or trunk should be allowed, after danger from cutworms and early accidents is past. The cluster of tubers is carefully lifted in autumn as soon as the bloom is past, dried in the sun after the tops are removed, and stored in the cellar as are potatoes. The tubers are laid on the side when planted and covered about 6 inches deep. Plants are commonly set about 3 or 4 feet apart. The tall varieties may need staking, as they are likely to be tipped over and broken by wind; but if the tip or center of the plant is pinched out after two or three joints have grown, it may stand alone.

Some of the races of dahlia are grown readily from seeds, which, in the North, may well be started under glass. The single dahlias come well by this method and give good bloom the same year in late summer and autumn. The plants produce tubers, and these may be employed for further propagation, or a new lot may be grown each year from seed.

For more rapid propagation and particularly for the perpetuation of named varieties, cuttings may be employed. These cuttings may be made of strong stems, cut just below a joint, or by the sprouting of tubers; in either method, the work should be carried under glass and the young plants kept growing until time for setting out in spring. The stem-cutting produces shoots, which should be severed from the cutting when 4 or 5 inches high and treated as independent plants. If roots are employed, they may be placed whole in heat and the shoots taken off and grown independently.

The named varieties are now very many, and there is a special literature about them. Fanciers should be associated with the American Dahlia Society.

arborea: *D. excelsa.*

coccinea. Rather slender, 3–4 ft., st. glaucous: pinnæ or ultimate lfts. ovate-acuminate and sharp-serrate, the rachis narrowly bordered or wingless: rays typically 8 (single), short, broad and nearly or quite obtuse (about 1⅓ in. or less long), scarlet on upper surface and lighter underneath. Mex.

excelsa (*D. arborea*). FLAT TREE D. To 20 ft. or more, st. somewhat woody and glaucous: ultimate lfts. ovate-acuminate, coarsely few-toothed or practically entire: heads erect, opening flat, 4–5 in. across, rays about 8, purplish or crimson-pink. Mex.—Little known within our limits.

glabrata: *D. Merckii.*

imperialis. Bell Tree D. Candelabra D. Sts. few, often single and not greatly branched, to 20 ft., more or less woody: ultimate lfts. ovate, rather sharply and finely serrate or toothed: heads nodding, 4–7 in. across, bright lilac or light reddish, rays about 8 and forming a bell-shaped corolla-like bloom. Mex.—Thrives in S. Calif., and can be fld. in the N. if tubbed and taken inside in autumn.

Juarezii. Cactus D. To 4 ft. or so: double or semi-double, most or all the long rays with recurved margins, irregular in length and overlapping, usually brilliant scarlet. Intro. from Mex.; commonly said to be a hybrid, but this origin is undetermined; see *D. Popenovii.*

Maxonii. Tree dahlia, to 18 ft., becoming more or less woody: ultimate lfts. lanceolate and conspicuously long-acuminate, dentate: heads erect, rays 8, opening flat, lavender-pinkish or lilac, ovate, to 2 in. long. S. Mex., Guatemala, where it is used for hedges.—Runs into white and also double; has bloomed in S. Calif.

Merckii (*D. glabrata*). Bedding D. Slender and glabrous, 2–3 ft., with finely cut foliage: ultimate lfts. or segms. 1–2 in. long and nearly as broad, mostly few-toothed or -serrate, more or less blunt: heads erect, 1–2 in. across, rays (single) lilac, short and nearly or quite obtuse. Mex.

pinnata (*D. rosea. D. variabilis*). Common or Garden D. Bush dahlia to 4 or 5 ft.: ultimate pinnæ ovate, crenate-dentate, grayish underneath, rachis more or less winged: heads horizontal or somewhat nodding, 2–4 in. or more across, much doubled and modified and various in color; rays probably originally 8 and rose-color or lilac. Mex.—Now runs into numerous forms in several classes.

Popenovii. A single-fld. bush dahlia, 3–4 ft.: ultimate lfts. or segms. ovate to oblong-ovate, sparsely hairy, dentate: heads erect or at length recurved or nodding, to 3½ in. across; rays 8, single and of the cactus type, long and narrow-revolute, scarlet or cardinal. Guatemala.—Supposed ancestor of the cactus dahlias (*D. Juarezii*); it has been raised in this country.

rosea: *D. pinnata.*

variabilis: *D. pinnata.*

Zimapani: *Cosmos diversifolius.*

DAHLIA, CLIMBING-: *Hidalgoa Wercklei.* **Sea-**: *Coreopsis* (*Leptosyne*) *maritima.*

DAHOON: *Ilex Cassine.*

DAIS. *Thymelæaceæ.* Deciduous shrubs with simple lvs. and bisexual fls. in terminal heads, the tubular calyx corolla-like; one species is grown out-of-doors in S. Calif. and S. Fla. Propagated by cuttings of half-ripened wood.

cotinifolia. To 18 ft.: lvs. obovate or oblong, 2½ in. long: fls. pink, fragrant, ¾ in. long, hairy outside, the heads long-stalked. S. Afr.

DAISY: *Chrysanthemum.* **African**: *Arctotis stœchadifolia, Lonas inodora.* **Barbeton**: *Gerberia Jamesoni.* **Blue**: *Felicia amelloides.* **English**: *Bellis perennis.* **Globe-**: *Globularia trichosantha.* **Michælmas**: *Aster.* **Orange**: *Erigeron aurantiacus.* **Seaside**: *Erigeron glaucus.* **Swan River**: *Brachycome iberidifolia.* **Transvaal**: *Gerberia Jamesoni.* **True**: *Bellis perennis.* **Turfing**: *Matricaria Tchihatchewii.* **White**: *Layia glandulosa.* **Yellow**: *Rudbeckia hirta.*

DAISY-TREE: *Olearia.*

DALBERGIA. *Leguminosæ.* Trop. trees or climbing shrubs with alternate pinnate lvs., small papilionaceous fls. in terminal or axillary panicles, and flattened pods; many species furnish valuable timber. Only one intro. into the subtrop. parts of the U. S. Propagated by seeds or cuttings.

Sissoo. Sissoo. Deciduous tree to 80 ft.: lvs. of 5 nearly orbicular abruptly acuminate lfts.: fls. yellowish-white, in short axillary panicles: pods to 4 in. long. India.

DALEA (*Parosela*). *Leguminosæ.* Herbs or shrubs native to N. and S. Amer., mostly in dry and sometimes desert locations: lvs. pinnate or simple, glandular-dotted: fls. papilionaceous, purple, white or yellow, in spikes or racemes. Sometimes transferred to grounds.

frutescens. To 2 ft., shrubby: lfts. 13–17: fls. violet, in spikes to ¾ in. long. Tex. to Mex.

Schottii. To 8 ft., shrubby, somewhat spiny: lvs. simple, linear, to 1¼ in. long: fls. dark blue to purplish, in racemes to 4 in. long. Colorado desert, Calif. to Lower Calif.

spinosa. Smoke-Tree. Characteristic ash-gray shrub or small tree of the Colorado desert, to 25 ft., with few lvs. that soon fall leaving a bare very stiff-spiny effect: fls. violet-purple.

DALECHAMPIA. *Euphorbiaceæ.* Trop. monœcious shrubs, often climbing, with alternate simple lvs. and small fls. without petals borne in dense clusters with 2 colored involucral bracts; one species grown in the greenhouse. Propagated by cuttings.

Roezliana. To 4 ft., erect, much branched: lvs. oblanceolate, 6 in. or more long, entire or with coarse teeth above middle: fls. yellow; bracts rose, to 2½ in. long, toothed. Mex. Var. **alba** has white bracts.

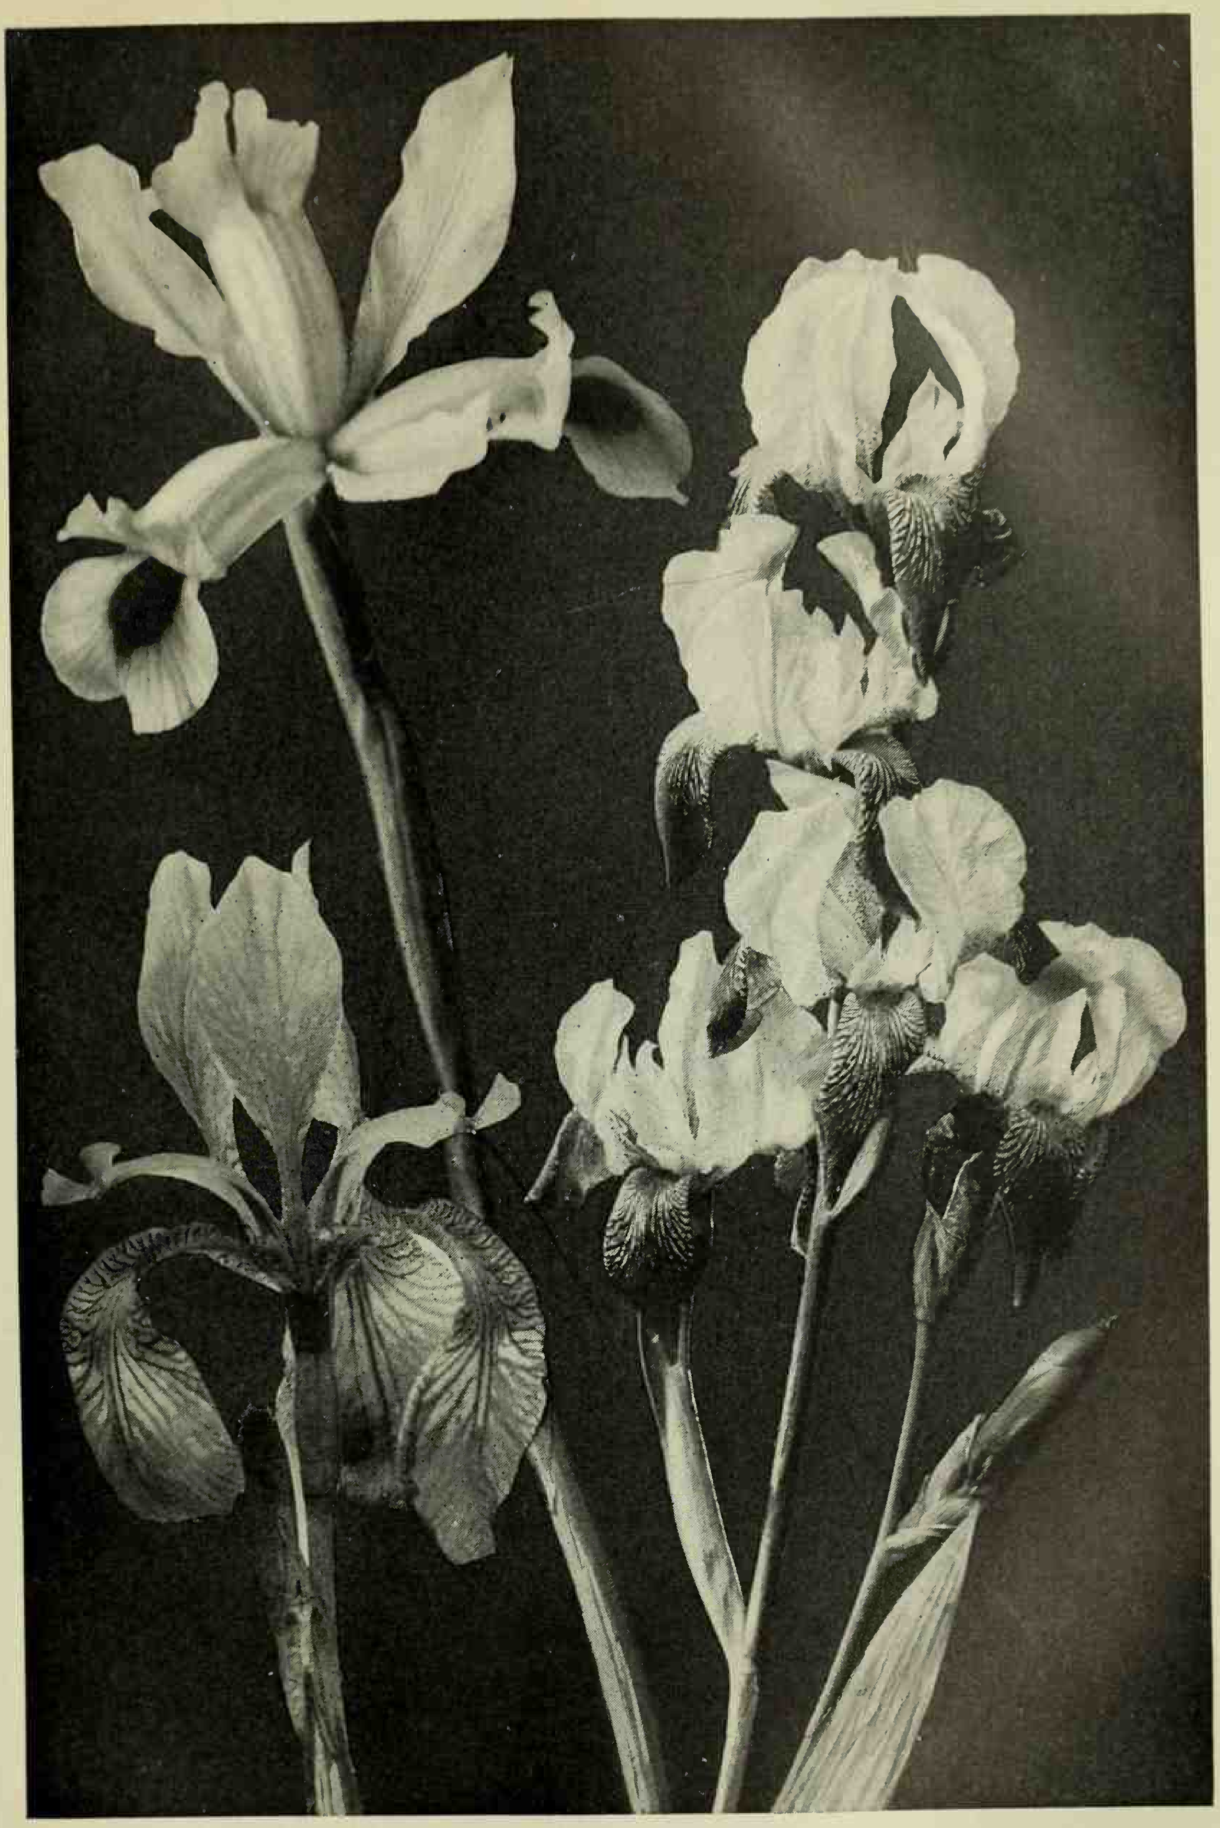
DALIBARDA. *Rosaceæ.* One simple-lvd. per. herb native in N. E. N. Amer., sometimes transplanted to the rock-garden or border where it grows well in sheltered positions in rich or woodsy soil. **D. repens** (*Rubus Dalibarda*). Tufted and creeping, pubescent: lvs. heart-shaped, to 2 in. across, wavy-toothed: fls. white, to ½ in. across, 1–2 at tip of scape, June–Sept.

DANAË. *Liliaceæ.* One evergreen shrub native in S. W. Asia and sometimes planted as an ornamental. **D. racemosa** (*Ruscus racemosus*). Alexandrian-Laurel. To 3 ft.: lvs. scale-like, the apparent lvs. being modified branches to 4 in. long and 1 in. wide: fls. white, small, in short terminal racemes: fr. a red berry. For *D. androgyna*, see *Semele.*

DANDELION (*Taraxacum officinale*). The common dandelion is often gathered for greens. Improved large-leaved horticultural forms are grown as an autumn and spring vegetable, the plants attaining a large size and the leaves more tender. The seed may be selected from the best field-growing plants, but it is better to purchase the French seed of seedsmen. Sow in spring in well-manured soil, either in drills or in hills 1 foot apart. A cutting of leaves may be had in September or October, and some of the stools may stand until spring. The delicacy of the leaves may be improved by blanching them, either by the use of boards or earth. The plant is usually not left the second year.

DANGLEBERRY: *Gaylussacia frondosa.*

DAPHNE. *Thymelæaceæ.* European and Asian shrubs, sometimes evergreen, with alternate (unless noted opposite) simple and entire lvs., white, purple or lilac bisexual fls. in short racemes or clusters, often preceding the lvs., and fr. a little drupe; grown out-of-



VI. IRIS, IN THREE CLASSES. — Left, *Iris sibirica*. Center, *Iris Xiphium*. Right, Candelabre, one of the tall bearded horticultural irises

doors or under glass; some of them are very low and good for borders or rockeries. Most of them are hardy to N. Y. and New England.

A well-drained light soil is best or for forced plants a compost of peat and loam. Propagated by seeds sown at once or stratified; by softwood cuttings or the evergreen species by hardwood cuttings taken in fall and carried till spring in a cool greenhouse; or by grafting in winter on seedling stocks or roots. Layers may also be employed; compost should be used in place of soil for 2 or 3 inches about the plant, removed the following spring and the small white buds planted in pots of fine soil.

alpina. From 6 in. to 1½ ft., deciduous: lvs. to 1½ in. long, pubescent: fls. white or pinkish, fragrant, in terminal clusters, May–June. Eu.

altaica. Small deciduous shrub: lvs. oblanceolate to oblong, to 2½ in. long, glabrous: fls. white, little scented, few in terminal clusters, May and June. Siberia.

Blagayana. To 1 ft., evergreen: lvs. to 1¾ in. long: fls. creamy-white, fragrant, in terminal clusters in early spring. Mts. of Eu.

caucasica. To 5 ft. or more, deciduous: lvs. oblanceolate to lanceolate, to nearly 2 in. long: fls. white, pubescent outside, fragrant, in terminal heads. Caucasus.

Cneorum. To 1 ft., with trailing branches, evergreen: lvs. to 1 in. long: fls. pink, fragrant, in terminal clusters in early spring. Mts. of Eu.

Fioniana: probably of hybrid origin: fls. lilac.

Genkwa. To 3 ft., deciduous: lvs. opposite, to 2 in. long: fls. lilac, in clusters along branches of previous year, before the lvs. China.

Gnidium. To 6 ft., evergreen: lvs. linear-lanceolate: fls. yellowish-white, fragrant, in terminal panicles. S. Eu.

Laureola. Spurge-Laurel. To 3 ft., evergreen: lvs. to 3 in. long: fls. yellowish-green, in almost sessile racemes, in early spring. S. Eu., W. Asia.

Mezereum. To 4 ft., deciduous: lvs. to 3 in. long: fls. lilac-purple, fragrant, in clusters along branches of previous year, in early spring before the lvs.: fr. scarlet. Eu., W. Asia. Var. **alba** has white fls. and yellow fr.

odora. To 4 ft., evergreen: lvs. to 3 in. long: fls. white to purple, very fragrant, in dense terminal clusters, very early. China, Japan. In var. **marginata** the lvs. are bordered with yellow.

oleoides. To 3 ft., pubescent, evergreen: lvs. elliptic, obovate to lanceolate, to 1½ in. long, becoming glabrous above: fls. white or pale lilac, pubescent outside, about ½ in. long. Medit. region; not hardy N.

DAPHNIPHYLLUM. *Euphorbiaceæ.* Smooth evergreen small trees or shrubs with simple leathery lvs., diœcious fls. without petals borne in axillary racemes, and fr. a 1-seeded drupe.

The one species mostly planted in this country (*D. macropodum*) withstands several degrees of frost but requires winter protection; it is a small tree or shrub for the southern states and California. Propagated by cuttings or seeds if procurable.

humile. To 5 ft.: lvs. elliptic to oblong, to 5 in. long: fr. dark blue. Japan.

macropodum. To 30 ft. and more: twigs red: lvs. oblong, to 8 in. long: racemes to 4 in. long: fr. black, with a bloom. China, Japan.

DARLINGTONIA. *Sarraceniaceæ.* One per. insectivorous herb native in Calif. and Ore., sometimes grown as a curiosity. It requires a moist cool atmosphere and abundant water at the roots. It may be grown out-of-doors in the N. with winter protection. Propagated by division of roots or by seeds. **D. californica** (*Chrysamphora californica*). California Pitcher-Plant. To 3 ft.: lvs. or pitchers in basal rosettes, tubular, with an arched white-spotted hood and a 2-forked appendage: fls. yellowish to dark purple, 1¼ in. long, solitary.

DARNEL: *Lolium temulentum.*

DARWINIA. *Myrtaceæ.* Evergreen shrubs native in Australia and sometimes planted in Calif.: lvs. opposite or scattered, small and entire: fls. red or white, small, sometimes subtended by showy bracts. Propagated by cuttings taken from tips of side shoots, in spring or fall.

citriodora. To 2 ft., diffuse: lvs. nearly opposite, oblong to ovate-lanceolate, to ½ in. long: fls. in terminal heads with involucre of bracts slightly colored.

Scheurmanni. Much branched procumbent shrub: lvs. opposite, linear, ½ in. or less long: fls. solitary on very short pedicels in axils.

thymoides. Diffuse and much branched low shrub: lvs. commonly opposite, lanceolate or narrower, margins revolute, ⅛ in. or less long: fls. in terminal heads of 4–8, the bracts shorter than fls. and soon falling.

DASHEEN: *Colocasia esculenta.*

DASIPHORA: *Potentilla fruticosa.*

DASYLIRION. Sotol. *Liliaceæ.* Stiff desert tree-like plants having linear usually spiny-margined lvs. and small whitish fls. in dense panicled racemes; useful in desert work, or in formal plantings in dry warm regions; sometimes seen under glass as curiosities. The lvs. are utilized for thatching and baskets, the fiber is made into cordage, the heads are eaten, and an alcoholic beverage is extracted from the trunks. Of easy cult. as for yucca, to which they are related; propagated by seeds and cuttings.

acrotriche. Trunk 3 ft. or more: lvs. to 3 ft. long, ½ in. wide: infl. to 15 ft. high. Mex.

glaucophyllum. Trunk short: lvs. 3 ft. or more long, ½ in. wide, glaucous: infl. to 18 ft. high. Mex.

graminifolium. Lvs. about 3 ft. long and ½ in. broad, green and glossy, prickles very short and yellowish-white. Mex.

longifolium: *Nolina longifolia.*

longissimum (*D. quadrangulatum*). Trunk to 6 ft.: lvs. 6 ft. long and ¼ in. wide: infl. to 20 ft. high. Mex.

quadrangulatum: *D. longissimum.*

serratifolium. Stemless or nearly so: lvs. to 3 ft. long and 1½ in. wide, glaucous. Mex.

texanum. Trunk short or underground: lvs. 2–3 ft. long and ½ in. broad, glossy-green, the prickles yellow turning brown: infl. to 15 ft. high. Tex., Mex.

Wheeleri. Trunk to 3 ft.: lvs. to 3 ft. long and 1 in. wide: infl. to 16 ft. high. Tex., Ariz., Mex.

DASYSTEPHANA: *Gentiana.*

DASYSTOMA: *Aureolaria pedicularia.*

DATE (*Phœnix dactylifera*). A fruit of very ancient cultivation by the Arabs and others in the arid regions of the Old World, principally northern Africa, where moisture is supplied by spring or underground water or by irrigation. High temperatures are required in the growing and ripening season. The date of commerce is the naturally dried drupe of the palm, borne in heavy clusters. Dates are now grown in considerable plantations in southern California and Arizona, and undoubtedly adapted to many parts of Texas and other regions. The date palm is also widely planted as an ornamental tree in humid tropics and warm-temperature regions. When well established the tree withstands several degrees of frost.

The date is diœcious,—the male or staminate flowers on one tree and the females or pistillates on another tree. Seedless dates may be produced without pollination but they are inferior. Pollination takes place by the agency of wind but the results are uncertain and too many staminate or sterile trees are required. One male tree to about 100 females is sufficient if hand-pollination is practiced. This process consists in tying a piece of staminate inflorescence a few inches long, bearing 30 or more flowers, to the female cluster; as not all the female flowers in a cluster open at the same time, this operation needs to be repeated.

Propagation is by seeds and suckers, the latter being the prevailing method for the multiplication of particular or named varieties; and without as careful attention to varieties as with oranges or apples the rewards of date culture are small or negligible. The suckers arise about the base of the tree mostly before it reache full bearing age, but may spring from the trunk later on to 10 or more feet above ground. The sex of the sucker will of course be that of the tree from which it arises. The suckers are moved when three to six years old, mostly in spring when the ground is warm, the tops being headed back. Experience is required to assure uniform successful results. The cutting of offshoots extends from the first five to ten years of the mother palm's life. If many suckers are removed at one time, it may require two years for the parent to recover, with consequent loss of fruit; and leaving the suckers on the tree also retards fruiting.

Trees grown from suckers should bear considerably in five or six years, depending on soil, location and treatment. At ten to fifteen years the tree should be in full bearing and continue indefinitely, yielding 100 to 200 pounds annually. Trees may be planted about 30 feet apart.

Some dates under good conditions ripen naturally on the tree, but the fruits are likely to cure unevenly and for the most part the bunches are cut intact and matured in a warm place, not unlike the handling of bananas. Special ripening processes have been developed for superior results.

DATE, JERUSALEM: *Bauhinia monandra.*

DATISCA. *Datiscaceæ.* Per. herbs resembling hemp in habit, one sometimes planted for ornament: lvs. alternate, compound: fls. diœcious, in clusters or the pistillate in racemes. Propagated by seeds and division.

cannabina. To 7 ft.: lvs. pinnate, lfts. 7–11, linear-lanceolate, to 4 in. long, toothed: fls. yellow, small. Asia Minor to India.

DATISCACEÆ. DATISCA FAMILY. Three genera of trees or herbs in Asia, Eu. and W. N. Amer.: lvs. simple or compound: fls. mostly diœcious, of 4–9 sepals, no petals, 4–25 stamens, 1-celled ovary: fr. a caps. Placed near the Begonia family in the systematic schemes, although the plants lack such external resemblances. Datisca is rarely cult.

DATURA (incl. *Brugmansia*). *Solanaceæ.* Big bushy coarse erect annuals, shrubs or small trees, mostly strong-smelling, sometimes grown for ornament, also medicinal: lvs. large, simple, entire or coarsely toothed: fls. large, trumpet-shaped, erect or drooping, red, white, yellow, violet: fr. a mostly prickly or spiny caps. There are two groups: one with the calyx breaking apart near base and left as cup or crown on the fr. (circumscissile); the other with calyx splitting lengthwise down one side (spathe-like).

The annual daturas are propagated by seeds usually sown indoors in the spring in the North; the perennials from seed and from cuttings, the latter preferably taken with a heel.

ægyptiaca: *D. Metel.*

arborea. ANGELS-TRUMPET. Small tree: lvs. ovate-lanceolate, to 8 in. long, soft-hairy, in pairs: fls. white nerved with green, to 9 in. long, hanging, solitary, with musk-like odor; calyx spathe-like: fr. unarmed, 2½ in. long. Peruvian Andes.

ceratocaula. Fleshy, with thick st. and horn-like branches: lvs. pinnately lobed, mealy beneath: fls. large, erect, white stained blue; calyx spathe-like: fr. more or less pendent, smooth. Aquatic plant of Mex. and Cent. Amer.

chlorantha. Shrub: lvs. broad-ovate: fls. yellow, drooping: fr. prickly. Habitat unknown.—Probably a form of *D. Metel.*

coccinea: *D. DeNoteri.*

cornigera (*D. Knightii*). To 4 ft., branches downy: lvs. ovate: fls. drooping, very fragrant at night, white or creamy-white; calyx with a long spur. Mex.

cornucopia: *D. Metel.*

De Noteri (*D. coccinea*). Probably ann., 3 ft.: fls. fragrant, bright red, freely produced. S. Afr.—Of uncertain botanical identity.

fastuosa: *D. Metel.*

ferox. Sts. red at base: lvs. ovate, angled: fls. light blue. S. Eu.

humilis: *D. Metel.*

inermis: a form of *D. Stramonium* with spineless pods.

Knightii: *D. cornigera.*

Metel (*D. fastuosa. D. cornucopia. D. ægyptiaca*). Ann. to 5 ft.: lvs. ovate-lanceolate, to 8 in. long, solitary or upper ones paired: fls. to 7 in. long, whitish within, violet outside to yellowish, often double; calyx purple, circumscissile: fr. spiny, nearly globose, 1¼ in. diam. India; nat. in tropics of both hemispheres. Var. alba, fls. white; cærulea, fls. blue; **Huberiana,** fls. blue, yellow and red. *D. humilis flava fl.-pl.* also belongs here.

meteloides (*D. Wrightii*). Per. cult. as ann., to 3 ft., grayish-pubescent: lvs. ovate, to 7 in. long: fls. erect, to 8 in. long, white tinged with rose or violet, fragrant; calyx circumscissile: fr. nearly globose, 2 in. across, with sharp spines. Tex. to Calif. and N. Mex.

sanguinea. Tree-like shrub to 12 ft.: lvs. narrow-oblong, clustered, 7 in. long, soft-hairy, shining green above: fls. drooping, to 10 in. long, brilliant orange-red with yellow nerves, not fragrant; calyx spathe-like: fr. unarmed, 3½ in. long, top-shaped; seeds with narcotic properties. Peru.

Stramonium. JIMSON-WEED (Jamestown-weed). Ann. to 5 ft.: lvs. ovate, to 8 in. long, lobed: fls. erect, white or violet, 4 in. long; calyx circumscissile: fr. 2 in. long, very prickly. Tropics; nat. in N. Amer.

suaveolens. Tree-like shrub to 15 ft.: lvs. ovate-oblong, to 1 ft. long: fls. nodding, white, to 1 ft. long; calyx spathe-like: fr. unarmed, spindle-shaped, 5 in. long. Brazil.—Usually cult. as *D. arborea.*

Tatula: the purple-fld. form of *D. Stramonium.*

Wrightii: *D. meteloides.*

DAUBENTONIA. *Leguminosæ.* Shrubs or trees with pinnate lvs., yellow or rose papilionaceous fls. in axillary racemes, and 4-winged or -angled pods; the first-named species is grown out-of-doors in warm climates.

punicea (*Sesbania punicea*). To 6 ft. or more: lfts. 12–14, to 1 in. long: fls. red-purple, to ¾ in. long, in showy racemes to 4 in. long: pods to 4 in. long, 4-winged. Fla. to Miss., intro. from S. Amer.

Tripetii (*Sesbania Tripetii*). To 6 ft.: fls. orange-red with scarlet standard yellow-spotted at base, in drooping racemes. Argentina.

DAUCUS. *Umbelliferæ.* Herbs with pinnately decompound lvs., small white or yellowish fls. in compound umbels, and ovate or oblong frs.; one grown for the edible root.

Carota var. **sativa.** CULTIVATED CARROT. Ann. or bien., to 3 ft., with thick, fleshy, orange-colored roots: lvs. finely cut into many narrow segms.: umbels usually globose, thus differing from the flatter umbels of the common wild form, subtended by leaf-like bracts which are pinnately cut into fine divisions. See *Carrot.*

DAVALLIA. *Polypodiaceæ.* Mostly small trop. ferns of the Old World, with finely divided foliage, chaffy creeping rhizomes that often spread on the surface of the soil or cling over the side of the pot; sori at or near margins of segms. Often grown in hanging-baskets or as fern-balls. Old plants may be divided; ordinarily grown in shallow pans in temperature 60–65°; it is often necessary to fasten the rhizomes down. See *Ferns.*

affinis: the plant grown in gardens under this name is *D. dissecta.*

bullata. SQUIRRELS-FOOT-FERN. BALL-FERN. Creeping brown-hairy rhizomes: lvs. to 10 in. long and 6 in. wide, deciduous, 4-pinnatifid, segms. sharp-toothed, often sold as fern-balls. Malaya, India, Japan.

canariensis. Rhizomes pale brown, crooked: lvs. to 1½ ft. long and 1 ft. wide, 4-pinnatifid, segms. not sharp-toothed at apex. Canary Isls. to Spain and N. Afr.

denticulata. Lvs. to 2 ft. long and 15 in. wide, 3–4-pinnatifid, leathery and shining. Trop. Asia and Afr.

dissecta. Rhizomes extensively creeping: lvs. to 1½ ft. long and 1 ft. wide, 4-pinnatifid, segms. sharp-toothed. Java.

elegans: the plant known to hort. under this name is *D. dissecta.*

fejeensis. Lvs. evergreen, to 1 ft. long, triangular, 4-pinnatifid into linear segms., drooping with age. Fiji Isls. Var. **plumosa** is feathery and more gracefully drooping.

Griffithiana. Rhizome creeping, covered with white or yellowish scales: lvs. to 1 ft. long and 8 in. wide, 3–4-pinnatifid, segms. toothed or cut. India, S. China.

lucida: *D. solida.*

Mooreana: *D. pallida.*

pallida (*D. Mooreana*). Lvs. to 3 ft. long, on straw-colored stalks to 1½ ft. long, 4-pinnatifid, segms. triangular. Aneiteum and Borneo.

pentaphylla. Lvs. 1-pinnate into 5 or more wavy-toothed segms. to 6 in. long and ½ in. wide. Java, Polynesia.

pyxidata. Lvs. about 1 ft. long and 9 in. wide, 3–4-pinnatifid, leathery and shining. Australia.

solida (*D. lucida*). Lvs. to 2 ft. long and 1½ ft. across, 3-pinnatifid. Malaya.

tenuifolia: *Odontosoria chinensis.*

DAVIDIA. *Nyssaceæ.* One Chinese deciduous pyramidal tree to 50 or 60 ft., hardy as far north as Mass. **D. involucrata.** DOVE-TREE. Lvs. alternate, broad-ovate, to 6 in. long, toothed: fls. monœcious or essentially so, without petals, in dense heads ¾ in. across subtended by 2 unequal creamy-white drooping showy bracts, the larger to 6 in. long, in May or June: fr. a green bloomy drupe to 1½ in. long. Var. **Vilmoriniana** differs in having lvs. glabrous instead of silky-pubescent beneath.—Propagated by seeds, cuttings of half-ripened wood, and by layers.

DAWN-FLOWER, BLUE: *Ipomœa Leari.*

DAY-FLOWER: *Commelina.*

DAY-LILY: *Hemerocallis.*

DEAMIA. *Cactaceæ.* One cactus climbing or clambering on trees and rocks, S. Mex. to Colombia, **D. testudo** (*Cereus testudo*): joints to 4 in. or more broad usually with 3 wide wings but sometimes 5–8-ribbed, making aerial roots; spines 10 or more and spreading, brownish: fls. diurnal, yellowish-white, to 11 in. long, the tube 4 in. long and slender, expanding broadly.

DEBREGEASIA. *Urticaceæ.* Shrubs and trees native in Asia and Afr., with alternate toothed lvs., unisexual fls. in clusters and fr. a syncarp composed of small fleshy drupes; one species is sometimes grown as an ornamental in the S. Propagated by seeds or by cuttings of young wood under glass.

longifolia (*D. velutina*). To 20 ft.: lvs. lanceolate, to 6 in. long, rough and dark green above, white-tomentose beneath: fr. orange or red, about ⅓ in. across. S. Asia.

velutina: *D. longifolia.*

DECAISNEA. *Lardizabalaceæ.* Two Asian shrubs with odd-pinnate lvs., polygamous fls. in panicled racemes, and fr. of 3 fleshy follicles; one species is grown in U. S., being hardy to N. Y.

Fargesii. To 16 ft.: lvs. of 6–12 pairs of ovate entire lfts. to 6 in. long, glaucous beneath: fls. greenish, 1 in. long, drooping: fr. blue and bloomy, to 4 in. long. China.

DECIDUOUS: falling, shedding as the leaves of non-evergreen trees.

DECKENIA. *Palmaceæ.* One monœcious unarmed feather-palm from the Seychelle Isls. in the Indian Ocean, related to Dictyosperma but differing technically in the subbasilar stigma, 9 connate stigmas, 3-fid pistillode, and in the spines on lvs. and spathes; fr. much compressed. From Acanthophœnix, to which it is sometimes referred, it differs in the flattened rather than globose fr., fewer stamens not with twisted filaments, 3-fid instead of 2-fid pistillode, spadix much larger, and other technical characters. **D. nobilis** (*Acanthophœnix nobilis*). Tree to 120 ft. in its native isls.: lvs. to 12 or more ft. long; long lf.-sheath usually spiny; midrib and pinnæ bristly when young and usually retaining some bristle-hairs when old, midrib yellowish: branches of infl. very slender and drooping: fr. ½ in. long. —It has been grown under glass in U. S., and is probably hardy in parts of S. Fla.

DECODON. *Lythraceæ.* One per. somewhat woody herb, native in swamps and about ponds from Me. to Fla. and La., and sometimes planted in wet locations and borders of ponds. **D. verticillatus** (*Nesæa verticillata*).

WATER-WILLOW. SWAMP LOOSESTRIFE. Sts. recurved, to 8 ft. long: lvs. to 5 in. long and ½ in. wide: fls. rose-purple, 1 in. across, in axillary cymes, July–Sept.

DECOMPOUND: more than once compound.

DECUMARIA. *Saxifragaceæ.* Shrubs climbing by aerial rootlets, having opposite lvs. that are deciduous or partially persisting, and small white fls. in terminal corymbs; hardy in the N. only with protection. Propagated by cuttings of young wood under glass or rarely by seeds.

barbara. Tall climber: lvs. ovate, to 4 in. long, glabrous and shining above: corymbs to 4 in. across, May–June. Va. to Fla. and La. along streams and in low grounds.

DECUMBENT: reclining or lying on the ground, but with the end more or less erect or ascending.

DECURRENT: running down along the stem, as the leaf of mullein.

DECUSSATE: opposite leaves at right angles, therefore in four rows up and down the stem; alternating in pairs.

DEERBERRY: *Vaccinium stamineum.*

DEER-BRUSH: *Ceanothus integerrimus.*

DEER-FOOT: *Achlys triphylla.*

DEERINGIA. *Amaranthaceæ.* Herbs and subshrubs, some of them climbing, with alternate ovate lvs. and inconspicuous fls. in terminal panicles; native in Madagascar, Australia and the Pacific Isls.; about a half dozen species, one sometimes planted for ornament.

amaranthoides (*D. baccata. D. celosioides*). Woody climber to 15 ft.: fls. greenish-white: fr. a red globular berry ¼ in. across. Australia; grown in S. Calif. Var. **variegata** has variegated lvs.

Amherstiana: *Bosea Amherstiana.*

baccata: *D. amaranthoides.*

celosioides: *D. amaranthoides.*

DEGUELIA: *Derris.*

DEHISCENCE: the method or process of opening of a seed-pod or anther.

DELONIX. *Leguminosæ.* African trees with 2-pinnate lvs., showy orange or scarlet fls. in corymbose racemes, and great flat woody pods; one very showy species is commonly planted in frostless regions. Cult. as for Cæsalpinia.

regia (*Poinciana regia. Cæsalpinia regia*). ROYAL POINCIANA. PEACOCK-FLOWER. FLAMBOYANT. Wide-branching tree to 40 ft. or more: lfts. numerous and small: fls. bright scarlet, 3–4 in. across, mostly in summer: pods to 2 ft. long and 2 in. or more broad. Madagascar.

DELOSPERMA. *Aizoaceæ.* Segregate from Mesembryanthemum (which see for cult.), native in S. Afr.: per., with lanceolate or narrower sessile soft lvs., the branches matted or plant sometimes stemless and with branching tuberous rootstock: fls. either rather small and white or yellow, or in some species large and purple; stigmas 5.

echinatum (*M. echinatum*). Erect or spreading, 1 ft.: lvs. to ½ in. or more long, hispid, thick: fls. yellowish or white, on hispid peduncles.

Ecklonis (*M. Ecklonis. D. Patersoniæ*). Diffuse, more or less trailing; lvs. pubescent but a nearly or quite glabrous form in cult.: lvs. linear, to 1 in. long: fls. ½ in. and more across, glistening-white.

Patersoniæ: *D. Ecklonis.*

DELOSTOMA. *Bignoniaceæ.* S. American trees or shrubs with simple leathery lvs., funnelform 5-lobed fls. in terminal racemes or panicles, and oblong woody frs.; one species is sometimes grown in S. Calif.

roseum. Lvs. oval or orbicular, to 6 in. long, tomentose beneath: fls. rose or pink, 1½ in. long, in panicles to 8 in. long: fr. dark purple, about 2 in. long. Ecuador, Colombia.

DELPHINIUM. LARKSPUR. *Ranunculaceæ.* Erect per. and ann. herbs of the north temp. zone around the world, of probably 250 or more species, a number of which are interesting and showy flower-garden subjects; lvs. palmate, variously cut and divided. The fls. have a single spur; they are mostly blue, but vary to pink, blush and white in garden races; in some they are naturally scarlet and red and in one of the cult. species are yellow. There are double-fld. strains. The showy outer part of the larkspur fl., including the spur, is the calyx (5 sepals). The petals are smaller interior parts, 2 or 4 in number, the upper pair (sometimes united into 1) having spurs that project into the calyx spur; sometimes the petals are small and crowded in the throat of the fl. like a bee, as in some of the common garden kinds. The Latin names are much confused in Delphinium, particularly in hort. material.

Larkspurs are mostly hardy North, and require no very special attention as to soil and exposure, but do best in open exposure. They come readily from seeds, those of the perennials mostly blooming the year following the sowing. Of the perennial kinds the clumps may be divided in autumn or spring, or cuttings may be made of young shoots in spring or from second growth in summer after the flower-stems have been cut down. Asexual propagation of these kinds is essential in named garden varieties, but otherwise it is well to have fresh stock coming on from seed. As soon as the flowers are gone and before seeding, cut away the flower-stems (unless seeds are desired for sowing); frequently new flower-stems arise and give a second although usually inferior bloom in late summer or autumn. It is well to place sand or sifted coal-ashes about the crowns for winter protection, particularly on moist or heavy soils. The stately candle larkspurs of the *D. elatum* type, with long erect spike-like racemes, are suitable for massing and for back borders, while the lower and loosely branching bouquet and garland kinds are adaptable for beds and front borders. The annual larkspurs bloom readily from seeds sown early in the open; early bloom may be had by sowing indoors and transplanting.

Ajacis. ROCKET L. Erect branching ann., 1–4 ft., root simple or branched: lvs. finely divided, mostly bunched at nodes: fls. blue, white, violet, pink, in long simple racemes, often double: pod normally 1 but often more in cult. forms, pubescent. S. Eu.; popular in flower-gardens and somewhat escaped.

albescens: *D. virescens.*

alpinum. Like *D. elatum* and sometimes referred to it, distinguished by the lower bracts being variously parted and usually rather broad. Eu., Asia.

atropurpureum: *D. elatum.*

azureum: *D. carolinianum, D. cheilanthum, D. elatum*; the name is likely to be applied to any blue-fld. hort. kinds.

Barbeyi (*D. subalpinum*). Stout and mostly simple per., 2–3 ft. and more, usually pubescent: lvs. with few and broad divisions: fls. dark blue, in short and dense raceme, the sepals acuminate and mostly exceeded by the spur; upper petals yellow with blue tinge: follicles 3, glabrous. Wyo., Colo., Utah.—Sometimes planted.

Barlowii. The plant now grown under this name is of the *D. cheilanthum* group, but the original *Barlowii* figured in 1837 is a very double form regarded as *D. elatum* × *D. grandiflorum.*

Belladonna: *D. cheilanthum.*

Bellamosum: *D. cheilanthum.*

bicolor. Erect few-lvd. per. to 20 in., the narrow lf.-divisions obtuse: fls. blue, in a short open raceme; spur somewhat exceeding sepals; upper petals brownish-yellow: follicles 3, glabrous or pubescent. Wyo. north and west.—Sometimes planted in collections.

Brunonianum. Musk L. Per. to 18 or 20 in., musk-scented: lower lvs. reniform and 5-parted, upper 3-parted: fls. large, light blue with much darker margins and center; spur very short: follicles 3 or 4. Himalayas.—Little grown.

Bulleyanum. Per. 2–4½ ft.: lvs. deeply cut, somewhat pubescent: fls. deep blue, spur strongly hooked or nearly horse-shoe-shaped: pods 3, lightly pilose. China.—Little grown.

californicum. Coast L. Root tuberous: st. to 7 ft. high, lightly pubescent: lvs. to 6 in. across, deeply parted and cut: fls. white or whitish, sometimes purplish inside, pubescent, in long dense raceme. Calif., near coast.

cardinale. Scarlet L. Erect or flexuose per. 2–3 ft. and often much more, finely pubescent, making long sts.: lvs. thick, cut into narrow often linear lobes: fls. long-spurred, in very open racemes, bright scarlet with yellowish petals; sepals often ¾ in. long: follicles mostly 3, glabrous. S. Calif.

cardiopetalum (*D. halteratum* var. *cardiopetalum*). Tap-rooted ann. to 20 in.: lvs. divided into linear or oblanceolate segms.: fls. blue, less than 1 in. across, in short terminal racemes, with upwardly projecting spur, petals heart-shaped: follicles 3, nearly or quite glabrous. S. France.

carolinianum (*D. azureum* of botanists). Per., erect, 1–2½ ft., pubescent: lvs. cleft into narrow or linear segms.: fls. blue, pedicelled in open racemes, about 1 in. across, the long spur horizontal or ascending: follicles 3, pubescent; seeds strongly winged. Va. south and west.—Little cult. Some of the plants cult. as *D. carolinianum* are to be associated with the *D. cheilanthum-elatum* series.

cashmerianum. Per., 10–20 in., leafy: lvs. cordate-orbicular in outline, broad-lobed and sharply toothed: fls. blue, pubescent, 1–2 in. long, few and showy in a terminal broad or corymbose cluster, the spur shorter than sepals, slightly curved, obtuse or nearly so: follicles 3–5, hairy. High Himalayas.—Little cult., but distinct. Var. **Walkeri** is a leafy many-fld. short-stemmed form, upper lvs. less lobed or nearly entire, fls. very large and light blue with yellow petals.

caucasicum: *D. elatum.*

cheilanthum. Garland L. Tall leafy per., diffusely much branched above: lvs. with 3 or more deep widely separated mostly narrow divisions (except perhaps the radical ones): infl. open and loose, scarcely spicate; fls. blue, varying to whitish, large and open, at full expansion usually 1½–2 in. across in cult. forms, lightly pubescent, commonly not horizontal; spur ¾–1 in. long and stout and nearly or quite straight; petals open or spreading, blue or dull yellow, lower ones barbate and entire or nearly so: follicles 3, glabrous or pubescent, seeds 3-angled winged on margin, not scaly or only slightly so. Siberia.—Assumed parent of many garden larkspurs, as *azureum*, *Belladonna* (light blue), *Bellamosum* (dark blue), *cœlestinum*, *formosum.*

chinense: *D. grandiflorum.*

cœlestinum: *D. cheilanthum.*

cœlestis: hort. name for a clear blue; probably without exact application.

columbianum (*D. Nuttallii*). Roots fascicled and thickened: similar to *D. Menziesii* but glabrous or nearly so except in infl. which is somewhat hairy or perhaps viscid, herbage more or less glaucous, follicles erect: fls. dark blue, not large, in a slender spike. Ore., Wash.

Consolida. Forking L. Tap-rooted ann. to 1½ ft., forking rather than racemose: lvs. scattered, with linear divisions: fls. few, terminating the branches, 1 in. or more across, blue or violet: follicle 1, glabrous. Eu.—Little cult., the stock usually going under this name being *D. Ajacis.*

cultorum. A collective name proposed by Voss in 1896 for the florists or garden larkspurs, that cannot be readily referred to botanical species; many of them bear double and semi-double fls. These plants are of two groups, the true candle or spicate larkspurs to be associated with *D. elatum* and the garland larkspurs to be associated with *D. cheilanthum.* These two groups are apparently now somewhat confused from long cult. and breeding; other elements may have entered into the hort. kinds.

dasyanthum. Per. to 1½ ft., more or less pubescent: lvs. reniform to nearly orbicular and 5-angled or sometimes palmately 5-lobed, to 4 in. across, glabrous except on margins and nerves: fls. deep blue, rather large, the spur incurved at apex. Siberia.

decorum. Slender or lax per., 6–20 in., nearly or quite glabrous: lvs. few, cut or parted into narrow lobes, the basal ones shallowly cleft into broad segms.: fls. blue, petals tinged yellow, in loose often somewhat panicled racemes: follicles 3, glabrous. Calif.—Little cult.

divaricatum. Very diffuse mostly simple-rooted ann., to 2 ft.: lvs. few, much divided into short narrow segms.: fls. purplish, ¾ in. across, terminal on the branches, spur long and straight and acute: follicles 1, pubescent. S. W. Asia.

Duhmbergi: *D. elatum* var.

elatum (*D. intermedium*). Bee L. Candle L. Tall and very erect per. to 6 ft. and more, the branches usually fastigiate: lvs. with broad mostly close or contiguous divisions that are sharply cut at the top: infl. a long more or less close spike-like raceme, the fls. on ascending not elongated pedicels; lower bracts very narrow, entire: fls. blue, little or not at all pubescent, usually not opening widely, 1 in. or less across, spur equally or slightly exceeding the sepals and slender and slightly curved and usually horizontal; petals small and closing the throat, brownish-purple, the lower pair bifid and yellow-barbate: follicles 3, lightly pubescent to glabrous; seeds widely winged, not scaly. Germany to Mongolia.—Presumed parent of the tall larkspurs with elongated spike-like clusters and relatively small fls.; it often persists in old yards. Plants cult. as *atropurpureum*, *azureum*, *caucasicum*, *formosum*, *hybridum*, *Maackianum* are to be associated here. Var. **Duhmbergi** has glabrous follicles and usually colored broad bracts and bractlets.

exaltatum. Slender per., to 5 or 6 ft., nearly or quite glabrous: lvs. with 3–5 narrow divisions usually cleft or toothed toward apex: fls. blue or purple, ¾ in. long, in long mostly dense terminal racemes; spur about ⅓ in. long and straight: follicles 3, pubescent. Woods, Pa. to Minn., Neb., Ala.—Seldom planted.

fissum: *D. hybridum.*

formosum. The true *D. formosum* (of botanists) appears not to be cult., at least outside botanical collections. Plants so named in gardens are mostly forms of the *cheilanthum* group but sometimes of the *elatum* class.

Geyeri. Erect per. to 2½ ft.: lvs. mostly near base, much divided into linear lobes: fls. deep blue, sepals ½–¾ in. long; upper petals yellow: follicles usually 3, pubescent. Colo., Wyo., Utah.—Little planted.

glabellum: a name without botanical definition.

glaucum (*D. scopulorum* var. *glaucum*). Three to 6 ft., leafy, more or less glaucous: lvs. to 6 in. across, deeply 5–7-parted: racemes to 18 in. long; fls. blue or purplish: follicles glabrous. Calif., north.

grandiflorum (*D. chinense*). Bouquet L. Much branched forked per. but often blooming first year from seeds, to 2 or 3 ft. or more: lvs. cut into many linear segms. making a fine feathery foliage: infl. open, diffuse, and fls. scattered or sometimes short-racemose on ends of main branches and on long spreading pedicels; fls. blue, varying to white, opening wide, 1–1½ in. across, the slightly curved or straight spur equalling or exceeding the sepals; upper petals color of sepals or sometimes yellowish: follicles 3, pubescent. Siberia-China.—One of the commonest garden larkspurs, often dwarf.

halteratum. Like *D. cardiopetalum* but petals suborbicular and not heart-shaped. Medit. region.

hybridum. Plants in cult. under this name are likely to be forms of other species, as of the *D. cheilanthum* and *D. elatum* groups. The true *D. hybridum* (*D. fissum*) is probably not in the gardens; it is a tall pubescent plant with somewhat bulbous root, seeds orbicular in transverse section and neither scaly or winged (in *D. elatum* 3-angled and winged). S. E. Eu. to Turkestan.

imperialis: hort. name, probably for candle larkspurs.

intermedium: *D. elatum.*

Maackianum. The plant in gardens under this name is an *elatum* larkspur. The true *D. Maackianum* with sheathing petioles, lvs. pubescent both sides, infl. loosely paniculate, upper petals minute, seeds scaly, is apparently not in hort. cult.

Menziesii. Small per. with a cluster of thickened roots although sometimes reaching 2 ft., white-puberulent at least above: lvs. small, cut into linear divisions: fls. blue, 1 in. across, more or less pubescent outside, scattered or few in a loose raceme, spur about equalling the sepals: follicles 3, pubescent or glabrous, spreading. Ida., B.C., Calif.—Sometimes planted.

mesoleucum: a name of uncertain application.

Moerheimi: a garden name, probably for a form of the *cheilanthum-elatum* group.

Nelsoni. Per. to 1½ ft., with tuberous roots, slender, more or less pubescent: lvs. parted into linear lobes: fls. blue, in an open terminal raceme, somewhat hairy, lower petal 2-cleft and with tuft of hairs. Neb. to B. C.

Nortonianum. Very tall, even to 4 and 5 ft., strict, bearing long open racemes of deep bluish-purple fls.: follicles 3, large, lightly pubescent. Ozark region, Mo.—Has been referred to *D. carolinianum.*

nudicaule. Red L. Slender per. to 2 ft., told from *D. cardinale* by the broad mostly obtuse divisions of the lvs., which are few on the sts.: fls. long-spurred, red, sepals ⅓–½ in. long, petals mostly yellow: follicles puberulent, becoming glabrous. Ore., Calif.—Little planted.

Nuttallianum (*D. pauciflorum*). Slender per., 6–18 in., with tuberous root: lvs. small, little more than 1 in. broad, with deep linear lobes: fls. small, in raceme, blue; sepals ¼ in. long, upper petals whitish: follicles 3, glabrous. Wyo., Utah, Ore., Wash.—Little planted.

Nuttallii: *D. columbianum.*

occidentale. Stout erect per. to 6 ft. or more: lvs. 3–6 in. broad, pubescent both sides, with 3–7 rhombic-cuneate sharply cut divisions: fls. dark blue, in a many-fld. panicle, the sepals ½ in. or more long, viscid outside; upper petals yellowish: follicles 3, glabrous or pubescent. Mts., Wyo., Ida., Colo., Utah.—Sometimes planted.

oxysepalum. Per., st. simple and erect, 12–20 in.: lvs. palmately 5-parted into incised lobes: infl. 10–12-fld., racemose; fls. pale blue, spur incurved and shorter than the long-acuminate sepals (about 1 in. long); petals brownish: follicles glabrous or nearly so. E. Eu.—Little known in cult.

Parryi. Mostly simple per., 1 to 3 ft.: lvs. 3–5-parted, the lobes linear or nearly so and usually obtuse: fls. deep blue, in a raceme; sepals and spur ½ in. long: follicles puberulent. S. Calif.—Infrequently planted.

pauciflorum: *D. Nuttallianum.*

Penardi. Erect per., 10–20 in., whitish-pubescent, the lvs. mostly basal and much divided into narrow lobes: fls. white, in a short open raceme; spur about 1 in. long and much exceeding sepals, nearly vertical: follicles 3, pubescent. Colo. to Tex. and Ariz.—Sometimes planted.

Przewalskii. Glabrous erect per., 6–10 in.: lvs. deeply 3–5-parted and again divided: fls. blue, few, terminal; spur straight or curved and about ¾ in. long and equalling sepals; upper petals dark brownish, lower ones with white and yellow hairs: follicles 3, hairy. Mongolia.

Pylzowi. Silky-pubescent leafy per. 4–10 in.: lvs. divided into oblong or linear acute parts: fls. few (1–3), terminal, large, violet-blue; spur 1 in. long and straight or curved at tip and equalling or exceeding the hairy sepals; petals dark violet: follicles villous. China.

pyramidale: hort. name, apparently for forms in the *D. elatum* group.

Requienii. Erect, to 20 in., nearly simple: lower lvs. 5-parted, upper 3-parted, the segms. oblong or linear: raceme loose, the bracts narrow-lanceolate or linear, peduncles pubescent and bracted at middle; fls. blue, the curved spur about equal to the ovate white-hairy sepals; upper petals pale yellowish usually with bluish tinge: follicles 3. Medit. region.—Sometimes regarded as form of *D. Staphisagria*, differing in longer spur and bracts on peduncles, and less stature.

scopulorum. A variable group as formerly defined; if the original New Mexican collection is taken as typical, the plant is a puberulent or glabrous simple-stemmed per. 1–2 ft. high: lvs. much cut into narrow acute segms.: fls. indigo-blue and rather large, the spur exceeding the sepals (about ½–¾ in. long): follicles 3, nearly glabrous.—Hybrids are reported between *D. scopulorum* and *D. cardinale*, but it is doubtful what the *scopulorum* parent may be. *D. scopulorum* var. *subalpinum* is now known as *D. Barbeyi.*

simplex. Erect and simple, mostly tall, to 3 ft., pubescent: lvs. divided into linear parts: infl. spike-like and narrow; fls. blue, pubescent outside, sepals obtuse, spur reflexed at tip; upper petals with brownish-white apex: follicles 3, pubescent. Wyo., Ore., Wash.—Seldom cult.

sinense (*chinense*): *D. grandiflorum.*

speciosum. This name when applied to garden larkspurs is likely to indicate one of the showy (as the name implies) forms of the *cheilanthum-elatum* group. The true *D. speciosum* of the Caucasus region and beyond is probably not in garden cult.; it is a simple-stemmed plant 4–24 in. high, fls. blue, the sepals pubescent both sides and ½–¾ in. long and spur of equal length, petals dark purple: seeds scaly.

Staphisagria. Tall stout bien. to 3 ft. or more, soft-hairy, st. thick: lvs. 5–7-palmatifid. the segms. broad-lanceolate and acute: raceme many-fld., simple or branched at base, bracts at base of peduncles, the upper ones linear; fls. blue, often greenish-striped, sometimes pale or white, the obtuse spur much shorter than sepals; upper petals whitish and prominent: follicles 3, swollen. S. Eu., Medit. region.—Seldom cult.

subalpinum: *D. Barbeyi.*

sulphureum: *D. Zalil.*

superbissimum: hort. name.

taitsiense. Erect branching hispid per., 1½ ft. or more tall: lvs. divided into long-oblong acute parts or the upper ones linear: infl. many-fld. and corymbose; fls. violet-blue, spur very slender and 1 in. long and much exceeding sepals; petals dull yellow, the lower ones yellow-barbate: follicles 3, hairy. China.

Thunbergii: hort. name, perhaps for a form of *D. grandiflorum.*

tricorne. Soft-stemmed simple per., 1–3 ft., roots a tuberous cluster: lvs. with many lobes nearly linear to lance-oblong: fls. blue, lilac, lavender to white, prominently pedicelled in a terminal raceme, 1–1½ in. across, spur about equalling sepals: follicles 3, light-pubescent to glabrous. Pa. to Minn., Ark., Ga.—A semi-succulent species sometimes planted for early spring bloom; often called "staggerweed."

triste. To 2 ft.: lvs. 3–5-parted: fls. dark brown tinted red, in loose racemes. Siberia.

trolliifolium. Weak-stemmed, often reclining per. 2–6 ft.: lvs. parted into cuneate divisions that are cut into narrow acute lobes: fls. blue, racemose, sepals and spur ¾ in. long; upper petals white: follicles glabrous. N. Calif. and north.—Occasionally planted; known as "cow poison" and "poison larkspur."

variegatum. Royal L. Root tuberous: st. simple or branched, to 18 in.: lvs. much parted or divided into oblong mostly obtuse segms., with spreading hairs: fls. royal purple varying to lavender, in a few-fld. loose raceme. Coast ranges, Calif.

villosum. Tall erect per.: lvs. 3–7-parted, the segms. lanceolate-acute: raceme loose, the main bracts oblong or linear; fls. blue, the spur about equalling the sepals; petals brownish-purple: follicles pubescent or hairy. Turkestan, Russia.—Variable.

vimineum (*D. carolinianum* var. *vimineum*). Differs from *D. carolinianum* in having prominently scaly not winged seeds: lvs. broader: plant 2–4 ft., more or less branched: fls. blue, violet or whitish. Prairies, Tex.

virescens (*D. albescens*). Has been combined with *D. carolinianum*, but differs in the white or bluish-white fls., upper lvs. with oblong segms. N. C. west and southwest.

Walkeri: *D. cashmerianum* var.

yunnanense. Erect per., 2–3 ft.: lvs. with cuneate oblong-ovate incised lobes: fls. deep blue, spur slender and exceeding sepals (¾ in. long); upper petals light brownish, lower ones blue: follicles 3, glabrous. China, Tibet.—Little grown.

Zalil (*D. sulphureum*). Yellow L. St. simple or nearly so, 1–2 ft., root tuberous: lvs .with stiffish linear segms.: fls. yellow, sepals less than ½ in. long and about equalled by the straight spur. Persia.

DELTOID: triangular; delta-like.

DEMAZERIA (erroneously spelled *Desmazeria*). *Gramineæ*. Ann. and per. grasses with flattened many-fld. spikelets borne in spikes; one is sometimes grown for ornament. See *Grasses*.

sicula (*Brizopyrum siculum*). SPIKE-GRASS. Ann. to 1 ft.: lvs. to 6 in. long and ⅛ in. wide: spikelets to ½ in. long, in spikes 2–3 in. long. Medit. region.

DENDRIUM: *Leiophyllum*.

DENDROBIUM. *Orchidaceæ*. Epiphytes of various habit and leaf form, the fls. in racemes or sometimes solitary, dorsal sepal and petals similar, lateral sepals forming a sac or spur, lip entire or 3-lobed; popular greenhouse orchids. For cult. see *Orchids*.

acuminatum (*Sarcopodium acuminatum*). Pseudobulbs about 2 in. high, bearing 2 lvs. to 1 ft. long: fls. dark purple-red, 2½ in. across, in loose 10–30-fld. racemes, the lip 3-lobed, May–June. Philippines.

aggregatum. Pseudobulbs to 3 in. high, with 1 lf. about 2 in. long: fls. golden-yellow with orange-yellow throat, about 1 in. across, in 5–15-fld. lateral racemes, Mar.–May. Burma, China.

Ainsworthii. Hybrid between *D. nobile* and *D. aureum* (*heterocarpum?*).

albo-sanguineum. To 1 ft., leafless at flowering time: lvs. to 6 in. long: fls. white, with 2 red spots in throat, 2 in. long, in 2–3-fld. lateral racemes, May–June. Burma.

amplum (*Sarcopodium amplum*). Pseudobulbs to 2 in. long: lvs. to 6 in. long and 2 in. broad: fls. greenish-white suffused with purple, in few-fld. racemes. Trop. Himalayas.

anceps. Sts. to 16 in. long, thickly covered with 3-cornered lvs. to 3 in. long: fls. greenish-yellow, the lip edged with purple, in lateral and terminal clusters, May–Oct. Himalayas.

atroviolaceum. To 14 in., the pseudobulbs with 2 lvs. to 6 in. long: fls. whitish-yellow spotted with violet with dark violet lip marked with green, 2 in. across, in 10–20-fld. racemes to 8 in. high, Apr.–May. New Guinea.

aurantiacum. To 20 in. high: lvs. to 4 in. long: fls. golden-yellow, drooping, 2 in. across, in 2–3-fld. racemes, May–June. Burma.

aureum: *D. heterocarpum*.

barbatulum. St. to 1½ ft. long: lvs. to 3 in. long: fls. whitish, about ½ in. across, in dense 8–15-fld. racemes, Mar.–Apr. Indo-China.

bellatulum. St. about 2 in. high: lvs. to 2 in. long: fls. white with a purple-red lip, Apr.–May. Indo-China.

Bensoniæ. To about 3 ft. high, leafless at flowering: fls. white, the yellow lip orange-yellow at base and with purple spots in throat, 2 in. across, mostly 2 together, Mar.–Apr. Siam, Burma.

bigibbum. Pseudobulbs to 1½ ft. long: lvs. leathery, to 2 in. long: fls. purple-red, 2 in. across, in 4–10-fld. racemes to 1 ft. long, lip 3-lobed, Feb.–Mar. Australia.

Bronckartii. Pseudobulbs to 3 ft. long: fls. pale rose with orange spot on lip, 2 in. across, in many-fld. pendulous racemes. Cochin-China.

Brymerianum. Sts. to 2 ft. long: lvs. to 5 in. long: fls. golden-yellow, 2½ in. across, in 3–5-fld. lateral racemes, the lip fringed, Feb.–May. Burma.

bufordiense: *D. dulce*.

Calceolaria: *D. moschatum* var.

Cambridgeanum: *D. ochreatum*.

cariniferum. Pseudobulbs to 10 in. long: fls. 1½ in. across, with white sepals and petals and red-orange lip tipped with white or pale orange, long-spurred. Burma.

chlorostele (*D. xanthocentron*). Hybrid between *D. Linawianum* and *D. Wardianum*.

chrysanthum (*D. Paxtoni*). Sts. to 5 ft. long, leafless when flowering: lvs. to 6 in. long: fls. golden-yellow with 2 dark brown spots on throat, 1½ in. across, 2–3 together, the lip toothed, Mar.–Sept. Himalayas.

chrysodiscus: *D. melanodiscus*.

chrysotoxum. Pseudobulbs to 5 in. long, with 2 lvs. to 4 in. long: fls. golden-yellow with dark brown throat, 2 in. across, in 8–15-fld. pendulous racemes to 10 in. long, the lip fringed, Nov.–Apr. Burma, China. Var. **suavissimum** (*D. suavissimum*) has large chestnut spot on lip.

ciliatum. Sts. to 1½ ft. high: lvs. to 5 in. long: fls. in 5–15-fld. racemes to 10 in. long; sepals and petals greenish-yellow; lip 3-lobed, yellow veined with red, the middle lobe fringed, Oct.–Nov. Burma.

Cœlogyne (*Sarcopodium Cœlogyne*). Pseudobulbs 2 in. high, with 2 leathery lvs. to 4 in. long: fls. solitary, terminal, about 2 in. across, the sepals and petals brownish-yellow, lip dark purple, Oct.–Nov. Burma.

crassinode: *D. pendulum*.

crepidatum. Sts. to 10 in. long: lvs. to 4 in. long: fls. rose with center of lip golden-yellow, about 1 in. across, in 2's, Apr.–May. Himalayas.

crystallinum. Sts. about 1 ft. long, leafless when flowering: lvs. to 6 in. long: fls. white tipped with rose, the lip orange-yellow at base, 2 in. across, usually solitary, May–June. Himalayas.

cupreum: *D. moschatum* var.

Curtisi. Hybrid between *D. Cassiope* and *D. aureum* (*heterocarpum?*).

Dalhousieanum: *D. pulchellum*.

Dearei. Sts. to 2 ft. high: lvs. about 2 in. long: fls. white with green in center of lip, to 2½ in. across, in 3–6-fld. terminal racemes, Apr.–June. Philippine Isls.

densiflorum. Pseudobulbs to 16 in. high, with 3–5 leathery lvs. about 6 in. long: fls. golden-yellow or white with orange-yellow lip, about 2 in. across, in dense many-fld. pendulous racemes to 10 in. long, Mar.–May. Himalayas.

Devonianum. Sts. to 3½ ft. long: lvs. to 4 in. long: fls. white tipped with rose, the fringed lip with 2 large orange-yellow spots, 2 in. across, usually solitary on leafless sts., May–June. Himalayas.

dixanthum. Pseudobulbs to 3 ft. high: fls. yellow with orange spot on lip, in 2–6-fld. racemes. Burma.

draconis. Sts. to 14 in. high: lvs. 3 in. long: fls. white with 3 golden-yellow ridges on lip, about 1½ in. across, in 2–4-fld. terminal racemes, May–July. Burma, Cochin-China.

dulce (*D. bufordiense*). Hybrid between *D. aureum* and *D. Linawianum*.

endocharis. Hybrid between *D. aureum* and *D. moniliforme* (the latter being *D. Linawianum*).

eriæflorum. Sts. to 8 in. long: lvs. linear-lanceolate: fls. usually white veined with red, in many-fld. racemes. Himalayas.

euosmum. Hybrid between *D. nobile* and *D. endocharis*.

Falconeri. Pseudobulbs to 1½ ft. long: lvs. to 6 in. long: fls. white tipped with violet, the lip orange-red in center and with dark purple throat, about 3 in. across, usually solitary on leafless sts., May–June. Burma.

Farmeri. Pseudobulbs to 1½ ft. high: fls. about 2 in. across, in many-fld. pendulous racemes; sepals and petals white tipped with rose; lip golden-yellow tipped with rose, Apr.–May. Himalayas.

fimbriatum. St. to 5 ft. high: lvs. to 6 in. long: fls. deep yellow, 2 in. across, in 8–15-fld. pendulous racemes to 10 in. long, the lip fringed, Mar.–May. Himalayas. Var. **oculatum** has 2 dark brown spots in throat.

Findlayanum. Sts. to 1 ft. long: lvs. 3 in. long: fls. about 3 in. across, usually 2 together on leafless sts.; sepals and petals white tinged with rose near tip; lip yellow, pale rose near edges, Feb.–Mar. Burma.

formosum. Sts. to 1½ ft. high: lvs. to 4 in. long: fls. snow-white with center of lip orange-yellow, to 4 in. across, in 2–4-fld. clusters near top of st., Feb.–May. Himalayas. Var. **giganteum** has fls. to 5 in. across.

Goldiei: *D. superbiens*.

heterocarpum (*D. aureum*). Sts. to 16 in. long: lvs. 6 in. long: fls. to 2½ in. across, usually in 2's; sepals and petals cream-colored; lip yellow marked with orange-brown, May–June. Himalayas to Philippines.

Hillii. Pseudobulbs to 1 ft. long, with 3–4 lvs. to 10 in. long: fls. pure white with red-spotted lip, in pendulous racemes, Mar.–May. Australia.

infundibulum. Pseudobulbs to 2 ft. long: fls. snow-white with orange-yellow spot on lip, about 3 in. across, May–June. Burma. Var. **Jamesianum** (*D. Jamesianum*) has lateral lobes of lip roughened and throat cinnabar.

Jamesianum: *D. infundibulum* var.

Kingianum. Pseudobulbs about 6 in. long, with 2 lvs. to 6 in. long: fls. rose or rarely white, the 3-lobed lip marked with greenish-yellow, in 3–8-fld. racemes, Apr.–May, Australia.

Linawianum. Pseudobulbs to 1½ ft. long: fls. in 2's or 3's, about 2 in. across, rose-purple on upper part and white below, the lip obscurely 3-lobed. China, Japan.

lituiflorum. Sts. to 2 ft. long: lvs. to 4 in. long: fls. 2 in. across, in 2's on leafless sts.; sepals and petals violet-red, lip whitish tipped with violet and with 2 purple spots on throat, curved like a trumpet, Apr.–May. Burma.

macrophyllum. Pseudobulbs to 1 ft. high, with 2–3 lvs. to 8 in. long: fls. about 2 in. across, in 4–10-fld. racemes to 8 in. long; sepals greenish-white; petals white with band spotted violet-brown; lip 3-lobed, white marked with violet-brown, Apr.–June. Java, Moluccas.

melanodiscus (*D. chrysodiscus*). Hybrid between *D. Findlayanum* and *D. Ainsworthii.*

micans. Hybrid between *D. Wardianum* and *D. lituiflorum.*

moschatum. St. to 6 ft. high: lvs. to 6 in. long: fls. reddish-yellow with 2 red-brown spots in throat, about 2½ in. across. in 10–15-fld. racemes to 8 in. long, May–June. Himalayas. Var. **Calceolaria** (*D. Calceolaria*) has smaller orange-yellow fls. Var. **cupreum** (*D. cupreum*) has copper-colored fls.

nobile. Sts. to 1½ ft. high: lvs. to 4 in. long: fls. to 3 in. across, in 2's; sepals and petals rosy-purple; lip white edged and tipped with rose and with dark purple throat, Mar.–June. Himalayas. Runs into various color forms, such as: **album** with pure white fls.; **Amesiæ** with large pure white fls.; **Ashworthianum** with pure white fls. except the green mouth of lip; **Cooksonianum** with petals colored like the lip; **murrhiniacum,** fls. white tinged with violet, the throat deeper; **nobilius** with larger deeper colored fls.; **Oweniianum; Rothwellianum; summitense; virginale** with pure white fls. slightly tinged with primrose on lip.

ochreatum (*D. Cambridgeanum*). Pseudobulbs to 10 in. long: fls. golden-yellow with crimson throat, 2 in. across, in 2's, Mar.–Apr. Himalayas.

Parishii. Sts. to 1 ft. long: lvs. to 4 in. long: fls. rose with dark purple throat, about 2 in. across, in 2's, May-June. Burma.

Paxtoni: *D. chrysanthum.*

pendulum (*D. crassinode*). Sts. to 2 ft. long: lvs. to 5 in. long: fls. white tipped with purple, the throat yellow, to 2½ in. across, 1–3 together. Burma.

Phalænopsis. Sts. 2 ft. or more high: fls. rose with dark purple throat, 3 in. across, in 4–12-fld. racemes to 2 ft. long, Jan.–May. Australia to New Guinea. Var. **Schroederianum** has white sepals and petals. Var. **Statterianum** has deep violet fls.

Pierardi. Sts. to 3 ft. long: lvs. to 4 in. long: fls. 2 in. across, in 2–3-fld. racemes; sepals and petals bright rose; lip yellow marked with red, Apr.–May. Himalayas. Var. **latifolium** has broader lvs.

Pitcherianum (*D. Rolfeæ*). Hybrid between *D. nobile* and *D. primulinum.*

platycaulon. Pseudobulbs 7 in. long, with 3–5 lvs. to 3½ in. long: fls. straw-colored, in short 3–6-fld. racemes. Philippine Isls.

primulinum. Sts. to 16 in. long: lvs. to 4 in. long: fls. to 3 in. across, solitary on leafless sts.; sepals and petals whitish tinged with yellowish-red; lip primrose-yellow with purple striped throat, Apr.–May. Himalayas.

pulchellum (*D. Dalhousieanum*). Sts. to 4 ft. long: fls. brownish-yellow with large dark purple spot in throat, 3 in. across, in 6–10-fld. pendulous racemes, Apr.–May. Himalayas.

ramosum. Pseudobulbs slender, to 1½ ft. tall: fls. solitary or in 2's, pale primrose-yellow; lip 3-lobed, the lateral lobes white and streaked. Himalayas.

regium. Sts. to 16 in. high: lvs. to 4 in. long: fls. about 3 in. across, in 2's; sepals and petals rose, white at base; lip rose edged with white and with golden throat, July. India.

Roeblingianum. Hybrid between *D. nobile* and *D. Ruckeri* (the latter being *D. ramosum*).

Rolfeæ: *D. Pitcherianum.*

rubens. Hybrid between *D. Ainsworthii* and *D. nobile.*

Sanderæ. Very similar to *D. Dearei* but with larger fls. having a reddish throat, Oct.–Dec. Philippine Isls.

Schneiderianum. Hybrid between *D. Findlayanum* and *D. aureum.*

secundum. Sts. 3 ft. high: lvs. to 4 in. long: fls. rose with orange-yellow disk, in many-fld. one-sided racemes, Apr.–June. Sumatra, Philippine Isls.

speciosum. Pseudobulbs to 1 ft. long, with 3–4 lvs. to 10 in. long: fls. yellow with white lip spotted red, in many-fld. racemes to 16 in. long, Feb.–Apr. Australia.

suavissimum: *D. chrysotoxum* var.

superbiens (*D. Goldiei*). Pseudobulbs to 2½ ft. high: fls. crimson-purple, with white ridges on lip, about 2 in. across, in nodding terminal racemes, Mar.–May. Australia.

superbum. Pseudobulbs to 4 ft. long: fls. rose-purple with 2 dark purple spots in throat, to 4 in. across, in 2's, Feb.–Apr. Borneo to Philippines.

Thwaitesæ. Cross between the hybrids *D. Ainsworthii* and *D. Wiganiæ.*

thyrsiflorum. Perhaps only a form of *D. densiflorum* with longer sts. and white sepals and petals. Himalayas.

undulatum. Fls. 2 in. across, yellowish-brown with whitish lip, the sepals and petals twisted, Apr.–May. Australia.

Veitchii. Hybrid between *D. moniliforme* and *D. Wardianum.*

Wardianum. Sts. to 2½ ft. long: lvs. 3 in. long: fls. white tipped with rose-purple, the lip with yellow throat with 2 dark purple spots, to 4 in. across, in 2's on leafless sts., Apr.–June. Burma.

Wiganiæ. Hybrid between *D. nobile* and *D. signatum* (the latter being *D. Bensoniæ*).

xanthocentron: *D. chlorostele.*

DENDROCALAMUS. GIANT BAMBOO. *Gramineæ.* Tree-like bamboos of S. Asia and Malaya, the spikelets borne in globose clusters or heads in long panicles, stamens 6. See *Bamboo.*

Hamiltonii. To 80 ft.: lvs. to 15 in. long and 2½ in. wide, rough on edges: heads many-fld., to 1½ in. across, in branching panicles. Himalayas.

latiflorus. Tall: lvs. to 10 in. long and 2 in. wide: heads few-fld., about ¾ in. across. India, Cochin-China.

membranaceus. To 80 ft.: lvs. to 10 in. long and ¾ in. wide: heads many-fld., 1 in. across. India.

strictus. MALE BAMBOO. To 50 ft., sts. becoming yellowish: lvs. to 1 ft. long and 1½ in. wide: heads many-fld., 1½ in. across. India, Java.

DENDROCHILUM (*Platyclinis*). *Orchidaceæ.* Epiphytes with small pseudobulbs bearing 1 narrow evergreen lf. and small fls. in long pendulous racemes, sepals and petals similar, the lip 3-lobed; warmhouse plants. For cult. see *Orchids.*

Cobbianum. To 1 ft.: fls. white with yellow lip, about ½ in. across, in long-stalked racemes, Mar.–Oct. Philippines.

cucumerinum. Lvs. to 5 in. long and ½ in. wide: fls. green and transparent. Philippines.

filiforme. Lvs. to 8 in. long: fls, yellowish-white with yellow lip, about ¼ in. across, in long-stalked racemes to 2 ft. long, May–June. Philippines.

glumaceum. Fls. white with greenish-yellow lip, about ½ in. across, in long-stalked racemes, Mar.–Apr. Philippines. Var. **superbum** has larger spikes.

latifolium. Lvs. to 10 in. long: fls. yellow-green, about ½ in. across, in long-stalked racemes, Mar.–Apr. Philippines.

DENDROMECON. *Papaveraceæ.* One Californian glabrous evergreen shrub planted for ornament in warm climates. Propagated by seeds which are very slow in germinating. **D. rigida.** Bush-Poppy. Tree-Poppy. To 10 ft.: lvs. leathery with prominent veins, lanceolate to ovate-lanceolate: fls. golden-yellow, 2 in. across: fr. linear, to 4 in. long.

DENDROPANAX: *Gilibertia japonica.*

DENDROPOGON: *Tillandsia usneoides.*

DENEA: *Howea Forsteriana.*

DENNSTAEDTIA. Cup-Fern. *Polypodiaceæ.* Large or medium-sized ferns with 1–3-pinnate lvs., hairy creeping rhizomes and marginal sori; native in the tropics and subtropics, one in N. N. Amer. Of easy cult.; see *Ferns.*

adiantoides. Glossy C. Lvs. to 4 ft. long and 3 ft. wide, 3-pinnate, glabrous and shining, on bright brown stipes to 3 ft. long. W. Indies, N. S. Amer.

cicutaria (*Dicksonia cicutaria. Sitolobium cicutarium*). Common C. Lvs. to 6 ft. long and 3 ft. wide, 4-pinnate, shining and glabrous, on yellowish-brown stalks to 3 ft. long. W. Indies, N. S. Amer.

punctilobula (*Dicksonia pilosiuscula* and *punctilobula*). Hay-scented-Fern. Hardy: lvs. to 3 ft. long and 9 in. wide, 3-pinnate, pubescent beneath. N. B. to Ga. and Ala.—Sometimes planted in the wild-garden.

DENTARIA. Toothwort. *Cruciferæ.* Little spring-blooming woods herbs of the northern hemisphere, useful in the wild-garden, rock-garden, and for colonizing: per., with toothed or scaly rootstocks, and few divided or compound lvs. high on st., the radical lvs. often of different character: fls. white, rose or purple, in terminal corymb-like racemes: fr. or silique elongated and beaked.

diphylla. Erect, 6–12 in. from a long continuous rootstock: st.-lvs. mostly 2 and opposite, ternate, the divisions or lfts. ovate and toothed or shallowly lobed: fls. white, in a glabrous cluster. N.S. to Minn. and S. C.

laciniata. To 1 ft. or so from a jointed rootstock: st.-lvs. commonly 3, approximately verticillate, the divisions very narrow: fls. white or purplish, in a somewhat pubescent cluster. Que. to Minn. and Fla.

DENTATE: with sharp spreading rather coarse indentations or teeth.

DERRIS (*Deguelia*). *Leguminosæ.* Trop. woody climbers with alternate pinnate lvs., papilionaceous purple or white fls. in racemes, panicles or clusters, and flattened pods; sometimes planted out-of-doors in warm regions.

scandens (*D. timorensis*). Malay Jewel Vine. Lvs. of 9–18 oblong lfts. to 2 in. long: fls. pale rose, in axillary racemes often twice as long as lvs.: pods to 3 in. long. Malaya, China, Australia.

timorensis: *D. scandens.*

DESCHAMPSIA: *Aira.*

DESERT-CANDLE: *Eremurus.*

DESFONTAINEA. *Loganiaceæ.* One glabrous little shrub in the Andean regions of S. Amer., intro. in Calif. **D. spinosa.** To 3 ft., with opposite coriaceous spiny-tooth holly-like elliptic-oblong lvs.: fls. tubular, scarlet and yellow, terminal, with 5-lobed somewhat trumpet-shaped corolla, and 5 stamens: fr. a globose or ovoid berry.

DESMANTHUS (*Acuan*). *Leguminosæ.* American per. herbs or sometimes shrubs with bipinnate mimosa-like lvs. and small regular greenish or whitish fls. in heads or spikes; one species is rarely offered.

brachylobus: *D. illinoensis.*

illinoensis (*D. brachylobus*). To 3 ft.: lfts. numerous and very small: pods in dense heads, oblong, to 1 in. long, curved. Ohio to Fla. and New Mex.

DESMAZERIA: *Demazeria.*

DESMODIUM (*Meibomia*). Tick Trefoil. Tick Clover. *Leguminosæ.* Herbs, often woody at base, with lvs. mostly of 3 lfts., small papilionaceous fls. in racemes or panicles, and flat pods consisting of several joints which separate readily and often adhere to clothing like burs. They are sometimes transferred to borders and the wild-garden. Natives in dry woods and fields.

bicolor: *Lespedeza bicolor.*

canadense. Per. to 8 ft.: lfts. oblong or oblong-lanceolate: fls. purple, to ¾ in long: pods 1 in. long, 3–5-jointed. N. S. to N. C. and Okla.

ciliatum: *Rhynchosia puberula.*

cinerascens. Procumbent per., sts. to 4 ft. long, gray-pubescent: lfts. elliptic-oblong: fls. purple, about ½ in. long: pods 6–8-jointed. Mex.

Dillenii. Per. to 3 ft.: lfts. oval to oblong-ovate: fls. purple, ¼ in. long: pods to 1 in. long, 2–4-jointed. Ont. to Fla. and Tex.

floribundum (*D. sambuense*). Sts. woody: lfts. obovate-oblong: fls. purple, ½ in. long: pods to 1 in. long, 6–8-jointed. Himalayas.

gyrans (*Codariocalyx gyrans*). Telegraph-Plant. Per. to 4 ft.: terminal lft. oblong, the lateral ones very small and moving in all directions: fls. purple or violet, ¼ in. long: pods to 1½ in. long, 6–10-jointed. Trop. Asia.—Grown as a curiosity in greenhouse. Treated as an ann. Propagated by seeds.

japonicum: *Lespedeza japonica.*

marylandicum. Per. to 3 ft.: lfts. ovate or orbicular: fls. purplish, ⅙ in. long: pods very small, 1–3-jointed. Ont. to Fla. and Tex.

nutans. Perhaps a synonym of *D. tiliæfolium* but lvs. and pods more pubescent.

penduliflorum: *Lespedeza formosa.*

purpureum (*D. tortuosum*). Beggarweed. Per., but grown as ann., to 8 ft.: lfts. ovate or oblong: fls. blue or purple, ⅙ in. long: pods to 1 in. long, twisted, 2–6-jointed. W. Indies.—Grown in S. U. S. as a forage and cover-crop. Seeds should be sown on rather moist land, in spring. No care will be needed after first year as it will reseed itself.

sambuense: *D. floribundum.*

tiliæfolium. Sts. woody: lfts. obovate: fls. purple, ½ in. long: pods to 3 in. long, 6–9-jointed. Himalayas.

tortuosum: *D. purpureum.*

DESMONCUS. *Palmaceæ.* Monœcious slender gregarious very spiny feather-palms climbing or clambering by means of the prolonged lf.-rachis, otherwise considerably like Bactris, in trop. Amer.; sparingly tried in Fla. and probably under glass. See *Palm.*

major. St. very long, climbing: pinnæ 20 pairs, more or less clustered, linear, acuminate, rachis dark-tomentose and spiny: spathe brown-prickly. Trinidad.

oxyacanthos. Nearly erect or straggling at apex: pinnæ about 6 in. long, alternate or subopposite, 2 in. or less broad, rachis somewhat tomentose or spotted, spiny: spathe nearly or quite glabrous. Brazil.

DESMOTHAMNUS: *Lyonia lucida.*

DETARIUM. *Leguminosæ.* Trop. African trees with pinnate lvs., small fragrant white fls. without petals borne in panicles, and pod round and indehiscent resembling a drupe; one species has been intro. into S. Fla. for ornament and interest.

senegalense. Lfts. 6–12 or more, ovate-oblong, to 3 in. long: panicles to 6 in. long: pods to 2½ in. across.

DEUTZIA. *Saxifragaceæ.* Attractive and popular floriferous shrubs with opposite usually deciduous serrate lvs. and white, blush or purplish fls. mostly in panicles and racemes in early summer; native in E. Asia and the Himalaya region. Most of them are hardy N.

Deutzias thrive in any well-drained soil. Potted plants may be forced in a temperature of not over 50° for conservatory and greenhouse decoration, but they cannot be forced again. They are propagated by both greenwood and hardwood cuttings, also by divisions, layers, and by seeds sown in boxes or pans in spring.

candelabrum. Hybrid between *D. gracilis* and *D. Sieboldiana,* having ovate-lanceolate lvs. and fls. in panicles.

candidissima: *D. scabra* var.

corymbiflora: *D. setchuenensis* var.

crenata: *D. scabra.*

discolor. To 6 ft.: lvs. oblong-lanceolate, to 4 in. long, densely hairy beneath: fls. white, ¾ in. across, in many-fld. corymbs. Cent. China. Var. **major** has fls. about 1 in. across, rosy outside.

elegantissima (*D. discolor* var. *elegantissima*). Hybrid between *D. purpurascens* and *D. Sieboldiana:* lvs. ovate or oblong-ovate, pubescent beneath: fls. pink, ¾ in. across, in loose corymbs.

excellens (*D. discolor* var. *excellens*). Hybrid between *D. Vilmorinæ* and *D. rosea* var. *grandiflora:* lvs. ovate-oblong, to 4 in. long, gray-pubescent beneath: fls. ¾ in. across, in loose corymbs.

Fortunei: *D. scabra* var.

globosa. Resembling *D. discolor* but with smaller lvs. and fls. which are creamy-white. Cent. China.

gracilis. To 6 ft., branches slender, wide spreading or arching: lvs. lanceolate, to 2½ in. long, nearly glabrous beneath: fls. pure white, ¾ in. long, in open simple or compound racemes. Japan. Var. **aurea** has yellow lvs.

grandiflora. To 6 ft.: lvs. ovate, to 2 in. long, white-tomentose beneath: fls. white, 1–3 together, 1 in. and more across, Apr.–May. N. China.

hypoglauca. To 6 ft.: lvs. ovate-oblong to oblong-lanceolate, to 3½ in. long, glabrous and glaucous beneath: fls. white, to ¾ in. across, in many-fld. corymbs. Cent. China.

kalmiæflora. Hybrid between *D. purpurascens* and *D. parviflora:* lvs. ovate-oblong, to 2 in. long, slightly hairy beneath: fls. white with outside carmine, ¾ in. across, in loose corymbs.

Lemoinei. Hybrid between *D. gracilis* and *D. parviflora:* lvs. elliptic-lanceolate, to 4 in. long: fls. pure white, ¾ in. across, in large corymbs or broad panicles. Var. **compacta** is a dwarf form with smaller fls.

longifolia. To 6 ft.: lvs. lanceolate, to 5 in. long, pale and densely hairy beneath: fls. light purple, to 1 in. across, in many-fld. corymbs. W. China.

macrothyrsa: listed name.

magnifica. Hybrid between *D. scabra* and *D. Vilmorinæ:* lvs. ovate-oblong, to 3 in. long, tomentose and grayish-green below: fls. double, white, in short panicles. Var. **eburnea** has campanulate fls.

Moubergi: listed name.

myriantha. Hybrid between *D. parviflora* and *D. setchuenensis:* lvs. oblong-ovate to -lanceolate, to 3½ in. long, hairy beneath: fls. white, ¾ in. across, in loose corymbs.

parviflora. To 6 ft.: lvs. ovate to ovate-lanceolate, to 4 in. long, somewhat hairy: fls. white, about ½ in. across, in many-fld. corymbs. N. China.

purpurascens. To 6 ft., slender curving branches: lvs. oblong-ovate to -lanceolate, to 2½ in. long, pubescent beneath: fls. white inside, purplish outside, ¾ in. across, in 4–10-fld. corymbs. W. China.

reflexa. Similar to *D. discolor* but with simple hairs and smaller fls. Cent. China.

rosea. Hybrid between *D. gracilis* and *D. purpurascens:* lvs. ovate-oblong to -lanceolate, slightly hairy: fls. pinkish outside, ¾ in. across, in short panicles. Var. **campanulata,** fls. white, 1 in. across; var. **carminea,** fls. purplish outside; var. **eximia,** fls. only slightly pinkish outside; var. **floribunda,** infl. dense; var. **grandiflora,** infl. less dense; var. **multiflora,** fls. white; var. **venusta,** fls. white.

scabra (*D. crenata*). To 7 ft.: lvs. oblong-lanceolate to ovate, to 3 in. long, pubescent on both sides: fls. white or blush, to ¾ in. long, in narrow erect panicles. Japan, China. In the trade are also offered the vars.: **candidissima** (*D. Wellsii*), fls. pure white, **Fortunei,** fls. larger; **plena,** fls. double, white tinged with rose outside; **Pride of Rochester,** very large fls. faintly tinted with rose outside; **Watereri,** fls. white tinted carmine outside.

Schneideriana. To 6 ft.: lvs. elliptic-ovate, to 2½ in. long, grayish-tomentose beneath: fls. white, in broad loose panicles. Cent. China. Var. **laxiflora** has narrower lvs. and broader panicles.

setchuenensis. To 6 ft.: lvs. lanceolate, to 3 in. long, densely pubescent beneath: fls. white, ½ in. or less across, in loose corymbs. China. Var. **corymbiflora** (*D. corymbiflora*) has larger lvs. and fls.

Sieboldiana. To 6 ft.: lvs. ovate, to 3 in. long, pubescent beneath: fls. white, ½ in. across, in loose panicles. Japan.

taiwanensis. Lvs. lanceolate or elliptic, to 5 in. long, hairy on both sides: fls. resembling *D. Sieboldiana.* Formosa.

Vilmorinæ. To 6 ft.: lvs. oblong-lanceolate, to 3½ in. long, densely pubescent beneath: fls. white, to 1 in. across, in loose corymbs. China.

Watereri: *D. scabra* var.

Wellsii: *D. scabra* var. *candidissima.*

Wilsonii. Hybrid between *D. discolor* and *D. mollis:* lvs. oval to oblong-lanceolate, to 5 in. long, pubescent: fls. white, ¾ in. across, in loose corymbs.

DEVILS-CLUB: *Echinopanax horridum.*

DEVILS-PAINTBRUSH: *Hieracium aurantiacum.*

DEVILS-TONGUE: *Hydrosme Rivieri.*

DEVILS-WALKING-STICK: *Aralia spinosa.*

DEVIL-TREE: *Alstonia scholaris.*—Wood: *Osmanthus americanus.*

DEWBERRY. The dewberries of American gardens and plantations are forms of native species of running trailing blackberries that root at joints or tip; they are mostly *Rubus flagellaris.* Dewberries commonly mature fruit earlier in the season than the highbush or non-trailing blackberries, the difference amounting perhaps to one or two weeks.

The culture is like that of the blackberry, but support should be given to the canes, as they are very slender and rank growers. A wire trellis or large-meshed fence-wire answers admirably; or they may be tied to stakes. The fruits are large and showy, which, combined with their earliness, make them desirable; but they are usually deficient in flavor. The Lucretia is the leading variety. Lay the canes on the ground in winter in rigorous climates. In spring tie all the canes from each plant to a stake. After fruiting, cut the old canes and burn them (as for blackberries). In the meantime, the young canes (for next year's fruiting) are growing. These may be tied up as they grow, to be out of the way of the cultivator. See *Blackberry.*

DIACRIUM. *Orchidaceæ.* Trop. American epiphytes with pseudobulbs bearing a few lvs. and white fls. in racemes, the sepals and petals similar, the lip free and 3-lobed; often regarded as a section of Epidendrum. For cult. see *Orchids.*

bicornutum (*Epidendrum bicornutum*). Sts. to 8 in. long, with 4–5 lvs. to 8 in. long: fls. white finely spotted with red, about 2 in. across, in 5–20-fld. racemes to 1 ft. long, May–June. Trinidad, Guiana.

DIAMOND-FLOWER: *Ionopsidium.*

DIANELLA. *Liliaceæ.* Rhizomatous perennials with fibrous roots, grass-like sheathing lvs., blue or whitish fls. in loose panicles, the perianth-segms. distinct, and blue berries.

The plants succeed in a cool greenhouse or out-doors in mild climates. Propagated by division or seeds sown in spring with heat.

ensifolia (*Dracæna ensifolia*). To 6 ft.: lvs. to 1 ft. long and 1 in. wide: fls. blue or whitish, to ⅓ in. long. Asia, Australia, Hawaii.

intermedia. Rootstocks creeping, bearing the lvs. at top which are 3 ft. long and ¾ in. wide: fls. greenish- or purplish-white, about ⅓ in. across, in panicles to 2 ft. long. New Zeal.—*Mondo Jaburan* has been cult. under this name.

revoluta. To 3 ft.: lvs. in rosette, to 1½ ft. long and ⅓ in. across, purplish at edge and base. Australia, Tasmania.

DIANTHUS. Pink. *Caryophyllaceæ.* Per. and ann. herbs, mostly of the northern hemisphere of the Old World, grown for the ornamental and often fragrant bloom. They are mostly tufted or mat-forming evergreen plants, thriving best in the northern parts of the country; many of the smaller alpine and boreal species are attractive in the rock-garden. The fls. are prevailingly pink or rose, but they run also to red, white and even yellow. The ann. pinks (*D. chinensis*) of flower-gardens are really short-lived perennials that bloom the first year from seed. The carnation (*D. Caryophyllus*) is a subject of special cultivation: see *Carnation.* The "grass pinks" of yards and borders are mostly *D. plumarius* and derivatives. The familiar sweet william is *D. barbatus.*

Pinks are of simple cultivation. Many of them are spring-bloomers. Even the perennials should be renewed every two or three years either by division, cuttings, layers, or preferably by seeds when named varieties are not involved. Sowings in spring or summer should give good blooming plants the following year, and the second year of bloom is often the best. The perennial mat-forming kinds may be renewed by the cutting back in autumn of all the long growths; and the prompt plucking of flowers, removing the stems far down, is essential for best results. Consult the comments under some of the leading species; the plants are perennial unless otherwise stated.

acaulis: *D. frigidus*, which is *D. sylvestris* var.

acicularis. Cespitose, to 10 in. high, the sts. 4-angled and branched: lvs. long-linear and acute, less than 1 in. long: fls. rose or white, the petals digitate-multifid; bracts 4, short, appressed. Russia, Rumania.

Allwoodii. A class of hybrids between *D. plumarius* and *D. Caryophyllus* by Allwood Bros., England: per., hardy, in many colors, petals entire to variously fringed, mostly with firm broad more or less glaucous foliage and good tufted habit.—Named kinds or particular strains may be propagated any time in summer by means of cuttings and layers.

alpestris. Low alpine, to 8 or 9 in., with very short narrow lvs. overtopped by inodorous fls. that are solitary or paired and about 1 in. across: petals notched or somewhat fringed and deep pink or rose. Eu.

alpinus. Cespitose: lvs. dark green, the radical ones broad, short and obtuse: fls. to 1½ in. across, mostly solitary on sts. 2–4 in. high, inodorous, deep rose to purplish and crimson spotted and an eye; petals broad; handsome. Switzerland to Greece and Russia.

arenarius. Cespitose: sts. many, very slender, 6–15 in. tall, bearing several long-pedicelled white fls. with slender calyx and somewhat fragrant: petals finely cut beyond middle. Finland to Dalmatia.

Armeria. Weedy ann., nat. in old fields in this country, seldom cult.: sts. erect, forked, to 2 ft.: fls. rose or pink, many and small, in close heads with long pubescent bracts. Eu.

arvernensis. A name in the trade for a small cespitose plant with 2 or 3 pink fls. on sts. 2–4 in. high, petals denticulate: lvs. mostly basal, narrow, about ½ in. long. France; reported as a natural hybrid, of which *D. monspessulanus* is one parent.

asper: see *D. Seguieri.*

atrorubens. Sts. stiffly erect, to 2 ft. bearing at the top a close fl.-head 1 in. or more across furnished with long-pointed bracts: fls. dark red, small, the petals dentate and expanding flat in sun. S. and E. Eu.—By some writers treated as a form of *D. carthusianorum.*

Balbisii: plants listed under this name may be either *D. liburnicus* or a form of *D. carthusianorum.*

banaticus. Glaucous: sts .simple, 1 ft. high: fls. red, 10 or 12 of them in a head subtended by acuminate reddish dry bracts; petals obovate, bearded. S. E. Eu.—Plants grown under this name are likely to be forms of *D. carthusianorum.*

barbatus. Sweet William. Glabrous, to 2 ft.: lvs. green, broad and flat: fls. in large bracted heads, inodorous, red, purple, rose, white, particolored, in some forms double. Pyrenees to Russia and China; run wild in E. U. S.—There are named vars., as Newport Pink. It is per. but would better be treated as bien. for the improved kinds; the so-called ann. sweet williams bloom first year from seed.

brevicaulis. Compact cespitose glaucous plant with sts. about 1 in. high and surpassing the lvs.: fls. solitary, about ½ in. long; calyx reddish; petals purple, dentate. Mt. Taurus, Cilicia.

cæsius. Cheddar Pink. Mat-forming, glaucous: sts. simple or somewhat branched, 3 to 12 in.: lvs. short and narrow: fls. solitary or few on a st., showy, rose-color, fragrant; petals bearded and toothed. England to Germany and S. France.

callizonus. Glaucous and glabrous plant with 1-fld. terete sts. 4–14 in.: lvs. rather short and broad, spreading: fls. 1 in. across, the petals broad and contiguous, purple and spotted above, rose underneath, zoned in center, dentate; calyx-bracts 4, purplish, spreading. S. E. Eu.

calocephalus. Smooth and glaucous, to nearly 3 ft.: lvs. linear-acute, more or less recurved: fls. brick-red, in few-fld. heads. S. E. Eu., Asia Minor.

capitatus. Glaucous, pubescent or woolly: sts. simple, to 1 ft. or more: fls. small, 6–8 together in a mucronate-bracteate head; petals purple and spotted. Balkans to Siberia.—Likely to be confused in cult. with *D. carthusianorum.*

carthusianorum. Carthusian Pink. Widely variable cespitose glabrous green or seldom somewhat glaucous plant with 4-angled erect simple sts. to 20 in. high terminating in a dense few- or many-fld. head with mucronate or aristate bracts, the fls. small, inodorous, rose, purple or dark red. Denmark and the Urals to Portugal and Egypt.

Caryophyllus. Clove Pink. Carnation. Tufted glabrous and glaucous plant, 1–3 ft. high, of stiff habit: fls. solitary or few on a st., showy and very fragrant, 1 in. and more across, the petals not bearded and irregularly dentate. S. Eu. to India.—Under cult. has given rise to many sizes, colors, races and forms, the petals from entire to shallowly cut; colors pink, rose, purple, white, yellow, known in this country mostly as a glasshouse cut-flower, but there are hardy border and marguerite races; the picotee belongs here. See *Carnation.*

caucasicus: name of doubtful standing; plants so listed are at least sometimes *D. deltoides.*

chinensis (*D. sinensis*) Glabrous green tufted plant of rather strict habit, 12–18 in. high, sts. more or less branching: fls. solitary or loosely assembled, slightly if at all fragrant, lilac, red or white, to 1 in. across. Portugal to China and Japan.—Little cult. (if the European *D. Seguieri* is excluded). Var. **Heddewigii**, supposed derivative, comprises the hardy ann. pinks of gardens, blooming first year from seed although bien. to per.; lvs. broad, bracts under calyx spreading; fls. in many colors and markings and often of great size and petals much cut and frilled. *D. stellaris* is a form with narrow petals, sometimes almost linear.

ciliatus. Cespitose, glabrous, glaucous: st. simple, to 2 ft., branched above: fls. long-peduncled, rose-color, fragrant, petals dentate or entire. Austria, Italy to Egypt.

collinus. Glaucous, pubescent, 1–2 ft., slightly branched except near apex: lvs. many on the st., erect, rather broad, 1–2 in. long: fls. 3–5 together in an open fascicle, about ¾–1 in. across, deep pink or darker. Pyrenees to Asia Minor.

compactus. Glabrous, to about 20 in.: lvs. plane, lanceolate: fls. purple, scentless, in dense 3-forked fascicles. S. E. Eu.

connatus. Name of a mat-forming somewhat glaucous plant with short basal lvs. and simple or forked sts. 6 in. high: fls. white, 1 in. across, deeply fringed; calyx cylindric; bracts short, pointed. Cultigen?

corsicus. Name in the trade for a low matted green plant with abundant rather soft basal foliage: sts. 4–12 in., simple or forked: fls. blush, to 1 in. across, deeply sharp-dentate; bracts short, pointed.

crinitus. Sts. somewhat woody at base, erect, 4–18 in., often sparingly forked, sometimes pubescent: lvs. narrow, about 1 in. long: fls. solitary, white, slender-cylindrical, 1½–2 in. long; petals cut into hair-like divisions. Algeria to N. W. India.

croaticus. The plant grown under this name has small red or rose fls. in a compact head, after the manner of *D. carthusianorum.*

cruentus. Cespitose, glaucous: sts. to 18 in., forked, terete, terminating in a small head of blood-red fls.: petals dentate. E. Eu.—One of the *D. carthusianorum* group, to which the cult. plants may belong.

Cyri. Ann. but surviving the winter if sown in midsummer, much branched, to 2 ft.: fls. solitary but many, each subtended by long-pointed bracts exceeding the turbinate calyx, corolla ⅜ in. across, rose, dentate, opening in sun. S. W. Asia, Egypt.—Weedy.

delicatus: a form of *D. plumarius* or a derivative.

deltoides. MAIDEN PINK. Mat– or sod-forming, green, with radical lvs. and those on runners 1 in. or less long and obtuse, those on st. acute: fls. ¾ in. or less across, red or pink with crimson eye (a white-fld. form), borne on forks of sts. that rise 4–15 in. Great Britain to Japan; nat. in U. S.—Known also as *D. procumbens.* Var. **glaucus** has prominently glaucous foliage.

dentosus. Botanically a form or associate of *D. chinensis*, but the plant in cult. under this name may be different.

diadematus: *D. chinensis* var. *Heddewigii.*

diffusus. Glabrous: sts. 10 in. tall, with terete branches: radical lvs. obtuse: fls. 2 together and long-peduncled, rose and red, the petals slightly hairy; bracts 2, obovate and mucronate. Greece.

erythrocoleus. Cespitose, glabrous: sts. 1-fld., 2 in. high: lvs. about 2 in. long, acute: fls. rose, the petals fimbriate to about the middle; bracts 4, about ⅓ length of calyx. Armenia.—Plants grown under this name may be *D. deltoides.*

fimbriatus. Woody at base, glabrous: sts. simple, 1 ft.: lvs. acute and appressed: fls. rose-color, the petals deeply cut or fimbriate; bracts 4–12, ⅓ length of calyx, straw-colored. Portugal to Tibet.—Forms of *D. plumarius* are also grown under this name.

fragrans. Cespitose, glabrous: sts. to 1½ ft., with angled branches above: lvs. acuminate: fls. fragrant, rose-white and spotted; petals fimbriate, bracts 6–8, appressed. Caucasus.

Freynii: *D. glacialis* var.

frigidus: *D. sylvestris* var.

furcatus. Attractive cespitose glaucous plant with lvs. mostly basal: sts. mostly forked, to 9 in. high: fls. solitary, rose-color, inodorous, about ½ in. across; petals dentate, with reflexed margin. Alps in Italy.

gallicus. Plant pubescent, at least on radical lvs. (which are ciliate) and lower part of st., glaucous, to 1 ft. or more: fls. rose to white, fragrant, about 1 in. across, blade fimbriate or cut to ⅓ its depth; calyx-bracts 4, short, appressed. W. France.

Gardnerianus: *D. chinensis* var. *Heddewigii.*

gelidus. Cespitose and glabrous, the sts. to 3 or 4 in high, simple and 4-angled: fls. rose and spotted; calyx-bracts 6, acuminate and recurved. E. Eu.

giganteus. Cespitose, glabrous and glaucous, the sts. terete, stout and simple, to 2–3 ft. or more, terminated by dense 10–12-fld. head: fls. red; calyx purple and narrowed at top. E. Eu.—Plants grown under this name may be *D. carthusianorum.*

glacialis. Cespitose, glabrous, 3–4 in., the sts. simple, 4-angled, 1–2-fld.: radical lvs. obtuse: fls. ½ in. or more across, inodorous, reddish-purple; petals denticulate and yellowish underneath, contiguous or close together; calyx and 2–4 bracts reddish. Mts., S. Eu.—Other species are likely to be grown under this name. Var. **Freynii** (*D. Freynii*) has short soft lvs., sts. always 1-fld., calyx-teeth ciliate.

graniticus. Sts. 4–7 in., slender, 4-angled, bearing 1–3 fls.: lvs. very narrow, acute: fls. to 1 in. across; petals dentate, purple above but paler underneath; calyx purple. Pyrenees.—*D. deltoides*, a very different plant, has been grown under this name.

Grisebachii: *D. viscidus* var.

hæmatocalyx. Cespitose, to 9 in.: radical lvs. to 2 in. long, stiffish, with rough margins, very narrow (a var. with somewhat glaucous foliage): fls. 3–5 on forking sts., calyx red, petals purple and yellowish underneath. Greece.

Hartwegii: *D. chinensis* var. *Heddewigii.*

Hoeltzeri. Cespitose and low, with strict radical lvs.: fls. spotted rose or yellowish, more or less fringed, about 1½ in. diam. Turkestan.

hungaricus: name of doubtful application.

hybridus: hort. name applied in the *D. chinensis* group.

imperialis: *D. chinensis* var. *Heddewigii.*

inodorus: *D. chinensis* var. *Heddewigii;* also variously applied.

integer: synonym of *D. strictus.*

kamtchaticus: listed name.

Knappii. Erect to 16 in., scabrous, more or less glaucous, sts. simple and bearing a compact head at apex: fls. light yellow, not fragrant, ¾ in. across, with prominent acuminate calyx-bracts. Italy to Hungary.

laciniatus: *D. chinensis* var. *Heddewigii.*

latifolius. Stiff and erect, 10–16 in., roughish, branched above, green, bearing terminal 1–6-fld. bracted heads: lvs. short and broad, 2–3 in. long and to ⅝ in. wide: fls. rose to dark red, single or double. Cultigen; intermediate in character between *D. barbatus* and *D. chinensis* or *D. plumarius* and accounted a hybrid.

leptopetalus. Glabrous: sts. 2–3-fld., to 15 in.: lvs. long-linear and acuminate: petals yellowish-white above and bluish underneath, entire. Russia, Siberia.

Lereschei: a form of *D. alpestris* of low condensed habit and deeply dentate petals.

Liboschitzianus. Cespitose, glabrous: sts. to 8 in., 4-angled and 1-fld.: lvs. narrow-acuminate: fls. white or pale rose, the petals bluntly toothed; calyx-bracts very narrow and sharp. Caucasus.

liburnicus. Glabrous: sts. simple and stiff, to 2 ft. high, more or less 4-angled at least above, terminating in a 2–6-fld. head: fls. rose, spotted, about ¾ in. across; petals dentate; calyx-bracts stiff and long-pointed. S. and E. Eu.

longicaulis. Erect stiff plant to 2 ft., glabrous, simple or branched above and sts. more or less 4-angled: lvs. very narrow: fls. 1 or 2 at summit of st., rose, fragrant, about ¾ in. across; petals sharp-dentate; calyx cylindrical, to 1 in. long, the bracts very short and broad. S. Eu.—The name has been applied also to a form of *D. Caryophyllus.*

microlepis. Per., dwarf and cespitose: lvs. short, soft: fls. very small, solitary among foliage, rose-color. High mts., Thrace.

mirabilis: *D. chinensis* var. *Heddewigii.*

monspessulanus. Sts. terete, branching at top, glabrous: fls. solitary or 2 or 3 near together, inodorous, rose, varying to white (var. **alba**) or carmine (var.

carmineus), 1 in. or more across; petals fringed to about the middle; sepals and bracts awn-tipped. Spain to Caucasus.

neglectus. Like *D. glacialis*, of which it is regarded as a var. by some writers, but radical lvs. acute, fls. solitary, calyx leathery in texture, bracts 4, petals not contiguous. S. Eu.

nobilis: *D. chinensis* var. *Heddewigii.*

ochroleucus: *D. chinensis* var. *Heddewigii.*

pallens: doubtful name.

Pancicii (*D. Velenovskyi*). Cespitose, glabrous, 1 ft. or more, with slender 4-angled sts.: lvs. rather soft, mostly in basal tuft: fls. rose, several together in a paniculate cyme or head. Balkans.

petræus. Cespitose or mat-forming, glabrous: sts. slender, simple or forked, 6–15 in. tall: lvs. green, sharp-pointed, 3-nerved: fls. white, about ¾ in. across, fragrant; petals dentate or fimbriate; calyx cylindrical, narrowed at apex, to 1 in. long; bracts 4, about ⅓ length of calyx. E. Eu.

pinifolius. Cespitose, roughish: st. simple and strict, to 1½ ft.: lvs. awl-like, the radical ones recurved: fls. rose, inodorous, 5–8 in a head; calyx reddish; bracts 4, aristate. S. E. Eu.

plumarius. GRASS PINK. Mat-forming, glabrous and glaucous, to 1½ ft., the sts. simple or branched above and 2–3-fld.: fls. rose, varying to purple, white and particolored, very fragrant, petals fringed to the middle or less; bracts 4, about ⅓ length of calyx. Austria to Siberia.—Cult. in various forms, some of them double; a popular strain is var. **semperflorens** (*D. semperflorens*). Named vars. of garden pinks may be offshoots of this species or hybrids with *D. Caryophyllus* and possibly other species; see *D. Allwoodii.*

præcox: doubtful name, probably *D. arenarius.*

Pritchardii: a cult. pink, perhaps of the *plumarius-Caryophyllus* group.

procumbens: *D. deltoides.*

prolifer. Glabrous simple or branching ann., to 2 ft., with inconspicuous little pink fls. in small heads terminating the stiff sts.; calyx and bracts dry. Eu.; nat. in U. S.—A weedy plant of little hort. interest.

puberulus: the hort. plant is probably the puberulent form of *D. carthusianorum.*

pubescens. Glandular-pubescent, rather weak: sts. terete and slender, much branched, to 1 ft.: foliage soft: fls. odorless, solitary or twin, long-peduncled; petals rose and spotted above, greenish underneath; calyx villous; bracts 2, spreading, long-pointed. S. E. Eu.

punctatus: *D. chinensis* var. *Heddewigii:* also a form of *D. Caryophyllus.*

pungens. Cespitose, glabrous, light green or somewhat glaucous, 1 ft., rhizomatous: sts. 1–3-fld., slender but strict: lvs. very narrow and sharp-pointed: fls. rose, the petals unequally dentate. France, Spain.

pyridicolus. The plant cult. under this name is a compact grayish-pubescent tufted little plant with leafy sts. 3–4 in. high: lvs. small and narrow: fls. solitary or close together, pink, the calyx-bracts awn-like. Greece.

Requienii. Cespitose, glabrous and glaucous: sts. slender, to 15 in., 4-angled, forked: lvs. short, narrow, strict: fls. purple, the petals dentate, somewhat rhomboid. Pyrenees.

rupicolus. One of the many vars. of *D. carthusianorum* (var. *rupicolus*): sts. many, to 16 in. high: lvs. linear: fls. dark red, 2–6 in a head; bracts obtuse, straw-colored. Eu.

Seguieri (*D. chinensis* var. *asper*). The European extension of *D. chinensis*, perhaps a distinct species differing in the panicled fls., and wide-spreading calyx-bracts.

semperflorens: see *D. plumarius.*

serpyllifolius. Puberulent little alpine, 2–4 in., with leafy slender more or less prostrate sts.: lvs. about ½ in. long, more or less obtuse: fls. red and purple, about ½ in. across, the petals separated and notched; bracts short. Probably Eu.

sinensis: *D. chinensis.*

speciosus: *D. superbus* var.

spiculifolius (*D. acicularis* var. *spiculifolius*). Not cespitose: sts. 10–12 in.: lvs. long-linear and acute: fls. rose to white, the petals palmatifid and barbulate; bracts 4, about ¼ length of tube. Russia and Rumania.—The plant sometimes catalogued under this name is said to be a form of *D. petræus.*

spinosus: *Acanthophyllum pungens.*

squarrosus. Cespitose: sts. terete, slender and spreading, glabrous, branched, to 2 ft.: lvs. linear, acute, recurved: fls. rose, few to each st., the petals not close together, pinnately multifid; bracts 4, about ⅓ length of calyx. Russia, Siberia.

stellaris: see *D. chinensis.*

Sternbergii. Cespitose and glaucous: sts. 4-angled, 2-fld., 6–12 in.: lvs. long-linear, spreading: fls. rose and spotted, fragrant, the petals not contiguous; bracts 4, purplish, ⅓ length of calyx. Portugal, Alps, Switzerland.

strictus. Cespitose and glabrous: sts. to 10 in., strict, slender, 1- or sometimes 2-fld.: fls. small, white, inodorous; petals not contiguous or close together and not fimbriate, oval-rhomboid. S. E. Eu.

subacaulis. Low, cespitose, glaucous, with several-headed caudex: sts. simple, 4-angled, 2-fld., 3–4 in.: fls. small, purple, standing above the tufts, the petals not contiguous, entire. Spain, France.

subcaulescens: listed name for a small alpine.

Sundermannii. Much like *D. strictus*, but more showy: petals to ⅓ in. broad, entire or nearly so, calyx ¾ in. long. Greece.

superbissimus: *D. chinensis* var. *Heddewigii.*

superbus. Light green glabrous plant with branching sts. to 2 ft. high: lvs. rather soft, flat: fls. pale rose or lilac, very fragrant, mostly to about 1½ in. across, few or many in lax panicle, the petals multifid nearly or quite to base; calyx cylindrical, to 1 in. long; bracts very short. Spain to Norway and Japan. Var. nanus, a dwarfer form with smaller fls., is offered. Var. **speciosus** (*D. speciosus*) is mostly lower than the species, sts. little branched and few-fld., branches divaricate, fls. much larger and more showy.

sylvestris. Cespitose, glabrous: sts. simple or branched, 6–16 in. tall and much exceeding the very narrow basal lvs.: fls. solitary, odorless, rose, to 1 in. across, petals contiguous and dentate; bracts very short and truncate. Spain to E. Eu. Var. **frigidus** (*D. frigidus*) is a dwarf form from Hungary.

tener. Glabrous, to 5 in. high, the slender sts. 1-fld.: fls. rose, spotted, the petals oblong-cuneate. France.

tenuifolius (*C. carthusianorum* var. *tenuifolius*, preferably). A green plant with very slender sts.: heads 3–6-fld., the bracts brown, coriaceous and very obtuse; fls. red.

vaginatus: a form of *D. carthusianorum.*

Velenovskyi: *D. Pancicii.*

versicolor. Glabrous plant with terete paniculately branched st. 10–12 in. high: lvs. narrow-linear, the uppermost scale-like: fls. with contiguous petals red and spotted above and greenish-yellow underneath; calyx-bracts obovate and spreading. Altai Mts., Siberia.

virgineus. Glabrous and glaucous, cespitose: sts. to 8 in. high, simple or sparingly branched: fls. solitary, fragrant, rose. S. Eu., Morocco.

viscidus. Plant cespitose and viscid-pubescent, to 1 ft., the sts. simple: lvs. soft, those on the st. appressed: fls. in fascicles of 3–6, purple and spotted, the petals few-toothed; bracts usually 4. Bulgaria, Greece, Turkey. Var. **Grisebachii** has fls. 2–3 in the fascicle and bracts 2.

Waldsteinei. Sts. terete, 10–14 in.: lvs. rather soft, spreading: fls. rose, very fragrant, to about 1 in. across; petals not contiguous, obovate, fringed to middle; bracts 4. Pyrenees, Alps.

warleyensis: a listed name, of the *D. carthusianorum* type.

Wimmeri. Allied to *D. superbus:* sts. terete, to 15 in.: lvs. soft, linear, acute: fls. purple, fragrant, in a lax forked panicle, the petals fimbriate nearly to base; bracts 4, mucronate, short. Switzerland north and east.

zonatus. Cespitose and somewhat woody at base, scabrous: sts. 4-angled and branched, about 1 ft. high: lvs. strict: petals very broad, purple with dark zones above, yellowish underneath. Asia Minor.—The name may be applied also to zoned forms of *D. chinensis.*

DIAPENSIA. *Diapensiaceæ.* Tufted evergreen plants with crowded mostly opposite entire lvs. and solitary bell-shaped fls.; suitable for the rock-garden.

lapponica. To 4 in.: lvs. to ½ in. long, obtuse: fls. white, to ¾ in. across, June–July. Circumpolar, extending southward on mts. of N. Y. and New England.

DIAPENSIACEÆ. Diapensia Family. About 6 genera in the north temp. zone of little evergreen shrublets or stemless per. herbs, having simple lvs., bisexual regular fls. with 5-lobed calyx and corolla, 5 stamens, superior 3-celled ovary and capsular frs.; allied to Primulaceæ. Diapensia, Galax, Pyxidanthera, Schizocodon and Shortia are cult. in rock-gardens and similar places, and employed as ground-cover.

DIASCIA. *Scrophulariaceæ.* S. African low slender herbs of many species ann. and per., with lvs. mostly opposite, fls. violet or rose in racemes, 2-lipped but the tube nearly lacking, the lower lip 2-spurred. One is grown in flower-gardens and also as a pot-plant. The cultural requirements are simple; easily propagated by seed.

Barberæ. Twinspur. Ann., 1 ft.: lvs. ovate, to 1½ in. long, toothed: fls. rosy-pink with yellow spot in throat, ½ in. across, in terminal racemes to 6 in. long.

DICENTRA (*Bicuculla. Bikukulla*). *Fumiariaceæ.* Per. herbs with ternately compound lvs., irregular rose, yellow or white fls. in racemes, the corolla heart-shaped or 2-spurred and closed at top, and capsular frs.; cult. in the flower- or wild-garden.

The plants thrive in fertile light soil, in usual exposures. Propagated by division of crowns or roots.

canadensis. Squirrel-Corn. To 1 ft., the root with many small tubers: lvs. all basal: fls. greenish-white tinged with purple, with short rounded spurs, nodding in simple racemes. N. S. to Tenn. and Neb.

chrysantha. Golden-Eardrops. To 5 ft., with leafy sts.: fls. sulfur-yellow, with very short spurs, erect in large panicled racemes. Calif.

Cucullaria. Dutchmans-Breeches. To 10 in.: lvs. all basal: fls. white tipped with yellow, with widely divergent spurs, nodding in simple racemes. N. S. to N. C. and Kans.

eximia. To 2 ft.: lvs. all basal: fls. rose or pink, with short rounded spurs, nodding in compound racemes. N. Y. to Ga.

formosa. To 1½ ft.: lvs. all basal: fls. rose-purple or rarely white, with short rounded spurs, nodding in compound racemes. B. C. to Calif.

spectabilis (*Dielytra spectabilis*). Bleeding-Heart. To 2 ft., with leafy sts.: fls. rosy-red, with short rounded spurs, in simple one-sided racemes. Japan.—An old garden plant. Var. **alba** has white fls.

DICHELOSTEMMA: *Brodiæa.*

DICHORISANDRA. *Commelinaceæ.* Perennials from trop. Amer. with sheathing alternate lvs. and irregular blue or purple fls. in racemes or panicles, on erect or ascending simple or branched sts.

Grown under glass, or out-of-doors in warm regions. They require abundant water in the growing season. Propagated by seeds, cuttings, and division.

cærulea: hort. name.

mosaica. St. spotted: lvs. cross-banded with white longitudinally and along cross-veins, purple underneath: fls. blue and white, close to foliage. Peru. Var. **gigantea** has large fls. and var. **undata** lacks white cross-veins.

thyrsiflora. To 3 ft. or more, nearly or quite simple: lvs. glossy green, not variegated: fls. blue. Brazil.

vittata: probably *Rhœo discolor* var. *vittata.*

DICHOTOMOUS: forked in pairs.

DICHROSTACHYS: *Cailliea.*

DICKSONIA. *Cyatheaceæ.* Greenhouse tree-ferns with a distinct trunk usually several ft. tall: lvs. large, 2–3-pinnate; sori marginal at the tips of veins: mostly in the tropics and subtropics of the southern hemisphere. See *Ferns.*

antarctica. Trunk to 50 ft., with matted aerial rootlets: lvs. to 6 ft. long, 3-pinnate, with lanceolate toothed segms. to 2 in. long. Australia.

cicutaria: *Dennstaedtia cicutaria.*

fibrosa. Trunk to 20 ft., stout, brown, covered with fibrous aerial rootlets: lvs. to 8 ft. long, 2–3-pinnate. New Zeal.—A frequent glasshouse fern.

pilosiuscula: *Dennstaedtia punctilobula.*

punctilobula: *Dennstaedtia punctilobula.*

squarrosa. Trunk to 20 ft., slender, black: lvs. to 8 ft. long, 2–3-pinnate, stiff and leathery. New Zeal.

DICRANOSTIGMA. *Papaveraceæ.* Herbs from Cent. Asia with woody roots, basal pinnatifid lvs. and alternate st.-lvs., orange or yellow fls., and capsular frs.; one species is grown in rock-gardens.

Franchetianum (*Chelidonium Franchetianum*). About 1 ft. high, glaucous: fls. orange, 1 in. across: caps. linear, to 3 in. long. China.

DICTAMNUS. *Rutaceæ.* One variable species ranging from S. Eu. to N. China, cult. for the ornamental fls. **D. albus** (*D. Fraxinella*). Dittany. Fraxinella. Gas-Plant. Burning-Bush. Hardy per. to 3 ft., strong-smelling and long-enduring: lvs. of 9–11 ovate lfts.: fls. white, about 1 in. long, in terminal racemes: fr. a 5-parted caps. Var. **caucasicus** is a very large form with longer racemes. Var. **purpureus** has dark fls. and var. **rubra** rosy-purple fls. *D. dahuricus* is a form of the species.—These plants do best in rich heavy soil. Propagated by seeds in open ground; these will germinate the following spring and seedlings may be set out permanently after two years. Propagated also by division but with more difficulty.

DICTYOGRAMMA: *Coniogramme.*

DICTYOSPERMA (*Linoma*). *Palmaceæ.* One variable monœcious unarmed feather-lvd. tree of the Mascarene Isls. in the Indian Ocean, sometimes regarded as 2 or 3 species: lvs. long and gracefully curving, with infl. on the trunk beneath the long lf.-sheaths: spadix 2 ft. or less long with a short stout peduncle and many spreading or hanging branches; fls. in 3's of which the central one is pistillate, spirally disposed on the cord-like branches; stamens 6, pistillode shorter than stamens, terete: fr. oblong to cartridge-shaped, ¾ in. or less long; albumen ruminate; stigma apical. Planted in S. Fla.; see *Palm.* **D. album** (*Areca alba*). To 40 or 50 ft.: lvs. 10 ft. long more or less; pinnæ curved or drooping, 2–3 ft. long and 2–3 in. broad, only the midrib very prominent, long-acuminate, green underneath. Var. **aureum** (*Areca aurea*). More slender and smaller and fls. smaller: young plants with orange or yellow petioles and veins. Var. **furfuraceum.** Petioles and sheaths of young plant tomentose. Var. **rubrum** (*Areca rubra* of hort.: see *Acanthophœnix*) in juvenile stage has very dark green lvs. with veins and margins reddish.

DIDISCUS: *Trachymene cœrulea.*

DIEFFENBACHIA. *Araceæ.* Trop. American erect shrubby plants bearing the oblong entire lvs. toward the top of the st., the petioles sheathing, the unisexual fls. borne on an erect spadix about the length of the oblong spathe; grown as foliage subjects in the greenhouse.

Several plants may be put in a large pot until they cease developing good leaves. They may then be topped and the stems cut into 2- or 3-inch pieces, dried for a few days, and then put in boxes of sand where they will throw off shoots which will root and form new plants.

Barraquiniana: *D. picta* var.

Baumannii: *D. Bowmannii.*

Bausei. Hybrid between *D. picta* and *D. Weirii,* (the latter a dwarf kind with yellow spotted lvs.) having yellowish-green lvs. with small white spots and glaucescent beneath.

Bowmannii (*D. Baumannii*). To 3 ft.: lvs, to 16 in. long and 8 in. wide, spotted with white, the petioles deeply channelled: spathes pale green, about 6 in. long. Colombia.

brasiliensis: *D. picta.*

costata. To 4 ft.: lvs. to 16 in. long and 1 ft. wide, deep green, paler beneath, the petioles channelled: spathes to 1 ft. long. Colombia, Peru.

Fournieri: hort. name.

imperialis. Lvs. to 2 ft. long and 1 ft. wide, shining green spotted with yellow and with whitish midrib, the petioles deeply channelled. Peru.

Jenmannii: *D. picta* var.

Leonii: hort. name.

Leopoldii: *D. Seguine* var. *liturata.*

magnifica: *D. picta* var.

picta (*D. brasiliensis*). To 4 ft.: lvs. shining green, irregularly marked with white and yellow: spathes about 6 in. long. S. Amer. Runs into many forms, some of which are: Var. **Barraquiniana** having lvs. spotted with white and petioles and midribs almost entirely white; var. **Jenmannii** with lvs. veined and spotted with white; var. **magnifica** (*D. Rex*) has lvs. spotted along veins with yellowish-green and petioles marked with white.

Rex: *D. picta* var. *magnifica.*

Seguine. To 6 ft.: lvs. green often variously spotted, pale green beneath, with thick midribs and petioles striped and dotted with white, not channelled: spathes green or pale green. Trop. Amer., where it is known as "dumb cane." Var. **liturata** (*D. Leopoldii*) has an irregular yellowish stripe along midrib.

splendens. Hybrid between *D. Leopoldii* and *D. picta* having lvs. spotted with white and deeply channelled petioles.

DIELYTRA: *Dicentra spectabilis.*

DIERAMA. *Iridaceæ.* Two S. African cormous herbs, sometimes grown in S. Calif. or under glass in cold climates. Cult. as for Ixia.

pendula. To 4 ft.: basal lvs. to 2 ft. long and ¼ in. broad: fls. white to pale or dark mauve, to 1 in. long, in several slender drooping spikes. Trop. and S. Afr.

pulcherrima (*Sparaxis pulcherrima*). To 4 ft.: lvs. very stiff, to 2 ft. long and ¼ in. wide: fls. bright purple, 1½ in. long, with short tube, in slender drooping spikes.

DIERVILLA. Bush-Honeysuckle. *Caprifoliaceæ.* Three little bushes of E. N. Amer., spreading by means of underground sts. and forming patches: lvs. opposite: fls. small, in spring and summer, yellow sometimes shaded reddish or brownish, borne in small leafless axillary clusters that are sometimes aggregated into terminal cymes, corolla more or less bilabiate: fr. a thin-walled taper-pointed caps. bearing the awl-shaped calyx-lobes at apex, indehiscent or essentially so. The Weigelas of gardens, sometimes referred to this genus, are here kept distinct. See *Weigela.*

The bush-honeysuckles are adaptable for holding banks and for colonizing in rear situations and for tall ground-cover. They propagate readily by suckers.

Lonicera (*D. trifida*). To 4 ft., glabrous or essentially so: lvs. ovate to oval, long-pointed, 2–4 in. long, petioled. Newf. to Sask. and south to N. C., on banks and in rocky places.

rivularis. To 6 ft., pubescent: lvs. ovate or narrower, long- or short-pointed, short-petioled: fls. in terminal clusters. N. C., Tenn., Ga., Ala., on damp banks and rocks; hardy in New England.

sessilifolia. To 4 or 5 ft., glabrous, with 4-angled branchlets: lvs. nearly or quite sessile, ovate-lanceolate and acuminate: fls. often in crowded terminal clusters. N. C., Tenn., Ga., Ala., on exposed rocky hillsides; hardy in New England.

trifida: *D. Lonicera.*

DIFFUSE: loosely branching or spreading; of open growth.

DIGITALIS. Foxglove. *Scrophulariaceæ.* Erect herbs with mostly tall and simple fl.-sts., grown in the border for their long racemes of tubular 2-lipped fls., the upper lip shorter than lower, in purple, yellowish or white, in summer: lvs. alternate and long and decorative, especially young rosettes, mostly ovate-lanceolate to lanceolate: native from Eu. to Cent. Asia.

Foxgloves are easily grown. The perennial species are propagated by seeds or by division. The common species and cultigens are usually treated as biennials, the seed sown in the spring or summer producing flowering plants the following season.

ambigua (*D. grandiflora. D. ochroleuca*). Yellow F. Per. or bien. to 3 ft., hairy: fls. 2 in. long, yellowish marked with brown, calyx-lobes linear. Eu., W. Asia.

Buxbaumii: hort. name for a yellow-fld. foxglove.

canariensis: *Isoplexis canariensis,* but the plant grown under this name is sometimes *D. ambigua.*

ferruginea. Rusty F. Per. or bien. to 6 ft.: fls. rusty-red, downy outside, lower lip bearded, middle lobe longer than others, calyx-lobes ovate. S. Eu.

gloxinioides: *D. purpurea* var. *gloxiniæflora.*

grandiflora: *D. ambigua.*

lævigata. Per. to 3 ft.: fls. yellow marked with purple, middle lobe of lower lip longer than others, calyx-lobes oblong. S. Eu.

lanata. Grecian F. Per. or bien. to 3 ft.: fls. 1 in. long, nearly white with fine veins, middle lobe of lower lip longer than others, calyx-lobes linear, racemes hairy. Danube region and Greece.

lutea. Straw F. Per. to 2 ft.: fls. yellow to white, to ¾ in. long, in one-sided racemes, upper lip 2-parted, calyx-lobes lanceolate. Eu.

nervosa. Per.: fls. yellowish, small, in long dense racemes. Cent. Asia.

ochroleuca: *D. ambigua.*

purpurea. Common F. Bien., sometimes per., to 4 ft.: fls. to 3 in. long, purple more or less spotted, with ciliate lobes, drooping in one-sided racemes to 2 ft. long; calyx-lobes broad-ovate. W. Eu. Hort. vars. are: **alba,** fls. white; **campanulata,** upper fls. united into a large bell-shaped bloom; **gloxiniæflora** (*D. gloxinioides*) has longer racemes and more open fls. than the type; **maculata superba,** Leopard F., improved spotted form; **monstrosa,** a double peloric form.

sibirica. Hairy per.: fls. yellowish, middle lobe of lower lip much longer than others, calyx-lobes linear. Siberia.

DIGITARIA: *Syntherisma.*

DIGITATE: hand-like; compound with the members arising from one point, as the leaflets of horse-chestnut. See *Palmate.*

DIHOLCOS: *Astragalus bisulcatus.*

DILL: *Anethum graveolens.*

DILLENIA. *Dilleniaceæ.* Warm-country trees, Asia to Australia, one intro. in southernmost parts of U. S.: lvs. alternate, large and strongly pinnately veined: fls. mostly large and showy, white or yellow, solitary or in clusters, the parts 5 or in multiples, the calyx enlarging and inclosing the fleshy fr.

indica (*D. speciosa*). To 40 ft., evergreen or losing its foliage in the dry season: lvs. oblong, thick, to 12 in., serrate, borne at ends of branches: fls. white, 6 in. or more across, with a mass of yellow stamens and a rayed stigma: fr. size of fist, acid, edible. Trop. Asia.

speciosa: *D. indica.*

DILLENIACEÆ. DILLENIA FAMILY. Trees, shrubs or rarely herbs of about a dozen genera, some having medicinal properties but only Actinidia, Candollea, Dillenia, and Hibbertia known in cult. in the U. S. outside botanic gardens. The family is characterized by mostly alternate lvs., yellow, white or rarely red usually bisexual fls. having commonly 5 sepals and petals, numerous stamens, and ovary of 1 to many carpels.

DILLWYNIA. *Leguminosæ.* Heath-like shrubs, mostly of small size, native in Australia and adapted to Calif.: lvs. scattered or alternate, narrow-linear or needle-like: fls. papilionaceous, yellow or orange-red, prevailingly in small axillary or terminal racemes or corymbs or sometimes solitary: pod ovate or broader.

Preissii. To 5 ft. with long erect branches: lvs. to ¾ in. long, stiff: fls. about 3 or less in the axils, standard somewhat exceeding calyx.

DIMORPHANTHUS: *Aralia.*

DIMORPHOTHECA. CAPE-MARIGOLD. *Compositæ.* S. African herbaceous or subshrubby annuals and perennials with white, purple, yellow or orange, solitary terminal heads of ray- and disk-fls. In Calendula the ray achenes are incurved, the lvs. entire or minutely toothed; in Dimorphotheca the ray achenes are straight, the lvs. conspicuously toothed.

Cape-marigolds are grown in the flower-garden and sometimes in the greenhouse and bedded out. They make a good display in warm sunny situations, requiring a long season for best results. Propagated by seeds and the perennial species by cuttings.

annua (*Calendula pluvialis*). Ann., rough-hairy: lvs. oblong: rays white or yellowish above, purplish below. Var. **ligulosa** (*Calendula Pongei*). Double, the rays white above, yellow or violet beneath.

aurantiaca (*Calendula Tragus*). Per. blooming as an ann., often shrubby: lvs. linear-oblong: rays orange-yellow.

Ecklonis. Per. or subshrub to 2 ft.: lvs. lanceolate or linear-lanceolate: rays white above, purplish beneath.

hybrida (*Calendula hybrida*). Hybrids between *D. annua* and *D. aurantiaca* with fls. varying from white to red, yellow and orange.

DINEMA. *Orchidaceæ.* One orchid native in trop. Amer., **D. polybulbon** (*Epidendrum polybulbon*). Rhizomes creeping, bearing pseudobulbs: lvs. to 2 in. long: fls. solitary, with yellow or brownish sepals and petals and snow-white lip yellow at base, Dec.–Feb.

DIOCLEA. *Leguminosæ.* Twining vines with lvs. of 3 lfts. and papilionaceous blue, red or white fls. in clusters or racemes; sometimes planted in warm regions. Propagated by seeds, cuttings, or suckers.

glycinoides. Fls. scarlet, 1 in. long. Argentina.—The botanical position of the plant grown under this name is much in doubt, and it may belong to another genus.

DIŒCIOUS: staminate and pistillate flowers on different plants.

DION (*Dioon:* see page 8). *Cycadaceæ.* Mexican palm-like or tree-fern-like plants with stiff pinnate lvs. and fls. borne in cones. For cult. and uses see *Cycas,* from which it differs in technical floral and fr. characters.

Dohenii. A plant not fully described and yet little known: lfts. broadest at base, very stiffly sharp-pointed, not toothed, glabrous, margins recurving, parallel side nerves about 12 and prominent. Erroneously reported from Guatemala.

edule. Trunk to 6 ft. high, very stocky: lvs. 3–5 ft. long; lfts. entire in adult plants but toothed at tip on young ones, side nerves 12 or less, sharp-pointed. Hot open situations.

spinulosum. Trunk to 50 ft. high, more slender: lvs. 4–6 ft. long; lfts. long, with separate slender spiny teeth on each margin, the parallel side veins 18 or more. Rain forests.

DIONÆA. *Droseraceæ.* One insectivorous per. of restricted range in N. C. and S. C., sometimes grown as an oddity or for botanical demonstration. The plant thrives in sunshine in a humid atmosphere. It should be potted in sphagnum or silver-sand and black silt and the pots set in about 1 in. of water. Propagated by seed under a bell-jar. **D. muscipula.** VENUS FLY-TRAP. Lvs. in basal rosettes, having flat petioles and round 2-lobed blades which are fringed with sensitive hairs, closing together when touched: fls. white, in umbels terminating scapes about 1 ft. high.

DIOON: *Dion.*

DIOSCOREA. YAM. *Dioscoreaceæ.* Herbaceous twining vines or perhaps more or less woody, in both eastern and western hemispheres and mostly of warm regions, with tuberous roots and often aerial tubers, simple or compound broad lvs. and small diœcious fls. in spikes or racemes.

Several species are cultivated in the tropics for the edible tubers, and a few in the North for ornament and interest. Yams are of easy cultivation and may be planted at any time of year where hardy. Propagated by seeds, tubers or cuttings. The word yam is sometimes applied to certain varieties of sweet potato.

alata. Tubers to 8 ft. long: sts. 4-winged or -angled, often with small axillary tubers: lvs. opposite, ovate to oblong and deeply heart-shaped at base. India to Malaya; not hardy N.

Batatas. CHINESE Y. CINNAMON-VINE. Tubers to 3 ft. long, deep in ground: sts. tall-climbing, slightly angled, bearing small axillary tubers: lvs. opposite, ovate, strongly broadened or angled at base. China;

hardy N., remaining for years, the tops dying to the ground.

bulbifera. AIR POTATO. With small or no root-tubers: sts. cylindrical, bearing axillary angular tubers to 1 ft. long: lvs. alternate, ovate, heart-shaped at base. Trop. Asia, Philippines; not hardy N.

cayenensis. YELLOW or ATTOTO Y. St. angled or cylindrical, prickly toward base: lvs. mostly opposite, ovate, deeply heart-shaped at base. W. Indies to Brazil; not hardy.

discolor. Root tuberous: lvs. ovate, heart-shaped at base, purplish beneath, white along midrib. S. Amer.—Grown as a greenhouse foliage plant.

macroura. Lvs. alternate, orbicular, heart-shaped at base, wavy-margined. Trop. Afr.

oppositifolia. Lvs. opposite, lanceolate to ovate, not heart-shaped at base. India, E. Indies.

trifida. CUSH-CUSH. YAMPEE. Tubers small: sts. angled or winged: lvs. 3–5-lobed to middle or lower. S. Amer.; not hardy.

villosa. WILD YAM. COLIC-ROOT. Rootstock woody, to ¾ in. thick: lvs. ovate, heart-shaped at base. R. I. to Fla. and Tex.

DIOSCOREACEÆ. YAM FAMILY. Ten genera of twining herbaceous or somewhat woody vines with woody or tuberous roots, widely distributed, characterized by monœcious or diœcious fls. having 6 perianth-segms. in 2 series, 6 or 3 stamens, typically 3-celled ovary, 3 styles, and capsular or baccate fr. Only Dioscorea, Rajania, Tamus and Testudinaria are in general cult.

DIOSMA. *Rutaceæ.* Heath-like shrubs native in S. Afr., with simple linear lvs., small white or red fls., and fr. of 5 carpels; cult. out-of-doors in the S. and under glass for ornament and use in floral decorations.

Soil for diosmas should be similar to that for heaths, fibrous loam and leaf-mold with sharp sand added. Plants should be cut back after flowering to induce bushy growth. Propagated by cuttings of young wood.

alba: *Coleonema album.*

capitata: *Audouinia capitata.*

ericoides. BUCHU. To 2 ft., with many branches, fragrant: fls. white and borne in great profusion.

purpurea: *Agathosma villosa.*

Reevesii: listed name.

DIOSPYROS. PERSIMMON. *Ebenaceæ.* Widely distributed trees and shrubs, largely Asian, with alternate simple lvs., unisexual or imperfect fls. in cymes or the pistillate solitary, and fr. a juicy edible berry with the enlarged calyx at base. *D. Kaki* and *D. virginiana* are grown for the edible fr., and others for ornament and interest.

Persimmons are not hardy North with the exception of *D. virginiana* which will stand in parts of New England. They succeed in most soils. Propagated by seeds, cuttings, and layers. For culture of *D. Kaki* see *Persimmon. D. Ebenaster*, the black sapote, thrives only in the tropics or perhaps will withstand two or three degrees of frost. Propagated by seeds and shield-budding. *D. Lotus* stands perhaps to north-central regions. The other species are tropical or of mild climates.

Cargillia. Small tree: lvs. oval, to 3 in. long, yellowish beneath: fr. black, ½ in. long. Australia.

chinensis: *D. Kaki.*

Ebenaster. BLACK SAPOTE. Tree to 60 ft.: lvs. oval or oblong, to 8 in. long, shining: fls. small, white: fr. olive-green, to 5 in. long, with chocolate-brown flesh. Mex., W. Indies.

Ebenum. Large tree with smooth branchlets: lvs. elliptic, to 4 in. long, thick: staminate fls. fascicled, pistillate solitary, corolla tubular: fr. ¾ in. diam. India.

Kaki (*D. chinensis*). KAKI. JAPANESE P. Tree to 40 ft.: lvs. ovate or obovate, to 7 in. long, shining above, pubescent beneath: fls. yellowish-white, about ½ in. long: fr. orange or reddish, to 3 in. across, with orange flesh. Japan, China, where it is much cult.

Lotus. DATE-PLUM. Tree to 45 ft.: lvs. oval or oblong, to 5 in. long, pubescent: fls. reddish or greenish, to ⅓ in. long: fr. yellow turning black, ½ in. across. W. Asia to Japan.

montana. Tree: lvs. ovate or oblong, to 4 in. long: fls. white, ¼ in. long: fr. reddish-brown, 1½ in. across. Trop. Asia.

virginiana. COMMON P. Tree to 50 ft. or more: lvs. ovate, to 6 in. long, shining above: fls. to ½ in. long: fr. yellow or orange, to 1½ in. across. Conn. to Fla. and Tex., in woods and fields.

DIOSTEA: *Baillonia juncea.*

DIOTIS. *Compositæ.* One per. less than 1 ft. high, growing along the European coast and useful in rock-gardens. Propagated by seeds or cuttings. **D. candidissima.** COTTON-WEED. White-tomentose: lvs. alternate, oblong, ½ in. long: heads ⅓ in. across, in dense terminal clusters, of disk-fls. only, Aug.–Sept.

DIPELTA. *Caprifoliaceæ.* Chinese deciduous shrubs allied to Diervilla and Weigela, with opposite lvs., pinkish or purple tubular-campanulate fls. solitary or in racemes, and fr. a caps. inclosed by large showy bracts. They are hardy in the N. and thrive in any good soil. Propagated by seeds in spring and by cuttings of green and hard wood.

floribunda. To 16 ft.: lvs. ovate to oval-lanceolate, to 4 in. long, entire: fls. pink with orange-yellow throat, fragrant, 1 in. long, the corolla slender at base; May: fr.-bract shield-like, to 1 in. across.

ventricosa. To 20 ft.: lvs. elliptic or narrower, to 5 in. long, mostly finely denticulate: fls. rose with orange throat, drooping, the corolla swollen at base: fr.-bract cordate, attached at base.

DIPHYLLEIA. *Berberidaceæ.* Two per. herbs native in E. N. Amer. and Japan, the former transferred to wild-gardens: lvs. large, peltate, 1 radical and 2 smaller cauline lvs.: fls. white, in a terminal cyme: fr. a berry.

cymosa. UMBRELLA-LEAF. To 2 ft.: basal lf. to 2 ft. across, deeply 2-lobed, with many toothed lobes: berries blue, about ½ in. long. Va. to Ga. and Tenn., in wet places in mts.

DIPLACHNE: *Leptochloa fascicularis.*

DIPLACUS: *Mimulus.*

DIPLADENIA. *Apocynaceæ.* Climbing shrubs, perhaps at first erect, with opposite lvs., large funnelform fls. in terminal or axillary racemes, white or rose corolla with 2 scales at base inside, and fr. of 2 spreading follicles; native in trop. S. Amer., grown in greenhouses, and out-of-doors in the S. *D. splendens* and *D. boliviensis* are the usual species in cult; other names are likely to represent hort. derivatives.

Dipladenias may be grown under heat with good drainage, in a soil composed of fibry peat, sand and charcoal. Propagated by cuttings over bottom heat.

amabilis. Fls. rosy-crimson.

amœna. Fls. pink, suffused with rose.

boliviensis. Lvs. oblong, to 3½ in. long: fls. white, the throat yellow inside, 1½ in. across, 3 or 4 together. Bolivia.

Brearleyana. Fls. pink, changing to crimson.

hybrida. Fls. bright crimson-red.

insignis. Fls. rosy-purple.

profusa. Fls. bright rose.

rosea. Fls. pink with purple eye, to 4 in. across.

splendens. Lvs. oval, to 8 in. long, heart-shaped at base: fls. white suffused with rose, 4 to 6 together. Brazil.

DIPLAZIUM. *Polypodiaceæ.* Ferns closely resembling Asplenium and requiring the same general treatment, grown under glass, differing in the arrangement of the sori; mostly in the warmer zones. See *Ferns.*

lanceum (*Asplenium lanceum*). Lvs. simple, lanceolate, to 9 in. long and 1 in. wide, usually entire. India, China, Japan.

DIPLOGLOTTIS. *Sapindaceæ.* One tall Australian tree, sometimes planted in S. Calif. **D. Cunninghamii** (*Cupania Cunninghamii*). Lvs. pinnate, of 8–12 oblong or ovate-lanceolate lfts. to 1 ft. long, pubescent beneath: fls. greenish, in large panicles: fr. a tomentose caps. ½ in. across, the seed inclosed in a pulpy aril from which jam is made in Australia.

DIPLOTAXIS. ROCKET. *Cruciferæ.* A score of mustard-like erect ann., bien. or per. herbs of Eu. and the Medit. region, one of them sometimes raised for ornament: lvs. pinnatifid or lobed: fls. yellow, white, rose or lilac, in terminal racemes: pod or silique elongated. **D. erucoides** is ann., to 18 in., branching from base: lower lvs. lyrate: fls. white, veined rose or lilac. In cult. fields, Eu., coming quickly to bloom.

DIPLOTHEMIUM: D. campestre is *Allagoptera campestris:* **D. caudescens** is *Polyandrococos caudescens.*

DIPSACEÆ. TEASEL FAMILY. Old World herbs of about 7 genera, having mostly opposite lvs., small bisexual fls. in dense involucrate heads or spikes, like composites, with gamopetalous 2–5-lobed corolla, 2–4 stamens, inferior 1-celled ovary, and fr. an achene, and the general looks of Compositæ. A few genera are cult. for ornament or commercial purposes, as Cephalaria, Dipsacus, Morina, Pterocephalus, Scabiosa, Succisa.

DIPSACUS. TEASEL. *Dipsaceæ.* Bien. prickly or hairy coarse tall herbs with opposite entire or pinnately cut lvs. and 4-lobed fls. in terminal heads or spikes subtended by spiny involucral bracts; plants of thistle-like aspect; native in Eu., Asia, N. Afr. A few species are grown in the garden and *D. fullonum* for raising the nap on woollen cloth.

asper. To 6 ft.: lower lvs. pinnatifid, rough and hairy: fls. white. Himalayas.

chinensis. To 6 ft.: lvs. pinnately cut into about 8 pairs of coarsely toothed bristly lobes: heads globose, to 2 in. across, the involucral bracts shorter than head and recurved, stamens long-exserted. China.

fullonum. FULLERS T. To 6 ft.: lvs. lanceolate or oblong, to 1 ft. long, entire or toothed, sessile: fls. pale lilac, in cylindric heads to 4 in. long, the involucral bracts shorter than head and becoming reflexed, bracts of receptacle with hooked tips and the dry head employed by fullers. Eu.; grown as a special crop in U. S., and somewhat escaped.

pilosus. To 4 ft.: lvs. oblong, entire or toothed, petioled: fls. yellowish-white, in globose heads to 1 in. across, the involucral bracts equalling those of receptacle and shorter than head, bristly. Eu.

sylvestris. COMMON T. Differs from *D. fullonum* in the involucral bracts as long as or exceeding head and curved upward. Eu., Asia; extensively nat. in E. N. Amer.

torsus: hort. name.

DIPTERONIA. *Aceraceæ.* Two Chinese deciduous trees with odd-pinnate opposite lvs. and imperfectly monœcious little fls. in large terminal panicles: fr. winged all around. **D. sinensis,** adapted to southern states and Calif., is 30 ft. or more: lfts. 4–6 pairs, narrow-ovate to oblong, serrate: fls. whitish, very small: samara about 1 in. across.

DIRCA. LEATHERWOOD. *Thymelæaceæ.* Two deciduous bushes native in the U. S., with tough flexible branches and yellowish funnelform declined or pendent short-stalked bisexual fls. in advance of the simple alternate lvs.: fr. a small red or greenish drupe. **D. palustris,** N. B. to Mo. and Fla. in damp or fertile woods and copses, is a neat shrub to 6 ft.: lvs. elliptic to obovate, 2–3 in. long, entire.

DISA. *Orchidaceæ.* Terrestrial African orchids with tuberous rootstocks and leafy sts., the fls. with large helmet-shaped dorsal sepal, small petals and lip; require moist situations in the greenhouse. For cult. see *Orchids.*

grandiflora: *D. uniflora.*

Luna. Hybrid between *D. racemosa* and *D. Veitchii.*

racemosa. Fls. rose-red in effect, marked with purple, about 1½ in. across, in one-sided racemes to 9 in. long. S. Afr.

uniflora. To 2 ft., with 1–5-fld. sts.: fls. to 4 in. across, with scarlet lateral sepals and bright red dorsal sepal whitish within and with short spur, July–Aug. S. Afr.

Veitchii. Fls. rose-lilac, about 2½ in. across. Hybrid of *D. racemosa* and *D. uniflora.*

DISCARIA. *Rhamnaceæ.* Mostly S. American spiny shrubs, but one kind in Australia and another in New Zeal., with small opposite or clustered lvs. or sometimes lacking, axillary fls. and fr. a leathery drupe or caps.; sometimes grown for ornament.

serratifolia. To 12 ft., with pendulous branches, spines to 1 in. long: lvs. to 1 in. long, narrow-oblong: fls. greenish-white, many, ⅛ in. across, fragrant. Chile, Patagonia.

Toumatou. To 15 ft., divaricately much branched, spines 2 in. long: lvs. to ¾ in. long, linear-obovate: fls. many, greenish-white, ⅙ in. across. New Zeal.; grown in S. Calif.

DISCOCACTUS. *Cactaceæ.* Low plants, globose or flattened endwise, with many tubercled ribs, spines clustered at the areoles and usually curved: fls. in a small head from the center of the plant, nocturnal, with a tube, white or pinkish: fr. naked. E. S. Amer. Differs from Cactus in its night-blooming habit and flower-limb of many rather than few segms.; not to be confused with the very different genus Disocactus. See *Cacti.*

Besleri: *D. placentiformis.*

placentiformis (*D.* and *Melocactus Besleri*). Plant depressed, broader than high, blue-green; ribs broad and low, 10–14, radial spines 6 or 7, central usually wanting: fls. somewhat elongated, rose-color. Brazil. —Long in cult. but apparently seldom seen.

DISEASES: see *Fungi and Fungicides:* also *Insects and Insecticides.*

DISK, DISC: a more or less fleshy or elevated development of the receptacle about the pistil; also the receptacle in the head of Compositæ; a flattened extremity, as on tendrils of Virginia creeper.

DISK-FLOWERS: the tubular flowers in the center of heads of Compositæ, as distinguished from the ray-flowers.

DISOCACTUS. *Cactaceæ.* Spineless epiphytic plants with terete st. and flattened often more or less leaf-like branches, of bushy habit: fls. diurnal, near tips of branches, the tube shorter than limb and segms. few. Two species in Cent. Amer.; not to be confounded with Discocactus. See *Cacti.*

biformis (*Cereus* and *Phyllocactus biformis. Epiphyllum biforme*). Becoming pendulous, plant 8 in. or more long; branches ½–¾ in. broad and 3 in. long, serrate: fls. purple-red, about 1½ in. long. Honduras, Guatemala.

DISPHYMA. *Aizoaceæ.* Segregate from Mesembryanthemum (which see for cult.): sts. prostrate: stigmas and fr.-cells 5, with 2-lobed tubercle at opening of each cell. **D. australe** (*M. australe*). Per., rooting at joints: lvs. opposite, oblong, flattened or 3-angled, mostly obtuse: fls. solitary, reddish, 1 in. across. Australia, New Zeal., Pacific Isls. **D. clavellatum** is similar but has somewhat clavate lvs. Australia.

DISPORUM. Fairy Bells. *Liliaceæ.* Per. woods herbs with slender rhizomes, alternate lvs., white or greenish-yellow drooping fls. solitary or in few-fld. umbels, and fr. a berry; sometimes planted in the wild-garden.

lanuginosum. To 2½ ft.: lvs. to 4½ in. long and 2 in. wide: fls. greenish, ¼ in. long: berries red. Ont. to Ga. and Tenn.

oreganum. To 2 ft.: lvs. to 3½ in. long and 2 in. wide, cordate at base: fls. creamy-white, ½ in. long. B.C. to Ida. and Ore.

DISSECTED: divided into many slender segments.

DISTEGIA: *Lonicera involucrata.*

DISTICTIS. *Bignoniaceæ.* Trop. American woody vines with lvs. of 2–3 entire lfts. and often a terminal tendril, purple or pink funnelform fls. in terminal racemes or panicles, and oblong smooth frs.; one species grown in S. Calif.

cinerea: *D. lactiflora.*

lactiflora (*D. cinerea*). Lfts. ovate or oblong, to 2½ in. long, pubescent: fls. purple, to 3½ in. long and limb 2½ in. across, tomentose outside: fr. to 3½ in. long. Mex.

DISTYLIUM. *Hamamelidaceæ.* A few evergreen trees and shrubs native in Asia, diœcious, monœcious or polygamous, with alternate lvs., fls. without petals but with small bracts, borne in axillary racemes; hardy only in warm regions. Propagated by seeds and by layers.

racemosum. To 80 ft., shrubby in cult.: lvs. elliptic, to 3 in. long, entire, dark green and shining above, sometimes with irregular margins: fls. with red anthers, in racemes 2–3 in. long. Japan. Var. **variegatum** has lvs. bordered or splashed yellowish-white.

DITCH-MOSS: *Elodea canadensis.*

DITTANY: *Dictamnus albus.* **Maryland**: *Cunila origanoides.*

DIVIDED: separated to the base.

DIVI-DIVI: *Cæsalpinia coriaria.*

DIZYGOTHECA. False Aralia. *Araliaceæ.* Shrubs or small trees, probably native in the Pacific Isls., with alternate digitately compound lvs., small fls. in umbels, and berry-like frs. The species or names are not well understood.

Tender foliage plants grown in the greenhouse in the juvenile state as pot specimens and seldom coming to flower. A good soil is one composed of equal parts sandy loam and peat or leaf-mold. For propagation see *Polyscias.*

elegantissima (*Aralia elegantissima*). Lvs. of 7–11 thread-like drooping lfts.; petioles mottled with white.

Kerchoveana (*Aralia Kerchoveana*). Lvs. of 7–11 prominently notched lfts. about ½ in. wide; petioles mottled.

Veitchii (*Aralia Veitchii*). Lvs. of 9–11 toothed or wavy-margined lfts. about ¼ in. wide, reddish beneath. Var. **gracillima** has very narrow lfts. with white midribs.

DOCK: *Rumex.* **PRAIRIE**: *Silphium terebinthaceum.*

DOCKMACKIE: *Viburnum acerifolium.*

DOCYNIA. *Rosaceæ.* A few partially or wholly evergreen small trees of farther Asia allied to apples and pears, sometimes planted for ornament and interest in the warmer parts of the U. S., the fruits more or less employed in other countries in cooking: the genus belongs with the Cydonia or quince group bearing several to many seeds in each carpel: lvs. simple, sometimes shallowly lobed: fls. white, in small umbels, appearing before the lvs. or with them, the calyx and pedicels tomentose.

Delavayi (*Pyrus Delavayi*). Evergreen, to 30 ft.: lvs. ovate-lanceolate, entire, to 4 in. long, tomentose underneath: fr. ovoid, about 1 in. long. China.

docynioides. Deciduous or only partially evergreen: lvs. elliptic or broad-lanceolate, often serrate toward apex, to 3 in. long, thinly pubescent becoming glabrous underneath: fr. nearly globose, about 1 in. diam. China.

DODECATHEON. Shooting-Star. American Cowslip. *Primulaceæ.* N. American small per. herbs, of woods, prairies and mts., with basal lvs., nodding cyclamen-like fls. borne in umbels on scapes, the corolla-lobes reflexed, the long slender anthers connivent into a cone.

Sometimes planted, and grown in well-drained soil in a shady place; useful in the wild-garden and some species in the rock-garden. Propagated by division and seeds.

Clevelandii. Lvs. to 2½ in. long: fls. purple with yellow base, varying to white; filaments of stamens purple, anthers yellow. S. Calif.

Hendersoni. Similar to above but anthers deep purple. Calif. to Wash.

integrifolium: *D. Meadia.*

Jeffreyi. Lvs. to 1 ft. or more long: fls. deep red-purple; filaments and anthers purple. Calif. to Ida. and B. C.

latilobum. Lvs. to 10 in. long: fls. yellowish-white; filaments very short, anthers purple. Wash., Ore.

Meadia (*D. integrifolium*). Lvs. to 6 in. long: fls. rose, white at base; filaments reddish-yellow, anthers purple. Pa. to Tex.

radicatum. Lvs. to 5 in. long: fls. rose or reddish; anthers purple. Kans. to N. Mex.

salinum. Lvs. to 1¾ in. long: fls. lilac with yellowish throat, anthers purple. Sask. to Ida. and Utah.

DODONÆA. *Sapindaceæ* (or *Dodonæaceæ*). Small trees and shrubs with alternate simple or sometimes compound lvs.: fls. small, polygamous or diœcious: frs. capsular, winged: sometimes planted for ornament in warm regions. Some species carry medicinal properties, and most of them have resinous sticky excretions. They are native of trop. and semi-trop. regions in both hemispheres.

attenuata. Viscid shrub, somewhat like narrow-lvd. *D. viscosa*, but lvs. linear-cuneate or long and linear, only slightly sinuate-toothed, to 2½ in. long: fls. in short simple racemes. Australia.

cuneata. HOP-BUSH. Shrub, usually viscid: lvs. obovate or cuneate, to 1 in. long: fls. in terminal racemes or axillary clusters. Australia.

madagascariensis. Tree to 14 ft.: lvs. of about 12 pairs of linear-lanceolate lfts. to 1½ in. long. Madagascar.

ptarmicæfolia. Tall shrub, sometimes viscid, young branches angled: lvs. linear-lanceolate and acuminate, to 3 in. long and in some cases more, serrate or entire: fls. in terminal racemes or panicles. W. Australia.

spatulata: considered to be one of the forms of *D. viscosa*.

Thunbergiana. Shrub to 10 ft., glabrous: lvs. lanceolate to linear-lanceolate, to 2½ in. long: fls. in dense racemes. S. Afr.

viscosa. Shrub to 15 ft., viscid: lvs. obovate-oblong to lanceolate, to 4 in. long: fls. in short racemes. Widely distributed in Fla. and W. Indies; a variable species.

DOELLINGERIA: *Aster umbellatus*.

DOGBANE: *Apocynum*.

DOGSTAIL, CRESTED: *Cynosurus cristatus*.

DOGWOOD: *Cornus*.

DOLICHANDRA. *Bignoniaceæ*. One Brazilian climbing shrub, suitable for greenhouse cult. **D. cynanchoides** (*Macfadyena cynanchoides*). Lvs. of 2 oblong entire lfts. to 2 in. long and a 3-parted terminal tendril: fls. red, tubular, to 2½ in. long, stamens long-exserted, calyx split and spathe-like: caps. linear, to 4 in. long.

DOLICHOLUS: *Rhynchosia*.

DOLICHOS. *Leguminosæ*. Mostly twining herbs or subshrubs with trifoliolate lvs., papilionaceous fls. solitary or clustered in the axils, and flattened beaked pods; native in the tropics where several species are grown for human food, as forage and green-manure crops, but in N. Amer. cult. chiefly for ornament. Seeds should be sown in spring where the plants are to stand.

biflorus. Ann. twiner: lfts. 1–2 in. long: fls. yellow: pods to 2 in. long, with gray seeds. India.

Hosei. Forming mats to 6 in. thick: lfts. to 1½ in. long and ¾ in. broad: pods ⅙ in. across. Borneo.—Grown as cover-crop and propagated by cuttings.

japonicus: *Pueraria Thunbergiana*.

Lablab. HYACINTH BEAN. BONAVIST. LABLAB. Per. but grown as ann.: lfts. to 6 in. long and very broad: fls. purple or white: pods to 2½ in. long, with black or white seeds. Probably Old World but widely spread in tropics, and common in cult. Var. giganteus is a large form with white fls. The hort. form Darkness has violet-purple fls. and black seeds and Daylight white fls. and white seeds.

lignosus. Per., evergreen: lfts. to 1½ in. long, triangular-ovate: fls. rose-purple or white in var. alba: pods to 1 in. long, with black seeds. Probably Asia.

sesquipedalis: *Vigna sesquipedalis*.

DOLICHOTHELE. *Cactaceæ*. Three small globose and more or less cespitose Texan-Mexican cacti segregated from Mammillaria, soft in texture and juice not milky, tubercles long: fls. in axils of old tubercles, large, tube funnelform, yellow. See *Cacti*.

longimamma (*Mammillaria longimamma*). Solitary or cespitose, to 4 in. high, tubercles 2 in. long, spines puberulent, the radials 6–12 and centrals 1–3: fls. 2 in. long more or less. Cent. Mex.

sphærica (*Mammillaria sphœrica*). Depressed plant growing in masses that may be 8 in. across, tubercles ½ in. long, more or less, spines glabrous, the radials 12–15 and central solitary: fls. about 2½ in. across when wide open. S. Tex., N. Mex.

DOMBEYA (*Assonia. Astrapæa*). *Sterculiaceæ*. African shrubs or small trees with alternate palmately-veined lvs., showy fls. in cymes or heads, and capsular fr.; ornamental subjects in the tropics and semi-tropics and sometimes grown in the greenhouse. Propagated by seeds, or by cuttings over heat.

calantha. To 12 ft.: lvs. 3–5-lobed, toothed, tomentose beneath: fls. rose, 1½ in. across. Cent. Afr.

Cayeuxii. Hybrid between *D. Mastersii* and *D. Wallichii*: fls. pink, in drooping many-fld. umbels.

Mastersii. To 5 ft.: lvs. toothed, densely tomentose beneath: fls. white, fragrant, in many-fld. umbels. Trop. Afr.

nairobensis. To 6 ft.: lvs. wavy-margined, densely white-tomentose beneath: fls. pink, in umbels. Nairobi.

natalensis. Shrub or small tree: lvs. poplar-like, toothed, becoming glabrous beneath: fls. white, fragrant, in umbels. Natal.

punctata. To 10 ft.: lvs. toothed or angled, tomentose beneath: fls. pink, in umbels. Mauritius, Bourbon.

spectabilis. To 10 ft.: lvs. wavy-margined, densely white- or rusty-tomentose beneath: fls. white, in umbels. Madagascar, trop. Afr.

Wallichii. To 30 ft.: lvs. toothed, densely tomentose beneath: fls. scarlet or pink, in many-fld. very large dense hanging heads. Madagascar, E. Afr.—Commonly planted in warm countries.

DOODIA. *Polypodiaceæ*. Dwarf dense ferns suitable for window-boxes and protected ferneries, with stiff pinnate or pinnatifid lvs.; sori in rows parallel to midrib; native Ceylon to New Zeal.

They are to be protected from strong sunlight, and require an intermediate or cool atmosphere; propagated by spores and sometimes by division. Mostly grown under glass, often under benches. See *Ferns*.

aspera. HACKSAW-FERN. Lvs. pinnatifid, to 1½ ft. long and 4 in. wide, very rough, segms. to 3 in. long. Australia.

caudata. Lvs. pinnatifid or pinnate at base, to 1 ft. long and 2 in. wide, slightly rough, segms. to 1½ in. long. New Zeal., Australia.—Some of the material cult. as *D. aspera* belongs here.

DORITIS. *Orchidaceæ*. One terrestrial Phalænopsis-like orchid native in Burma, Cochin-China and Siam. **D. pulcherrima** (*Phalænopsis Esmeralda*). To 2 ft.: lvs. to 8 in. long and 2 in. wide: fls. violet or purple varying to white, to 1½ in. across, in 10–15-fld. racemes, Sept.–Nov.

DORONICUM. LEOPARDS-BANE. *Compositæ*. Herbaceous perennials: basal lvs. long-petioled, st.-lvs. alternate, often clasping: heads yellow, long-stalked, with one row of ray-fls., showy in spring and summer; pappus of hairs. Native in Eu. and temp. Asia.

Doronicums thrive under the average garden conditions, and are frequent in borders. Increased either by seeds or divisions.

austriacum. To 4 ft., hairy: lvs. toothed, ovate, cordate at base: heads several. Eu.

caucasicum. To 2 ft., somewhat hairy: lvs. coarsely toothed, ovate, cordate at base: heads solitary. Sicily to Asia Minor.

Clusii (*Arnica Clusii*). To 2 ft.: lvs. ovate or oblong, toothed, not cordate at base: heads solitary. S. Eu.

Columnæ: *D. cordifolium.*

cordifolium (*D. Columnæ*). To 5 in., glabrous: lvs. cordate-ovate to ovate-lanceolate, toothed or lobed: heads solitary. S. E. Eu. and W. Asia.

excelsum: *D. plantagineum.*

macrophyllum. To several ft.: lvs. cordate-ovate, coarsely toothed: heads in corymbs. Caucasus, Persia.

magnificum: hort. name.

Pardalianches. To 4 ft., hairy, roots tuberous: lvs. toothed, ovate to oblong, cordate at base: heads 1–5. Eu.

plantagineum (*D. excelsum*). To 5 ft., roots tuberous: lvs. toothed, ovate to oblong: heads 2–4 in. across, solitary. Eu.

DOROTHEANTHUS. *Aizoaceæ.* One of the Mesembryanthemum segregates represented in cult. by one showy flower-garden ann. **D. gramineus** (*M. lineare. M. pyropæum. M. tricolor*). Low densely-fld. clump to 8 in. across, somewhat tubercled: lvs. opposite, more or less fleshy, linear, to 3 in. long: fls. solitary, to 1½ in. across, light pink, rose, white, red, sometimes blue- or red-centered. S. Afr.

DORSAL: back; relating to the back or outer surface of a part or organ.

DORSTENIA. *Moraceæ.* Trop. herbs with basal lvs. and unisexual fls. imbedded in the flat dilated receptacle (something like a fig opened out); grown under glass for botanical study as an example in morphology of the receptacle or torus. Propagated by division or seeds.

Contrajerva. Lvs. to 8 in. long and as broad, deeply lobed or entire, the petioles to 10 in. long: receptacles about 1 in. long and broad, peltate. Trop. Amer.

DORYALIS: *Dovyalis.*

DORYANTHES. Spear-Lily. *Amaryllidaceæ.* Very large succulent plants native in the deserts of Australia, with lvs. in basal rosettes and large red fls. in panicles or heads, the perianth-segms. nearly distinct; occasionally cult. in the S. and Calif. Propagated slowly by suckers.

excelsa. To 18 ft.: lvs. many, sword-shaped, to 4 ft. long: fls. to 4 in. long, in globular heads to 1 ft. across, with green bracts.

Palmeri. To 10 ft.: lvs. sword-shaped, to 6 ft. long and 4 in. broad: fls. 2½ in. long, whitish inside, the heads or spikes in panicles to 3 ft. long, the bracts colored.—Perhaps a var. of *D. excelsa.*

DORYCNIUM. *Leguminosæ.* Herbs or subshrubs from Medit. region and the Canary Isls., somewhat clover-like, with lvs. of 3 or 5 lfts., papilionaceous fls. in heads, and small cylindrical pods. Of easy cult. for ornament. Propagated by seeds or division.

herbaceum. To 2 ft., herbaceous: fls. white marked with dark purple, ½ in. across, May–July. S. Eu.

hirsutum. To 2 ft., shrubby, whole plant white-hairy: fls. white, in heads to 1½ in. across, July–Sept. S. Eu.

rectum. To 2 ft., shrubby: fls. rose-colored, in heads to ¾ in. across, July–Oct. S. Eu.

suffruticosum. To 2 ft., much branched, shrubby, gray-green: fls. white, marked with dark blue, in heads ½ in. across, Apr.–June. S. Eu.

DORYOPTERIS. *Polypodiaceæ.* Small trop. American ferns with lobed or entire attractive fronds, the sori confluent in a marginal line; something like Pteris and requiring similar handling. See *Ferns.*

palmata. Lvs. to 9 in. long and wide, palmately divided into 5 or more triangular lobes, stalks black. W. Indies to Brazil.

DOSSINIA. *Orchidaceæ.* One terrestrial species native in Borneo, suitable for a warm greenhouse. **D. marmorata** (*Anœctochilus marmoratus*). To 14 in.: lvs. to 3 in. long, broadly elliptic, dark green veined and marbled with gold: fls. bright brown tipped with white, about 2 in. long, in many-fld. racemes, July–Oct.

DOUBLE: said of flowers that have more than the usual or normal number of floral envelopes, particularly of petals; full.

DOUGLASIA. *Primulaceæ.* Tufted per. herbs with lvs. in rosettes and yellow or rose fls. in 1–7-fld. umbels terminating the scape; one species grown in the rock-garden. Cult. as for *Androsace.*

Vitaliana (*Androsace* and *Gregoria Vitaliana*). Sts. prostrate, tipped by rosettes of small linear hairy lvs.: fls. yellow, long-tubed, nearly sessile, solitary or 1–2. Alps, Pyrenees.

DOVE-FLOWER: *Peristeria elata.*

DOVE-TREE: *Davidia.*

DOVYALIS (sometimes but not originally spelled *Doryalis*). *Flacourtiaceæ.* Shrubs or small trees, with or without axillary spines, having alternate simple lvs., fls. diœcious, small and inconspicuous, and fr. an edible berry; native in Afr. and Ceylon.

The plants are suitable for subtropical climates, the umkokolo withstanding drought and lower temperatures than the kitambilla. To insure fruit both staminate and pistillate plants must be provided. Propagated by seeds, layering and shield-budding.

caffra (*Aberia caffra*). Kei-Apple. Umkokolo. To 20 ft., with long stiff thorns: lvs. to 2 in. long, often in clusters at base of thorns: fls. greenish: fr. 1 in. diam., yellow, acid, used for pickles and preserves. S. Afr.

hebecarpa (*Aberia Gardneri*). Kitambilla. Ceylon-Gooseberry. To 20 ft., much branched: lvs. to 4 in. long: fr. maroon-purple, 1 in. across, edible. India and Ceylon.

DOWNINGIA. *Lobeliaceæ.* Small annuals from W. N. and S. Amer., on low plains and in valleys, with alternate entire lvs., blue, yellow or white 2-lipped fls. borne in the axils of lvs. or bracts, and fr. a linear caps.; sometimes grown in the flower-garden. Propagated by seeds.

elegans (*Clintonia elegans*). To 7 in.: lvs. oblong to oblong-lanceolate, to ¾ in. long: fls. light blue with white throat marked with green or yellow, the stamen-column long-exserted. Wash. to Calif.

pulchella (*Clintonia pulchella*). To 10 in.: lvs. oblong-ovate, ½ in. long: fls. deep blue with white center of lower lip marked with yellow and purple, stamen-column scarcely exserted. Ore. to Calif.

DOWNY: covered with very short and weak soft hairs.

DOXANTHA. *Bignoniaceæ.* Trop. American woody vines of 2 species, with lvs. of 2 lfts. and a terminal 3-parted claw-like tendril, funnelform 5-lobed fls. solitary or few together, and linear leathery frs. Grown out-of-doors in the S. where it will stand a few degrees of frost, and also in the greenhouse. Propagated by cuttings under glass.

capreolata: *Bignonia capreolata.*

Unguis-cati (*Bignonia Unguis-cati* and *Tweediana. Batocydia Unguis*). CATS-CLAW. Lfts. ovate to lanceolate, 2 in. long: fls. bright yellow, to 3 in. long and 4 in. across: frs. 1 ft. or more long. W. Indies to Argentina.

DRABA. *Cruciferæ.* Many little plants, ann., bien., per., mostly in north temp. and cold regions and in mts., a good number of them adaptable to alpine- and rock-gardens and cool borders: lvs. simple and small, the basal ones commonly forming a rosette, the sts. sometimes devoid of foliage, often with very deep tap-root: fls. small but dainty, white, yellow, rose or purplish, in terminal racemes: fr. a small pod or silicle, often globular or orbicular. The species are variable and difficult of determination.

Propagation is by seed sown a season in advance of blooming in the case of the biennials and perennials, and by division of the tufts.

Aizoon. To 6 in.: lvs. very numerous, broad-lanceolate, strongly ciliate, to ¾ in. long, in rosettes: fls. sulfur-yellow, on hairy scape, in many-fld. racemes. Eu.—Variable.

armata: *D. longirostra.*

athoa. To 4 or 5 in. high: lvs. broad-linear, to ¾ in. long, obtuse, ciliate: fls. yellow, in 8–20-fld. racemes. S. E. Eu.

aurea. Bien. or per., pubescent: lvs. oblanceolate to lanceolate, to 2 in. long, entire or sparingly serrate: fls. yellow to nearly white, in 15–30-fld. racemes. Arctic to Ariz., in several forms.

austriaca (*D. stellata*). Per., cespitose, to 4 in.: basal lvs. narrowly obovate, obtusish, entire or toothed at apex: fls. milk-white. Eu.

azoides. Per., tufted, to 4 in.: lvs. linear and acute, entire, to ½ in. long, in rosettes: fls. yellowish. Medit. region, in mts.

borealis. Cespitose, to 12 in., simple or somewhat branched: lvs. pubescent, ovate to oblong-ovate, to 1 in. long, with 1 or 2 teeth: fls. white. Arctic, Canada, Siberia.

bruniifolia. Per., tufted, to 4 in.: lvs. linear and obtuse, about ¼ in. long, in rosettes: fls. attractive orange. Medit. region, in mts.

cuspidata. Per., densely tufted, to 4 in.: lvs. linear and obtusish, to ½ in. long: fls. purplish. Medit. region, in mts.

Dedeana. Densely cespitose, scape to 2 in. high: lvs. oblong-linear, obtuse, in rosettes, ciliate, about ¼ in. long: fls. white, 3–10 in a raceme. Spain.

diversifolia: one of the many forms of *D. bruniifolia*, from Armenia, the lvs. in rosettes rather broad and deflexed, those on offsets narrow and erect.

fladnizensis. Per., cespitose and cushion-like, 2–3 in. high: basal lvs. oblong, obtusish, mostly entire, to ⅓ in. long or more: fls. greenish-white. Arctic regions, and south in Eu. and Amer. in mts.

hirta. Per. to 10 in., hairy: basal lvs. narrow-lanceolate, sometimes toothed at apex, to ¾ in. long: fls. milk-white. Subarctic Eurasia.

hispanica. Densely cespitose, scape to 2 in. or somewhat more: lvs. in rosettes, linear and acutish, ciliate, to ½ in. or more long: fls. yellow, in 6–15-fld. racemes. Spain, in several forms.

incana. Bien. to 1 ft. high, gray-pubescent: lvs. lanceolate and obtusish, entire or sparsely dentate, to 1 in. long, the basal ones in rosettes: fls. white, sepals often purplish. Far north in Amer. and Eurasia.

lasiocarpa: form or synonym of another species.

laxa: form of *D. norvegica.*

longirostra (*D. armata*). Much like *D. aizoides* but smaller, to 1½ in. high in bloom. lvs. shorter, about ⅓ in. long: fls. yellowish, mostly 3–6 in a raceme. S. Eu., in many forms.

norvegica (*D. laxa. D. scandinavica*). Per. to 6 or 8 in.: lower lvs. oblong-lanceolate, acute, entire or few-toothed at apex, ciliate on margin, to 2 in. long: fls. white. Subarctic.

olympica. Per., cespitose and cushion-like, 2–4 in.: lvs. linear and obtusish, lightly ciliate, ¼ in. long: fls. orange, rather large. Medit. region.

pyrenaica: *Petrocallis pyrenaica.*

repens: *D. sibirica.*

rupestris. Per., forming tufts 1 in. or so broad, with very slender sts. with a single lf. or none, somewhat hairy: lvs. membranaceous, linear-lanceolate, entire or toothed at apex: fls. small, white. N. Eu.

scandinavica: *D. norvegica.*

sibirica (*D. repens*). Plant soft, green, the slender sts. more or less prostrate and sometimes 12 in. long: lvs. scarcely in rosettes, oblong-lanceolate, acute, entire, somewhat hairy: fls. yellow, on ascending sts. Siberia, Caucasus.

stellata: *D. austriaca.*

Sundermannii: listed name.

verna. WHITLOW-GRASS. Ann., 2–3 in. high, mostly in winter and blooming in spring: fls. small, white, the petals 2-cleft. Eu.; nat. in N. Amer.—Very variable; by some authors separated in the genus Erophila.

DRACÆNA. DRACENA. *Liliaceæ.* Trees and shrubs grown in the greenhouse, and out-of-doors in the S., for the handsome often vari-colored foliage; fls. rather small, in small clusters, borne in panicles. For cult. see *Cordyline*, to which most of the so-called dracenas belong and from which the genus differs in technical carpellary and floral characters.

amabilis: *Cordyline amabilis.*

australis: *Cordyline australis.*

Baptistii: a form of *Cordyline terminalis.*

Bruantii: a form of *Cordyline rubra.*

Cantleyi: an unidentified hort. name.

concinna. To 6 ft.: lvs. oblanceolate, the margins purple. Madagascar.

deremensis. To 15 ft.: lvs. to 2 ft. long and 2 in. broad: fls. dark red outside and white inside. Trop. Afr. Var. Warneckii is mostly grown.

Doucetii: a form of *Cordyline australis.*

Draco DRAGON-TREE. To 60 ft.: lvs. to 2 ft. long and 1¾ in. across, glaucous: fls. greenish: berries orange. Canary Isls.—Planted in Calif.

ensifolia: *Dianella ensifolia.*

fragrans. To 20 ft.: lvs. to 3 ft. long and 4 in. across: fls. yellowish, fragrant. Upper Guinea. Var. Lindeni has creamy-white bands on lvs. and var. Massangeana a broad yellow stripe down center. Var. canariensis is a hort. name.

Godseffiana. Lvs. to 5 in. long and 2½ in. or less across, irregularly spotted with white: fls. greenish-yellow. Upper Guinea.

Goldieana. Lvs. to 9 in. long and 5 in. across, with cross bars of gray and bright green: fls. white, in dense heads. Upper Guinea.

gracilis: an unidentified hort. name.

hybrida: hort. form of *Cordyline terminalis.*

imperialis: form of *Cordyline terminalis*

indivisa: *Cordyline indivisa.*

Kellerii: hort. form of *D. Godseffiana.*

Knerkii: form of *D. fragrans* with glossy light green lvs.

letigenosa: an unidentified trade name.

Lindeni: *D. fragrans* var.

Mandeana (**Mandaiana**?): a trade name.

Massangeana: *D. fragrans* var.

Rothiana: a garden form of *D. fragrans.*

rubra: *Cordyline rubra.*

Sanderiana. Lvs. to 9 in. long and 1¼ in. across, with broad margins of white. Cameroons.

Shepherdi: listed name.

stricta: *Cordyline stricta.*

terminalis: *Cordyline terminalis.*

tricolor: *Cordyline terminalis.*

Veitchii: *Cordyline australis* var.

Victoria: garden form of *D. fragrans.*

Youngii: form of *Cordyline terminalis.*

DRACENA: *Dracæna, Cordyline.*

DRACOCEPHALUM. DRAGONHEAD. *Labiatæ.* Hardy ann. or per. herbs, mostly erect, with entire, toothed or deeply cut lvs. and purple, blue or seldom white 2-lipped fls. in whorls axillary or in terminal spikes. Sometimes grown in borders and flower-gardens.

Dragonheads prefer a rather moist partially shady position and moderately rich sandy loam. Propagated by seeds or by division.

argunense: synonym of *D. Ruyschiana.*

austriacum. Per. to 1½ ft., somewhat hairy: lvs. cleft into 3–5 very narrow revolute lobes: fls. blue, 1½ in. long. Eu., Caucasus.

botryoides. Per. to 6 in., soft-pubescent: lvs. small, ⅓ in. across, round-ovate, deeply 5–7-lobed: corolla pubescent, in whorls that are aggregated into a head. Caucasus.

bullatum. Per. to 10 in., hairy: lvs. cordate-ovate or -elliptic, crenate, to 2 in. long and nearly as broad: fls. bright blue, lower lobe somewhat darker. China.

canariense: *Cedronella canariensis.*

Forrestii. Per. to 1½ ft., leafy: lvs. pinnatisect with 2 or 3 pairs of lobes, or 3-parted, the segms. ¾ in. long, revolute, white-hairy underneath: fls. blue-purple, in whorls. China.

grandiflorum. Per. to 1 ft.: lvs. oblong or ovate, basal lvs. notched at base: fls. blue, hairy, 2 in. long, in spikes to 3 in. long, June–July. Siberia.

Isabellæ. Per. to 2 ft.: lvs. deeply divided into 5–7 linear entire segms. to 1 in. long: fls. purple-blue, to 2 in. long, hairy, in spikes to 4 in. long. China.

japonicum: *D. Ruyschiana* var.

Moldavica (*Moldavica suaveolens*). Ann. to 2 ft.: lvs. lanceolate, to 1½ in. long, toothed: fls. blue or white, 1 in. or less long, in long leafy racemes, July–Aug. Eu., N. Asia.

nutans. Per. to 1 ft.: lvs. ovate or oblong, to 2 in. long, coarsely toothed: fls. bright blue, ½ in. long, sometimes drooping, in spikes to 6 in. long. Cent. Asia.

parviflorum (*Moldavica parviflora*). Ann. or bien. to 2½ ft.: lvs. lanceolate to ovate, to 3 in. long, toothed: fls. light blue, scarcely longer than calyx, in short dense spikes. N. Amer.

peregrinum. Decumbent, branches ascending: lvs. lanceolate, entire or with few teeth: fls. blue, in racemes to 1½ ft. long, July. Siberia.

Ruyschiana. Per. to 2 ft.: lvs. linear-lanceolate, to 2 in. long, entire: fls. blue or bluish and in var. japonicum white shaded with blue, 1 in. long, hairy, in short spikes. Siberia.

speciosum. Per. to 1½ ft.: lvs. orbicular, to 4 in. long, wavy-toothed, pubescent beneath and wrinkled: fls. purplish to deep purple, 1 in. long, hairy, in dense heads, June–July. Himalayas.

tanguticum. To 2 ft.: lvs. pinnatisect into 2–3 pairs of long-linear lobes: fls. blue, 1 in. long, in interrupted spikes. Mongolia.

thymiflorum. Ann., lightly pubescent, sts. erect and simple, to 18 in.: lvs. orbicular-ovate, cordate, serrate or entire: fls. light purplish, in many-fld. whorls forming a long raceme. Eu., Asia.

virginianum: *Physostegia virginiana.*

DRACOPIS: *Rudbeckia amplexicaulis.*

DRACUNCULUS. *Araceæ.* Tuberous herbs native in the Medit. region, bearing pedately dissected lvs. and unisexual fls. on spadices surrounded by spathes; of very offensive odor when in bloom and grown only as a curiosity in the greenhouse or in the open far S.

vulgaris (*Arum Dracunculus*). Lvs. of 13–15 segms. from a bow-shaped base, the petioles about 1 ft. long: spathes with purple limb to 1 ft. long, the tube striped purple.

DRAGONHEAD: *Dracocephalum.* False: *Physostegia.*

DRAGON-ROOT: *Arisæma Dracontium.*

DRAGON-TREE: *Dracæna Draco.*

DRIMYS (*Drymis* is a later spelling). *Magnoliaceæ.* About a dozen aromatic glabrous trees and shrubs in the southern hemisphere: lvs. alternate, bearing pellucid dots: fls. small in ours, solitary or fascicled; petals spreading, 5 or more: fr. of 1 or more indehiscent berries.

axillaris. To 25 ft. or more, with black bark: lvs. narrow-ovate to oblong, to 5 in. long, obtuse, mostly coriaceous, greenish-yellow, the petals linear. New Zeal.; intro. in Calif.

DROPWORT: *Filipendula hexapetala.*

DROSANTHEMUM. *Aizoaceæ.* Segregate from Mesembryanthemum: per., sometimes woody at base, branching and spreading or diffuse, the sts. hispid or rough with small pustules: lvs. small, cylindric or somewhat angled, glistening: fls. solitary, white, rose, violet or reddish; stigmas 4–6. S. Afr. For cult. see *Mesembryanthemum.*

candens (*M. candens*). Sts. or branches to 2 ft. or more, rooting, very slender: lvs. to ½ in. long: fls. small, violet or pinkish, terminating short lateral leafy branches.

floribundum (*M. floribundum*). Branches short, somewhat decumbent: lvs. to about 1 in. or less, cylindrical, obtuse: fls. rose, on peduncles 1 in. or more long.

DROSERA. SUNDEW. *Droseraceæ.* Insectivorous usually per. herbs with basal lvs. covered with glandular hairs, and small white, pink or red fls. in a one-sided raceme terminating the scape; occasionally grown for botanical study and sometimes in rock-gardens; native in moist or swampy places.

The sundews are planted under glass in pots containing moist loam and sphagnum. They require abundant moisture and sunlight. Propagated by seeds, division of shoots and root-cuttings.

filiformis. Lvs. linear and thread-like, to 8 in. long, with purple hairs: fls. bright purple or rarely white, on scapes to 2 ft. high. Mass. to Fla. and Miss.

longifolia. Lvs. with long petioles and spatulate hairy blades to 1¼ in. long: fls. white, on scapes to 1 ft. high. N. Amer., N. Eu., Asia.

rotundifolia. Lvs. with flat petiole and round hairy blades to 1½ in. long: fls. white to red, on scapes to 10 in. high. N. Amer., Eu., Asia.

DROSERACEÆ. SUNDEW FAMILY. Four widely distributed genera of herbs with lvs. in basal rosettes which are glandular-hairy and insectivorous, bisexual fls. having 4–5 sepals, 5 petals, 4–20 stamens, superior 1-celled ovary, and capsular frs. Dionæa and Drosera are sparingly cult.

DRUPE: a fleshy 1-seeded indehiscent fruit, with seed inclosed in a stony endocarp; stone-fruit, as peach, cherry.

DRUPELET: one element in a fruit made up of aggregate little drupes, as in the raspberry.

DRYANDRA. *Proteaceæ.* Shrubs of extratrop. W. Australia, two or more intro. in Calif.: lvs. alternate, mostly sinuate or pinnatifid and sometimes pinnate, often prickly-toothed: fls. in dense heads, mostly yellow, the head sitting in an involucre of scale-like bracts and attended by foliage lvs.: fr. a caps., usually hairy.

floribunda. Bush to 8 ft.: lvs. nearly or quite sessile, cuneate or obovate, undulate and prickly, mostly less than 1 or 2 in. long: fl.-heads small, terminal, involucre not ½ in. long; fls. nearly 1 in. long, silky.

formosa. Erect shrub to 15 ft.: lvs. to 8 in. long, divided to midrib: fl.-heads large, terminal, involucre to 1½ in. diam.; fls. to 1½ in. long, more or less silky.

DRYAS. *Rosaceæ.* Evergreen creeping plants somewhat shrubby at base, with alternate lvs., white or yellowish solitary showy fls., and fr. an achene with feathery style or tail; native in high northern parts of northern hemisphere and on mts., suitable for rock-gardens; they make a rather close ground-cover and send up peduncles a few inches high. Propagated by cuttings, division, or seed.

Drummondii. Lvs. oblong, to 1½ in. long, white-tomentose beneath: fls. yellowish, about ¾ in. across, nodding: fruiting styles to 1½ in. long. N. N. Amer.

lanata: woolly-lvd. form of *D. octopetala*, from S. Eu.

octopetala. Lvs. elliptic or oblong, to 1 in. long, white-tomentose beneath: fls. white, 1–1½ in. across, erect: fruiting styles 1 in. long. N. N. Amer., N. Eu., N. Asia.

Suendermanni. Hybrid between *D. octopetala* (staminate) and *D. Drummondii:* fls. yellowish in bud, white in full bloom and nodding.

DRYMIS: *Drimys.*

DRYMOCALLIS: *Potentilla.*

DRYMOPHLŒUS: D. Normanbyi is *Normanbya Normanbyi;* **D. singaporensis** is *Ptychoraphis.* The genus Drymophlœus is retained for other species, but is not known to be represented in the U. S.

DRYNARIA: *Polypodium.*

DRYOPTERIS (*Lastrea. Nephrodium. Thelypteris. Aspidium* in part). Wood-Fern. *Polypodiaceæ.* Both temp. and trop. ferns with compound foliage; sori borne on veins with or without indusia. Many of them are woodsy plants native in the U. S. and Canada and are sometimes transferred to grounds. The greenhouse species require no special treatment. See *Ferns.*

acrostichoides: *Polystichum acrostichoides.*

aculeata: *Polystichum aculeatum.*

arguta: see *D. rigida.*

Boottii (*Aspidium Boottii*). Lvs. to 2½ ft. long and 5 in. wide, 2–3-pinnate, segms. finely toothed. N. S. to Minn. and Va.; probably a hybrid between *D. cristata* and *D. spinulosa* var. *intermedia.*

chrysoloba. Lvs. to 9 in. long and 4 in. wide, 2-pinnate, segms. entire. Brazil, Colombia.

Clintoniana: *D. cristata* var.

cristata (*Aspidium cristatum*). Lvs. to 2½ ft. long and 6 in. wide, 2-pinnatifid, segms. finely toothed. Newf. to Va. and Neb., Eu., Asia. Var. **Clintoniana** (*D. Clintoniana*) has broader lvs.

decomposita. Lvs. to 1½ ft. long and 1 ft. wide, 2–3-pinnate, segms. toothed, pubescent. New Zeal., Australia.

dentata (*D. mollis. D. parasitica. Aspidium violescens*). Downy W. Lvs. to 3 ft. long and 1 ft. wide, 1-pinnate, the segms. pinnatifid and entire, hairy. Tropics.

dilatata: *D. spinulosa* var.

Dryopteris: *D. Linnæana.*

erythrosora. Lvs. to 1½ ft. long and half as wide, 1-pinnate, segms. pinnatifid, toothed: fruit-dots red when young. China, Japan.—Some of the material cult. as *D. chrysoloba* belongs here.

Filix-mas (*Aspidium Filix-mas*). Male-Fern. Lvs. growing in crowns, nearly evergreen, to 4 ft. long and 1 ft. wide, 2-pinnate, segms. toothed or cut. N. Amer., Eu.—There are crisped, crested, forked, dwarf forms.

Goldiana (*Aspidium Goldianum*). Goldie-Fern. Lvs. in large crowns, to 4 ft. long and 1½ ft. wide, 2-pinnate, segms. toothed, dark green above. N. B. to N. C. and Tenn.

hexagonoptera (*Polypodium hexagonopterum. Phegopteris hexagonoptera*). Winged W. Lvs. triangular, to 15 in. long and broad, 1-pinnate into pinnatifid wavy-toothed segms.; sori without indusia. Que. to Fla. and La.

hirtipes. Lvs. stiff, to 3 ft. long and 16 in. wide, 1-pinnate into segms. cut one-third to midrib, stalks black-scaly. India.

intermedia: *D. spinulosa* var.

Linnæana (*Phegopteris* and *Polypodium Dryopteris*). Oak-Fern. Lvs. triangular, to 11 in. each way, 2-pinnate, segms. entire or wavy-toothed; sori without indusia. N. N. Amer., Eu., Asia.

marginalis (*Aspidium marginale*). Leather W. Lvs. in crowns, to 2½ ft. long, 2-pinnate, segms. entire or lobed. N. S. to Ga. and Kans.

mollis: *D. dentata.*

noveboracensis (*Aspidium noveboracense*). New-York-Fern. Lvs. pale green, to 2 ft. long and 7 in. wide, 1-pinnate, segms. deeply pinnatifid. Newf. to Ga. and Ala.

oreopteris (*Polystichum montanum*). Mountain W. Lvs. to 3 ft. long and 8 in. wide, 1–2-pinnate, segms. nearly entire. Wash. to Alaska, Eu., Japan.

parasitica: *D. dentata.*

pennigera (*Polypodium pennigerum*). Lvs. to 5 ft. long and 1½ ft. wide, 1-pinnate into deeply cut nearly entire segms. New Zeal., Polynesia.

Phegopteris (*Polypodium Phegopteris. Phegopteris polypodioides*). Long or Narrow Beech-Fern. Lvs. triangular, to 9 in. long and 8 in. wide, 1-pinnate into deeply pinnatifid nearly entire segms.; sori without indusia. N. N. Amer., Eu., Asia.

rigida (*Aspidium rigidum*). Lvs. to 2 ft. long and 1 ft. wide, 2-pinnate, segms. toothed or cut. Eu., W. N. Amer.—The American plant is separated as *D. arguta.*

Robertiana (*Phegopteris Robertiana*). Northern Oak-Fern. Scented Oak-Fern. Limestone Polypody. Stalks and lvs. minutely glandular beneath, lvs. to 8 in. long and 7 in. wide, 2–3-pinnatifid; sori without indusia. N. N. Amer., Eu.

spinulosa (*Aspidium spinulosum*). Toothed W. Lvs. to 1½ ft. long and 9 in. wide, 2-pinnatifid into deeply cut segms. N. Amer., Eu., Asia. Var **intermedia** (*D. intermedia*) has indusia with marginal glands. Var. **dilatata** has 3-pinnate lvs.

Thelypteris (*Aspidium Thelypteris. Thelypteris palustris*). Marsh-Fern. Rootstock creeping: lvs. to 2½ ft. long and 6 in. wide, 1-pinnate into deeply pinnatifid segms., margins revolute. N. Amer., Eu., Asia.

viridescens. Glossy W. Lvs. to 2 ft. long, 3-pinnate, segms. toothed, stalks shining. Japan.

DUCHESNEA. Indian- or Mock-Strawberry. *Rosaceæ.* Asian per. herbs with trailing often rooting branches, long-stalked 3-parted lvs., yellow solitary fls., and fr. composed of achenes borne on a dryish receptacle; used as ground-cover and for hanging baskets.

indica (*Fragaria indica*). Lfts. ovate, coarsely toothed: fls. ½–1 in. across: fr. red, surrounded by large persistent calyx. India; nat. in N. Amer.—Looks like a strawberry.

DUCKWEED: *Lemna.*

DUCKWHEAT: *Fagopyrum tataricum.*

DUDLEYA. *Crassulaceæ.* Succulent perennials related to Cotyledon and Echeveria, native from Ore. to Lower Calif. and Ariz., mostly near the coast: with or without erect fl.-sts., usually not making offsets: lvs. flat, linear to ovate, forming prominent basal clumps or rosettes, the st.-lvs. smaller and sessile or clasping: fls. commonly in panicles, yellow, orange, red, or seldom white; corolla nearly cylindric, the segms. united below the middle and the tips erect or spreading. Useful and attractive plants, of some 60 species, for colonizing, in the regions in which they grow.

cæspitosa (*Cotyledon cæspitosa*). Stemless, green or perhaps glaucous: lvs. ovate-oblong to nearly lanceolate, to 3 in. or more long, in mostly rather loose rosettes, those on scapes more or less triangular and small: fls. yellow or pale, about ½ in. long, in cyme on scapes to 1½ ft. or more high. Calif.

densiflora: *Stylophyllum densiflorum.*

farinosa (*Cotyledon* and *Echeveria farinosa*). Sts. low, rootstock short: basal lvs. tongue-shaped, flat and white-mealy; st.-lvs. sagittate: fls. lemon-yellow, on slender pedicels in rather open cymes. Coasts, Calif.

lanceolata (*Cotyledon* and *Echeveria lanceolata*). Green or somewhat glaucous: fl.-sts. to 2 ft.: basal lvs. lanceolate and long-acuminate, to 6 in. long; st.-lvs. cordate or sagittate: fls. reddish-yellow, about ½ in. long. S. Calif.

laxa (*Cotyledon* and *Echeveria laxa*). Glaucous or yellowish-green: fl.-sts. to 2 ft.: lvs. ovate to lanceolate, acute, to about 3 in. long: fls. yellow, deeply parted, ½ in. long, in loose lax cyme. S. and Cent. Calif.

lurida (*Cotyledon lurida*). Not glaucous, lvs. becoming bronzed: fl.-sts. to 20 in., purplish: lvs. lance-acuminate, to 6 in. long: fls. reddish, to about ½ in. long, in panicles. S. Calif.

Plattiana (*Cotyledon Plattiana*). Somewhat glaucous: fl.-sts. to 8 in. long: lvs. oblanceolate, to 4 in. long: fls. reddish, about ⅓ in. long, in short somewhat flat-topped infl. Cent. Calif.

pulverulenta (*Cotyledon* and *Echeveria pulverulenta*). Mealy all over: fl.-sts. to 2½ ft.: lvs. broadly spatulate, to 3½ in. long, those on st. broadly ovate and clasping: fls. red, above ½ in. long, in racemes. S. Calif.

septentrionalis. White-powdery: fl.-sts. about 3 in. long: lvs. in compact rosettes, ovate, 1 in. broad: fls. pale yellowish-green, short and broad, in a very compact cyme. N. Calif.

DUGALDIA: *Helenium Hoopesii.*

DUGGENA. *Rubiaceæ.* Shrubs or small trees with opposite lvs., small salverform fls. in terminal spikes, racemes or panicles, and berry-like frs.; one species intro. in S. Calif.

hirsuta (*D. spicata*). To 10 ft.: lvs. ovate to lanceolate, to 7 in. long, pubescent or becoming glabrous: fls. white, ½ in. long, in spike-like panicles to 16 in. long: fr. white or blue. W. Indies, N. S. Amer.

spicata: *D. hirsuta.*

DURANTA. *Verbenaceæ.* Shrubs and trees with opposite or whorled lvs., small fls. in terminal racemes, and drupe-like frs.; one species (*D. repens*) is commonly planted in warm regions and sometimes under glass. Propagated by seeds and cuttings in spring.

Lorentzii. Shrub to 10 ft. with drooping branches: lvs. ovate, small and leathery, toothed toward apex: fls. white. Argentina.

Plumieri: *D. repens.*

repens (*D. Plumieri*). PIGEON-BERRY. SKY-FLOWER. Shrub or tree to 18 ft., sometimes spiny and often with drooping or trailing branches: lvs. ovate to obovate, to 4 in. long, entire or coarsely toothed: fls. lilac, to ½ in. across: fr. yellow, to ½ in. across. Fla. to Brazil. Var. **alba** has white fls. and **variegata** variegated lvs.

stenostachya. Shrub to 15 ft.: lvs. oblong-lanceolate, to 8 in. long, entire or toothed: fls. lilac, ½ in. across: fr. yellow, ⅓ in. across. Brazil.

DURIAN: *Durio.*

DURIO. *Bombacaceæ.* Malayan trees with entire leathery lvs., fls. in cymes, and large spiny frs.

The durian is grown sparingly in the western tropics, not being hardy in continental United States. It does best in deep rich soil with plenty of moisture. Propagated by seeds, and superior strains by budding on seedling stocks.

zibethinus. DURIAN. To 80 ft.: lvs. obovate-oblong, to 7 in. long: fls. whitish: fr. oval, to 8 in. long, with custard-like pulp of disagreeable odor.

DURRA: *Holcus Sorghum* var. *Durra.*

DUSTY MILLER: *Artemisia Stelleriana, Centaurea Cineraria* and *gymnocarpa, Lychnis Coronaria, Senecio Cineraria* and *leucostachys.*

DUTCHMANS-BREECHES: *Dicentra Cucullaria.*

DUTCHMANS-PIPE: *Aristolochia durior.*

DUVALIA. *Asclepiadaceæ.* Succulent little leafless herbs in Afr., one or more intro. in Calif. and perhaps elsewhere: sts. thick and angled, teeth tipped: fls. near base or middle of young sts., mostly in small clusters; corolla rotate and deeply 5-lobed; corona double.

Corderoyi (*Stapelia Corderoyi*). Sts. 1¼ in. or less long from one crown, oblong or nearly globose, tinged purple in sun: fls. 2 to 4, olive-green with darker tips and bearing purple hairs toward base, to 2 in. diam.; outer corona brick-red, inner one buff. S. Afr.

DYCKIA. *Bromeliaceæ.* Stemless succulent or thick herbs with stiff spiny-margined lvs. in basal rosettes and yellow or orange fls. in racemes or panicles; native in S. Amer. and occasionally planted in Fla. or Calif. Cult. as for *Bromeliaceæ.*

rariflora. Lvs. to 6 in. long and ⅙ in. wide: fls. orange, ⅓ in. long, the infl. to 1½ ft. Brazil.

sulphurea. Lvs. to 8 in. long and ¾ in. wide: fls. yellow, ⅓ in. long, the infl. to 1 ft. high. Brazil.

DYERS-GREENWEED: *Genista tinctoria.*

DYPSIS: see *Chrysalidocarpus madagascariensis.*

DYSCHORISTE (*Calophanes*). *Acanthaceæ.* Per. Ruellia-like herbs widely distributed in warm regions: lvs. opposite, entire: fls. irregular, bracted, in cymes.

linearis. To 1½ ft.: lvs. linear to spatulate, to 2½ in. long: fls. violet spotted with purple, 1 in. long. Tex. to N. Mex.—Sometimes transferred to grounds.

DYSOXYLUM. *Meliaceæ.* Large trees of which one has been intro. into Calif. for ornament, native from trop. Asia to New Zeal.: lvs. alternate, pinnate: fls. in loose axillary panicles: fr. a leathery caps.

spectabile. To 50 ft.: lvs. of 3–4 pairs of ovate-oblong entire lfts. to 7 in. long: fls. waxy-white, 1½ in. across, in drooping panicles to 1½ ft. long: caps. 1 in. long. New Zeal.

E

EASTER BELLS: *Stellaria Holostea.*

EBENACEÆ. Ebony Family. Trees or shrubs of some 6 genera in warm and temp. regions of both hemispheres, with very hard wood, alternate entire lvs., regular unisexual or bisexual gamopetalous fls. having prominent 3–7-lobed calyx and corolla, 2–3 times as many stamens as corolla-lobes, superior ovary with 2–8 styles, and fr. a berry. Diospyros is grown for the edible frs. of some species and for the ornamental character of others, and Maba and Royena for ornament.

EBENUS. *Leguminosæ.* About a score of herbs or subshrubs of E. Medit. region and W. Asia, one of which is intro. in Calif.: lvs. simple, digitate, or odd-pinnate: fls. papilionaceous, in colored clover-like heads: pod small and included in the calyx, seeds 1 or 2. **E. cretica** is somewhat shrubby, to 2 ft.: lfts. 3 or more, narrowly oblong: heads more or less cylindrical, red or purplish. Crete. See *Maba.*

EBONY FAMILY: *Ebenaceæ.*

EBONY, MOUNTAIN: *Bauhinia variegata.*

ECBALLIUM. *Cucurbitaceæ.* One monœcious per.-rooted herb of the Medit. region, more or less trailing or prostrate but without tendrils, planted sometimes for the interest of its odd frs.: fls. yellow, pistillate solitary, staminate racemose. It grows readily from seeds. **E. Elaterium** (*Momordica Elaterium*). Squirting-Cucumber. Hairy-pubescent and grayish: lvs. triangular-ovate, to 4 in. long, angled or obscurely lobed: fr. oblong, to 2 in. long, rough-hairy, squirting the seeds when detached.

ECCREMOCARPUS (*Calampelis*). Glory-Flower. *Bignoniaceæ.* Climbing shrubs from Peru and Chile with pinnate lvs. terminated by a branching tendril, tubular yellow, orange or scarlet fls. in terminal racemes, and fr. an ovoid caps.; grown as an ann. in the N. and per. where it is hardy.

scaber. Woody, climbing to 12 ft. but sometimes treated as an herb and blooming first year from seed: lvs. 2-pinnate into ovate entire or toothed lfts. to 1¼ in. long: fls. orange-red, 1 in. long, in racemes to 6 in. long, with small lobes: fr. 1½ in. long. Chile. Var. **aureus** has golden-yellow fls., **carmineus** carmine-red, and **coccineus** scarlet.

ECHEVERIA. *Crassulaceæ.* American succulents with broad lvs. in rosettes and fls. in spikes, racemes or panicles, the strongly angled corolla with short tube that little if at all exceeds the calyx. By some authors the genus is included in Cotyledon. For cult. see *Sempervivum* and *Succulents;* grown in pots and frequently planted out. The plants have the habit of Sempervivums.

agavoides: *Urbinia agavoides.*

Cooperi: presumably *Cotyledon Cooperi.*

farinosa: *Dudleya farinosa.*

gibbiflora (*Cotyledon gibbiflora*). To 2 ft.: lvs. obovate-spatulate, to 7 in. long, becoming pinkish: fls. red. Mex. Var. **metallica** has glaucous-purple foliage with metallic luster.

glauca (*E. secunda* var. *glauca*). Lvs. nearly orbicular, ¾ in. across, pale and glaucous, with purple point: fls. pinkish outside, yellow inside, the flowering branches reddish. Mex.

Hoveyi (*Cotyledon Hoveyi*). Nearly stemless, but fls. on an elongated peduncle or scape: lvs. long-spatulate forming a basal rosette, margined: fls. 6–12, racemose, pinkish. Origin unknown; perhaps a cultigen.

lanceolata: *Dudleya lanceolata.*

laxa: *Dudleya laxa.*

metallica: *E. gibbiflora* var.

multicaulis. To 3 ft.: lvs. to 8 in. long and ¾ in. wide: fls. reddish, yellowish inside, the flowering branches rose-colored. Mex.

pulverulenta: *Dudleya pulverulenta.*

secunda (*Cotyledon secunda*). Lvs. obovate, with very short sharp point, glaucous-blue, reddish at margins: fls. reddish, on scapes to 15 in. tall. Mex.

Weinbergii: *Byrnesia Weinbergii.*

ECHIDNOPSIS. *Asclepiadaceæ.* Leafless succulent plants of trop. Afr. and Arabia allied to Stapelia, the stout branching sts. tubercled: fls. fleshy, 5-lobed, yellow or purple-brown, small, in fascicles or sometimes solitary. **E. Dammanniana** is offered: sts. to ¾ in. thick, grayish-green or purplish-green, 8–10-angled: fls. 2–5 together or solitary; corolla dark purple-brown, about ⅓ in. across. Nile Land.

ECHINACEA (*Brauneria*). Coneflower. *Compositæ.* N. American coarse herbaceous perennials with thick black roots of pungent taste and alternate simple lvs.: heads large and showy, solitary and terminal, ray-fls. purple or rose or yellow, disk-fls. green or purple, becoming conical; pappus a short crown.

The coneflowers are easily cultivated in the border or wild-garden. Propagated by division but this should not be practiced too frequently; also by seed.

angustifolia. To 2 ft., hairy: lvs. lanceolate or linear-lanceolate, to 8 in. long, entire: heads light purple, rays about 1 in. long, spreading, the fruiting disk often 1 in. high. Sask. to Tex.

pallida (*Rudbeckia pallida*). To 3 ft., hairy: lvs. linear-lanceolate, to 8 in. long, entire: heads rose-purple to nearly white, rays to 3 in. long, drooping. Ill. to Tex.

purpurea (*Rudbeckia purpurea*). Purple C. To 5 ft.: lvs. ovate or ovate-lanceolate, to 8 in. long, usually toothed: heads purple varying to white, rays to 3 in. long, spreading or drooping. Pa. to Ga. and La.

ECHINOCACTUS. *Cactaceæ.* More than 1,000 names have been applied in this genus, but it is now restricted to about 9 species: plants thick, sometimes very large, many- or several-ribbed, cylindric, the large areoles very spiny: fls. on the crown, yellow or pink, often immersed in wool; axils of scales on ovary and fr. woolly: fr. white-woolly. S. W. U. S. and Mex. See *Cacti*.

Various kinds of echinocacti and closely related genera are favorites for pot and tub culture and for plunging in the open in summer. They are propagated by seeds as they do not branch nor readily produce offsets. Seeds are sown in late spring or early summer. Under glass they may require pollination to produce seeds. In winter, the plants may be placed in a light dry greenhouse and kept fairly dormant; in spring and summer water may be supplied liberally to established plants.

acanthodes: *Ferocactus acanthodes.*

albatus: of doubtful application in the trade.

anfractuosus (*Echinofossulocactus anfractuosus*). Simple, 4–5 in. tall and half as thick, dull green, ribs many, radial spines 7 and central solitary, curved: fls. purple, segms. white-margined. Mex.

Beguinii: *Neolloydia Beguinii.*

bicolor: *Thelocactus bicolor.*

capricornis: *Astrophytum capricorne.*

conoideus: *Neolloydia conoidea.*

coptonogonus (*Echinofossulocactus coptonogonus*). Perhaps cespitose, globular or somewhat depressed, to 4 in. high, ribs 10–14, spines 3–5 and stout: fls. about 1 in. long and broader when open, purple, segms. white-margined. Mex.

crispatus (*Echinofossulocactus crispatus*). Obovoid and somewhat depressed at apex, 5 in. or more high, ribs about 25, spines 10 or 11 and rigid: fls. rather small, purple or white with purple stripes. Mex.

cylindraceus: *Ferocactus acanthodes.*

denudatus: *Gymnocalycium denudatum.*

disciformis: *Strombocactus disciformis.*

gibbosus: *Gymnocalycium gibbosum.*

glaucescens: *Ferocactus glaucescens.*

Grusonii. A few inches to 4 ft. or more high, to 2½ ft. diam., light green, ribs 21–37, spines golden-yellow when young but becoming whitish, the radials 8–10: fls. yellow, brownish outside, imbedded in a felt-like cushion, opening in sunlight. Cent. Mex.

hamatacanthus: *Ferocactus hamatacanthus.*

heteracanthus (*E. tetraxiphus. Echinofossulocactus heteracanthus*). Globose or short-cylindric, light green, closely covered with spines, ribs 30–34, radials 11–13, centrals 4: fls. greenish-yellow. Mex.

heterochromus: *Thelocactus Pottsii.*

hexædrophorus: *Thelocactus hexædrophorus.*

horizonthalonius. Not large, globular or short-cylindric, to 10 in. high, glaucous, ribs commonly 8, spines 6–9 and to 1½ in. long and reddish or blackish at base, central solitary: fls. pale rose or pink, 2 in. or more long and of greater breadth when expanded. W. Tex. to Ariz. and Mex.

humilis: doubtful name in the lists.

ingens. To 5 ft. high and 4 ft. diam., more or less short-oblong, somewhat glaucous and purplish, woolly at top, ribs 8, spines brown, 8 radial, 1 central: fls. ¾ in. long and somewhat broader, yellow. Mex.

intertextus: *Echinomastus intertextus.*

intortus: *Melocactus intortus.*

Johnsonii: *Ferocactus Johnsonii.*

Krausei: dubious name.

latispinus: *Ferocactus latispinus.*

Lecontei: *Ferocactus Lecontei.*

Leninghausii: *Malacocarpus Leninghausii.*

leucacanthus: *Thelocactus leucacanthus.*

longihamatus: *Ferocactus hamatacanthus.*

lophothele: *Thelocactus lophothele.*

Macdowellii: *Echinomastus Macdowellii.*

mammulosus: *Malacocarpus mammulosus.*

melocactiformis: *Ferocactus melocactiformis.*

minusculus: *Rebutia minuscula.*

Mostii: *Gymnocalycium Mostii.*

multicostatus (*Echinofossulocactus multicostatus*). Simple, mostly globose and sometimes depressed, 2–4 in. diam., ribs 100 or more, spines usually 6–9: fls. 1 in. long, white with broad purple stripe. Mex.

multiflorus: *Gymnocalycium multiflorum.*

myriostigma: *Astrophytum myriostigma.*

ornatus: *Astrophytum ornatum.*

Ottonis: *Malacocarpus Ottonis.*

peninsulæ: *Ferocactus peninsulæ.*

pilosus: *Ferocactus Stainesii.*

polycephalus. Rather small, at length forming clumps, body globular or short-cylindric and sometimes 2 ft. tall, ribs 13–21, spines many and covering the plant, radials 7–15, centrals 4: fls. yellow, 2 in. or more long. Utah, Nev., Ariz., Calif., Mex.

Pottsii: *Thelocactus Pottsii.*

robustus: *Ferocactus robustus.*

Schickendantzii: *Gymnocalycium Schickendantzii.*

setispinus: *Hamatocactus setispinus.*

Simpsonii: *Pediocactus Simpsonii.*

Stainesii: *Ferocactus Stainesii.*

submammulosus: *Malacocarpus mammulosus.*

tabularis: *Malacocarpus tabularis.*

tetraxiphus: *E. heteracanthus.*

texensis: *Homalocephala texensis.*

turbiniformis: *Strombocactus disciformis.*

uncinatus: *Ferocactus uncinatus.*

unguispinus: *Echinomastus unguispinus.*

viridescens: *Ferocactus viridescens.*

viridiflorus: *Echinocereus viridiflorus.*

Visnaga. Large, to 10 ft. high and 3 ft. or more diam., glaucous-green, tawny-woolly on top, ribs 15–40, spines 4 and all radial: fls. yellow, about 3 in. long. Mex.

Whipplei: *Sclerocactus Whipplei.*

Williamsii: *Lophophora Williamsii.*

Wislizeni: *Ferocactus Wislizeni.*

ECHINOCEREUS. *Cactaceæ.* Sts. solitary or cespitose and forming large clumps, erect or prostrate, always low, sometimes pendent, globular to cylindric, mostly spiny or bristly, ovary and fr. spiny: fls. diurnal but not always closing at night, bell-shaped to funnelform, scarlet, purple, yellow. About 60 species in W. U. S. and Mex. See *Cacti*.

The echinocereuses are more or less grown in collections but are not generally useful for greenhouse conditions although the bloom is showy. The plants are likely not to last many years, and they may be renewed from the wild or from the stock of regular dealers.

acifer (*Cereus acifer*). Sts. clustered, 6–8 in. high and to 2 in. diam., glossy-green, ribs prevailingly 10, radial spines 5–10, centrals mostly 4: fls. scarlet, 2 in. and more long. Mex.

aggregatus: *Coryphantha aggregata.*

Baileyi. Cylindric, about 4 in. high, ribs 15, radials about 16 and first white then brownish or yellowish, no centrals: fls. about 2½ in. broad, light purple inside and segms. erose or toothed. Okla.

Berlandieri: *E. Blanckii.*

Blanckii (*Cereus Blanckii. E.* and *Cereus Berlandieri*). Prostrate and branching from the base making a colony of erect or ascending sts. to 6 in. long and 1 in. diam., ribs 5–7, radial spines 6–8, central solitary: fls. purple, to 3 in. and more long. S. Tex., Mex.

cæspitosus: *E. Reichenbachii.*

chloranthus (*Cereus chloranthus*). Usually simple, sts. cylindric to 6 in. long and 2–3 in. diam., very spiny, ribs about 13, radials several, centrals 3 or 4: fls. yellowish-green, ¾ in. long. W. Tex., New Mex. and Mex.

cinerascens (*Cereus cinerascens*). Making patches 2–4 ft. across, sts. ascending 1 ft., ribs about 12, spines pale or white, radials about 10, centrals 3 or 4: fls. about 3 in. long, purple inside, tube with white wool. Mex.

coccineus (*Cereus coccineus. C. phœniceus. C. Roemeri*). Mostly densely cespitose, forming mounds, sts. 6–8 in. high, 1–2 in. diam., ribs 8–11, radials 8–12 and needle-like and commonly white, centrals several and straight and terete: fls. 2 in. or more long, crimson. Colo., Utah, New Mex., Ariz.

conglomeratus (*Cereus conglomeratus*). In large clumps, sts. 4–8 in. long and often partly in the ground, ribs 11–13, radials needle-like, centrals several: fls. 2 in. or more long, purplish. Mex.

conoideus (*Cereus conoideus*). Cespitose; like *E. coccineus* but central spines somewhat curved and more or less angled. W. Tex., Mex.

ctenoides (*Cereus ctenoides*). Sts. cylindric, to 16 in. long and 3–4 in. diam., ribs 15–17, radial spines to 20 and not spreading, centrals 8–10: fls. 3–4 in. long, wide-expanding, bright or reddish-yellow. S. Tex., Mex.

dasyacanthus (*Cereus dasyacanthus*). St. cylindric, 4–12 in. high, very spiny, ribs 15–20, radials 16–24 and pinkish at first, centrals 3–8: fls. to 4 in. long, yellow. W. Tex., New Mex., Mex.

dubius (*Cereus dubius*). Somewhat cespitose, sts. to 8 in. long, soft, pale green, white-spined, ribs 7–9, radials 5–8, centrals 1–4: fls. 2½ in. or more long, pale purple. S. W. Tex.

Emoryi: *Bergerocactus Emoryi.*

Engelmannii (*Cereus Engelmannii*). In large clumps, sts. cylindric, 4–12 in. long and 2 in. or more diam., ribs 11–14, radial spines about 10, centrals 5 or 6: fls. 2–3 in. long, widely expanding, purple. Utah, Nev., S. Calif., Ariz., Mex.

enneacanthus (*Cereus enneacanthus*). Cespitose, sts. ascending and 3–5 in. long and 2 in. diam. more or less, ribs 7 or 8, radials mostly 8, central solitary: fls. to 2½ in. long, purple. S. Tex., New Mex., Mex.

Fendleri (*Cereus Fendleri*). Cespitose but with few sts. which are ascending or erect and 4–12 in. long and 2–3 in. diam., ribs 9–12, radials 5–10, central solitary: fls. to 4 in. broad in expansion, deep purple. Utah, Ariz., Tex., Mex.

Fitchii. Plant body cylindric or narrowed to top, to 4 in. high and half as thick, the ribs 10–12, radials about 20: fls. pink, to nearly 3 in. long, widely spreading. Tex.

Knippelianus. About 4–8 in. high, thick, branching, deep green, ribs 5–7, spines 1–3 and weak: fls. about 1 in. long, pinkish. Mex.

mamillatus (*Cereus mamillatus*). Cespitose, sts. 8–12 in. long, cylindric, 1½ in. or more diam., ribs 20–25, radials 10–25, central spines 3 or 4: fls. not described. Lower Calif.

Merkeri. Cespitose, parts erect, to 6 in. diam., light green, ribs 8 or 9, radial spines 6–9 and white, centrals 1 or 2: fls. 2 in. or more long, purple. Mex.

mojavensis (*Cereus mojavensis*). Forming great clumps, sts. globose to oblong to 8 in., pale green, ribs 8–13, radials about 10, central spine solitary: fls. to nearly 3 in. long, crimson. Utah, Nev., Calif., Mex.

octacanthus (*Cereus octacanthus*, and *C. Roemeri* of some lists). Cespitose, joints or sts. ovoid to 4 in. long and nearly 3 in. diam., ribs 7–9, radials 7 or 8, central solitary: fls. 2 in. long, red. Tex., perhaps westward.

papillosus (*E. texensis* of some lists). Somewhat cespitose, dark green, sts. to 12 in. long and to 1½ in. diam., ribs 6–10, radials about 7 and needle-like, central solitary: fls. 4 in. or more broad, yellow. W. Tex.

paucispinus: *E. triglochidiatus.*

pectinatus (*Cereus pectinatus*). Simple, cylindric, 4–6 in. long, 1–2 in. diam., with many interlocking spines, ribs 20–22, radials about 30, centrals several: fls. 2–3 in. long, purplish. Mex.

pentalophus (*Cereus pentalophus. C. procumbens*). Procumbent, branches ascending to 5 in. and deep green, ribs 4–6, radials 4 or 5 and very short, central solitary or absent: fls. 3–5 in. long, reddish-violet. S. Tex., Mex.

phœniceus: *E. coccineus.*

polyacanthus (*Cereus polyacanthus*). Cespitose, pale green sometimes tinged red, ribs mostly 10, radial spines about 12, centrals 4: fls. 2 in. or more long, crimson. New Mex., Ariz., Mex.

Poselgeri: *Wilcoxia Poselgeri.*

Reichenbachii (*Cereus Reichenbachianus. C.* and *E. cæspitosus. C. texensis*). Somewhat cespitose, sts. globose or short-cylindric, to 8 in. long and 3 in. diam., ribs 12–19, radials 20–30, centrals 1 or 2: fls. 2–3 in. long, light purple, fragrant. Tex., Mex., perhaps Kans.

rigidissimus. Rainbow Cactus. Simple, erect and rigid, short-cylindric, 4–8 in. high and 4 in. diam., covered with interlocking spines, ribs 18–22, radials about 16, no centrals: fls. 2–3 in. long, purple. Ariz., Mex.

stramineus (*Cereus stramineus*). Forming mounds 1–3½ ft. high, joints to 10 in. long and 1–3 in. diam., ribs about 13, radials 7–14, centrals 3 or 4: fls. 3-nearly 5 in. long, purple. W. Tex., New Mex., Mex.

texensis: *E. Reichenbachii, E. papillosus.*

triglochidiatus (*Cereus triglochidiatus. C. paucispinus*). Cespitose, sts. to 2 ft. long and 3 in. diam., ribs 5–8, spines 3–8 and often all radial: fls. 2 in. long more or less, scarlet. W. Tex., New Mex., Colo.

tuberosus: *Wilcoxia Poselgeri.*

viridiflorus (*Cereus* and *Echinocactus viridiflorus*). Small, nearly globular or cylindric, to 8 in. high, ribs 14, radials about 16, centrals 2 or 3 or wanting: fls. about 1 in. long, greenish. S. D. and Wyo. to Tex.

ECHINOCHLOA. *Gramineæ.* Tall coarse ann. or per. grasses with broad lvs. and spikelets in spike-like racemes borne in large terminal panicles; native in warm regions and grown for forage and grain. See *Grasses.*

Crus-galli (*Panicum Crus-galli. P. Crus-Corvi*). Barnyard-Grass. Ann. to 4 ft.: lvs. to 2 ft. long and 1 in. wide: panicles to 8 in. long, awned. Eu., but widely distributed elsewhere. Var. **edulis** (*E. frumentacea, Panicum frumentaceum*), Japanese Barnyard Millet, has denser panicles and purplish awnless spikelets.

frumentacea: *E. Crusgalli* var. *edulis.*

ECHINOCYSTIS (incl. *Marah*). *Cucurbitaceæ.* Ann. and per. tendril-climbing monœcious vines of N. and S. Amer., with lobed or angled lvs. and small white or greenish fls., the staminate racemose or paniculate and the pistillate solitary. One ann. species, grown from seeds, is frequently planted for covering arbors and fences.

lobata (*Micrampelis lobata*). Wild- or Mock-Cucumber. Essentially glabrous ann., slender, to 20 ft. or more: lvs. sharply 3- to 5-lobed: staminate fls. in long prominent profuse clusters: fr. a papery puffy spiny pod to 2 in. long. N. B. to Ida. and Tex.

macrocarpa. Chilicothe. Monœcious per. from very large thick root: st. to 20 ft.: lvs. more or less circular in outline, several-lobed, to 8 in. across: fls. clear white, staminate in racemes or panicles, pistillate solitary: fr. oblong, spiny, to 4 in. long. S. Calif., and sometimes planted there.

ECHINOFOSSULOCACTUS. A good number of Mexican cacti, many of them imperfectly understood, allied to Echinocactus, in which genus the cult. kinds have also been named and where they will be found in this book. In Echinocactus the axils of the scales on the ovary and fruit are woolly or hairy, whereas in Echinofossulocactus they are naked, and there are other differences.

ECHINOMASTUS. *Cactaceæ.* A half dozen globular or short-cylindric ribbed cacti allied to Echinocactus and with the appearance of Coryphantha; axils of scales on ovary and fr. naked, all or most of the spines needle-like; fls. purple, rose or reddish. See *Cacti.*

intertextus (*Echinocactus intertextus*). Simple, nearly or quite globular, to 4 in. diam., ribs 13, radial spines 16–25 and appressed and upper ones nearly or quite white, centrals 4: fls. about 1 in. long, purple. S. W. Tex., Ariz., Mex.

Macdowellii (*Echinocactus Macdowellii*). Simple, globular or somewhat depressed, nearly 3 in. high, more in diam., ribs 20–25, radials 15–20 and white, centrals 3 or 4 and dark: fls. to 1½ in. long, rose-purple. N. Mex.

unguispinus (*Echinocactus unguispinus*). Simple and usually globular but sometimes short-cylindric, to 4 or 5 in. high, pale bluish-green, spines almost hiding body, radials often 25, centrals 4–8: fls. 1 in. long, reddish. Mex.

ECHINOPANAX. *Araliaceæ.* A few prickly deciduous shrubs native in W. N. Amer. and E. Asia, with alternate palmately 5–7-lobed lvs. and greenish-white fls. in panicled umbels. Propagated by seeds, suckers, and root-cuttings.

horridum. Devils-Club. To 12 ft.: lvs. orbicular-ovate, to 10 in. across, toothed, prickly on both sides, bright green: fr. scarlet, ⅓ in. long. Alaska to Calif.

ECHINOPS. Globe Thistle. *Compositæ.* Stout erect thistle-like per. and bien. herbs with coarse pinnatifid spinescent lvs. tomentose or white-woolly underneath: florets each with its own involucel, all aggregated into a spherical dense head that bears a small reflexed common involucre at its base; achenes hairy; pappus either an entire cup, or a dentate or fimbriate crown comprised of more or less united parts; the bracts of the involucel and the pappus afford distinguishing marks for the identification of the species, which are confused in cult. The species of Echinops are many, distributed from Portugal and Spain to India and Cent. Asia, and also in Afr.

The globe thistles are bold plants good for striking effects in the border or in colonized clumps. The prominent stiff involucel scales are metallic-blue in the cultivated kinds, giving the head a pleasing color effect; the little corollas themselves may be blue or white. The plants are of simple culture, in open places. Propagation is by seed, which gives blooming plants the following summer; but perennial kinds may be increased also by dividing the clumps and by root-cuttings. They are hardy North.

bannaticus. Per. to 3 ft. and more, the st. lightly canescent: lvs. rather thin, green above and canescent underneath, lower ones petioled and lyrate or somewhat divided into large oblong segms., the margins ciliate-spinulose, upper lvs. small and clasping: involucel bracts 18–20, glabrous; pappus scales united at base. S. E. Eu., Asia Minor.

commutatus of lists: perhaps *E. exaltatus.*

dahuricus. Per., st. hairy-pubescent at base and cobwebby above: lvs. smooth above, white-tomentose underneath, pinnatifid into either narrow-lanceolate or broad-lanceolate segms., margin with small spines: involucel bracts slender- acuminate and ciliate; pappus a fimbriate crown. Siberia, Mongolia.—Imperfectly known as a cult. plant.

exaltatus. Bien. to 3 or 4 ft., st. simple or nearly so, glandular-hairy and cobwebby: lvs. somewhat rough above, grayish-woolly underneath, unevenly pinnatifid and small-spined: head large, blue; involucel bracts long-acuminate, short-ciliate; pappus a rim or entire cup. E. Eu., probably Russia.

Gmelini: probably *E. dahuricus.*

humilis. Per., 3–4 ft., st. simple and 1-headed: lvs. villous-cobwebby above, white-tomentose underneath, lower ones short-petioled, sinuate-lyrate and obtuse, nearly spineless, st.-lvs. oblong-linear and spiny-toothed: involucel bracts long-ciliate; pappus a fimbriate crown. Siberia.

niveus of lists: probably *E. sphærocephalus.*

pumilum: listed name.

Ritro. Small G. Per., 1–2 ft., st. glandless, terete, branched above, white-tomentose: lvs. nearly glabrous or somewhat webby above, white-tomentose underneath, much pinnatisect into narrow or linear and very spiny short lobes: involucel bracts about 20, the outer ones short and broad-triangular and dentate, the others lanceolate and ciliate; pappus scales united to about the middle. Spain to Asia Minor and Siberia.—Apparently little cult. although the name is common in the lists: see *E. sphærocephalus.*

ruthenicus: confused name; probably a form of *E. Ritro* is meant.

sphærocephalus. Great G. Per. to 5 and 8 ft., branched, st. grooved, glabrous or somewhat canescent or cobwebby on branches and more or less finely glandular or viscid: lvs. green and roughish above and with scattered viscid hairs, canescent underneath, pinnatifid into triangular-oblong spinulose segms.: head large, to 2 in. across; involucel bracts about 16, somwhat viscid, ciliate-pectinate; pappus united above the middle. Cent. and S. Eu., N. Afr. to Siberia.—Common in cult. and sometimes sparingly escaped; apparently sometimes passes for *E. Ritro.*

syriacus: *E. viscosus.*

viscosus (*E. syriacus*). Per., st. tall, branched, mostly canescent and with reddish glandular hairs: lvs. greenish or canescent above and with glandular hairs, canescent underneath, lobed or pinnate into spinose lanceolate revolute segms.: head large; involucel bracts 20–22, glabrous or glandular; pappus united ⅓ or less its length. Medit. Isls. to Asia Minor.

ECHINOPSIS. Sea Urchin Cacti. *Cactaceæ.* Low condensed plants with ribs continuous or undulate, bearing the areoles which are felted or spiny: fls. from old areoles just above the clusters of spines, narrowly funnelform with long tube, mostly white, the ovary and fr. not spiny. S. American cacti, east of the Andes, perhaps 30 known species although many more names have been applied in the genus; many of the species have also been named in Cereus. See *Cacti.*

The kinds of echinopsis are often showy because of the long flowers, and although not much grown with us they are capable of making good window-garden and conservatory subjects.

Eyriesii. Simple or clustered, globular to columnar, ribs 11–18, spines 14–18, very short: fls. from side of plant toward top, white. S. Brazil to Argentina.

gemmata: *E. turbinata.*

Muelleri: garden form, probably hybrid.

multiplex. Simple or proliferous, globular to club-shaped and rounded at top, to 6 in. high, ribs 13–15, radials 5–15, centrals 2–5: fls. rose-color, 6–8 in. long, tube enlarged. S. Brazil.

oxygona. Subglobose, simple or clustered, to 10 in. diam., somewhat glaucous, ribs 14, spines about 14: fls. about midway of body, to nearly 1 ft. long, pale red inside. S. Brazil to Argentina.

Pentlandii: *Lobivia Pentlandii.*

tubiflora. Simple or clustered, nearly globose, about 5 in. diam., ribs about 12, spines awl-like and black, to ½ in. long: fls. from side, 6–8 in. long, white inside. Brazil, Argentina.

turbinata (*E. gemmata*). Simple or clustered, globose, ribs 13 or 14, spines several and about ¼ in. long: fls. near top, about 6 in. long, jasmine-fragrant, white inside. Argentina.

ECHINOSPERMUM: *Lappula.*

ECHITES. *Apocynaceæ.* Twining shrubs with opposite simple lvs., salverform clustered fls. in purple, red, yellow, white, and fr. of 2 spreading follicles, the seeds with a tuft of hairs; native in trop. Amer. and one intro. to S. Calif.

tomentosa. Savannah Flower. Very hairy: lvs. oblong, to 4 in. long, lobed at base: fls. yellow with red center, 2 in. long, in long-stalked clusters. Trinidad, N. S. Amer.

ECHIUM. Vipers-Bugloss. *Boraginaceæ.* Bien. and per., bristly, herbs, sometimes shrubs, with alternate simple lvs. and blue, purple, rose or white irregular fls. in coiled racemes that are sometimes aggregated into long showy spikes. The species are native in the Old World, but *E. vulgare* is extensively nat. in this country.

Some of the large Canarian species are much planted in California, and other kinds are grown elsewhere in warm regions and sometimes under glass; the names are yet misunderstood. All of them thrive in open sunny places. Propagated by seeds or the shrubby kinds by cuttings and layers.

Bourgæanum. Shrub to 11 ft.: lvs. linear, drooping: fls. rose, in dense pyramidal spikes. Canary Isls.

candicans. White-hairy shrub to 6 ft.: lvs. lanceolate: fls. white or blue with white lines, in dense one-sided spikelets aggregated into a long spike. Madeira, Canaries.

creticum. Ann. to 2 ft., hairy: lvs. oblong to lanceolate: fls. brick-red, the spikelets in a loose cyme. S. Eu.

fastuosum. Gray-hairy shrub to 6 ft.: lvs. lanceolate: fls. purple or dark blue with red stamens, the dense one-sided spikelets aggregated into a cylindrical spike. Eu., Canaries.

giganteum. White-hairy shrub to 10 ft.: lvs. lanceolate: fls. white, the spikelets in a dense panicle, the stamens long-exserted. Teneriffe.

plantagineum. Ann. or bien. to 3 ft., with stiff white hairs and no tomentum: lvs. oval to oblong-lanceolate, passing into broad-based bracts: fls. combined of blue and light purple, not pubescent outside but with hairs, the spikelets forming a long panicle. S. Eu.

vulgare. Blue-Weed. Bien. to 2½ ft., with stiff white hairs: lvs. oblong to linear-lanceolate: fls. blue or violet-purple, in narrow panicles, the stamens long-exserted. Eu., Asia.

Wildpretii. Bien. to 3 ft., white-hairy: lvs. linear-lanceolate, sessile: fls. rose, in large terminal cymes, the stamens long-exserted. Canary Isls.

EDDO: *Colocasia esculenta.*

EDELWEISS: *Leontopodium alpinum.*

EDGEWORTHIA. *Thymelæaceæ.* Two shrubs in Himalayas, China and Japan, somewhat like Dirca, bearing dense heads of fragrant little yellow fls. in advance of the foliage or with it: lvs. alternate and crowded at ends of branches, entire: fr. a drupe-like dry body. **E. papyrifera** (*E. chrysantha, E. Gardneri*), Paper-Bush, Mitsumata, is not hardy N. nor does it thrive in hot dry summers, but is intro. in N. Amer.: small shrub with tough branches: lvs. lance-oblong, to 5 in. long: fls. precocious, narrow-tubular, silky, to ½ in. or more long. China, Japan.—The bast is a source of soft tough paper.

EDRAIANTHUS (sometimes spelled *Hedraianthus*). *Campanulaceæ.* Per. herbs of the Medit. region, with linear lvs. and bell-shaped 5-lobed fls. in heads or rarely solitary; differs from Wahlenbergia in technical characters of fr.

caudatus: *E. tenuifolius.*

dalmaticus: *E. tenuifolius.*

Kitaibelii. To 6 in., densely tufted: fls. blue, in 3–5-fld. heads. S. E. Eu.

latifolius: listed name.

tenuifolius (*E. caudatus. E. dalmaticus*). To 6 in., tufted, pubescent: fls. blue, in dense 3–8-fld. bracted heads. S. E. Eu.

EDWINIA: *Jamesia.*

EEL-GRASS: *Vallisneria.*

EGG-FRUIT: *Lucuma nervosa.*

EGGPLANT (*Solanum Melongena* var. *esculentum*). Tender branching large-leaved herb, grown in the vegetable-garden for the edible fruits; sometimes known also as Guinea squash. The large fruits, in purple, white, and stripes, are cooked in various ways.

The eggplant is well at home in the southern states, the long season suiting it. Seeds may be sown in a plant-bed, and the young plants moved directly to the field. In the North, unless one has a greenhouse or warm hotbed, the growing of eggplants should be left to the professional gardener, as the young plants are very tender and should be grown without a check. The seed may be sown in the hotbed or greenhouse a month or more before warm weather, keeping a temperature of 65° to 70°. When the seedlings have made three rough leaves, they may be pricked out into shallow boxes, or, still better, into 3-inch pots. The pots or boxes should be plunged to the rim in soil in a hotbed or coldframe so situated that protection may be given on chilly nights. Do not set in the field until the season is permanently settled. The soil should be "quick" but not of such nature as to keep the plants growing too large or too late. Watch for the potato-beetle. The plants are usually set 2–3 feet apart each way. A dozen plants are sufficient for the needs of a family, as each plant should yield two to six large fruits. The fruits are fit to eat at most stages of growth, from those the size of a large egg to their largest development. One ounce of seed will furnish 1,000–2,000 plants.

New York Improved Purple is a standard variety of eggplant. Black Pekin, Long Purple and Black Beauty are popular. For early, or for a short-season climate, the Early Dwarf Purple is desirable.

EHRETIA. *Boraginaceæ.* Trop. or semi-trop. shrubs or trees with alternate dentate or entire simple lvs. and short rough hairs, small white fls. in terminal corymbs or panicles or perhaps solitary, and fr. a small drupe; sometimes planted for ornament and interest in the extreme S. U. S. Propagated by seeds and cuttings.

acuminata: see *E. thyrsiflora.*

buxifolia: *E. microphylla.*

elliptica. Tree to 50 ft.: lvs. oval or oblong, to 2 in. long, undulate or serrate: fls. in corymbs to 2½ in. across. Tex. to Mex.

lævis. Variable shrub, or tree to 40 ft.: lvs. ovate, short-acuminate, to 5 in. long, serrate: fls. in corymbs 3 in. across. India.

macrophylla. Tree, with elliptic or rhomboid pubescent or hairy lvs. to 8 in. long, serrate: fls. small, in compound panicles: fr. a berry ½ in. or more diam. India; planted in S. Calif.

microphylla (*E. buxifolia*). Philippine-Tea. Shrub to 12 ft.: lvs. in clusters, obovate, to 2½ in. long, serrate: fls. solitary or 2–4 together. India to Malaya and Philippines.

thyrsiflora (*Cordia thyrsiflora. E. acuminata* of some.) Tree to 50 ft.: lvs. obovate, to 7 in. long: fls. in panicles to 8 in. long. Formosa: fairly hardy N.

EICHHORNIA (*Piaropus*). *Pontederiaceæ.* Trop. American aquatic herbs with floating or submerged lvs. and showy fls. mostly borne in terminal spikes; grown in ponds and tanks. The water should not be more than about 1 ft. deep and good soil provided. Propagated by division.

azurea. Lvs. broadly ovate to orbicular, the petioles not inflated: fls. lavender-blue with purple center. Brazil.

crassipes. Water-Hyacinth. Floating extensively, with feathery roots: lvs. ovate to orbicular, the petioles much inflated at base: fls. large and showy, violet with blue patch on upper lobe having a yellow spot. Trop. Amer. and nat. in Fla. where it chokes the ponds and streams. Var. **major** has rosy-lilac fls.

EINKORN: *Triticum æstivum* var. *monococcum*.

ELÆAGNACEÆ. Oleaster Family. Trees or shrubs of Eu., Asia, N. Amer. covered with silvery or golden scales, having simple and entire lvs., bisexual, polygamous or diœcious polypetalous fls. with 2–4-lobed calyx, no petals, 4 or 8 stamens, 1-celled ovary, and fr. inclosed by the fleshy calyx, forming a berry-like or drupe-like body. There are only three genera, Elæagnus, Hippophaë and Shepherdia, and they are grown for ornament and somewhat for edible fr.

ELÆAGNUS. *Elæagnaceæ.* Ornamental shrubs or small trees in many species, sometimes evergreen, with alternate lvs. covered with scales, inconspicuous fls., and attractive drupe-like frs.; native in N. Amer., S. Eu., Asia.

The species grow in any well-drained soil and sunny location. Propagated by seeds, preferably stratified and sown the second spring, hardwood- and root-cuttings, layers, and grafting.

angustifolia (*E. hortensis*). Oleaster. Russian Olive. Very hardy, to 20 ft., deciduous, sometimes spiny: branchlets and under sides of lvs. silvery: fls. fragrant, 1–3 in axils of lvs., in June: fr. yellow and silvery, on very short stalks. Eu., W. Asia. Var. **orientalis** has broader lvs. and larger fr. and var. **spinosa** is more spiny.

argentea. Silverberry. to 12 ft., deciduous: lvs. silvery on both sides: fls. fragrant, 1–3 in axils, May–June: fr. silvery, on very short stalks. E. Canada, to Minn. and Utah.

Fruitlandi: a form of *E. pungens*.

glabra. To 20 ft., evergreen, climbing or sarmentose: under sides of lvs. with brown scales: fls. fragrant, in autumn: fr. gray or rusty. Japan, China.

hortensis: *E. angustifolia.*

latifolia. Variable, either erect or climbing, sometimes tree-like: lvs. ovate to elliptic or broader, obtuse or acute, to 5 in. long, silvery or rusty underneath: fls. many, clustered: fr. to 1½ in. long, red. India.

longipes: *E. multiflora.*

macrophylla. To 12 ft., evergreen: lvs. silvery beneath, becoming dark shining green above: fls. fragrant, 4–6 in axils, in autumn: fr. red. Japan; to be grown far S.

multiflora (*E. longipes*). Gumi. To 6 ft., deciduous: lvs. silvery beneath, also with brown scales: fls. fragrant, 1–2 in axils, Apr.–May: fr. scarlet, on slender stalks to 1 in. long, edible. Japan, China; hardy in the N. Leaf forms are known under the varietal names **crispa, ovata** and **rotundifolia.**

parvifolia: *E. umbellata* var.

philippensis. To 9 ft., with drooping branches: lvs. silvery beneath, slightly toothed: fls. axillary, often solitary: fr. red. Philippines.

pungens. To 15 ft., evergreen, usually spiny: lvs. silvery beneath dotted with brown scales, wavy-margined: fls. fragrant, in axillary clusters in autumn: fr. red, silvery and brown when young, short-stalked. Japan, China. Variegated forms are **aurea,** lvs. margined yellow; **Frederici** (var. *Frederici variegata*), lvs. with yellow center; **maculata** (*aureo-maculata*), lvs. with large yellow blotch in middle; **variegata,** lvs. margined with yellowish-white. In var. **reflexa** the lvs. are very brown-scaly beneath and the margins not wavy; var. **Simonii** (*E. Simonii*), lvs. silvery beneath, sometimes variegated yellow and pinkish-white. The various leaf forms are often grown under glass; in the open hardy only far S.

reflexa: *E. pungens* var.

Simonii: *E. pungens* var.

umbellata. To 18 ft., deciduous, branchlets covered with brown scales: lvs. silvery beneath: fls. fragrant, 1–3 in axils, May–June: fr. scarlet, silvery when young, short-stalked. Himalayas, China, Japan. Var. **parvifolia** (*E. parvifolia*). Branchlets silvery: fr. silvery becoming pink. Himalayas.

ELÆIS. *Palmaceæ.* Monœcious tall feather-palms of trop. Afr. and Amer., perhaps of 4 or 5 species, unarmed except perhaps on the petiole and bracts and tips of spadices: spadices among the lvs., branched but short, dense and head-like in the center of the crown, some of them staminate and others pistillate; stamens 6: fr. a 1–3-seeded ovoid or obovoid drupe surrounded by spine-like bracts in a heavy compact head or cluster. See *Palm.*

guineensis. African Oil Palm. Trunk to 60 and more ft., much scarred: lvs. 10–15 ft. long, the lower ones drooping and some of the dead ones hanging, with very many ridged narrow pinnæ, green both sides: staminate head composed of many finger-like appressed spine-tipped branches 4–6 in. long; fruiting head 1 ft. long more or less: fr. ovoid or ovoid-conic, about 1 in. long, red, orange or yellowish. W. and Cent. Afr.—Prized for the oil-bearing frs. and planted for ornament and interest in the western hemisphere; stands in S. Fla.

ELÆOCARPACEÆ. Elæocarpus Family. About 8 genera of trees and shrubs, allied to Tiliaceæ, native in tropics and semi-tropics of both hemispheres: lvs. alternate or opposite, simple: fls. unisexual or bisexual, polypetalous, often showy, in racemes or panicles, having 4–5 sepals and petals, or sometimes petals absent, numerous stamens, superior ovary: fr. a caps. or drupe. Aristotelia, Crinodendron and Elæocarpus are known to hort. in the U. S., all grown in the warmer parts of the country.

ELÆOCARPUS. *Elæocarpaceæ.* Trees native in the tropics and warm parts of the Old World, with alternate simple lvs., mostly bisexual fls. in axillary racemes, and small drupaceous frs.; sometimes grown for ornament in S. U. S., and in Calif. Propagated by cuttings, and by seeds when obtainable.

cyaneus. Small mostly glabrous tree: lvs. oblong or elliptic to nearly lanceolate, acuminate, to 4 in. or more, serrate: fls. in loose racemes: fr. with 1 seed to ½ in. long. Queensland.

dentatus. To 60 ft., foliage mostly at ends of branchlets which are silky: lvs. leathery, linear-oblong to narrowly obovate, to 4 in. long, finely wavy-toothed, the margins recurved: fls. white, ½ in. across, drooping: fr. purplish-gray, ½ in. long. New Zeal.

Hookerianus. Tree to 40 ft. with glabrous branchlets: lvs. narrowly linear to nearly orbicular and even pinnate-toothed on young parts, narrow-oblong or lanceolate and serrate or crenate on old plants: fls. greenish-white and drooping: fr. ⅛ in. long. New Zeal.

ELÆODENDRON. *Celastraceæ.* Trop. or semi-trop. trees and shrubs with simple leathery lvs., small greenish or white fls. in axillary clusters, and drupaceous fr.; grown in trop. or warm regions or under glass in the juvenile state. Propagated by cuttings.

capense. Evergreen shrub: lvs. elliptic-ovate, margins revolute and slightly toothed: frs. red, to 1 in. long. S. Afr.

Laneanum. BERMUDA OLIVE-WOOD BARK. Evergreen tree to 45 ft.: lvs. oblanceolate, shallowly toothed: fls. diœcious: frs. yellowish-white, to 1 in. long. Bermuda.

orientale (*Aralia Chabrieri* of gardens). FALSE OLIVE. Lvs. obovate, wavy-margined, in the juvenile state long and narrow with a dark red midrib: frs. about size of olive. Madagascar, Mauritius.

ELAPHOGLOSSUM. *Polypodiaceæ.* Trop. ferns with creeping rhizomes and simple rather thick more or less tongue-like lvs.; sori covering under surface of lvs. They are treated as warmhouse plants, requiring abundant moisture if drainage is good. See *Ferns.*

crinitum (*Acrostichum* and *Hymenodium crinitum*). ELEPHANT-EAR-FERN. Lvs. to 2 ft. long and 10 in. wide, on shaggy-hairy stalks 1 ft. long. W. Indies, Mex., Cent. Amer.—A striking plant.

ELATINOIDES: *Kickxia.*

ELDER: *Sambucus.* **Box-:** *Acer Negundo.* **Yellow-:** *Stenolobium stans.*

ELECAMPANE: *Inula Helenium.*

ELEPHANTS-EAR: *Colocasia, Enterolobium cyclocarpum.*

ELEPHANTS-FOOT: *Testudinaria elephantipes.*

ELETTARIA. CARDAMON. *Zingiberaceæ.* Per. herbs of 1 or more species native in India, the seeds of which are used medicinally and as spices. **E. Cardamomun.** To 10 ft., with creeping rootstocks: lvs. to 2½ ft. long and 3½ in. wide: fls. white, the lip or staminodium margined with yellow and striped with blue, borne in bracts on panicles to 2 ft. long: caps. to ¾ in. long, containing aromatic seeds.—The plants succeed in moist shady places in warm climates. Propagated by division of roots and by seeds. See *Zingiberaceæ.*

ELEUSINE. *Gramineæ.* Tufted annuals with flat lvs. and spikelets in dense spikes borne in digitate terminal umbels or toward top of sts.; native in the Old World and grown for ornament and in some countries for grain. See *Grasses.*

barcinonensis: *E. tristachya.*

coracana. AFRICAN MILLET. To 4 ft.: lvs. to 1 ft. long and ¼ in. wide: spikes to 1½ in. long and ¼ in. broad, erect. Probably Asia and Afr.

indica WIRE-GRASS. To 2 ft.: lvs. to 1 ft. long and ¼ in. wide: spikes to 4 in. long, spreading. Old World, but nat. in N. and trop. Amer.

oligostachya: the plant grown under this name is *E. indica.*

tristachya (*E. barcinonensis*). To 1 ft.: lvs. short, 1/16 in. wide: spikes to 1½ in. long and ⅓ in. broad. India.

ELLIOTTIA. *Ericaceæ.* One deciduous shrub, **E. racemosa,** inhabiting sandy lands and pine woods in E. Ga. and S. C.: to 10 or 20 ft., sometimes tree-like: lvs. alternate, oblong to oblong-lanceolate, to 5 in. long, pointed, entire, glabrous above: fls. small, white, in slender terminal racemes. To be expected in grounds.

ELLIPTIC: a flat part or body that is oval and narrowed to rounded ends.

ELM: *Ulmus.* **Water-:** *Planera aquatica.*

ELODEA. *Hydrocharitaceæ.* Aquatic submerged perennials with soft leafy sts. and inconspicuous unisexual or bisexual fls.; grown in aquaria and ponds and spreads rapidly. Propagated by cuttings and winter-buds.

canadensis (*Anacharis canadensis. Philotria canadensis*). WATER-WEED. DITCH-MOSS. Lvs. about ¼ in. long and 1/12–1/6 in. wide, more or less obtuse, at the top of the st. strongly imbricated: fls. whitish, the pistillate with tube elongated, allowing fls. to float on surface; staminate fls. not known. Que. south and west; nat. in Eu.—Material in aquaria may also represent *E. occidentalis,* a plant with narrower more pointed not imbricate lvs., and distinct staminate fls.; native but not extending as far north.

densa (*Anacharis canadensis* var. *gigantea*). Lvs. densely crowded, to 1 in. long and much broader than in *E. canadensis.* La Plata River.

ELONGATE: lengthened; stretched out.

ELSHOLTZIA. *Labiatæ.* Herbs or undershrubs grown for their dense spikes of small 2-lipped blue or lilac fls., usually aromatic; stamens 4, exserted: lvs. opposite, toothed.

Elsholtzias require a sunny position for the most success in blooming. Propagated by seeds sown in the spring, the shrubby types also by greenwood cuttings in summer. The species below are hardy North.

cristata. Ann. to 1½ ft.: lvs. ovate to oblong, to 2 in. long: fls. light blue, in spikes to 3 in. long in terminal panicles. Asia.

Stauntoni. Shrub to 5 ft.: lvs. ovate-oblong to oblong-lanceolate, to 5 in. long: fls. lilac-purple, in dense one-sided spikes to 8 in. long terminating the branches, Sept.–Oct. N. China.

ELSOTA: *Securidaca diversifolia.*

ELYMUS. WILD RYE. LYME-GRASS. *Gramineæ.* Tall per. grasses of temp. regions around the world, the spikelets borne in dense terminal spikes; a few may be planted for ornament on banks and rear borders. See *Grasses.*

arenarius. SEA LYME-GRASS. DUNE-GRASS. To 8 ft.: lvs. 1 ft. or more long and ⅓ in. wide, becoming involute, rough above: spikes to 10 in. long, awnless. Asia, Eu.—Used as a sand binder.

canadensis. To 5 ft.: lvs. 1 ft. or more long and ¾ in. wide, rough: spikes to 1 ft. long, often nodding, awns to 2 in. long. N. Amer.

condensatus. To 10 ft.: lvs. 1 ft. or more long and 1 in. wide, rough: spikes stout, to 15 in. long, awnless. W. N. Amer.

giganteus. Erect to about 3 ft., with creeping rhizomes: lvs. rather stiff, to ½ in. broad: spikes to 15 in. long, with awn points. Russia, Siberia.

glaucus. To 5 ft.: lvs. to 1 ft. long and ½ in. wide, nearly smooth: spikes to 8 in. long, awns to ¾ in. long. Ont. to B. C. and Calif.

mollis. Differs from *E. arenarius* (of which it is often considered a var.) in the pubescent spikelets.

virginicus. To 3 ft.: lvs. to 14 in. long and ½ in. wide, rough: spikes to 7 in. long, awns to ½ in. long. N. S. to Fla. and Tex.

EMARGINATE: with a shallow notch at the apex.

EMBLIC: *Phyllanthus Emblica.*

EMBOTHRIUM. *Proteaceæ.* A few shrubs and small trees of the southern hemisphere, one of which is intro. in Calif.: lvs. coriaceous, entire: fls. bisexual, showy, in dense racemes: fr. 1-celled many-seeded follicle. **E. coccineum,** of Chile, is a shrub with oblong to elliptic alternate lvs.: fls. scarlet, about 2 in. long, with exserted red style.

EMILIA. *Compositæ.* Slender herbaceous annuals and perennials with alternate and basal lvs. and solitary or clustered rather small rayless heads in many colors; pappus of white soft bristles; mostly native in tropics of Old World. Two species, commonly confused, are grown as flower-garden annuals; of simple cult. in a sunny place.

coccinea: *E. sagittata.*

flammea: *E. sagittata.*

sagittata (*E. flammea. E.* and *Cacalia coccinea*). TASSEL-FLOWER. FLORAS-PAINTBRUSH. Ann. to 2 ft.: lower lvs. ovate, toothed, narrowly wing-petioled: heads red or scarlet, ½ in. across, in loose corymbs. Tropics. Var. lutea has golden-yellow fls.—This is the usual species in gardens.

sonchifolia (*Cacalia sonchifolia*). Ann. to 2 ft.: lower lvs. obovate, toothed or lyrate-pinnatifid: heads rose or purple, rarely white, ½ in. across, in loose corymbs. Tropics.

EMMENANTHE. *Hydrophyllaceæ.* Ann. herbs native in W. N. Amer., with alternate lvs., yellow fls. in terminal racemes and bell-shaped persistent corolla.

Seeds may be sown where the plants are to grow, or indoors if early bloom is desired, in open sunny exposure.

penduliflora. YELLOW- or GOLDEN-BELLS. WHISPERING BELLS. To 1½ ft., but often only a few inches: lvs. pinnatifid into ovate segms.: fls. drooping, about ½ in. long, in summer. Calif., on slopes and deserts.

EMMENOPTERYS. *Rubiaceæ.* One deciduous tree to 40 ft., adaptable to mild climates. Propagated by seeds and cuttings of soft wood under glass. **E. Henryi** has lvs. opposite, oval, to 6 in. long, entire: fls. yellow, funnelform, 1 in. long, in many-fld. terminal panicles: fr. a caps. to 1¾ in. long, often with 1 wing-like calyx-lobe persistent. Cent. China.

EMMER: *Triticum æstivum* var. *dicoccum.*

EMPETRACEÆ. CROWBERRY FAMILY. Three genera of heath-like evergreen small shrubs in the northern hemisphere: lvs. alternate and crowded, linear: fls. bisexual or unisexual, regular, with 2–3 sepals or none, no petals, 2–3 stamens, superior ovary: fr. a drupe. In the sequence of orders this family stands near Euphorbiaceæ. Corema and Empetrum are sometimes grown for ornament.

EMPETRUM. *Empetraceæ.* A few shrublets, more or less procumbent or depressed, of the western hemisphere and N. Eurasia, sometimes transferred to grounds: fls. very small, solitary in the axils: fr. a little drupe. **E. nigrum.** CROWBERRY. Spreading heath-like evergreen to 10 in. high: lvs. linear or nearly so, about ¼ in. long, margins revolute: drupe berry-like, black. Var. **purpureum** has red or purple fr. Rocky places N. Y. to N. Calif. and northward, and in N. Eu. and Asia and mts. southward; adapted to rock-gardens.

ENCELIA. *Compositæ.* Herbs or subshrubs with alternate or opposite entire or toothed lvs. and rather showy heads of yellow ray-fls. and yellow or purple disk-fls.; pappus none or of awns; native from W. N. Amer. to Chile. Sometimes planted for ornament.

californica. Per., woody at base, to 4 ft., strong-scented: lvs. ovate to broad-lanceolate, to 2½ in. long: heads solitary, long-stalked, 2½ in. across, golden-yellow, disk purple; involucre white-hairy. Calif.

farinosa. Shrubby, to 5 ft.: lvs. ovate, to 2½ in. long, often silvery-tomentose: heads in cymes, about 1 in. across, with yellow disk and rays; involucre slightly pubescent. Calif., Ariz., Mex.—The clumps are very showy early in season on deserts.

ENCEPHALARTOS. *Cycadaceæ.* African plants with stout trunks terminated by a cluster of stiff pinnate lvs.; about 20 species of which a few are grown for the ornamental foliage. For cult. see *Cycas*, from which the genus is separated by technical characters of fls. and frs., and pinnæ without midrib.

Altensteinii (*Zamia Altensteinii*). Trunk to 6 ft. high and 1 ft. diam.: lvs. to 6 ft. long; lfts. thick, very spiny when young but on older plants often spineless, about 1 in. broad. S. Afr.

Hildebrandtii. Trunk to 20 ft. high and 1 ft. diam.: lfts. leathery, margins with 1–4 teeth on either side, tip spiny. Trop. Afr.

Laurentianus. Trunk to 30 ft. high and 2½ ft. diam.: lvs. to more than 20 ft. long; lfts. leathery, margins with 6–10 teeth on either side, spiny-tipped, some of them to 16 in. long and 2 in. broad. Trop. Afr.

Lehmanni. Trunk very large: lfts. pale green, to 7 in. long, entire or occasionally with 1 or 2 spines, tip spiny, petiole and rachis somewhat 4-angled. S. Afr.—The plants advertised as *Zamia Lehmanni glauca* and *Skinneri* probably belong here.

villosus (*Zamia villosa*). Trunk entirely underground, woolly: lvs. to 6 ft. long; lfts. bright green, with spiny teeth and tips. S. Afr.

ENCHOLIRION: *Vriesia Saundersi.*

ENCHYLÆNA. *Chenopodiaceæ.* Little shrub allied to Kochia, native in Australia, **E. tomentosa,** adapted to planting in dry climates for its dense spreading habit and gray or silvery color: procumbent or horizontally much branched, to 3 ft. or more and making a broad mass: lvs. terete, ½ in. or less long: fls. small, solitary in axils, followed by fleshy red or yellow berry-like bodies.

ENCYCLIA. *Orchidaceæ.* Trop. American epiphytes with short pseudobulbs bearing 1–3 leathery lvs. and fls. in terminal racemes or panicles, the sepals and petals similar, lip 3-lobed; by some considered a section of Epidendrum. For cult. see *Orchids.*

aromatica (*Epidendrum aromaticum*). Lvs. to 1 ft. long: fls. primrose-yellow, fragrant, in many-fld. pendulous panicles to 3 ft. long, July–Sept. Mex., Guatemala.

atropurpurea (*Epidendrum atropurpureum* and *macrochilum*). Lvs. to 1 ft. long: fls. about 3 in. across, in 4–10-fld. racemes to 1½ ft. high; sepals and petals green, brown inside; lip white marked with red, Apr.–June. Cent. Amer., W. Indies.

nemoralis (*Epidendrum nemorale*). Lvs. to 1 ft. long: fls. rose, the lip marked with purple, to 4 in. across, in 8–15-fld. racemes to 16 in. long, July. Mex.

odoratissima (*Epidendrum odoratissinum*). Lvs. less than 1 ft. long: fls. greenish with yellowish lip marked with red, 1 in. across, in 5–15-fld. racemes to 10 in. long, June–July. Brazil.

osmantha (*Epidendrum osmanthum* and *Godseffianum*). Lvs. to 16 in. long: fls. about 2 in. across, in many-fld. racemes; sepals and petals yellow-green veined with red; lip white marked with red, Oct. Brazil.

virens (*Epidendrum virens*). Lvs. to 1½ ft. long: fls. about 2 in. across, in many-fld. panicles to 3 ft. high; sepals and petals yellow-green marked with brown; lip white lined with rose, May–June. Cuba, Guatemala, Venezuela.

virgata (*Epidendrum virgatum*). Lvs. to 10 in. long: fls. 1 in. across, in panicles to 6 ft. high; sepals and petals green tinged with brown; lip yellowish-white, July–Aug. Mex., Guatemala.

ENDIVE (*Cichorium Endivia*). Hardy annual or biennial, grown for its rosette of leaves which are used as salad and for greens. It is grown mostly as a late summer, autumn and early winter product, more or less extending the season of lettuce.

For summer harvest, seeds may be sown in April or early May, in drills in the garden. For autumn use, sowings may be June to August, and as the plants become fit to eat about the same time from sowing as does lettuce, a succession may be had until cold weather. The plants need protection from severe frosts by carefully lifting the plants and removing to a frame, where sash or cloth may cover them in freezing weather. The leaves, which constitute practically the whole plant, are blanched before being used, either by tying together or by standing boards on each side of the row, allowing the top of the boards to meet over the center of the row; in two to four weeks the interior leaves will be sufficiently blanched. If the foliage keeps wet inside, it is likely to decay; the leaves should be tied together only when dry, and it may be necessary to untie and open them after a rain, and a similar precaution is necessary in other methods of blanching. The rows should be 1½ or 2 feet apart, the plants 1 foot apart in the rows. One ounce of seed will sow 150 feet of drill more or less, before thinning or transplanting.

ENKIANTHUS. *Ericaceæ.* Mostly deciduous shrubs with alternate or crowded finely toothed lvs. turning bright colors in autumn, fls. in drooping umbels or racemes in spring, and capsular frs.; native in Asia and fairly hardy in the N. They thrive in well-drained peaty soil, like many other plants of the Heath family. Propagated by seeds, cuttings or layers.

campanulatus. To 30 ft.: fls. yellow or pale orange veined with red, bell-shaped, to ½ in. long. Japan.

cernuus. To 15 ft.: fls. white, bell-shaped with irregularly cut limb, ⅓ in. long. Japan. Var. **rubens** has deep red fls.

coloratus: listed name.

japonicus: *E. perulatus.*

perulatus (*E. japonicus*). To 6 ft.: fls. before the lvs., white, urn-shaped, ⅓ in. long, the corolla gibbous at base. Japan.

subsessilis. To 10 ft.: fls. white, urn-shaped, ⅙ in. long, gibbous at base. Japan.

ENTELEA. *Tiliaceæ.* One large-lvd. shrub or small tree to 20 ft., native in New Zeal. and planted in S. Calif. **E. arborescens.** Lvs. alternate, cordate-ovate, to 9 in. or more long, toothed and often slightly 3-lobed: fls. white, 1 in. across, in cymes: fr. a bristly caps. 1 in. across. For *E. palmata* see *Sparmannia palmata.*

ENTEROLOBIUM. *Leguminosæ.* Trop. American trees with 2-pinnate lvs., fls. in heads or clusters with prominent whitish, greenish or purplish stamens, and broad leathery pods which are usually bent or coiled inward; planted in the tropics as windbreaks or for ornament.

cyclocarpum. ELEPHANTS-EAR. CARO. Large broad-headed tree to 50 ft. or more: lfts. 20–30 pairs: stamens white: pods bent so as to form a complete circle, used as cattle feed in tropics. Jamaica, Venezuela.

Timbouva. Differs in its fewer lfts., 10–20 pairs, and the pods bent to form one-half or two-thirds of a circle. Brazil.

ENTIRE: margin continuous, not in any way indented; whole.

EOMECON. *Papaveraceæ.* The only species, **E. chionantha,** from China, is a rhizomatous herbaceous per. with white poppy-like racemose fls. 2 in. across on a slender branching scape 1 ft. or more tall: lvs. radical and long-stalked, cordate, to 6 in. long, sinuate: petals 4: spring-blooming and hardy at N. Y. City. Known as Snow-Poppy.

EORA: *Rhopalostylis.*

EPACRIDACEÆ. EPACRIS FAMILY. Shrubs and small trees of the southern hemisphere related to Ericaceæ and differing in technical characters. The family comprises about two dozen genera of which only Cyathodes and Epacris are much known in cult.

EPACRIS. *Epacridaceæ.* Heath-like evergreen shrubs, seen now and then under glass and adapted to warm climates; native in Australia and New Zeal.: lvs. small and entire, scattered: fls. solitary in axils of lvs. or bracts, the short peduncle covered with imbricating bracts; corolla tubular, white, red, purple, mostly small but often showy. Treatment as for ericas.

impressa. To 3 ft., with many ascending pubescent branches: lvs. narrow-lanceolate and sharp-pointed, mostly under ½ in. long: fls. white or red; corolla-tube ½ in. or less long, differing in the several forms. Australia.

EPAULETTE-TREE: *Pterostyrax.*

EPHEDRA. MEXICAN-TEA. JOINT-FIR. *Gnetaceæ.* Shrubs growing mostly in dry or desert regions around the world, with jointed green branches resembling the horsetail, scale-like or sheath-like lvs., unisexual fls. and red berry-like frs.

Occasionally planted in this country in dry locations as ground-cover or for the green stemmy clumps, as in regions where the native kinds grow. Mexicans and Indians make a medicinal tea from the branches. Propagated by division of clumps and by seeds, suckers and layers.

altissima. Climbing to 25 ft.: lvs to 1 in long. N. Afr.

distachya. Low or procumbent shrub to 2 ft.: lvs. scale-like, opposite. S. Eu., N. Asia.

fragilis. Erect or climbing shrub, or sometimes prostrate: lvs. minute, opposite. Medit. region.

trifurca. Erect, to 4 ft., pale green: scale-like lvs., mostly in 3's. Utah to Mex.

viridis. Erect, to 4 ft., bright green: awl-like lvs. opposite. Colo. to Calif. and Ariz.

EPHEMERAL: persisting for one day only, as flowers of spiderwort.

EPIBATERIUM: *Cocculus.*

EPIDENDRUM. *Orchidaceæ.* Epiphytic orchids native in trop. Amer., with leafy sts. or 1-lvd. pseudobulbs and fls. mostly in terminal racemes, the sepals and petals similar, the lip usually deeply 3-lobed and with a distinct claw partly united with column; see *Orchids* for cult. They are plants of various habit, and require mostly intermediate temperature as for cattleyas.

aromaticum: *Encyclia aromatica.*

atropurpureum: *Encyclia atropurpurea.*

aurantiacum: *Cattleya aurantiaca.*

bicornutum: *Diacrium bicornutum.*

Boothianum (*E. erythronioides*). To 8 in. high: lvs. to 5 in. long: fls. with brown-spotted sepals and petals and yellow lip. W. Indies, S. Fla.

Boundi. Hybrid between *E. Burtoni* and *E. radicans.*

Brassavolæ. Pseudobulbs to 6 in. high, with 2 leathery lvs. to 1 ft. long and 1 in. wide: fls. to 4 in. across, in 6–12-fld. racemes; sepals and petals brownish-yellow; lip white tipped with violet-red, July–Sept. Costa Rica.

Burtoni. Hybrid between *E. O'Brienianum* and *E. ybaguense.*

ciliare (*Auliza ciliaris*). Pseudobulbs to 6 in. high, with 1–2 leathery lvs. to 6 in. long: fls. in 4–8-fld. racemes; sepals and petals yellow; lip white with 2 yellow spots, fringed, Dec.–Jan. Trop. Amer.

cochleatum. Pseudobulbs to 5 in. long, with 2 lvs. to 8 in. long: fls. in 5–8-fld. racemes to 10 in. long; sepals and petals whitish-green; lip dark purple with yellow markings, Nov.–Feb. Trop. Amer.

conspicuum (*E. roseum*). Pseudobulbs to 5 in. high, with 2 lvs. to 8 in. long: fls. pale rose, 2 in. across, in 6–12-fld. racemes to 20 in. long. Brazil.

Cooperianum. Fls. 2 in. across, in 10–25-fld. drooping racemes; sepals and petals yellowish-green; lip bright rose, Apr.–May. Brazil.

dellense. Hybrid between *E. radicans* and *E. xanthinum.*

erythronioides: *E. Boothianum.*

evectum. St. to 3 ft., without pseudobulb: fls. rich purple, with fringed lip, on long nodding peduncles. Colombia.

fragrans. Pseudobulbs to 2 in. high, with 1 lf. to 4 in. long: fls. fragrant, in 2–5-fld. racemes to 5 in. long; sepals and petals yellowish-white; lip white lined with violet, Feb.–May. Brazil, W. Indies.

galtonense. Hybrid between *E. Boundi* and *E. xanthinum.*

Godseffianum: *Encyclia osmantha.*

inversum. Pseudobulbs to 4 in. long, with 2 leathery lvs. to 6 in. long: fls. pale straw-color or white with purple spot on lip, in 7–12-fld. racemes. Brazil.

kewense. Hybrid between *E. evectum* and *E. xanthinum.*

lanipes. Fls. yellow with filiform petals, in panicles to 9 in. long. Peru.

latilabrum. Lvs. ovate: fls. 2 in. across, green, with lip about four times broader than long, in 3–4-fld. umbel-like racemes. Brazil.

macrochilum: *Encyclia atropurpurea.*

nemorale: *Encyclia nemoralis.*

O'Brienianum. Hybrid between *E. evectum* and *E. radicans.*

odoratissimum: *Encyclia odoratissima.*

osmanthum: *Encyclia osmantha.*

polybulbon: *Dinema polybulbon.*

porphyreum. Lvs. oblong: fls. purple, with linear petals and middle lobe of lip toothed. Colombia.

prismatocarpum. Psudobulbs to 5 in. long: lvs. to 15 in. long: fls. in racemes to 14 in. long; sepals and petals yellow spotted with brown; lip rose, July–Aug. Costa Rica.

radicans (*E. rhizophorum*). Sts. to 5 ft. long, with long white roots: lvs. to 2 in. long: fls. to 2 in. across, in many-fld. racemes; sepals and petals cinnabar-red; lip orange-yellow, Oct.–Jan. Guatemala.

rhizophorum: *E. radicans.*

rigidum. To 10 in., without pseudobulbs: lvs. leathery, to 2½ in. long and ¾ in. wide: fls. green, in racemes to 4 in. long. Trop. Amer.

roseum: *E. conspicuum.*

Skinneri (*Barkeria Skinneri*). Fls. dark rose, the lip with yellow ridges, 1½ in. across, in few- or many-fld. racemes, Sept.–Jan. Guatemala.

spectabile (*Barkeria spectabilis*). Fls. rose spotted with darker color, to 3 in. across, July–Sept. Guatemala.

Stamfordianum. Pseudobulbs to 6 in. high, with 3–4 lvs. to 6 in. long: fls. in leafless panicles to 16 in. long; sepals and petals yellow spotted with purple; lip white with yellow toothed midlobe, Feb.–May. Guatemala.

venosum. BUTTERFLY ORCHID. Fls. in 5–7-fld. racemes, pink, brown and green. Mex.

virens: *Encyclia virens.*

virgatum: *Encyclia virgata.*

vitellinum. Pseudobulbs to 3 in. high, with 2 lvs. to 8 in. long: fls. cinnabar-red, 1½ in. across, in 10–20-fld. racemes to 1 ft. long, Oct.–Dec. Mex. Var. **majus** has larger brighter colored fls.

xanthinum. St. leafy, to 1½ ft. or more, size of quill: fls. yellow and sometimes tinted orange, in a dense head; lip 3-lobed and fringed. Brazil.

ybaguense. St. slender and tall, leafless at top: lvs. very fleshy: fls. orange and yellow, in dense nearly globose head; lip lobed, fringed. Colombia, Peru.

EPIGÆA. *Ericaceæ.* Evergreen perennials with woody creeping sts., clusters of delightfully fragrant flesh-colored fls. in very early spring; 2 species, N. E. Amer. and Japan.

The plants can be grown in the garden if given acid soil and shade, and their natural conditions imitated. Propagation by seed is much more satisfactory than by division; sow as soon as seed is ripe.

repens. TRAILING ARBUTUS. MAYFLOWER. Sts. hairy: lvs. ovate, to 3 in. long, bright green: fls. white or pink, salverform, about ½ in. long. Newf. to Fla. and Ky.

EPILOBIUM. WILLOW-HERB. *Onagraceæ.* Herbs or sometimes subshrubs with linear to willow-like to oblong lvs., mostly more or less weedy, rose-purple, white or rarely yellow small fls., and long narrow capsular frs.

Suitable for planting in damp places and wild-gardens. Propagated by seeds or division; some of them produce runners and rosettes. They are plants of minor horticultural importance.

adnatum. Large, branched, erect, appressed-pubescent above: lvs. oblong, acute, serrulate, but some of them sessile and decurrent: fls. rose. Eu.

angustifolium (*Chamænerion angustifolium*). FIREWEED. GIANT W. Per. to 8 ft.: lvs. alternate, lanceolate, to 6 in. long: fls. purple, 1¼ in. across, in long terminal racemes. Eu., Asia, N. Amer. Var. **album** has pure white fls.

boreale. Branched per., becoming large, pubescent above: lvs. ovate to lanceolate, denticulate, to 3 in. long: fls. rosy, less than ¼ in. long, becoming abundant. Alaska.

coloratum. Per., slender, much branching, 1–3 ft.: lvs. narrow-lanceolate, serrulate, 2–6 in. long: fls. very small but numerous, axillary, pink or white. Weedy plant in low ground and dry ditches, Me. to Kans. and S. C.

Dodonæi (*E. rosmarinifolium*). Per. to 3 ft.: lvs. scattered, linear, to 2½ in. long: fls. rose-purple, rarely white, crowded near ends of branches. Eu.

Fleischeri. To 8 in.: lvs. lanceolate to linear-lanceolate: fls. deep purple, in few-fld. panicles. Eu.

Hectori. Sts. decumbent and rooting but becoming erect to 6 in. high: lvs. small, mostly opposite, oblong, to ½ in. long: fls. about ¼ in. diam., in upper axils. New Zeal.

hirsutum. Per. to 4 ft., hairy: lvs. usually opposite, lanceolate, to 3 in. long: fls. purple, 1 in. across, solitary or in short racemes. Eu.; nat. in E. U. S.

Hornemanni. Erect to 12 in., simple or nearly so: lvs. ovate or elliptic, nearly or quite entire, to 1½ in. long: fls. purple, about ¼ in. across, in upper axils. N. N. Amer., Eurasia.

Lamyi. Depauperate bien., stoloniferous, with low branched st.: lvs. lanceolate, small-toothed, rosulate in autumn: fls. purple, funnelform. Eurasia.

lineare: name of doubtful application.

nummularifolium. Creeping and tufted, the sts. to 8 in. long: lvs. opposite, orbicular, to ½ in. long: fls. pink or whitish, ⅙ in. across, axillary. New Zeal.

obcordatum. Sts. decumbent, to 6 in. long: lvs. opposite, ovate, to ¾ in. long: fls. rose-purple, the petals to ¾ in. long, few in axils. Mts. Calif., Nev.

obscurum. Very low per., stoloniferous: lvs, lanceolate, remotely small-toothed, sessile: fls. small. purple, funnelform. Eurasia.

parviflorum. Erect per. to 1 or 2 ft., soft-pubescent, rosulate at base: lvs. lanceolate, dentate, sessile: fls. very small, purple or white. Eurasia.

rosmarinifolium: *E. Dodonæi.*

rubescens. Stoloniferous per. to 1½ ft., simple, hairy above: lvs. lanceolate, sharply acute, 1½ in. long: fls. white, small. Colo., Utah.

EPIMEDIUM. *Berberidaceæ.* Low per. herbs of the north temp. zone, with small pinnate lvs. and dainty racemes of small fls. in red, pink, white, yellow; the outer colored parts are interpreted as sepals, and the 4 inner ones as petals which are usually nectaries and sometimes produced into prominent spurs. The species and vars. are confused in cult. and plants may not belong to the names they bear; the various white-fld. kinds are probably *E. Musschianum*, and *E. macranthum* appears to be little grown at present.

The plants are very suitable for rock-gardens and semi-shady locations. In sheltered spots under trees the foliage often remains all winter and leaves persist when dead. Any usual soil is satisfactory. Propagated by division.

album: hort. name for a pure white form.

alpinum. To 1 ft.: lvs. biternate: fls. red with yellow slipper-like nectaries and short spurs. Eu. Cult. apparently only in var. **rubrum** (*E. rubrum*) with larger fls. and petals red outside and lvs. red-margined. May–June.

bicolorum: hort. form with rosy-brown fls., probably of *E. alpinum.*

coccineum: hort. form with red and white fls.

colchicum: *E. pinnatum* var.

diphyllum: *Aceranthus diphyllus.*

elegans: *E. pinnatum* var.

erectum: hort. name for a form with white fls.

macranthum. Long-spur E. To 9 in.: lvs. triternate: outer sepals red, inner petals violet with white deflexed prominently projecting spurs 1 in. long, May–June. Japan. Var **niveum** (*E. niveum*), fls. pure white; var. **roseum** (*E. roseum*), pinkish or pale rosy-red; var. **violaceum** (*E. violaceum*), spurs violet.

Musschianum. Japanese E. Lvs. 1-ternate: fls. white or pale yellow, drooping, spurs or sacs very short and not prominent. Japan.

niveum: *E. macranthum* var., at least in part.

pinnatum. Persian E. Lvs. usually biternate: fls. bright yellow with short red spurs or nectaries, Apr.–July. Persia, Caucasus. Var. **colchicum**, Golden-Fleece E., fls. brilliant yellow; var. **elegans**, June–Aug., larger and more numerous fls. than type.

roseum: *E. macranthum* var.

rubrum: *E. alpinum* var.

sulphureum: hort. name, probably form of *E. pinnatum.*

violaceum: *E. macranthum* var.

EPIPACTIS (*Goodyera. Peramium*). *Orchidaceæ.* Terrestrial orchids with basal usually variegated lvs. and fls. in spikes, the dorsal sepal and petals united into a helmet, lip entire; grown in shady places out-of-doors. See *Orchids.*

decipiens (*E. Menziesii*). To 1 ft.: lvs. to 2 in. long, dark green veined with white: fls. white, in dense one-sided spikes, in summer. N. Amer.

gigantea: *Amesia gigantea.*

Menziesii: *E. decipiens.*

pubescens. Rattlesnake Plantain. To 16 in.: lvs. to 2 in. long, dark green with white middle nerve and yellowish side nerves: fls. yellowish-white, in dense cylindrical spikes, in summer. E. N. Amer.

repens. To 10 in.: lvs. to 2 in. long, dark green indistinctly marked with lighter green: fls. snow-white, in dense one-sided spikes, July–Sept. N. Eu., N. Asia, N. Amer.

tesselata. To 1 ft.: lvs. about 2 in. long, bright green marked with white: fls. whitish, in loosely spiral spikes, July–Sept. E. N. Amer.

EPIPHRONITIS. *Orchidaceæ.* A group comprising hybrids between the genera Epidendrum and Sophronitis.

Veitchii (*E. radicans* × *S. grandiflora*).

EPIPHYLLANTHUS. *Cactaceæ.* Forking plants with thick globular, cylindric or flattened joints not toothed and bearing areoles all around, often epiphytic, with or without spines: fls. irregular, slender, purple to white, stamens more or less exserted. Cent. Brazil, 3 species. See *Cacti.*

microsphæricus (*Cereus obtusangulus*). At first erect, becoming much branched and more or less prostrate, joints slender and terete or obtusely angled, somewhat spiny or nude: fls. terminal, purple to rose.

EPIPHYLLUM (*Phyllocactus*). *Cactaceæ.* Mostly epiphytic cacti, branches usually flattened and leaf-like and sometimes 3-winged; mostly no spines on mature plants: fls. large and showy, with many long stamens, white, red or yellow, nocturnal or diurnal. Some 16 species, as now understood, Mex. and southward, some of them known as house plants; there are a number of hybrids. See *Cacti.*

The epiphyllums are very useful as greenhouse and window-garden subjects and are frequently seen in summer on porches. They propagate readily by cuttings and are of simple requirements.

Ackermannii. Sts. several, to 3 ft., flat, thin and crenate: fls. very large, to 8 in. long, scarlet outside and carmine within. Mex., but supposed to be a hybrid.

anguliger. Branches many, the lower ones terete, but upper ones flattened and deeply toothed: fls. brownish-yellow outside and otherwise white, tube about 3 in. long and segms. about 2 in. Mex.

biforme: *Disocactus biformis.*

crenatum. Sts. about 3 ft. long, terete, becoming woody, strongly crenate, branches glaucous and often tip-rooting: fls. 4 in. and more across and tube of similar length, very fragrant, cream-colored or greenish-yellow. Honduras, Guatemala.

Hookeri. Sts. 6–10 ft. long and more, joints rather thin and deeply crenate and 2–3 in. or more broad: fls. scentless, nocturnal, 8–9 in. long, yellow outside, petals white. Trinidad, Venezuela.

latifrons: *E. oxypetalum.*

Makoyanum: *Schlumbergera Gaertneri.*

oxypetalum (*E. latifrons*). Stout, to 10 ft. or more, with many thin flat branches to 4 in. or more broad and deeply crenate: fls. opening in evening and in full bloom about midnight, to 10 in. long, white, reddish outside, style white. Mex. to Brazil.—Much cult.

phyllanthoides: *Nopalxochia phyllanthoides.*

roseum: garden name, perhaps of a hybrid.

Russellianum: *Schlumbergera Russelliana.*

stenopetalum. Like *E. oxypetalum* (*latifrons*) but ultimate joints not acuminate as in that species: fls. fragrant, nocturnal but remaining open in morning, about 10 in. long, white, reddish outside, style pink or purplish. Mex.

strictum. Plant to 6 or 7 ft. or more, joints 2–3 in. broad and serrate: fls. opening at night and closing before dawn, white, brownish or pinkish outside, tube 6 in. long, sepals recurved. Mex. to Panama.

truncatum: *Zygocactus truncatus.*

EPIPHYTE: air-plant; a plant growing on another or on some other elevated support.

EPISCIA. *Gesneriaceæ.* Trop. American herbs with opposite often unequal lvs., scarlet, whitish or purple fls. with frequently spurred corolla-tube and 5-lobed limb, and leathery frs. opening by 2 valves; grown under glass and for hanging-baskets and in pyramids; require partial shade; propagated by cuttings or division of sts.

chontalensis. Sts. to 10 in. long, reddish-purple: lvs. ovate, to 4 in. long, marked with purple between veins: fls. pale lilac or white, to 2 in. across, solitary or clustered. Nicaragua.

cupreata. Sts. rooting at joints, drooping: lvs. oval, wrinkled and soft-hairy, tinged with copper or red: fls. scarlet, ¾ in. across, solitary. Nicaragua. Var. viridifolia has fls. to 1 in. across and green lvs.—The best known species in cult.

fulgida. Pubescent creeper: lvs. ovate, margins ciliate, rich dark green: fls. bright red, 1½ in. long, solitary. N. S. Amer.

metallica: hort. name, perhaps for a form of *E. cupreata.*

tessellata (*Centrosolenia bullata*). Pubescent, of robust habit: lvs. to 1 ft. long and 6 in. wide, bronzy-green, veined with purple, and elevated between veins, wavy and ciliate: fls. pale yellow, about 2 in., long, in clusters. Peru.

EPITHELANTHA. *Cactaceæ.* One very small globular cactus from W. Tex. and N. Mex. For cult. see *Cacti.* **E. micromeris** (*Mammillaria micromeris*). Simple or cespitose, about 2¼ in. or less diam., depressed at top, tubercles small in many spirals, spines many and white: fls. near center of plant among wool and spines, whitish to light pink, about ¼ in. across.

EQUISETUM. HORSETAIL. *Equisetaceæ* (the only genus). Per. rush-like cryptogamous herbs with hollow jointed sts. and no proper foliage; lvs. reduced to sheaths at the joints; spores borne in terminal cone-like spikes; widely distributed and rarely transplanted in moist locations.

hyemale. Evergreen, to 4 ft., sts. slender, furrowed and rough: spikes pointed. N. Amer., Eu., Asia.

præaltum (*E. robustum*). Evergreen, to 11 ft., sts. furrowed and rough: spikes with stiff point. N. Amer., Asia.—Other species may be transferred to grounds.

robustum: *E. præaltum.*

ERAGROSTIS. *Gramineæ.* Small or medium-sized ann. and per. grasses widely distributed in trop. and temp. countries, the small spikelets borne in open diffuse panicles; a few species are planted for the ornament of their delicate spray. See *Grasses.*

abyssinica. TEFF. Ann. to 3 ft.: lvs. to 6 in. long and 1/12 in. wide: panicles 1 ft. or more long, with long hair-like ascending branches. N. Afr.

amabilis. Ann. to 1 ft.: lvs. to 4 in. long and ⅙ in. wide: panicles to 6 in. long, with slender spreading or ascending branches. India.—Some of the material cult. under this name is *E. suaveolens.*

capillaris. Ann. to 1½ ft.: lvs. to 10 in. long and ⅙ in. wide, rough above: panicles to 15 in. long, with hair-like spreading or ascending branches. N. H. to Ga. and Tex.—Some of the material cult. as *E. capillaris* is *E. mexicana.*

chloromelas. Tufted per. to 1½ ft.: lvs. to 6 in. long and 1/12 in. wide, convolute, glaucous: panicles to 8 in. long, stiff, with slender spreading branches. S. Afr.

curvula. Tufted per. to 2 ft.: lvs. to 1 ft. long and 1/12 in. wide, convolute: panicles to 10 in. long, with slender branches erect or spreading. S. Afr. Var. valida has lvs. to 2 ft. long and ¼ in. wide.

elegans: *E. japonica.*

interrupta: *E. japonica.*

japonica (*E. elegans. E. interrupta*). Ann., erect, to 3 ft.: panicles narrow, somewhat interrupted, comprising about half the entire height with numerous minute spikelets. Japan.

maxima. Ann. to 3 ft.: lvs. lanceolate: panicles to 9 in. long, with hair-like branches. Madagascar.—Plants grown under this name may be *E. suaveolens.*

mexicana. Ann. to 2 ft.: lvs. to 8 in. long: panicles to 1 ft. long, the branches slender and spreading. S. Calif. to New Mex. and Mex.

obtusa (*Briza geniculata*). Tufted per. to 1½ ft.: lvs. to 5 in. long and 1/12 in. wide, usually involute: panicles to 4 in. long, with thread-like spreading branches. S. Afr.

pilosa (*Poa pilosa*). Tufted ann. to 1½ ft.: lvs. to 5 in. long and 1/12 in. wide: panicles to 6 in. long, branches spreading. Eu.; nat. in N. Amer.

suaveolens. Ann. to 3 ft., resembling *E. abyssinica* but with less spreading panicles and more compact spikelets. W. Asia.

unioloides. Ann., erect or spreading, to 1 ft.: panicle ovoid and open, to 6 in. long, the spikelets usually pink or purplish and somewhat like those of a Briza. India, Malaysia, China.

ERANTHEMUM (*Dædalacanthus*). *Acanthaceæ.* Trop. Asian herbs and shrubs with opposite simple lvs. and blue or rose tubular 5-lobed fls. in dense bracted spikes; one species grown in S. Fla. and under glass. It thrives in light rich soil with ample sunlight and water. Propagated by cuttings of young wood.

atropurpureum: *Pseuderanthemum atropurpureum.*

bicolor: *Pseuderanthemum bicolor.*

Eldorado: a form of *Pseuderanthemum atropurpureum.*

nervosum (*E. pulchellum*). To 4 ft.: lvs. ovate or oval, to 8 in. long, prominently veined, slightly toothed: fls. blue, 1 in. long and ¾ in. across, under pointed veiny bracts. India.—Commonly planted far S. and frequent under glass.

pulchellum: *E. nervosum.*

reticulatum: *Pseuderanthemum reticulatum.*

tuberculatum: *Pseuderanthemum tuberculatum.*

ERANTHIS. WINTER ACONITE. *Ranunculaceæ.* Small per. herbs with short tuberous root, native in Eu. and Asia, having basal palmately dissected lvs., solitary yellow vernal fls. subtended by an involucre-like lf., and fr. composed of many follicles. They are very hardy and thrive in most situations. Propagated by division of roots.

cilicica: *E. hyemalis* var.

hyemalis. To 8 in.: lvs. long-stalked, 1½ in. across, cut into many linear or oblong segms.: fls. to 1½ in. across, with 5–9 petal-like sepals, in very early spring. Eu.; somewhat nat. in N. Amer. Var cilicica (*E. cilicica*) has broader sepals ½ in. across.—Tubers may be planted in autumn as for tulips; plants are likely to persist.

sibirica. Similar to *E. hyemalis* but only 3–4 in. high, with smaller fls. having 5 sepals. Siberia.

ERCILLA. *Phytolaccaceæ.* Climbing evergreen shrubs with alternate entire lvs., pale purple fls. in many-fld. axillary racemes, and fr. a berry; sometimes grown in warm regions or under glass as a wall-cover as it climbs by aerial rootlets. Propagated by seeds and cuttings.

spicata (*Bridgesia spicata*). Lvs. leathery, elliptic or ovate, to 3 in. long and 1½ in. wide: racemes slightly longer than lvs.: berries dark purple. Chile.

EREMÆA. *Myrtaceæ.* W. Australian shrubs, some of them intro. in Calif., differing from Calothamnus chiefly in the fls. solitary or few and nearly terminal rather than in lateral clusters or spikes: lvs. heath-like, flat, alternate, often crowded: stamens longer than petals and showy, the fls. red.

ebracteata. Low bush, young parts somewhat hirsute: lvs. ⅓ in. or less long, linear: fls. 1–3 at a place, with few small bracts or none.

fimbriata. Stiff coarse shrub, more or less hirsute: lvs. ½ in. or less long, lanceolate or elliptic: fls. solitary, surrounded by bracts.

violacea. Hirsute shrub with nearly cylindrical linear acute lvs. and solitary twin or sometimes clustered fls. bearing violet filaments that are joined near the base.

EREMOCHLOA. *Gramineæ.* Per. grasses of Asia and Australia, with one-sided spikelets borne in terminal narrow spikes; one species grown for lawns in the S. See *Grasses.*

ophiuroides. CENTIPEDE-GRASS. Creeping by runners and stolons: lvs. about 3 in. long and ¼ in. wide, bluish- or yellowish-green: racemes straight or somewhat falcate, cylindric and slender, glabrous, to 2½ in. long. China.

EREMOCITRUS. AUSTRALIAN DESERT KUMQUAT. *Rutaceæ.* One species, **E. glauca,** in desert regions of subtrop. Australia, in this country resistant to cold and drought and promising beyond the regular citrus belt. It is a sharp-spiny shrub or small tree with very narrow xerophytic lvs. to 1½ in. long: fls. small, white, fragrant, solitary or 2 or 3 together in the axils: fr. light yellow, pyriform or oblate, about ½ in. diam., commonly 4-celled, mildly acid and edible. Works as a graft on Citrus, and vice-versa.

EREMOSTACHYS *Labiatæ.* Asian herbs with mostly basal toothed or cut lvs. and yellow 2-lipped fls. in many-fld. whorls in spikes; one species is known to hort.

laciniata. To 2 ft. or more, hairy: lvs. 2-pinnate into lanceolate or linear segms.: fls. yellow or cream-colored, in spikes to 2 ft. long. Asia Minor.

EREMURUS. DESERT-CANDLE. *Liliaceæ.* Asian per. herbs with thick fibrous or cord-like roots, narrow basal lvs. forming tufts or rosettes and white, pink or yellow fls. in racemes terminating stately scapes usually several ft. high, the perianth-segms. almost distinct.

These plants are hardy in the North with winter protection. They are good in rich well-drained soil. Propagated by division or slowly by seeds. They are seen to good advantage against a background of foliage.

Bungei. Lvs. linear, 1 ft. long: fls. yellow or orange, in racemes to 5 in. long. Persia.

Elwesii. Lvs. ovate-lanceolate, glaucous: fls. pink with deeper band down center. Habitat unknown. Var. **albus** is listed.

himalaicus. Lvs. strap-shaped, to 1½ ft. long: fls. white, in racemes to 2 ft. long and 4 in. through. Himalayas.—The commonest species in cult.

Olgæ. Lvs. narrow, to 1 ft. long and ¾ in. or less broad, rough on margins: fls. white with brownish midnerves, in a dense raceme. Turkestan. Var. **albus** has white fls.

robustus. Lvs. narrow-strap-shaped, to 2 ft. long, glaucous: fls. bright pink, in racemes to 3 ft. long and 5 in. through. Cent. Asia.

Shelfordi. A hort. form with coppery-yellow fls. tinged outside with red.

turkestanicus. Fls. reddish-brown margined with white, in racemes to 2 ft. long. Turkestan.

Tubergenii. Hybrid between *E. himalaicus* and *E. Bungei.*

Warei. Probably hybrid between *E. Bungei* and *E. Olgæ.*

EREPSIA. *Aizoaceæ.* Separated from Mesembryanthemum (which see for cult.): per., more or less woody, branches erect or ascending: lvs. opposite, 3-angled, sometimes serrate or toothed: fls. solitary or ternate, whitish, yellow or reddish; stamens hidden under staminodes. S. Afr.

heteropetala (*M. heteropetalum*). Lvs. somewhat compressed or flattened but 3-angled, glaucous, rough or cut on the keel, about 1 in long: fls. small, solitary, pale red or whitish, the petals unequal and shorter than calyx.

inclaudens (*M. inclaudens*). Lvs. somewhat flattened and 3-angled, scimitar-shaped, with wide keel, green, 1 in. or less long, essentially entire: fls. rose or purplish, with broad petals, inner ones very short.

mutabilis (*M. mutabile*). Lvs. to ¾ in. long, green, acute, keel entire: fls. rose, petals narrow or subulate, a little longer than calyx.

serrata (*M. serratum*). Erect: lvs. subulate, to ⅓ in. long, serrate on angles or keel: fls. yellow with purple lines, petals shorter than calyx.

ERIA. *Orchidaceæ.* Trop. Asian epiphytes of various habit and fls. in racemes or panicles, the sepals forming with the column a spur or sac-like body; subjects for the warm greenhouse. See *Orchids.*

ancorifera. Similar to *E. flava* but with black anchor-shaped mark on lip. Sumatra.

barbata. Pseudobulbs to 2 in. long, with 2 lvs. to 16 in. long: fls. yellow striped with brownish-purple, in hairy racemes to 5 ft. high, Oct.–Nov. India.

bractescens. Pseudobulbs 2 in. long, with 2–3 lvs. to 5 in. long: fls. white with lip purplish at base, in many-fld. racemes to 6 in. long, June. E. Indies.

convallarioides. Pseudobulbs 3½ in. long, with 3–4 lvs. to 7 in. long: fls. white with yellow lip, about ⅓ in. across, in drooping racemes about 1¾ in. long, May–June. Himalayas.

coronaria (*Trichosma suavis*). Pseudobulbs 6 in. long, with 2 lvs. to 7 in. long: fls. white with yellow lip, the side lobes marked with purple, in 3–5-fld. racemes to 6 in. long, Dec.–Mar. Himalayas.

densiflora: a listed name.

excavata. Pseudobulbs to 2 in. long, with 4–6 lvs. to 6 in. long: fls. white with yellow lip veined with purple and pink side lobes, in few-fld. racemes. Himalayas.

ferruginea. Pseudobulbs to 8 in. long, with 2–4 leathery lvs. to 6 in. long: fls. about 1 in. across, in 8–14-fld. racemes to 8 in. long; sepals olive-brown striped with darker color; petals white tinged with rose; lip white, bright rose within, Mar.–May. Himalayas.

flava. Pseudobulbs to 3 in. long, with 3–5 lvs. to 10 in. long: fls. yellow marked with purple, the scapes white-tomentose. Himalayas. Var. **lanata** (*E. lanata*) has smaller fls. with purplish midlobe of lip.

lanata: *E. flava* var.

monostachya. Lvs. linear: fls. in long cylindrical racemes. Java.

obesa. Pseudobulbs to 3 in. long: fls. white, greenish-yellow at base, in 4–6-fld. racemes, Feb.–Mar. Burma.

ERIANTHUS. PLUME-GRASS. *Gramineæ.* Robust per. grasses, sometimes grown as annuals, with long flat lvs. and spikelets with tufts of silky hairs at their base, borne in large terminal panicles; native in warm and temp. regions and ornamental as specimen plants. See *Grasses.*

alopecuroides: *E. divaricatus.*

divaricatus (*E. alopecuroides*). Per. to 10 ft.: panicle oblong, to 1 ft. and to 3 in. broad, the branches slender and loose. N. J. to Fla. and Tex.

Ravennæ. RAVENNA-GRASS. To 12 ft.: lvs. to 3 ft. long and ½ in. and more wide, midrib paler: panicles to 3 ft. long, silky, dense and plume-like. S. Eu. to India.

saccharoides. To 10 ft.: lvs. to 2 ft. long and 1 in. wide: panicles 1 ft. or more long, loose. N. J. to Fla. and Tex., Cuba.

ERICA. HEATH. *Ericaceæ.* Evergreen branchy shrubs or sometimes small trees, in very many species, with small needle-like or very narrow usually whorled lvs., small white, rose or yellow usually declined fls. that are mostly tubular, bell-shaped, urn-shaped, or globose, and capsular frs.; native in Eu. and S. Afr., particularly abundant in the latter country. Many Latin-named kinds occur in collections of fanciers, often representing variants and hybrids.

Heaths are grown somewhat in rock-gardens, but few of them are hardy in the North, also under glass for the profuse bloom. They are plants of attractive compact habit and slow growth. *E. carnea* and *E. vagans* are perhaps hardiest, standing in New York and central New England, but *E. cinerea* and *E. Tetralix* are nearly equally durable, and *E. scoparia* stands in middle regions. Heaths of many kinds are profuse bloomers and popular in the open in California, where they bloom in winter and early spring. They are particular as to soil in pot culture, preferring one of light peat and coarse sand. In the open, they are given a light or sandy soil; they do not stand well in limestone soils. Propagated by cuttings of young wood under glass, given good ventilation when rooted. New blooming wood may be produced by heading back after flowering.

abietina: see note under *E. Patersoni.*

arborea. TREE H. To 20 ft.; the sts. with long stout hairs: lvs. in 3's, glabrous: fls. white, ⅛ in. long, fragrant, in large panicles in winter or spring. Medit. region.

australis. To 4 ft.: lvs. in 4's, glabrous: fls. purplish-red, ⅓ in. long, in terminal clusters in spring. Spain, Portugal.

baccans. To 5 ft., erect, glabrous: lvs. in 4's, somewhat curved: fls. terminal in 4's, purple, the corolla narrowed at throat, about ¼ in. long. S. Afr.

Bergeriana (*E. turrigera*). To 3 ft.: lvs. in 4's, rough, ciliate: fls. red, to ¼ in. long, in 4's, May–June. S. Afr.

blanda: *E. doliiformis;* the material cult. under the name *E. blanda* may be of hybrid origin.

Bowieana. To 1 ft.: lvs. in 4's, glabrous: fls. white, tubular, to ¾ in. long, axillary. S. Afr.

caffra (*E. urceolaris*). To 12 ft.: lvs. in 3's, gray-pubescent: fls. white or yellowish-white, ¼ in. long, in few-fld. clusters. S. Afr.

capitata. To 15 in., branches more or less woolly: lvs. in 3's, obtuse, woolly underneath: fls. 1–3, greenish-yellow, globular, ¼ in. or less across. S. Afr.

carnea. To 1 ft., the branches prostrate: lvs. in 4's, glabrous: fls. red, to ¼ in. long, in one-sided racemes to 2 in. long in early spring, the stamens exserted. Eu. Var. **alba** has white fls.—Other forms bear hort. names.

Cavendishiana. Hybrid between *E. depressa* and *E. Patersoni*: fls. yellow, tubular.

cerinthoides. To 3 ft.: lvs. in 4's–6's, pubescent and ciliate: fls. crimson or pink, tubular, to 1⅓ in. long, in umbels. S. Afr.

Charlesiana, Charlesworthiana: listed as a hybrid: fls. pale pink, tubular, ½ in. long.

ciliaris. FRINGED H. To 1 ft., the branches prostrate: lvs. in 3's, ciliate: fls. rosy-red, ⅓ in. long, in terminal racemes to 5 in. long from July–Oct. W. Eu.

cinerea. TWISTED H. To 1½ ft., much branched: lvs. in 3's, glabrous: fls. rosy-purple, ¼ in. long, in umbels or racemes to 3 in. long, June–Sept. W. Eu. Var. **alba** has white fls. and **coccinea** red.

codonodes: *E. lusitanica.*

concinna: *E. verticillata.*

cruenta. Erect, to 3 ft.: lvs. in 3's, pubescent when young: fls. blood-red, to 1 in. long, more or less tubular. S. Afr.

darleyensis (*E. mediterranea hybrida*). Hybrid between *E. carnea* and *E. mediterranea:* to 2 ft.: fls. red, ¼ in. long.

depressa. Branches decumbent, with revolute lvs. in 3's: fls. white, small, terminal. S. Afr.

doliiformis (*E. blanda*). To 1 ft.: lvs. in 6's, glabrous, ciliate: fls. rosy, tubular, ½ in. long, in umbels. S. Afr.

glandulosa. Erect, to 2 ft. or more: lvs. in 4's: fls. in 4's, white, corolla nearly tubular, usually pubescent or glandular, about 1 in. long. S. Afr.

gracilis. To 1 ft.: lvs. in 4's, glabrous: fls. rosy, ⅙ in. long, in whorls of 4 at ends of branchlets, Feb.–Mar. S. Afr. Var. **autumnalis** blooms in fall.

grandiflora. Stout and erect, to 5 ft.: lvs. scattered or in 6's: fls. orange-red to bright yellow, corolla narrowed to base, about 1 in long, S. Afr.

Hieliana: see *E. hyemalis.*

hirtiflora. To 2 ft.: lvs. in 4's, hairy: fls. pale purple, ⅙ in. long, rough-hairy, in 4's. S. Afr.

hyemalis (*E. Hieliana?*). To 2 ft.: lvs. in 4's, ciliate: fls. pink tipped with white, to 1 in. long, borne along the branchlets and forming a leafy raceme, Nov.–Feb. Origin unknown.

linnæoides. Supposed hybrid: fls. mostly in 4's, corolla clavate, white in upper part, purple at base.

lusitanica (*E. codonodes*). SPANISH H. To 12 ft.: lvs. in 3's–5's or irregular, glabrous: fls. pink or white in var. **alba**, ⅙ in. long, profusely borne along branches from Feb.–Apr. W. Eu.

Mackaii (*E. Mackaiana*). Hybrid between *E. Tetralix* and *E. ciliaris:* fls. red, ¼ in. long. Var. **plena** (var. *flore-pleno*) has double fls.

mediterranea. To 10 ft.: lvs. in 4's–5's, glabrous: fls. deep red, to ¼ in. long, in short racemes in spring, the stamens exserted. W. Eu. Var. **alba** has white fls. Var. **hibernica** (var. *glauca*), to 3 ft., lvs. glaucous.

melanthera. To 2 ft.: lvs. in 3's, glabrous: fls. rosy, ⅙ in. long, blooming profusely at ends of branches in winter, the stamens exserted. S. Afr. Color forms are **purpurea** and **rubra.**

multiflora. To 3 ft.: lvs. in 5's or 6's, glabrous: fls. pink, ⅕ in. long, in dense spikes, the stamens exserted. S. Eu.

Patersoni. The trade name probably belongs to *E. abietina*, which is an erect glabrous bush to 2 ft. high, imbricated lvs. to ½ in. long, and fls. yellow with orange limb. S. Afr.

persoluta: *E. subdivaricata.*

regerminans. To 2 ft.: lvs. in 6's, glabrous: fls. pink or red, ⅙ in. long, in dense spikes to 5 in. long. S. Afr.—The plants usually cult. under this name are *E. hirtiflora.*

scariosa. Erect, to 1½ ft.: lvs. crowded and mostly on short branchlets: fls. solitary, terminal, white or rosy, corolla tubular and inflated, about ⅓ in. long. S. Afr.

scoparia. BESOM H. To 10 ft.: lvs. in 3's or 4's, glabrous and shining: fls. greenish, 1/12 in. long, in long spikes, May–June. S. Eu. Var. **pumila** is a dwarf form.

sessiliflora. Erect, to 1½ ft., very leafy: lvs. scattered or in 6's: fls. in dense spike, bracts and sepals light colored or red, corolla greenish or yellowish, trumpet-shaped, about 1 in. long. S. Afr.

stricta. CORSICAN H. To 9 ft., with stiff branches: lvs. mostly in 4's, glabrous: fls. rosy-purple, ¼ in. long, in terminal umbels in summer. S. Eu.

subdivaricata (*E. persoluta*). To 2 ft.: lvs. in 4's, glabrous: fls. rosy (var. **rosea**) or white (var. **alba** or **albiflora**), ⅙ in. long, in racemes in spring. S. Afr.

Tetralix. To 2 ft., the branches prostrate: lvs. in 4's, ciliate, whitish beneath: fls. rose, ¼ in. long, in dense terminal clusters, June–Oct. Eu. Var. **alba** has white fls.

translucens. Hybrid between *E. tubiflora* and *E. ventricosa:* fls. rosy, ¾ in. long, tubular.

tubiflora: a name variously applied to several species.

turrigera: *E. Bergeriana.*

urceolaris: *E. caffra.*

vagans. CORNISH H. To 1 ft.: lvs. in 4's or 5's, glabrous: fls. purplish-pink, ⅛ in. long, in leafy racemes to 6 in. long, the stamens exserted. W. Eu. Var. **alba** has white fls. and **rubra** deeper red. Var. **grandiflora** has larger fls.—There are forms with hort. names.

Veitchii. Hybrid between *E. arborea* and *E. lusitanica*: fls. white, borne profusely.

ventricosa. To 6 ft.: lvs. in 4's, ciliate: fls. white, pink or red, to ⅜ in. long, in dense umbels in spring and summer. S. Afr. Var. **grandiflora** has larger fls.

verticillata (*E. concinna*). To 5 ft.: lvs. mostly in 4's–6's, glabrous: fls. rosy, tubular, ¾ in. long, forming dense leafy racemes. S. Afr.

viridipurpurea. To 2 ft.: lvs. in 4's, glabrous: fls. red, 1/12 in. long, in clusters. S. Afr.

vulgaris: *Calluna vulgaris.*

Webbiana: supposed hybrid.

Williamsii. Hybrid between *E. Tetralix* and *E. vagans:* fls. rose, urn-shaped.

Wilmorei (*E. Wilmoreana*). Said to be a hybrid: fls. rosy tipped with white, tubular.

ERICACEÆ. HEATH FAMILY. Widely distributed hardwood shrubs and small trees with simple lvs., bisexual fls. mostly showy, with 4–5-parted calyx, 4–5-lobed gamopetalous corolla, 4–10 stamens, superior or inferior 2–5-celled ovary and 1 style, and fr. a caps., berry or drupe. The family furnishes many ornamental subjects and some, as the blueberry, grown for the edible frs. Some members of the family are the choicest broad-leaved evergreens. They are prevailingly plants of acid soils. Genera known to hort. are Andromeda, Arbutus, Arctostaphylos, Arctous, Befaria, Bruckenthalia, Calluna, Chamædaphne, Chimaphila, Chiogenes, Daboëcia, Elliottia, Enkianthus, Epigæa, Erica, Gaultheria, Gaylussacia, Kalmia, Ledum, Leiophyllum, Leucothoë, Loiseleuria, Lyonia, Menziesia, Oxydendrum, Pentapterygium, Pernettia, Phyllodoce, Pieris, Pyrola, Rhododendron, Rhodothamnus, Vaccinium, Zenobia.

ERICAMERIA. *Compositæ.* Evergreen shrubs often with heath-like foliage and yellow heads in terminal panicles or cymes, with or without rays; pappus of bristles; native in W. N. Amer. and sometimes planted.

ericoides (*Aplopappus ericoides*). MOCK-HEATHER. To 2½ ft.: lvs. crowded, cylindrical, to ⅙ in. long: heads to ⅓ in. long, with rays. Calif.

ERIGENIA. *Umbelliferæ.* One tuberous nearly stemless per. herb, native Ont. to Minn. and Kans. **E. bulbosa.** HARBINGER-OF-SPRING. To 9 in.: lvs. ternately decompound into oblong obtuse segms.: fls. white, in small usually compound umbels.

ERIGERON. FLEABANE. *Compositæ.* Annuals and perennials of wide distribution, resembling wild asters: lvs. alternate or basal, entire or toothed or occasionally dissected: heads solitary or in clusters, rays mostly white, rose, violet or purple, disk-fls. yellow; pappus of soft bristles.

Erigerons are of easy cultivation in the border or wild-garden and for colonizing, and the low kinds in rock-gardens. Propagated by seeds, division or cuttings, the tufted perennial species best by division.

acris (*E. umbellatus*). Per. or bien. to 2 ft.: lvs. spatulate to oblong, entire: heads in racemes or panicles, ½ in. across, rays purple short, a row of thread-like pistillate fls. inside the rays. N. N. Amer.

alpinus. To 1 ft.: lvs. spatulate to linear, entire: heads usually solitary, ¾ in. across, rays purple varying to white. N. Eu., N. Asia, Rocky Mts.

aurantiacus. DOUBLE ORANGE DAISY. To 10 in.: lvs. spatulate-oblong: heads 1–2, about 1 in. across, rays orange-yellow. Turkestan.

bellidifolius: *E. pulchellus.*

caucasicus. Per. to 10 in.: lvs. spatulate or oblong: heads 1–3, 1 in. across, rays rosy-purple. Caucasus.

cilicicus: *E. uniflorus.*

compositus. To 8 in.: radical lvs. crowded, usually 2-ternate into linear or spatulate segms.: heads solitary, ¾ in. across, rays white or purplish. Alaska to Calif. and Rocky Mts.

Coulteri. Per. to 2 ft.: lvs. obovate to lanceolate, slightly toothed: heads usually solitary, to 1½ in. across, rays white to purplish. Rocky Mts. to Calif.

elatior (*E. grandiflorus elatior*). Per. to 2 ft.: lvs. ovate-lanceolate, entire: heads 1–3, to 1½ in. across, rays lilac or purple. Colo. to Wyo.

glabellus. Per. to 1½ ft.: lvs. oblanceolate to linear-lanceolate: heads 1–3, to 2 in. across, rays violet or purple. Wis. to Rocky Mts.

glabratus. Per. to 8 in.: lvs. spatulate: heads usually solitary, to ¾ in. across, bright purple to white. Eu. Var. **roseus** is listed.

glandulosus. Per. to 6 in.: lvs. mostly basal, oblanceolate: heads solitary, 1 in. across, rays violet or purple. Colo., Wyo. Var. **major** is listed.

glaucus. BEACH ASTER. SEASIDE DAISY. Per. to 10 in.: lvs. mostly basal, spatulate or oblong, entire: heads solitary, to 1½ in. across, rays lilac or violet. Pacific Coast.

grandiflorus. Per. to 8 in.: lvs. lanceolate, hairy: heads solitary, rays purple to white, ⅓ in. long, involucres white-woolly. Canadian Rockies.

hybridus: hort. name of uncertain application.

intermedius: hort. name, probably *E. speciosus.*

Karvinskianus (*E. mucronatus*). Per. but blooming first year from seed, to 18 in. and some or all of the branches decumbent and more or less trailing: lvs. to 1 in. long, more or less toothed or lobed at apex: heads on solitary peduncles. to ¾ in. across, rays many and white or pinkish. Mex. and south.—Grown as a border or bed plant, usually under the name *Vittadinia* (which see).

macranthus. Per. to 2½ ft.: lvs. oblanceolate to ovate: heads in corymbs, to 1½ in. across, rays very numerous, lilac or bluish-purple. Mts., Alta. to Ariz.

mexicanus: a listed name.

mucronatus: *E. Karvinskianus.*

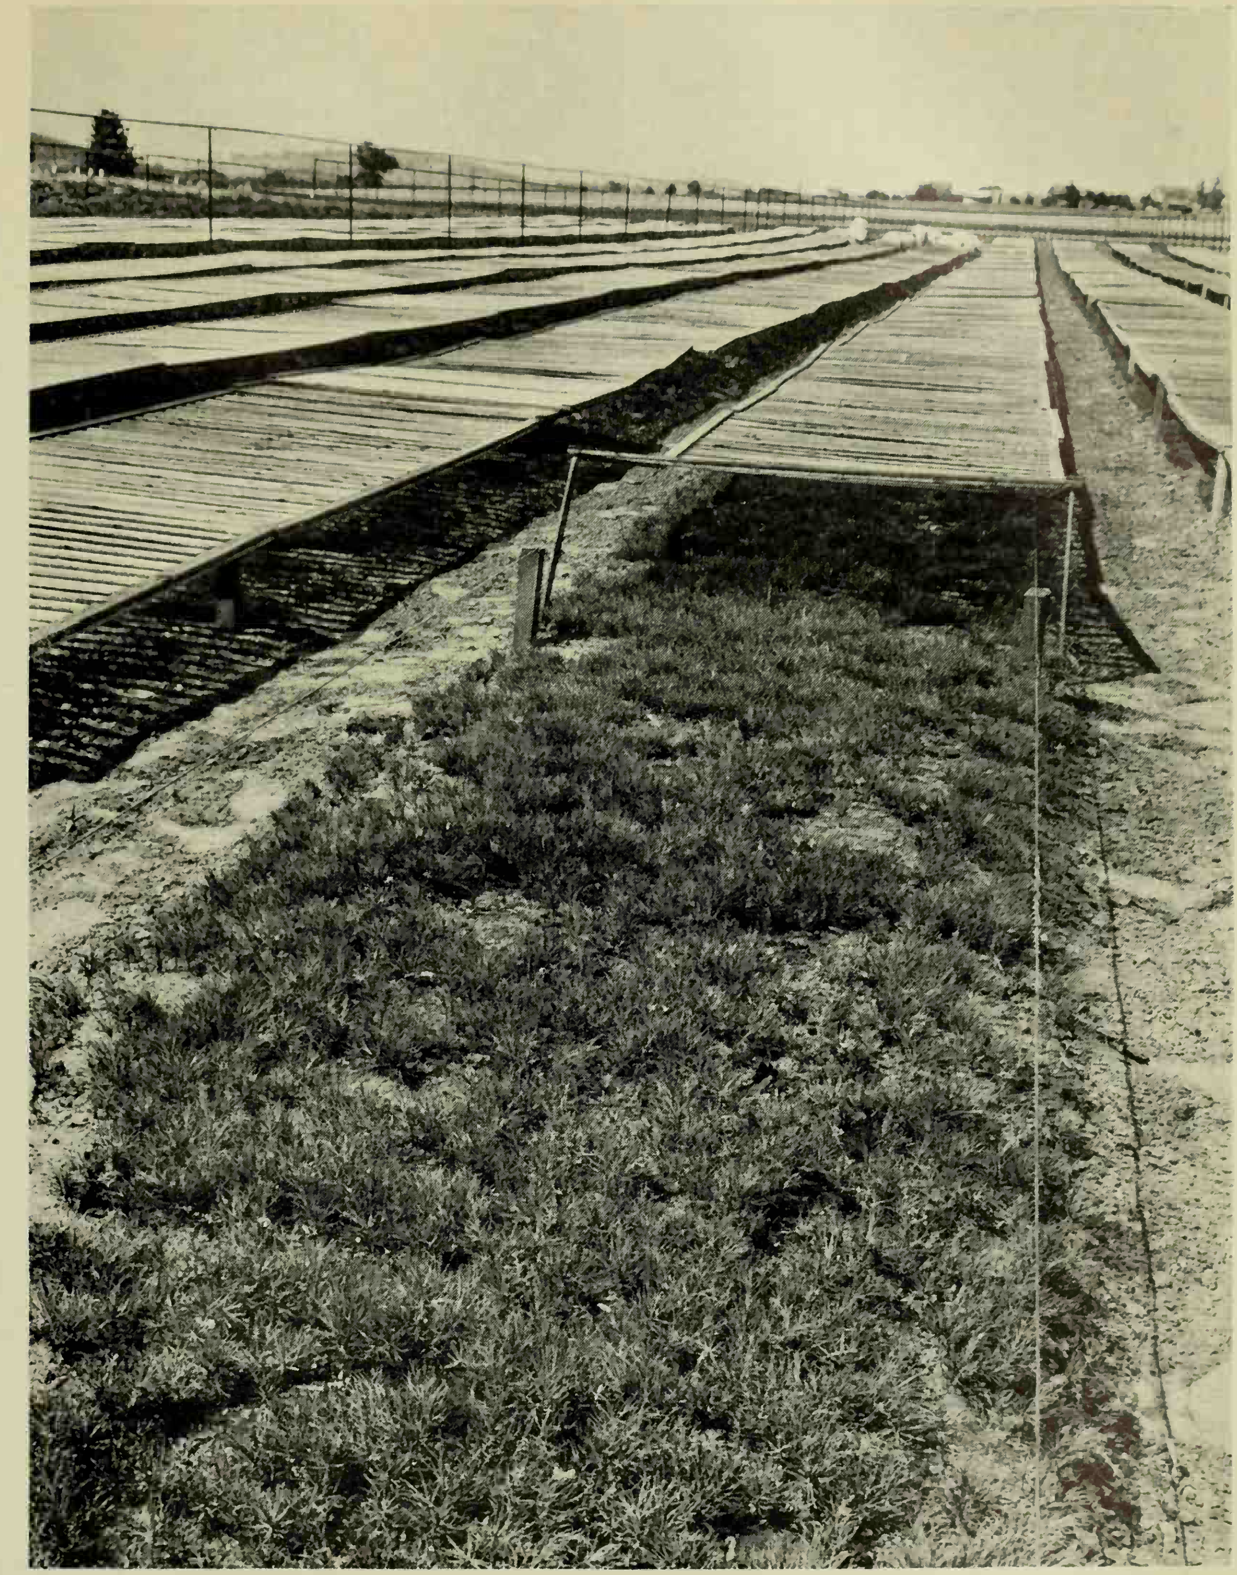
multiradiatus. HIMALAYAN F. From 6 in.–2 ft.: lvs. oblong or lanceolate, entire: heads solitary, to 3 in. across, rays very numerous, purplish. Himalayas. Var. **roseus** is listed.

philadelphicus. Per. by offsets, to 3 ft.: lvs. spatulate or oblong, toothed or entire: heads in corymbose clusters, to 1 in. across, rays purplish-white. N. Amer.

prostratus: listed name.

pulchellus (*E. bellidifolius*). POOR ROBINS PLANTAIN. Per. by offsets, to 2 ft.: basal lvs. tufted, spatulate, entire or toothed: heads 1–6, to 1½ in. across, rays violet or purplish. Me. to Fla. and La.

Roylei: an uncertain name, possibly *E. alpinus.*



VII. NURSERY. — Plantlets protected under lath screens; pine seedlings in foreground

salsuginosus. Per. to 1½ ft.: lvs. spatulate to lanceolate, entire: heads solitary, to 1¾ in. across, rays purple or violet. Alaska to Calif. and New Mex.

speciosus (*Stenactis speciosa*). Per. to 2 ft.: lvs. lanceolate to spatulate, entire: heads in corymbs, to 1½ in. across, rays very numerous, dark violet. B. C. to Ore. near the coast. Hort. vars. are **grandiflorus, major, roseus, semiplenus, superbus.**

trifidus. To 4 in.: lvs. basal, 3-cleft, segms. entire or 2–3-lobed: heads solitary, ½ in. across, rays white or pale lilac. Alaska to Rocky Mts.

umbellatus: *E. acris.*

uniflorus (*E. cilicicus*). To 4 in.: lvs. spatulate to linear, basal tufted: heads solitary, ¾ in. across, rays purple or sometimes white. Arctic regions.

ERINUS. *Scrophulariaceæ.* A hardy tufted per. 3–4 in. high suitable for the steeper parts of the rock-garden and for margins; native in the mts. of W. and Cent. Eu. Erinus should be planted in partial shade and where there is exceptionally good drainage. Propagated by seed or by division. **E. alpinus.** Lvs. spatulate, to ½ in. long, coarsely toothed: fls. ½ in. across, purple, 5-lobed, in racemes 2½ in. long. Vars. **albus** and **carmineus** are color forms. Var. **hirsutus** has hairy foliage.

ERIOBOTRYA. *Rosaceæ.* Several Asian evergreen trees and shrubs with alternate simple sessile lvs., white fls. in terminal panicles, and fr. a small pome; one is grown far S. for ornament and the edible fr. and is sometimes seen under glass. For cult. see *Loquat.*

japonica (*Photinia japonica*). LOQUAT. To 20 ft.: lvs. thick and stiff, obovate, to 1 ft. long, shining above, rusty-tomentose beneath: fls. fragrant, ½ in. across, in woolly panicles to 6 in. long: fr. pear-shaped, yellow, to 1½ in. long. China.—Sometimes called "Japan-plum." In var. **variegata** the lvs. are variegated with white.

ERIOCEPHALUS. *Compositæ.* S. African branching aromatic shrubs, mostly silvery, one of which is intro. in Calif.: lvs. alternate or opposite or clustered, small and usually linear, simple or 3-parted: heads hairy-white and becoming woolly, with pistillate ray-fls. **E. africanus** has linear or 3-lobed thick silky lvs. to 1 in. long and heads umbelled at ends of branches.

ERIODENDRON ANFRACTUOSUM: *Ceiba pentandra.*

ERIOGONUM. *Polygonaceæ.* Herbs or subshrubs native in W. N. Amer. in many species of varied habit, with basal, alternate or whorled lvs. and fls. borne in involucres in heads or umbels or sometimes solitary along the branches; sometimes transplanted from the wild, and requiring sunny positions and well-drained soil.

annuum. Ann. to 3 ft., white-woolly: lvs. oblong, to 2 in. long: fls. white, in flat-topped cymes. S. D. to Tex.

fasciculatum. WILD BUCKWHEAT. To 3 ft., woody at base: lvs. clustered, oblong or linear, to ¾ in. long, densely white-woolly beneath: fls. white, in heads in simple or compound umbels. Calif., Nev.

giganteum. Shrub to 8 ft.: lvs. ovate, to 2½ in. long, white-woolly: fls. white-woolly, in heads in dense compound cymes. Santa Barbara Isls.

latifolium. Per. to 2 ft.: lvs. ovate to oblong, to 2½ in. long, densely white-woolly at least beneath: fls. white or pink, in dense heads to ¾ in. across. Calif.

marifolium. Per. to 1 ft.: lvs. oval or ovate, ½ in. long, white-woolly at least beneath: fls. yellowish, in umbels. Calif.

parvifolium. Shrub to 3 ft.: lvs. ovate to oblong, to ½ in. long, densely white-woolly beneath: fls. white or pink, in heads or umbels. Calif.

umbellatum. Per. to 1 ft.: lvs, basal, obovate or oval, to 2½ in. long, white-tomentose beneath: fls. deep yellow, in umbels. Wash. to Wyo. and Calif.

ERIOPHORUM. COTTON-GRASS. *Cyperaceæ.* Per. sedges native in bogs in the northern hemisphere, with linear lvs. and fls. with perianth of soft white or brown bristles giving a cottony appearance; sometimes planted along the edges of ponds or in bog-gardening for the cotton-like heads on stiffish sts.

angustifolium. To 2 ft.: lvs. to ⅓ in. wide, flat except the tip: spikelets 2–12, in terminal umbels, the white bristles 1 in. long. Eu., Asia, N. N. Amer.

latifolium. To 1 ft.: lvs. about ¼ in. wide, flat: spikelets several, in terminal umbels, the white bristles 1 in. long. Eu.

vaginatum. To 1½ ft., tufted: lvs. mostly reduced to sheaths: spikelets solitary, the numerous white bristles 1 in. long. Eu., N. Asia.

viridicarinatum. Differs from *E. angustifolium* in thinner lvs. and more numerous spikelets with white or yellowish-white bristles. N. N. Amer.

ERIOPHYLLUM. *Compositæ.* Ann. or per. herbs or subshrubs native in W. N. Amer., with alternate white-tomentose lvs. which are entire or divided, and heads of yellow ray- and disk-fls.; pappus of scales or lacking; sometimes placed in gardens in dry regions.

cæspitosum. Per. to 1½ ft.: lvs. deeply 3–5-lobed, to ¾ in. long, green above: heads usually solitary, to 1¼ in. across. Calif.

confertiflorum. GOLDEN YARROW. Per. to 2 ft.: lvs. divided into linear segms., to 1 in. long, tomentose on both sides: heads in terminal clusters, ¼ in. across. S. Calif.

lanatum. Per. to 1½ ft., white-woolly: lvs. deeply divided into 3–7 oblong or linear segms.: heads mostly solitary, rays deep yellow, ½ in. long. B. C. to Ida. and Calif.

pedunculatum. Per. to 1½ ft.: lvs. oblong-lanceolate, to 2 in. long, entire, tomentose on both sides. Idaho.

stæchadifolium. Subshrub to 3 ft.: lvs. linear, to 1¾ in. long, entire or rarely few-toothed, green above: heads in dense corymbs. Calif.

ERIOPSIS. *Orchidaceæ.* S. American epiphytes with strong pseudobulbs bearing 2–4 lanceolate lvs. and yellow or brownish fls. in racemes, the sepals and petals similar, the lip 3-lobed; for cult. see *Orchids.*

rutidobulbon. Pseudobulbs about 8 in. high, with 2 lvs.: fls. brownish-yellow, the lip white spotted with violet, about 1½ in. across, July–Aug. Colombia.

ERIOSTEMON. *Rutaceæ.* Evergreen shrubs, chiefly Australian: lvs. simple and entire, alternate, often bearing large glands: infl. axillary or terminal, the fls. white, pink, blue: fr. of 5 (or fewer) mostly distinct elastic carpels. Two species are listed in Calif.

myoporoides. Glabrous stout shrub, with glandular tubercles often very marked: lvs. narrow-obovate to narrow-lanceolate, to 4 in. long, mucronate: fls. white or pink, the petals about ⅓ in. long. Queensland to Victoria.

spicatus. Heath-like shrub to 2 ft., glabrous or nearly so: lvs. almost needle-like, ½ in. or less long: fls. blue or pink; petals about ¼ in. long. W. Australia.

ERITRICHIUM. *Boraginaceæ.* Small depressed mostly hispid per. herbs with alternate simple lvs. and small blue fls. borne in racemes or cymes; one species is sometimes planted in rock-gardens.

barbigerum: *Cryptantha barbigera.*

nanum. Densely white-woolly tufted plant, fl.-sts. to 3 in. high: lvs. elliptic: fls. small but sky-blue and brilliant, with yellow eye. Alps.

ERLANGEA. *Compositæ.* African herbs or shrubs allied to Vernonia and differing chiefly in technical characters of the achene and pappus; *E. tomentosa* is sometimes seen in the greenhouse.

cordifolia (*Gutenbergia cordifolia*). Erect pubescent herb: lvs. ovate, nearly sessile to clasping and somewhat cordate, serrulate, to 3 in. long: heads purple or lavender, about ⅓ in. diam. Trop. Afr.—Reported in Calif.

tomentosa (*Bothriocline Schimperi* var. *tomentosa*). Shrub to 5 ft.: lvs. oblong to ovate-lanceolate, to 5 in. long, toothed, white-tomentose beneath, scented: heads to ⅔ in. across, in flat-topped panicles, of mauve or lilac disk-fls. Trop. Afr.

ERODIUM. Heronsbill. *Geraniaceæ.* Herbs with lobed or pinnately dissected lvs., fls. in axillary umbels having 5 fertile stamens, 5-celled ovary and styles coiled at maturity; grown in the border or rock-garden and some sorts for forage. Some species have become weedy.

Erodiums thrive in dry sunny positions in loamy soil. Propagated by seeds and division. *E. cicutarium*, *E. moschatum* and *E. Botrys* are forage plants in California.

absinthoides (*E. olympicum*). Per. to 8 in.: lvs. bipinnate: fls. violet, rarely rose or white, ¾ in. across. Asia Minor. Var. **amanum** (*E. amanum*) has gray-pubescent foliage and white fls. Var. **Sibthorpianum** is smaller with short lvs.

amanum: *E. absinthoides* var.

Botrys. Ann., prostrate or sometimes erect, white-pubescent: basal lvs. lobed, st.-lvs. pinnatifid: fls. violet. Medit. region; nat. in W. U. S.

cheilanthifolium. Per. to 4 in.: lvs. all basal, bipinnate, gray-tomentose: fls. white veined with rose, to ¾ in. across. Mts. of S. Spain and Morocco.

chrysanthum. Tufted per. to 5 in., silvery: lvs. bipinnate, the st.-lvs. few: fls. yellow, ½ in. across. Greece.

ciconium. Ann. to 2 ft., hairy: lvs. bipinnate: fls. purplish-blue, large. S. Eu.

cicutarium. Alfilaria. Red-stem Filaree. Ann. to 1½ ft.: basal lvs. in rosettes, the lfts. pinnatifid: fls. purple or pink, about ¼ in. across. Medit. region; nat. in U. S.

corsicum. Per. to 6 in.: lvs. ovate, undivided or only slightly lobed: fls. pink veined with rose, ¾ in. across. Corsica, Sardinia.

daucoides. Per. to 4 in.: lvs. all basal, pinnate: fls. rose, ½ in. across. Spain.

gruinum. Ann. or bien. to 1½ ft.: lvs. somewhat lobed: fls. violet-blue. Sicily, N. Afr. to Persia.

Kolbianum. Hybrid between *E. supracanum* and *E. macradenum:* fls. pale rose with darker veins.

macradenum. Per. to 1 ft.: lvs. all basal, pinnate: fls. light purple with dark spots, about ½ in. across. Pyrenees.

Manescavi. Per. to 1½ ft.: lvs. all basal, pinnate: fls. rosy-purple, to 1½ in. across. Pyrenees.

moschatum. White-stem Filaree. Musk-Clover. Ann. or bien. to 1½ ft.: lvs. pinnate: fls. rose-purple. Eu.; nat. in U. S.

olympicum: *E. absinthoides.*

romanum. Per. to 8 in.: lvs. all basal, pinnate: fls. purplish, ½ in. across. Medit. region.

supracanum. Per. to 4 in.: lvs. all basal, bipinnate, silvery: fls. pink veined with rose, ½ in. across. Pyrenees.

trichomanefolium. Per. to 5 in.: lvs. all basal, bipinnate: fls. violet veined with rose, ⅓ in. across. Syria.

Willkommianum. Hybrid between *E. cheilanthifolium* and *E. macradenum.*

EROPHILA: see *Draba verna.*

ERPETION RENIFORME: *Viola hederacea.*

ERUCA. *Cruciferæ.* Ann. and bien. erect more or less Brassica-like herbs of few species in Eu. and W. Asia, one sometimes grown as a salad plant: lvs. large-toothed or pinnatifid: fls. whitish, yellow, purplish, in long terminal racemes: fr. an oblong to long-linear pod or silique.

sativa. Rocket-Salad. Roquette. Half-hardy ann., branching, to 2½ ft., with scattered hairs: fls. to 1 in. long, whitish or cream-yellow with purplish veins: pods 1 in. or more long, flat-beaked, erect and appressed. S. Eu.—Grown in the vegetable-garden for salad. The foliage is strong-tasting, and therefore it should be kept tender by continuous growth and frequent cutting; best results are obtained from lvs. in fit condition in spring and autumn, as in summer the plant runs quickly to seed. Seed is sown in open ground as soon as weather is settled, and lvs. fit for use should be had in two months or less.

ERVATAMIA. *Apocynaceæ.* Shrubs or small trees, one of which is much planted far S. for ornament, differing from Tabernæmontana in technical characters, native in Old World tropics.

coronaria (*Tabernæmontana coronaria*). Crape Jasmine. Clavel de la India. Large much branched glabrous shrub: lvs. oblong-lanceolate to elliptic, abruptly acuminate, entire, to 8 in. long: fls. waxy-white, very fragrant, to 2 in. across. Var. **flore-pleno**, with double fls., is the usual form. India; widely spread in trop. and warm countries.

ERVIL: *Vicia Ervilia.*

ERYNGIUM. Eryngo. *Umbelliferæ.* Mostly per. herbs with spiny-toothed lvs. which are simple and variously lobed or divided, small white or blue fls. in dense bracted heads or spikes, and ovoid frs. without ribs.

Planted in borders and rock-gardens. They thrive in sunny positions in light rich soil. Propagated by seed sown as soon as ripe, and by division.

alpinum. To 2 ft.: lower lvs. triangular-cordate, the upper round and often 3-lobed or palmately cut, tinged with blue: fls. blue or white, the heads 1¼ in. long, subtended by long finely divided bracts. Eu.

amethystinum. To 1½ ft.: lvs. obovate, 2-pinnate: fls. blue, the heads ½ in. long, subtended by long lanceolate bracts. Eu.—The plant grown under this name may be *E. planum.*

aquaticum (*E. yuccæfolium*). Button Snakeroot. Rattlesnake Master. To 6 ft.: lvs. long-linear, rigid, parallel-veined, the margins bristly: fls. white or pale blue, the heads about ¾ in. long, subtended by short bracts. E. U. S.

Bourgati. To 1½ ft.: lvs. nearly orbicular, palmately 3–5-parted and lobed, stiff, spiny-toothed: fls. blue, the heads ½ in. long, subtended by long spiny-tipped bracts. Medit. region.

cæruleum. To 3 ft.: lvs. ovate or oblong, heart-shaped at base, undivided or 3-lobed or -parted: fls. blue, the heads less than ½ in. long, subtended by very long stiff bracts. Orient.

cœlestinum: an unidentified trade name; possibly referable to *E. amethystinum.*

giganteum. To 6 ft.: lvs. ovate or triangular, heart-shaped at base, the st.-lvs. 3-lobed: fls. blue or pale green, the heads to 4 in. long, subtended by long, rigid, much-cut bracts. Caucasus.

Leavenworthii. To 3 ft.: lvs. oblanceolate or palmately parted, very spiny: fls. blue or white, the heads to 2 in. long, subtended by long spiny bracts. Kans. to Tex.

maritimum. SEA-HOLLY. To 1 ft., glaucous-blue: lvs. fleshy and stiff, broadly ovate, 3-lobed, with coarse spiny teeth: fls. pale blue, the heads to 1 in. long, subtended by bracts similar to lvs. but much smaller. Eu.

Oliverianum. To 3 ft.: lvs. broadly ovate, heart-shaped at base, the upper st.-lvs. palmately 4–5-parted: fls. blue, the heads 1½ in. long, subtended by stiff linear bracts. Hybrid of uncertain parentage.

planum. To 3 ft.: lvs. oval to oblong, heart-shaped, the st.-lvs. 3–5-lobed or -parted: fls. blue, the heads ½ in. long, subtended by narrow rigid bracts. Eu., Asia.

Serra. To 4 ft. or more: lvs. sword-shaped, spiny-toothed: fls. whitish, the globose heads ⅓ in. across, subtended by lanceolate bracts. Brazil.

Spinalba. To 16 in., whitish-green: lvs. leathery and stiff, broadly ovate, 4–5-parted, with coarse spiny teeth: fls. blue, the heads 2 in. long, subtended by stiff spiny-pointed pinnatifid bracts. Alps of Eu.

yuccæfolium: *E. aquaticum.*

Zabelii. Hybrid between *E. alpinum* and *E. Bourgatii:* to 1½ ft.: heads about 1 in. long.

ERYSIMUM. BLISTER-CRESS. *Cruciferæ.* Ann., bien. and per. herbs of many species mostly in temp. regions as the genus is traditionally defined, some of them flower-garden subjects related to wallflowers and stocks, mostly with yellow but sometimes lilac or blue fls. The group is closely related to Cheiranthus, differing only in technical characters.

The plants in cultivation are hardy and of simple requirements; perennials raised from seeds sown the year before bloom is wanted; annuals, seeds usually sown where plants are to stand, for summer bloom. They should have sunny exposure.

Allionii: see *E. asperum.*

arkansanum: *E. asperum, E. murale.*

asperum (*E. arkansanum. Cheirinia aspera*). Per., 1–3 ft., erect, pubescent: lvs. lanceolate or narrower, entire or lower ones remotely dentate, to 4 in. long: fls. orange to yellow: mature pods slender and spreading, 2–4 in. long. Widespread in N. Amer.—The cult. plant known as *Cheiranthus Allionii* apparently belongs here. Often erroneously grown as *E. Perofskianum.* See *E. murale.*

canescens. Bien., gray-canescent, to 3 ft., much branched: lvs. linear-lanceolate, entire: fls. yellow. E. Eu., Caucasus.

capitatum. COAST WALLFLOWER. Bien. to 1½ ft., erect and leafy, simple or branching, lightly pubescent: lvs. linear to narrow-oblong, entire or dentate, to 3 in. long: fls. cream-color, yellowish, or white. Calif. to Wash.

cuspidatum. Bien., rigid, simple or somewhat branched above, somewhat hairy: lvs. oblong, lower ones lyrate: fls. yellow. S. E. Eu., S. W. Asia.

helveticum: *E. ochroleucum.*

Kotschyanum. Per., cespitose, pale green, st. simple, to 5 in. or less: lvs. crowded, narrow-linear to awl-like, denticulate: fls. yellow-orange. High mts., Asia Minor.

linifolium (*Cheiranthus linifolius*). Per. making low clump 1 ft. or less high, grayish, much branched, shoots decumbent: lvs. linear, entire or toothed: fls. lilac or mauve. Spain.

murale. Bien., perhaps per., but may be grown as ann., dwarf and compact, 20 in. or less high, very leafy, the lvs. very little if at all toothed: fls. golden-yellow, in compact racemes that lengthen in fr.: pods erect, short and thick, 1½ in. or less long. Eu.—An old garden plant of indefinite botanical history; sometimes grown as *E. nanum, E. arkansanum nanum compactum* and *E. Perofskianum.* See *E. pulchellum.*

nanum: see *E. murale.*

ochroleucum (*E. helveticum*). Per. to 1 ft., with yellowish creeping sts.: lvs. oblong-lanceolate, toothed, pubescent: fls. pale yellow, fragrant. Eu.

pachycarpum. Per. to 2 ft., stout, with appressed hairs, branched, sts. angled: lvs. lanceolate, sinuate-dentate, stalked: fls. orange-yellow. Himalayas.

Perofskianum. Ann. to 2 ft., erect, simple or little branching, grayish-pubescent: lvs. lanceolate or narrower, entire or remotely toothed, to 3 in. long: fls. yellow or orange, showy. Beluchistan, Afghanistan.—A good flower-garden subject, but the per. plants sold under this name are likely to be *E. asperum* or *E. murale.*

pulchellum. Per., cespitose or many-headed, green, from a few inches to 2 ft. high, sts. simple: lvs. oblong-spatulate, toothed or lyrate, upper ones narrow and deeply toothed: fls. deep orange: pod erect-spreading, slender. Greece, Asia Minor.—The plant grown under this name may be *E. murale.*

pumilum. Per., 6 in., sts. simple and angled: lvs. mostly radical, lance-linear, entire, those on st. 3–5: fls. sulfur-yellow, slightly fragrant. Mts., Eu.

purpureum. Per. with procumbent woody sts., flowering sts. to 6 in.: lvs. narrow-linear, the lower pinnate, upper toothed or entire: fls. purple. Asia Minor.

repandum. Ann., somewhat appressed-hairy, to 1 ft. or more: lvs. lanceolate, entire or remotely toothed, to 2½ in.: fls. small, yellow. S. E. Eu. to India.

rupestre. Per., low, woody at base: lvs. spatulate or oblong, somewhat toothed, somewhat pubescent: fls. few, yellow. Greece.

suffrutescens. BEACH WALLFLOWER. To 2 ft., woody, much branched: fls. pale yellow or cream-colored. Calif., along coast.

ERYTHEA. *Palmaceæ.* Five species, as now recognized, of Mexican hermaphrodite fan-palms of mostly low or medium stature, unarmed except on petioles of some species, most of which are planted in S. Calif.: allied to Brahea (from which it was separated) but distinguished by technical characters of fls. and seeds, by the primary branches of the spadix attended by spathes, larger fls. and mostly much larger fr., and in most cases filaments in lf.-sinuses very few or none. For cult. see *Palm.*

armata (*Brahea* and *Glaucothea armata. B. glauca*). MEXICAN BLUE PALM. Stout robust palm to 40 ft. or more, the trunk naturally covered by a dense "petticoat" or shag as in Washingtonia: lvs. waxy-blue, in a heavy crown, deeply cut into about 50 segms.; petiole bearing strong curved white teeth or spines: spadix very long and extending much beyond lvs., bending over: fr. globose, about ¾ in. long, fleshy. Lower Calif.

Brandegeei. Tall, reaching 125 ft., and in nature generally shedding the old foliage: lvs. about 3 ft. long, dark green above and pale-glaucous underneath, cut to middle or somewhat beyond into segms. about 1 in. or less broad and cleft 1–4 in. deep at apex, the ends eventually hanging; petiole glabrous, 3–5 ft. long, with many marginal irregular spine-like teeth mostly less than ¼ in. long: fr. about ½ in. diam. Southern part of Lower Calif.—Two different palms appear to be planted in S. Calif. under this name.

edulis (*Brahea edulis*). GUADALUPE PALM. Trunk stout and columnar, to 30 ft., becoming naked, ringed with scars: lvs. 3 ft. long, green both sides but paler underneath; segms. 70 or 80, extending one-third to one-half depth of blade, 1½ in. or less broad, deeply cleft at apex, with few fibers in sinuses; petiole nearly or quite destitute of spine-teeth or else short and not very sharp: spadix not much if any exceeding petiole when in bloom: fr. globose, black, 1 in. more or less diam., hanging in an elongated cluster, the pulp sweet; seed about ¾ in. diam. Guadalupe Isl., Lower Calif.—Commonly planted in S. Calif.

elegans. Small tree as seen in cult.: lf.-blade glaucous on both surfaces; segms. extending about half way down, shortly bifid at apex; petiole armed: fr. pyriform or broadly obovoid, about ¾ in. long. Sonora, N. Mex.—Apparently there is some confusion in the planted material.

ERYTHRÆA: *Centaurium.*

ERYTHRINA. CORAL-TREE. *Leguminosæ.* Trees or shrubs or sometimes herbs, commonly thorny, with lvs. of 3 broad lfts., showy red or reddish or yellowish, nearly papilionaceous fls. in racemes, and elongated pods constricted between the seeds.

Grown for ornament in warm countries or the herbaceous kinds under glass; showy when in bloom, which usually precedes the foliage. Some species are planted for shade in coffee and cocoa plantations under the name "immortelles"; the flowers are cooked and eaten; the seeds are made into necklaces; some species also have medicinal and poisonous properties. Propagated by seeds and cuttings. The herbaceous kinds are propagated by root-division and the woody sorts from cuttings of growing wood.

arborea: *E. herbacea* var.

arborescens. Low tree, the branches prickly: lfts. to 1 ft. long and broad: fls. in short dense racemes: pods to 9 in. long, curved. Himalayas.

caffra. Tree to 60 ft., having small prickles: much like *E. Corallodendrum* but calyx 2-lipped or splitting. S. Afr.

Corallodendrum. Tree to 20 ft., prickly or unarmed: lfts. rhombic-ovate: fls. with standard never opening, scarlet, in loose racemes: pods to 4 in. long, the seeds scarlet and mostly with black spot. Trop. Amer.

Crista-galli. COCKSPUR C. Shrub or small tree, the petioles and often midribs spiny: lfts. ovate-oblong to oblong-lanceolate: fls. with standard erect, crimson, in loose racemes. Brazil.

flabelliformis. Shrub or small tree with spiny branches: lfts. usually broader than long: fls. in dense short racemes: pods to 1 ft. long. S. Ariz., New Mex., Mex.

fusca. To 8 ft., the bark brownish, prickly: lfts. lanceolate: fls. brownish-red, in terminal racemes, the calyx split. Cochin-China.

glauca. Tree to 60 ft., prickly at least when young: lfts. ovate, pale or glaucous beneath, leathery: fls. with orange standard and brown wings tipped with crimson, in racemes to 8 in. long: pods to 10 in. long. Trop. Amer.

herbacea. Sts. herbaceous, to 4 ft., the petioles usually prickly: lvs. triangular, often angled: fls. with standard closed, scarlet, in few-fld. racemes to 2 ft. long: pods to 5 in. long. N. C. to Fla. and Tex. Var. **arborea** (*E. arborea*) is a shrub or tree with mostly shorter racemes.

indica. Tall broad tree, unarmed or sometimes with small black prickles: lfts. broadly ovate: fls. deep red or scarlet, in dense racemes, the standard erect, the calyx splitting down the back, appearing mostly when tree is leafless: pods to 1 ft. long. India, Malaya. Var. **picta** (*E. picta*) has spotted or variegated lvs. and is grown under the names *E. Parcellii* and *E. marmorata.*

marmorata: *E. indica* var.

micropteryx: *E. Poeppigiana.*

pallida. Similar to *E. Corallodendrum* but with fls. pale or salmon-red. Trop. Amer.

Parcellii: *E. indica* var.

picta: *E. indica* var.

Poeppigiana (*E. micropteryx*). BUCARE. Tree to 60 ft., prickly: lfts. ovate: fls. with erect standard, cinnabar-red, in short racemes. Probably Peru.

velutina. Tree to 30 ft., spiny: lfts. roundish or triangular, tomentose beneath: fls. orange-red, the standard erect, calyx split: pods to 5 in. long. Trop. Amer.

ERYTHROCHÆTE PALMATIFIDA: *Ligularia japonica.*

ERYTHRONIUM. ADDERS-TONGUE. TROUT-LILY. *Liliaceæ.* Bulbous spring-blooming herbs with 2 basal lvs., which are often mottled, and attractive nodding fls. solitary or in racemes terminating the scape, the perianth-segms. distinct.

Planted in wild-gardens or rockeries. They prosper in shady or partially shady places in well-drained soil rich in leaf-mold; a winter mulch is beneficial. Propagated by seeds, or by offsets planted 3–5 inches deep.

albidum. To 1 ft., producing offsets: lvs. green or mottled: fls. white, pink or purplish, 1½ in. long, the segms. recurved. Ont. to Ga. and Tex.

americanum. To 1 ft., producing offsets: lvs. mottled with brown and whitish: fls. yellow, to 2 in. long, the segms. recurved. N. S. to Fla. and Ark.

californicum. FAWN-LILY. To 1 ft.: lvs. strongly mottled: fls. creamy-white, 1¼ in. long. Calif.

citrinum. To 8 in.: lvs. mottled: fls. lemon-yellow, 1¼ in. long, the segms. recurved. Ore., Calif.

dens-canis. DOGS-TOOTH VIOLET. To 6 in.: lvs. mottled with reddish-brown: fls. rose or purple, 1 in. long, the segms. recurved. Eu., Asia.

giganteum. To 1½ ft.: lvs. mottled: fls. creamy-white, to 2 in. long, the segms. strongly recurved. S. Ore.

grandiflorum. To 2 ft.: lvs. not mottled: fls. bright yellow, 2 in. long, the segms. strongly recurved. B. C. to Ore. and Utah. Var. **robustum** grows near the sea-level. Var. **album** has white fls. with yellowish center.

Hartwegi: *E. multiscapoideum.*

Hendersoni. To 1 ft.: lvs. mottled: fls. purple, 1¼ in. long, strongly recurved. S. Ore.

Howellii. To 1½ ft.: lvs. mottled: fls. pale yellow with orange center. S. Ore.

multiscapoideum (*E. Hartwegi*). To 6 in., producing offsets: lvs. mottled: fls. white or cream with yellow center. Calif.

obtusatum. Similar to *E. parviflorum* but with smaller bulb, obtuse lvs. and purple instead of yellow anthers. Wyo. to Mont.

parviflorum. To 1 ft.: lvs. not mottled: fls. bright yellow, about 1 in. long, the segms. strongly recurved. Colo. to Utah.

purpurascens. To 1 ft.: lvs. not mottled: fls. light yellow tinged with purple, ⅔ in. long. Calif.

revolutum. To 1 ft.: lvs. mottled: fls. white or lavender, turning purple. B. C. to Calif. Var. **Johnsonii** has lvs. mottled with dark brown and dark rose fls. In var. **præcox** the lvs. are mottled with mahogany color and fls. creamy-white. Var. **albiflorum** (var. *Watsonii*) has white fls. banded at base with maroon.

ERYTHROXYLACEÆ. COCA FAMILY. Two trop. genera of shrubs or small trees with alternate lvs., small regular fls. and fr. a 1- or 2-seeded drupe; only Erythroxylon is cult. In the sequence of families it is placed near Rutaceæ and Zygophyllaceæ.

ERYTHROXYLON. *Erythroxylaceæ.* About 90 species, with the characters of the family; the lvs. of *E. Coca* yield cocaine, for which the bush is cult. in S. Amer. and eastern tropics. Sometimes grown in the open in the far S. or in economic greenhouse collections N. Under glass propagated by cuttings over bottom heat.

Coca. COCA. COCAINE-PLANT. Shrub to 12 ft.: lvs. to 2½ in. long: fls. yellowish, ¼ in. across, not showy: drupe about ⅓ in. long, reddish, with furrowed stone. Nativity unknown, but probably W. S. Amer.

ESCALLONIA. *Saxifragaceæ.* Good ornamental shrubs of S. Amer., sometimes tree-like, mostly in the Andean region, evergreen, or some kinds deciduous (if so stated), well adapted to warmer parts of the country and a few of them north to Va. or farther: species 60 and more: lvs. alternate or clustered, simple, entire or serrate, often resinous-dotted and glandular: fls. more or less grossularia-like, fragrant, mostly in terminal racemes and panicles; fl.-parts mostly 5: fr. a many-seeded caps. The leading white-fld. kinds in cult. with us are *E. floribunda* and *E. montevidensis*, and others are *E. Grahamiana*, *E. illinita*, *E.*

leucantha, *E. pterocladon* (tinted), *E. pulverulenta*, *E. revoluta*, *E. virgata* with intermediate effects in *E. Rockii* and *E. rubricalyx;* the remainder are pink, rose, or shades of red.

The escallonias thrive under the usual conditions of parks and yards, being rapid and free growers. They are sometimes trained as vines and on pillars. They have become well known in California, where they are prized for general adaptability as well as for the habit of blooming in autumn and early winter although the flowering of several species is nearly continuous in proper climates. Propagation may be by seeds, but the usual method in mild climates is by means of cuttings in a coldframe in autumn and transplanting to nursery in spring.

alba: *E. montevidensis.*

Berteriana: *E. pulverulenta* var. *glabra.*

bifida: *E. montevidensis.*

edinensis. Hybrid of same or similar origin and character as *E. langleyensis.*

exoniensis (*E. pterocladon* × *E. rubra*). To 20 ft., with sparingly glandular angled or ribbed branchlets: lvs. somewhat elliptic, to 1½ in., pointed, serrate, essentially glabrous: fls. rose-tinted or nearly white, in terminal panicles to 2 or 3 in. long.

floribunda. Large bush or small tree, with somewhat viscid branchlets: lvs. oblong to narrowly obovate, to 4 in. long, mostly obtuse, long-tapering at base, entire or very finely serrulate, bright or glossy green above, sparingly dotted underneath: fls. white, ½ in. across, in long terminal rather narrow panicles, the petals long-clawed. Venezuela and down the Andean region. See *E. montevidensis.*

franciscana. Tall glandular and viscid shrub with erect branches and strong odor: lvs. thick, oblong, with short margined petiole, acute or obtuse at apex: fls. pink, in narrow viscid panicle. A garden form or hybrid, with the odor of slippery elm.

gracilis: the plant grown under this name appears to be *E. punctata.*

Grahamiana. Erect shrub with more or less spreading branchlets which bear sessile glands: lvs. stiffish, elliptic or oblong, to 2 in. or more long, obtuse but mucronate, narrowed to base, serrate, glossy above: fls. white, in terminal narrow or pyramidal panicles. Chile.

illinita. To 10 ft. or more, glabrous but young parts resinous and glandular, strong-scented: lvs. obovate or long-oval, to 2 in. or more long, obtuse or short-pointed, narrowed to base, glossy above, serrate: fls. white, in large bracted panicle. Chile.

Ingrami. Garden plant, perhaps hybrid between *E. macrantha* and *E. punctata*, the lvs. smaller than those of the former and fls. slightly smaller but similar in color (rose-red).

langleyensis. Hybrid, probably *E. Philippiana* × *E. punctata:* to 10 ft., somewhat glandular, with spreading arching branches: lvs. small, 1 in. or less long, oval or obovate, sessile or nearly so, serrate, resinous underneath: fls. rose-carmine, about ½ in. across, in short racemes on lateral twigs.

leucantha. Very leafy large shrub: lvs. small, obovate, nearly or quite obtuse, finely serrate toward apex, glabrous, ½ in. or less broad: fls. small, white, many in very dense racemes. Chile.

macrantha. Compact spreading shrub to 10 ft., densely leafy: lvs. thick, broad-oval, to 3 in. long and one-half or more as broad, shining on upper side and bearing many prominent glands underneath: fls. crimson or rose-red, to ½ in. or more long, in short close more or less leafy panicles. Chile.—Common where escallonias are grown and often passing under other names.

montana. Shrub to 6 ft.: lvs. obovate-oblong to lanceolate, to ¾ in. long, more or less serrate: fls. white, about a dozen in a dense terminal raceme; petals nearly ½ in. long. Chile.

montevidensis (*E. floribunda* var. *montevidensis. E. bifida. E. alba*). Much like *E. floribunda* but branchlets not viscid, lvs. mostly slightly emarginate at apex, fls. larger in a more rounded corymb-like cluster, the petals not narrowly clawed, stamens and pistils prominent. S. Brazil, Uruguay.—Variously understood, by some authors considered to be a geographical form of *E. floribunda*, but probably distinct.

organensis. To 6 ft., very leafy, branchlets angled, glabrous but somewhat resinous or glandular: lvs. narrowly obovate to oblong, often red-margined, firm, to 3 in. long, obtuse, dentate: fls. rose-red, to ½ in. across, in short dense broad terminal cluster close to the lvs. Organ Mts., Brazil.

Philippiana: *E. virgata* var.

pterocladon. To 10 ft. or more, pubescent, the branches thin-edged or winged: lvs. narrow-obovate, to 1 in. long (usually less), toothed, tapering to base, shining above: fls. white, in slender racemes to 3 in. long, the petals ⅓ in. long. Patagonia.

pulverulenta. Downy viscid shrub to 12 ft.: lvs. oblong, obtuse, tapering at base, to 4 in. long, fine-toothed, varnished above: fls. white, crowded in slender or tail-like raceme to 9 in. long. Chile. Var. **glabra** (*E. Berteriana*) is nearly or quite glabrous.

punctata (*E. rubra* var. *punctata*). Shrub to 10 ft., the young parts glandular-sticky and pubescent: lvs. oval or obovate, to 1 or 2 in. long, tapering both ends, toothed toward apex, strongly glandular underneath: fls. crimson, sometimes solitary but mostly in terminal corymbose glandular panicles, calyx glandular. Chile.

revoluta. To 25 ft. or more, white-pubescent: lvs. thick, obovate, to 2 in. long, apex obtuse or acutish, base tapering, toothed, margins revolute: fls. white, in dense terminal pyramidal panicles, the petals about ½ in. long. Chile.

Rockii (*E. macrantha* × *E. montevidensis*). Tall widely branched shrub: lvs. obovate, obtuse, tapering at base, to 2 in. long, glandular-serrate: fls. pale pink or white, in thyrse-like panicle to 12 in. or more long.

rosea: a name of doubtful standing in hort., applied to rose-colored forms of different species or hybrids.

rubra. Erect shrub to 15 ft., the young parts more or less glandular and viscid: lvs. oblanceolate to long-obovate, to 2 in. long, acute, tapering at base, serrate toward apex, nearly or quite glabrous and with few glands underneath: fls. red or crimson, about ⅓ in. across, in terminal panicles, the calyx typically not at all or very little glandular. Chile.

rubricalyx. Spreading shrub of medium size and rounded outline, with slender branches: fls. having white petals and red calyx, the petals forming a tube: lvs. like those of *E. Grahamiana*, and the plant perhaps a hybrid between that species and *E. rubra.*

sanguinea: hort. form of *E. macrantha.*

virgata. Deciduous shrub to 8 ft., with aspect of Leptospermum, branchlets glabrous and very leafy: lvs. obovate to lanceolate, acute, tapering at base, serrate toward apex, to ¾ in. long, glabrous: fls. white, to ½ in. across, in leafy terminal racemes. Chile. Var. **Philippiana** (*E. Philippiana*). Branches rugose: lvs. strongly acute, crowded-fasciculate in short very leafy branches. Chile.

viscosa. To 10 ft., with drooping sticky resinous branches: lvs. obovate, to 3 in. long, obtuse or with short abrupt point, tapering to short petiole, clammy, serrate: fls. white, in rather loose large panicles, corolla ⅓ in. or less across. Chile.

ESCHSCHOLZIA. *Papaveraceæ.* Herbs native in W. N. Amer. with much dissected lvs. and showy yellow solitary fls.; popular for the flower-garden. Many species that have been described are probably seasonal forms of *E. californica.*

Grown as annuals, the seeds sown where the plants are to stand in sunny exposure; in mild climates may be treated as winter annuals, and *E. californica* may live over winter after blooming.

aurantiaca: a hort. form of *E. californica.*

cæspitosa. To 9 in., the fl.-sts. exceeding the basal tufted lvs.: fls. yellow, to 2 in. across: fr. linear, to 3 in. long. Calif.

californica. CALIFORNIA-POPPY. To 2 ft., very variable: fls. pale yellow to orange, to 3 in. across: fr. linear, to 4 in. long. Calif., Ore.; nat. in Eu.

maritima. Sts. prostrate: fls. lemon-yellow with orange spot at base, ¾ in. long. Coast S. Calif.

tenuifolia. To 1 ft.: fls. light yellow, ½ in. long. Calif.

ESCOBARIA. *Cactaceæ.* Globose or cylindric and mostly cespitose cacti, juice not milky, several species in Mex. and S. Tex.: tubercles grooved above, spines never hooked: fls. small, from top of plant. See *Cacti.*

tuberculosa (*Mammillaria tuberculosa;* one of the plants known as *M. strobiliformis*). Body cylindric or becoming so, to 1 ft. or so high, usually in clumps, tubercles about ¼ in. long, radials numerous and white, centrals several and stouter: fls. light pink, 1 in. across. S. W. Tex., New Mex., N. Mex.

ESCONTRIA. *Cactaceæ.* One cactus of S. Mex., separated from Cereus, the ovary bearing papery persistent scales rather than essentially naked: fls. small, yellow, diurnal. Apparently not often planted. See *Cacti.* **E. Chiotilla** (*Cereus Chiotilla*). Tree-like, numerously branched, to 20 ft. and more, ribs few, radial spines 10–15, centrals several, all similar: fls. near ends of branches, about 1 in. long.

ESMERALDA: *Arachnis Clarkei.*

ESPARCET: *Onobrychis viciæfolia.*

ESPINO CAVAN: *Acacia Cavenia.*

ESTRAGON: *Artemisia Dracunculus.*

EUANTHE. *Orchidaceæ.* One Philippine orchid sometimes grown in the warm greenhouse. **E. Sanderiana** (*Vanda Sanderiana*). Sts. to 2 ft. high, thickly covered with lvs. to 1½ ft. long and 1½ in. wide: fls. 4 in. across, in 5–10-fld. racemes to 1 ft. long; dorsal sepal pale lilac, the lateral yellow marked with red-brown; petals shorter, light lilac; lip yellow, the lateral lobes forming a cup-like base, Oct.–Nov.

EUBOTRYS: *Leucothoë.*

EUCALYPTUS. Gum-Tree. *Myrtaceæ.* Evergreen trees, or sometimes shrubs, much grown in warm and semitrop. climates for the valuable timber and oil, for ornament and firewood, some of them for bee pasture, mostly native in Australia, having simple entire lvs. alternate or opposite on young shoots and often polymorphous, white, yellowish or red fls. in umbels or heads, the petals and calyx-lobes united to form a lid or cap which opens transversely and falls off, revealing the numerous showy stamens; there are 300 and more species, and the understanding of them is a special study.

Eucalypts are grown from seed. The capsules should be gathered and placed on canvas sheets in the sun till the seeds fall out. Seed should be sown in June or July in flats, either one seed in a place or broadcast and the seedlings then transplanted. Screens or lath-houses should be provided for shade. These seedlings will be ready to set permanently by about the following February, when from 6–10 inches high. On heavy soils the trees for forest plantations should be set 6 by 6 feet or if irrigation is employed 4 by 8 feet; on light soils 8 by 8 feet is best. The stands should be cultivated for at least the first two years.

Many species besides those entered in this article have been introduced into North America, largely in California, for forest purposes, specimen planting, and for test, represented by such names as *E. acmenioides, annulata, astringens, buprestium, cæsia, Caleyi, camphora, Consideneana, corrugata, crucis, decipiens, Drummondii, erythrocorys, Flocktoniæ, fœcunda, gracilis, grandis, Guilfoylei, gummifera, leptophylla* (equals *uncinata*), *Le-Souefii, macrandra, macrorhyncha, maculosa, Mortoniana, nutans, obtusifolia, oleosa, odorata, Preissiana, ptychocarpa, pyriformis, redunca, saligna, salmonophloia, Smithii, spathulata, Stowardi, Stricklandi, tetragona, Todtiana, torquata, uncinata.*

alba. Bark rough, ash-colored: lvs. ovate-oblong to broadly lanceolate, pale and glaucous: fls. small, in few-fld. umbels: fr. ¼ in. across.

albens: *E. hemiphloia* var.

alpina. Shrub to 12 ft.: lvs. ovate to oblong, very thick: fls. rather large, solitary or few together: fr. to 1 in. across.

amplifolia: a form of *E. tereticornis* having large round lvs. when young.

amygdalina. Peppermint Gum. To 300 ft., with persistent fibrous bark: lvs. lanceolate, with peppermint odor: fls. rather small, in many-fld. umbels: fr. ¼ in. across. Var. **angustifolia** (*E. linearis*) has very narrow lvs. and drooping branchlets. Var. **numerosa** has more than 20 fls. in an umbel. Var. **regnans** (*E. regnans*), to 325 ft., lvs. broad-lanceolate.

angustifolia: *E. amygdalina* var.

bicolor. Black Box. To 40 ft., with persistent rough bark: lvs. lanceolate: fls. small, in few-fld. umbels forming panicles: fr. about ⅙ in. across.

Blaxlandi. Similar to *E. capitellata* but with less stringy bark and young lvs. undulate with toothed margin.

Bosistoana. Bairnsdale Gray Box. Lvs. narrowly lanceolate: fls. in few-fld. umbels.

botryoides. Bastard Mahogany. Bangalay. To 150 ft., with persistent rough furrowed bark: lvs. lanceolate: fls. rather large, nearly sessile: fr. ⅓ in. across.

calophylla. Medium-sized tree, with rough corky deciduous bark: lvs. ovate-lanceolate, thick: fls. rather large, white or pink in var. **rosea**, in umbels forming a terminal panicle: fr. to 1½ in. across.

capitellata. Large tree, with furrowed fibrous bark: lvs. ovate-lanceolate, very thick and shining: fls. sessile, in umbels: fr. ⅓ in. across.

cinerea. Medium-sized tree, the bark whitish and persistent: lvs. ovate to ovate-lanceolate, glaucous or mealy-white: fls. in clusters: fr. ¼ in. across. Var. **multiflora** is listed.

citriodora: *E. maculata* var.

cladocalyx (*E. corynocalyx*). Sugar Gum. To 120 ft., with smooth deciduous bark: lvs. ovate-lanceolate to lanceolate: fls. ½ in. across, in 6–12-fld. umbels: fr. ¼ in. across.

coccifera. Small tree, the bark smooth and white: lvs. lanceolate, glaucous: fls. in clusters: fr. to ½ in. across.

cordata. To 50 ft.: lvs. orbicular to ovate, often crenate, usually glaucous or mealy-white: fls. rather small, nearly sessile: fr. ⅓ in. across.

coriacea. Tall tree, the bark deciduous, the inner bark smooth and whitish: lvs. ovate-lanceolate to lanceolate, very thick and shining: fls. in umbels: fr. ¼ in. across.

cornuta. Yate-Tree. Medium-sized tree: lvs. oblong or broadly lanceolate: fls. greenish-yellow, in dense heads, having a long horn-like lid: fr. ⅓ in. across.

corymbosa. Bloodwood. Medium-sized tree, with persistent rough bark: lvs. lanceolate: fls. yellowish-white, fragrant, in panicled umbels: fr. ½ in. across.

corynocalyx: *E. cladocalyx.*

cosmophylla. Shrub or small tree with smooth ash-colored bark: lvs. broadly lanceolate: fls. rather large, nearly sessile: fr. ⅔ in. across.

crebra. Narrow-leaved Ironbark. Bark deeply furrowed, persistent: lvs. lanceolate: fls. to ½ in. long, in panicles: fr. to ⅙ in. across.

diversicolor. Karri Gum. To 100 ft. and more, the bark smooth and white: lvs. lanceolate: fls. in umbels: fr. ⅓ in. across.

elæophora: *E. goniocalyx.*

eremophila. Shrub or small tree, with smooth scaly bark: lvs. narrow-lanceolate: fls. with reddish lid to 1 in. long.

erythronema. Small tree with rough reddish bark: lvs. lanceolate, thick and shining: fls. pink-red, in umbels: fr. to ½ in. across.

eugenioides. Resembling *E. piperita,* but with strongly fibrous bark, thicker not odorous lvs., and the rim of fr. flat or raised instead of depressed.

eximia. Mountain Bloodwood. Large tree, the bark brown or yellowish and scaly: lvs. falcate-lanceolate: fls. in panicles: fr. ⅓ in. across.

ficifolia. Scarlet-flowering Gum. To 30 ft. or more, the bark dark and furrowed: lvs. ovate to lanceolate, thick: fls. white to pink and scarlet, to 1½ in. long, in panicles: fr. to 1½ in. across.

gigantea: *E. obliqua.*

globulus. Blue Gum. To 300 ft., the bark deciduous, the trunk smooth grayish or bluish-white: lvs. lanceolate in mature trees, much broader and very glaucous on young ones: fls. 1½ in. across, solitary or few together: fr. to 1 in. across.—The commonest species in N. Amer. Var. **compacta** is a densely branched dwarf form.

gomphocephala. Tooart-Tree. To 120 ft., with persistent rough bark: lvs. lanceolate, thick and shining: fls. in umbels, sessile: fr. ½ in. across.

goniocalyx (*E. elæophora*). Bastard Box. Tall tree with rough deciduous bark: lvs. lanceolate, pale green: fls. in umbels: fr. ⅓ in. across.

Gunnii. Cider Gum. To 30 ft., with smooth whitish deciduous bark: lvs. ovate to lanceolate, thick and shining: fls. rather large, in umbels: fr. to ⅓ in. across.

hæmastoma. Large tree, the bark smooth and deciduous: lvs. falcate-lanceolate: fls. in umbels: fr. to ⅓ in. across. Var. **micrantha** (*E. micrantha*) has longer lvs. and smaller fls. and frs. Var. **capitata** is listed.

hemiphloia. To 90 ft., with rough persistent bark: lvs. lanceolate or broader, thick, often gray: fls. in panicles: fr. ¼ in. across. Var. **albens** (*E. albens*) has glaucous or white-mealy lvs. and larger frs.

Lehmanni. Small tree, the bark rough and deciduous: lvs. ovate to oblong: fls. in dense heads, the lid to 1½ in. long: fr. ½ in. across.

leucoxylon. White Ironbark. Tall tree with smooth pale deciduous bark: lvs. narrowly lanceolate, grayish-green: fls. 1 in. across, in umbels: fr. ½ in. across. Var. **purpurea** has bright purple fls. and var. **rosea** pink fls.

linearis: *E. amygdalina* var. *angustifolia.*

longifolia. Woollybutt. To 200 ft., with rough persistent bark: lvs. lanceolate: fls. rather large, in umbels: fr. ½ in. across.

Macarthuri. Bark rough and woolly: lvs. lanceolate: fls. in umbels: fr. to ¼ in. across.

macrorhyncha. Tall tree, the bark dark gray, fibrous and furrowed: lvs. lanceolate: fls. in umbels: fr. to ½ in. across.

maculata. Spotted Gum. To 150 ft., the bark deciduous in patches: lvs. lanceolate: fls. ½ in. long, in many-fld. panicles: fr. ½ in. across. Var. **citriodora** (*E. citriodora*), Lemon-scented Gum, has lvs. with strong odor of lemon.

Maideni. Tall tree, the bark smooth and whitish: lvs. narrow-lanceolate, chalky-white: fls. in umbels: fr. ¼ in. across.

marginata. Jarrah. Tall tree, the bark persistent or flaking: lvs. lanceolate: fls. in umbels: fr. ½ in. or more across.

megacarpa. To 100 ft., the grayish-white bark smooth and deciduous: fls. in umbels: fr. to 1 in. across.

melliodora. Honey-scented Gum. Yellow Box. To 150 ft., the roughish bark flaking off: lvs. narrowly lanceolate: fls. small, in umbels: fr. ¼ in. or less across.

micrantha: *E. hæmastoma* var.

Muelleriana. Yellow Stringybark. Medium-sized tree with stringy bark and yellow inner bark: lvs. lanceolate, glossy: fls. in umbels: fr. ½ in. across.

numerosa: *E. amygdalina* var.

obliqua (*E. gigantea*). To 300 ft., with persistent fibrous bark: lvs. ovate-lanceolate, very oblique, thick: fls. in umbels: fr. to ½ in .across.

occidentalis. Flat-topped Yate. Small tree, the bark usually smooth and deciduous: lvs. lanceolate: fls. in umbels, the lid to ¾ in. long: fr. ⅓ in. across.

ovata. Medium-sized to tall tree: lvs. lanceolate or very broad: fls. small, in axillary clusters, the lid sometimes beaked.

paniculata. Tall tree with hard deeply furrowed persistent bark: lvs. lanceolate: fls. in panicles or umbels: fr. ⅓ in. across.

pilularis. Blackbutt. To 150 ft., with blackish-gray persistent bark: lvs. lanceolate: fls. in umbels: fr. ⅓ in. across.

piperita. Peppermint Stringybark. Tall tree, with rough gray persistent bark: lvs. narrowly lanceolate, oblique, with peppermint odor: fls. in umbels: fr. ¼ in. across.

platyphylla. Bark deciduous, smooth and white: lvs. ovate: fls. in umbels, on short thick stalks: fr. ⅓ in. across.

platypus. Small tree with smooth grayish bark: lvs. oval, very thick and shining: fls. dull red or yellowish-white, in umbels with thick stalks: fr. ½ in. across.

polyanthemos. Red Box. Australian Beech. To 150 ft., the bark persistent: lvs. orbicular to ovate, grayish-green: fls. small, in many-fld. panicles: fr. ¼ in. across.

pulverulenta. Small tree: lvs. orbicular or ovate, glaucous or mealy-white: fls. in 1–3-fld. umbels: fr. ⅓ in. across.

punctata. Leather-Jacket. To 100 ft., the smooth dark bark deciduous in flakes: lvs. narrowly lanceolate: fls. in umbels: fr. ⅓ in. across.

rariflora. Tall tree, branches red: lvs. lanceolate to ovate: fls. in panicles or small umbels: fr. about ⅙ in. across.

regnans: *E. amygdalina* var.

resinifera. Red Mahogany. To 100 ft., with rough persistent bark: lvs. lanceolate, thick: fls. in umbels: fr. ⅓ in. across.

Risdoni. To 50 ft., the smooth bark deciduous in patches: lvs. ovate or lanceolate, on young shoots opposite and united at base, glaucous: fls. in umbels: fr. ⅓ in. across.

robusta. Swamp Mahogany. To 100 ft., with rough persistent bark: lvs. ovate-lanceolate: fls. ¾ in. across, in umbels: fr. ½ in. across.

rostrata. Red Gum. To 200 ft., with smooth gray deciduous bark: lvs. narrowly lanceolate: fls. to ½ in. across, in umbels: fr. ¼ in. across.

rubida. Resembling *E. viminalis* but with smooth white bark often having reddish patches.

rudis. Desert Gum. To 100 ft., with rough gray persistent bark: lvs. lanceolate: fls. ½ in. across, in umbels: fr. ½ in. across.

siderophloia. Broad-leaved Ironbark. To 100 ft., with deeply furrowed persistent bark: lvs. ovate-lanceolate to lanceolate: fls. in panicles: fr. ¼ in. across.

sideroxylon. Red Ironbark. Medium-sized tree with rough dark red or black persistent bark: lvs. narrowly-lanceolate, on young lvs. linear-lanceolate: fls. white or yellowish, in umbels: fr. ½ in. across. Var. **rosea** has rose-colored fls. Var. **pallens** has rose-colored fls. and silvery-gray foliage.

Sieberiana. Differs from *E. hæmastoma* chiefly in the dark furrowed bark.

Stuartiana. Apple-scented Gum. Tall tree with rough fibrous bark: lvs. ovate-lanceolate to lanceolate: fls. in umbels: fr. to ⅓ in. across.

tereticornis. Gray or Slaty Gum. To 150 ft., with smooth gray deciduous bark: lvs. broadly lanceolate: fls. ¾ in. across, in umbels: fr. ¼ in. across.

tetraptera. Small tree with sharply 4-angled branches: lvs. oblong-lanceolate, very thick: fls. very large, sessile and solitary: fr. 1 in. across.

urnigera. Bark smooth, pale brown, branchlets drooping: lvs. ovate to lanceolate, glaucous: fls. in 3-fld. umbels: fr. ⅓ in. across.

viminalis. Manna Gum. To 300 ft., the branches pendulous: lvs. lanceolate: fls. ½ in. across, in umbels: fr. ¼ in. across.

virgata. Shrub or small tree: lvs. lanceolate, shining: fls. in umbels: fr. to ½ in. across.

EUCHARIDIUM. *Onagraceæ.* Californian ann. herbs with alternate lvs., showy fls. having 3-lobed petals borne in terminal racemes or spikes, and linear capsular frs. Cult. as for *Clarkia;* flower-garden subjects for sunny positions.

Breweri (*Clarkia Breweri*). Fairy Fans. To 9 in.: lvs. lanceolate: fls. deep pink; petals fan-shaped with a narrow central long lobe.

concinnum (*E. grandiflorum. Clarkia concinna* and *grandiflora*). Red Ribbons. To 2 ft.: lvs. ovate-oblong to oblong: fls. rose-purple; petals with 3 nearly equal lobes.

grandiflorum: *E. concinnum.*

EUCHARIS. *Amaryllidaceæ.* Bulbous herbs from Colombia, with broad basal lvs. narrowed into petioles, and large beautiful chaste-white fls. in umbels terminating the scape, the perianth with cylindrical tube and spreading segms.

The Amazon-lily is grown out-of-doors in warm countries or in a greenhouse with the night temperature at about 65°. It succeeds in coarse fibrous soil and should be liberally watered except in the resting period. Protection from the sun should be given except in the winter months. Propagated by offsets in spring.

amazonica: *E. grandiflora.*

grandiflora (*E. amazonica*). Amazon-Lily. Lvs. about 1 ft. long and 6 in. broad, the petiole 1 ft. long: fls. fragrant, to 3 in. across, on scapes 2 ft. high. Andes of Colombia.

EUCHLÆNA. Teosinte. *Gramineæ.* Broad-leaved grasses resembling maize and grown for forage in the S.: monœcious; staminate spikelets in terminal panicles; pistillate in axillary spikes inclosed in a husk from which the long styles protrude; grain or seed large; native in Mex. and Cent. Amer.

luxurians: *E. mexicana.*

mexicana (*E. luxurians*). Ann. to 10 ft. or more, very leafy: lvs. to several ft. long and 1–2 in. wide, midrib prominent: grain shining, ¼ in. long. Mex.

perennis. Differs from *E. mexicana* in being per. and propagating by rhizomes. Mex.

EUCOMIS. *Liliaceæ.* S. African bulbous herbs with basal lvs. in rosettes and greenish or whitish fls. in racemes terminating the scape and tipped with a crest of leafy bracts, the perianth-segms. distinct. Of easy cult. in warm climates or in greenhouses in the N. Propagated by offsets.

punctata. Pineapple-Flower. To 2 ft.: lvs. to 2 ft. long and 3 in. across, spotted with brown beneath: fls. green, ½ in. long.

EUCOMMIA, the only genus of *Eucommiaceæ,* which stands near Hamamelidaceæ and Rosaceæ. One deciduous tree from Cent. China, yielding rubber although difficult of extraction. **E. ulmoides.** To 60 ft.: lvs. alternate, elliptic to oblong-ovate, to 3 in. long, toothed, elm-like as the specific name implies: fls. unisexual, in Apr. before or with the lvs., without perianth, the anthers red: fr. a winged nutlet to 1½ in. long.—Hardy N. Propagated by seeds and cuttings of young wood under glass.

EUCRYPHIA, the only genus in *Eucryphiaceæ.* A few species in Australia and Chile, by some authors formerly included in Rosaceæ and also in Saxifragaceæ and Hypericaceæ: evergreen shrubs or trees, sometimes partially deciduous, planted for ornament, intro. particularly in Calif.: lvs. opposite, simple or pinnate, bearing large white somewhat rose-like fls. in the axils: petals 4, large; stamens numerous and conspicuous: fr. a dehiscent caps.

Billardieri. Large glabrous tree, sometimes grown as a shrub: lvs. simple, oblong, obtuse, entire, whitish underneath: fls. to 2 in. across. Tasmania.

cordifolia. Small tree or large shrub: lvs. simple, cordate and oblong, pubescent, crenate: fls. large. Chile.

glutinosa (*E. pinnatifolia*). Tree to 20 ft.: lvs. pinnate, the 3–5 lfts. elliptic to lance-ovate, to 2 in. long: fls. 2 in. or more across. Chile.

pinnatifolia: *E. glutinosa.*

EUGENIA (incl., for our purpose, *Jambosa, Myrciaria, Syzygium*). *Myrtaceæ.* Trop. and semi-trop. evergreen bushes and trees in many parts of the world and of very many species, in the western hemisphere native as far north as S. Fla.: lvs. opposite, simple, mostly firm and glossy: fls. commonly white, cream-colored or purple, solitary, racemose or paniculate, the stamens numerous and conspicuous: fr. a drupe-like yellow, red, purple or black berry, sometimes edible.

Eugenias are grown in Florida, California and similar climates for the ornamental habit, foliage, flowers and berries, and some kinds for the eatable fruits. They are of simple requirements, propagating by means of seeds, and by cuttings on a bench or in a frame. In California, *E. paniculata* and its variety are much planted, and in Florida also; the young growths are red-brown and showy, the winter color often brilliant; there is a form with variegated leaves.

apiculata (*Myrtus Luma*). To 4 ft. or more: lvs. oval, to 1 in long: fls. white, ½ in. across, in 3's: fr. black. Chile.

aromatica (*Caryophyllus aromaticus*). Clove-Tree. Tree to 30 ft.: lvs. ovate-oblong, to 5 in. long: fls. pale purple, ¼ in. across, in terminal cymes, the dried fl.-buds comprising the cloves of commerce. Moluccas.

australis: *E. paniculata* var.

brasiliensis: *E. Dombeyi.*

cauliflora (*Myrciaria cauliflora*). Jaboticaba. Tree to 40 ft., upward-branching from near the ground and bearing clusters of fls. and fr. along the trunk and branches: lvs. lanceolate or somewhat broader, acuminate, to 4 in. long: fls. small, white: fr. globular, to 1 or 1½ in. diam., purple. S. Brazil, prized for the edible fr.—Has been tried in Fla. and S. Calif. Two or three related species are apparently known as jaboticabas.

Cumini (*E.* and *Syzygium Jambolana*). Jambolan-Plum. Tree to 80 ft.: lvs. oblong to oval, to 8 in. long, acuminate and sometimes emarginate on same tree with others: fls. white, about ⅓ in. across, in branching cymes: fr. purplish-red, to 2 in. diam., edible. E. Indies, Burma.

Curranii. Tree to 50 ft.: lvs. oblong-elliptic, to 12 in. long: fls. in panicles often from tubercles on st.: fr. size of grape, edible. Philippine Isls.

cyanocarpa. Glabrous tree with lanceolate willow-like lvs. to 3 in. long and tapering both ways from middle, strongly cross-veined, petiole very short: fls. to ¾ in. across, in terminal clusters: fr. blue. Australia.

Dombeyi (*E. brasiliensis* of planters). Grumixameira-Tree. Tree to 50 ft.: lvs. oval to somewhat obovate, coriaceous, to 5 in. long: fls. solitary, white: fr. dark red becoming black, edible. Brazil.

eucalyptoides. Small tree or shrub: lvs. lanceolate, to 6 in. or more long, pointed: fls. in compact terminal cymes, the orbicular petals about ¼ in. across: fr. globular. Australia.

floribunda (*Myrciaria floribunda*). Tree to 30 ft., glabrous: lvs. lanceolate to ovate-lanceolate, to about 3 in. long, long-acuminate: fls. white, sessile in lateral clusters: fr. red or yellow, to ⅓ in. diam. W. Indies.

Hookeri, Hookeriana: *E. paniculata.*

Jambos (*Jambos vulgaris* and *J. Jambos. Caryophyllus Jambos*). Rose-Apple. Jambos. Broad tree to 30 ft.: lvs. long-lanceolate, tapering both ends, to 8 in. long: fls. greenish-white, to 3 in. across, the stamens very conspicuous, terminal and few together: fr. to 2 in. diam., greenish or yellow, employed in making preserves and confectionary. Trop. Asia; nat. elsewhere.

malaccensis (*Jambosa malaccensis*). Malay-Apple. Pomerack. Tree to 30 ft. or more high, with thick heavy top: lvs. oblong to somewhat obovate, thick, to 12 in. long: fls. red-purple, 2 in. across, borne along branches, stamens much exceeding petals and covering the ground as they fall: fr. red, 2 in. long. India, Malaya.

Mato. Tree to 20 ft.: lvs. ovate to oblong-lanceolate, obtuse: fls. white, solitary in the axils, on stalks to ¾ in. long. Argentina.

Michelii: *E. uniflora.*

microphylla: see *E. myriophylla.*

monticola. Shrub or tree to 30 ft.: lvs. ovate to lanceolate, to 1½ in. long, pale beneath: fls. small, in axillary clusters: fr. black at maturity, very small. W. Indies.

myriophylla (*Myrciaria myriophylla*). Much branched bush: lvs. very narrow and crowded (at least on juvenile plants), to 1½ in. or more long, 1/16 in. or less broad, entire, punctate, midrib obscure above but prominent underneath: fls. white, solitary on axillary peduncles. S. Cent. Brazil.—Grown in pots in its vegetative stage for decoration under the mistaken name *E. microphylla.*

myrtifolia: *E. paniculata* var. *australis.*

operculata (*Syzygium operculatum*). Tree to 50 ft.: lvs. elliptic to broadly ovate, to 8 in. long: fls. small, white, 3 together: fr. purplish-black, edible. Himal.

paniculata (*E. Hookeri* and *Hookeriana*, Hort.). Small vigorous tree, mostly not continuous-blooming: lvs. oblong-lanceolate, to 3 in. or more long, prominently acuminate, tapering at base: fls. white or whitish with conspicuous stamens, about ½ in. across, in small clusters terminal and on the ends of short branchlets or long peduncles and therefore showing beyond the foliage: fr. rose-purple, to about ¾ in diam., employed in jelly-making. Australia. Var. **australis** (*E. australis. E. myrtifolia*). Remaining more bushy and usually blooming more or less throughout the year: lvs. on young shoots oblong-acuminate but on flowering shoots prevailingly short-elliptic and obtuse or short-acute and about 2½ in. long or less: fls. not prominent beyond the foliage: fr. usually smaller.—There are different opinions as to the botanical name this species should bear.

Pitanga. Low shrub, young parts pubescent: lvs. elliptic-oblong or narrow-lanceolate, to 3 in. long: fls. solitary or in one form fascicled: fr. red, nerved, about ½ in. diam. Brazil, Argentina.

pungens. To 40 ft.: lvs. elliptic-oblong, to 3 in. long, spine-tipped: fls. solitary, the peduncles shorter than lvs.: fr. white-tomentose or puberulent, small. Brazil.

Smithii. Tall tree: lvs. ovate to ovate-lanceolate, to 3 in. long: fls. white, small, in terminal panicles: fr. white or purplish. Australia.

supraaxillaris. Tree to 25 ft.: lvs. oval-oblong, to 5 in. long, shining, pale beneath: fls. in about 9-fld. racemes to ¾ in. long, supraaxillary. Brazil.

Ugni: *Myrtus Ugni.*

uniflora (*E. Michelii*). Pitanga, Surinam-Cherry. Shrub or tree to 25 ft.: lvs. ovate to ovate-lanceolate, to 2 in. long: fls. white, fragrant, ½ in. across, solitary or few together: fr. deep crimson at maturity, 8-ribbed, edible. Brazil.

EULALIA: *Miscanthus.*

EULOBUS: see *Œnothera californica.*

EUONYMUS. Spindle-Tree. *Celastraceæ.* Shrubs or small trees, sometimes root-climbers or creepers, mostly of the north temp. zone, sometimes evergreen, with opposite simple lvs., small greenish or purplish bisexual fls. in axillary cymes, and capsular fr. having the seeds inclosed in an aril.

Whether the name of this genus shall be spelled Evonymus or Euonymus is a question of varying practice. Botanical nomenclature begins with Linnæus, Species Plantarum, 1753, with which it is agreed to associate the generic descriptions of his Genera Plantarum, fifth edition, 1754. In the former work Linnæus spelled the name Evonymus, having taken it over from Tournefort, and in the latter Euonymus as if it were at that time a preference. In those days less importance was attached to such variables. There are good arguments for either spelling and neither one can be said to be "correct" as against the other, but it is preferred here to adopt Euonymus.

Many species and varieties are grown for ornament. Most of the species are hardy in the northern states. Ordinary soil and position are satisfactory. Propagated by seeds stratified and sown in spring, hardwood cuttings, the evergreen species under glass, and layers. Grafting is sometimes practiced with varieties and weak kinds, using strong kinds for stock.

alatus. Deciduous shrub to 8 ft., the branches with corky wings: lvs. elliptic, finely toothed: fr. purplish. China, Japan. In var. **aptera** (*subtriflora*) the branches are not winged.

americanus. Strawberry-Bush. Deciduous shrub to 8 ft.: lvs. ovate- to oblong-lanceolate, wavy-toothed: fr. pink. N. Y. to Fla. and Tex.

arborescens: listed name.

atropurpureus. Wahoo. Burning-Bush. Deciduous shrub or tree to 25 ft.: lvs. elliptic, finely-toothed: fls. purple: fr. scarlet. Ont. to Fla. and Mont.

britzensis: listed name, probably a form of *E. radicans.*

Bungeanus. Deciduous shrub to 15 ft.: lvs. elliptic-ovate or -lanceolate, finely toothed: fr. yellowish. China, Manchuria. Var. **semipersistens** is half-evergreen.

europæus. Deciduous shrub or tree to 25 ft.: lvs. ovate to oblong-lanceolate, finely toothed: fr. pink. Eu. Var. **alba** (var. *leucocarpa*) has whitish fr. Var. **nanus** is a dwarf form.

fimbriatus: *E. pendulus.*

Hamiltonianus. Small tree: lvs. lanceolate-oblong, finely toothed: fr. pink. Himalayas.

japonicus. Evergreen shrub to 15 ft.: lvs. oval, obscurely toothed, shining above: fr. pink. Japan; planted in southern states. There are many forms, a few of which are: **albo-marginatus,** lvs. with narrow white border; **argenteo-variegatus,** lvs. edged and marked with white; **aureus** has yellow lvs. when young; **aureo-marginatus,** lvs. edged with yellow; **aureo-variegatus,** lvs. blotched with yellow; **medio-pictus,** lvs. with yellow blotch in center; **microphyllus** (*E. pulchellus*) has small lvs.; **pallens,** young lvs. pale yellow; **pyramidatus** (var. *columnaris*) is of columnar habit; **viridi-variegatus** or "Duc d'Anjou" has bright green lvs. variegated with yellow and green.

kewensis: *E. radicans* var. *minimus.*

lanceifolius. Deciduous shrub or tree to 30 ft.: lvs. lanceolate, wavy-toothed: fr. pale. China.

latifolius. Deciduous shrub or tree to 20 ft.: lvs. oval to oblong, finely toothed; fr. rosy-red. Eu., W. Asia.

Maackii. Shrub or small tree: lvs. oblong, finely toothed: fr. pink. China, Manchuria, Korea.

nanus (*E. rosmarinifolius*). Deciduous shrub to 3 ft., sometimes procumbent: lvs. linear, usually entire, the margins revolute: fr. pink. Asia.

obovatus (*E. americanus* var. *obovatus*). Running Strawberry-Bush. Deciduous procumbent shrub to 1 ft., the branches rooting: lvs. obovate, finely toothed: fr. pink. Ont. to Ky.

oxyphyllus. Deciduous shrub or small tree: lvs. ovate to ovate-oblong, finely toothed: fr. dark red. Japan.

patens. Partially evergreen shrub to 10 ft.: lvs. oval to obovate, wavy-toothed: fr. pink. China.

pendulus (*E. fimbriatus*). Small evergreen tree, branches drooping: lvs. oblong-lanceolate, finely sharp-toothed: fr. 4-winged. Himalayas.

planipes. Deciduous shrub or small tree: lvs. obovate, finely toothed: fr. 5-angled. Japan.

pulchellus: *E. japonicus* var. *microphyllus.*

radicans. Evergreen shrub, trailing or climbing by rootlets: lvs. oval, wavy-toothed: fr. greenish-white or pinkish. Japan. Var. **acutus** is a climbing form with acute lvs. Var. **argenteo-marginatus** has lvs. margined with white. Var. **Carrierei** is a low spreading shrub. Var. **coloratus,** lvs. bright red in autumn. Var. **foliis-variegatus** has lvs. with a broad white margin. Var. **minimus** (*E. kewensis*) has very small lvs. ½ in. or less long. Var. **pictus** (var. *argenteo-variegatus*), veins of lvs. marked with white. Var. **reticulatus** has lvs.

marked with white along the veins. Var. **vegetus** is a bushy form to 5 ft. and more; common.—This species and its forms are popular for covering brick walls and foundations.

rosmarinifolius: *E. nanus.*

Sieboldianus. Lvs. elliptic: fr. 4-ribbed. Japan.—The plant usually cult. under this name is *E. patens.*

verrucosus. Shrub to 6 ft.: lvs. ovate, crenate-toothed: fr. yellowish-red, deeply 4-lobed. S. Eu., W. Asia.

Wilsonii. Shrub climbing to 20 ft.: lvs. lanceolate, to 5 in. or more long, serrate: fls. many, yellowish, in cymes: fr. 4-lobed, with yellow aril. China.

yedoensis. Deciduous shrub to 10 ft.: lvs. obovate, minutely toothed: fr. pink. Japan.

EUPATORIUM. THOROUGHWORT. BONESET. *Compositæ.* Mostly herbaceous perennials with opposite lvs. and heads in clusters or panicles, of purple, rose and white disk-fls. blooming in late summer and autumn; pappus of hair-like bristles; mostly native in Mex., W. Indies and trop. S. Amer.

Many tropical bonesets are very satisfactory in the greenhouse and others in the hardy border or wild-garden. Those grown under glass are given the same care as the florists stevia (Piqueria), being propagated usually by cuttings in winter or early spring. The hardy herbaceous types require the treatment of the average perennial and are increased by division or by seeds. The species most likely to be seen under glass are *E. glabratum, glandulosum, glechonophyllum, ligustrinum, riparium, sordidum (ianthinum).*

adenanthum: *E. glandulosum.*

adenophorum: *E. glandulosum.*

ageratoides: *E. urticæfolium.*

album. To 3 ft., rough-hairy: lvs. oblong, to 4 in. long, coarsely toothed: heads white. L. I. to Fla. and La.—Suited to poor soil.

altissimum. To 8 ft., grayish-pubescent: lvs. lanceolate, to 5 in. long, toothed or entire: heads white or pinkish. Pa. to N. C. and Tex.

americanum: *E. glandulosum.*

araliæfolium. Shrub: lvs. oblong, to 8 in. long, entire, leathery and glabrous: heads white. Mex. to Guatemala.

aromaticum. To 2 ft., slightly pubescent: lvs. ovate, to 3 in. long, coarsely toothed: heads white. Mass. to Fla. and Miss.

atrorubens. To 2½ ft., with red or purple hairs: lvs. ovate, to 1 ft. long, toothed: heads red or purple. Mex.

cannabinum. HEMP AGRIMONY. To 6 ft., pubescent: lvs. 3–5-parted into lanceolate coarsely toothed segms.: heads pale purple. Eu.

cinereum. Shrubby: lvs. ovate-lanceolate, 3 in. long, toothed, white-tomentose beneath: pappus white. Trinidad.

cœlestinum (*Conoclinium cœlestinum*). MIST-FLOWER. To 3 ft., pubescent: lvs. triangular-ovate, to 3 in. long, coarsely toothed: heads light blue to violet. N. J. to Fla. and Tex.

conspicuum (*E. grandifolium*). Herb or shrub to 6 ft.: lvs. triangular-ovate, to 5 in. long, toothed: heads white. Mex., Guatemala.

elegans: *E. glabratum.*

Fraseri: *E. urticæfolium.*

glabratum (*E. elegans. E. latifolium*). Shrub to 8 ft., sticky and nearly glabrous: lvs. ovate to oblong, to 2½ in. long, fine-toothed or entire, pale beneath: heads pale pink. Mex.

glandulosum (*E. adenanthum. E. adenophorum. E. americanum*). Often decumbent, glandular-pubescent: lvs. ovate, coarsely toothed: heads pure white, ageratum-like. Mex.—Sometimes grown erroneously as *E. glutinosum.*

glechonophyllum (*Ageratum conspicuum*). Low branching subshrub, nearly glabrous: lvs. triangular-ovate, about 1 in. long, bluntly few-toothed: heads white. Chile.

glutinosum: see *E. glandulosum.*

grandiflorum: probably *E. atrorubens.*

grandifolium: *E. conspicuum.*

ianthinum: *E. sordidum.*

incarnatum. To 4 ft., pubescent: lvs. triangular-ovate, to 2 in. long, toothed: heads pink or pale purple. Va. to Fla. and Mex.

Lasseauxii (*Ageratum* and *Conoclinium Lasseauxii*). To 2 ft., glandular-hairy: lvs. alternate, oblong-lanceolate, bluntly toothed: heads white changing to rose. Temp. S. Amer.

latifolium: *E. glabratum.*

ligustrinum (*E. micranthum. E. Weinmannianum*). Shrub to 15 ft.: lvs. oblong, to 3½ in. long, few-toothed, glandular below: heads white, often with deep rose pappus. Mex. to Cent. Amer.

macrophyllum: listed name of doubtful identity.

maculatum. JOE-PYE WEED. To 6 ft., rough-pubescent, st. often spotted purple, not glaucous: lvs. ovate or ovate-lanceolate, often whorled, thick, coarsely toothed: heads pink or purple, in flat-topped infl., the florets 9–15. Newf. to B. C. south to Ill. and N. Mex.—Probably most of the stock planted as *E. purpureum* belongs here.

micranthum: *E. ligustrinum.*

odoratum (*Osmia odorata*). Shrubby, to 2 ft. or partially climbing, pubescent: lvs. ovate or ovate-lanceolate, to 6 in. long, toothed: heads white to blue. Fla., W. Indies, S. Amer.

perfoliatum. COMMON B. To 5 ft., pubescent: lvs. lanceolate, to 8 in. long, the pairs united at base around the st., rugose, fine-toothed: heads grayish-white varying to bluish-purple. N. S. to Fla. and Tex.

purpureum. JOE-PYE WEED. To 10 ft., sts. mostly not speckled, glaucous: lvs. mostly in whorls, oval to lanceolate, to 1 ft. long, tapering at base, coarsely toothed: heads pink or purple, rarely whitish, in open convex infl., the florets 5–7. Me. to Fla., Okla. and Tex.—See *E. maculatum* and *E. verticillatum.*

riparium. Woody at base, 2 ft., sts. pubescent, reddish: lvs lanceolate, to 4 in. long, toothed: heads white. Mex.

serotinum. To 8 ft., pubescent, much branched: lvs. ovate-lanceolate, to 6 in. long, coarsely toothed: heads white. Del. to Fla. and Tex.

serrulatum. Shrub: lvs. lanceolate, to 2½ in. long, finely toothed, slightly glandular-pubescent: heads white. Brazil.

sessilifolium. To 6 ft., nearly glabrous: lvs. lanceolate or ovate-lanceolate, to 6 in. long, sharp-toothed, sessile: heads white. Vt. to Ga. and Ala.

sordidum (*E. ianthinum*). Shrub, the sts. densely reddish-tomentose: lvs. ovate to ovate-oblong, to 4 in. long, toothed: heads violet, fragrant. Mex.

Torreyanum. To 3 ft.: lvs. lanceolate, to 3 in. long, slightly toothed, sessile: heads white. Pa. to Fla. and Tex.

urticæfolium (*E. ageratoides. E. Fraseri*). WHITE SNAKEROOT. To 4 ft., glabrous or hairy: lvs. ovate, to 6 in. long, coarsely toothed: heads white. N. B. to Fla. and La.

vernale. Shrub, pubescent: lvs. oblong-ovate, to 5 in. long, toothed, grayish-tomentose beneath: heads white. Mex.

verticillatum. JOE-PYE WEED. To 8 ft. or more, st. speckled purple: lvs. ovate to narrow-ovate, mostly in 3's and 4's, to 8 in. long, broadly contracted at base: fls. purple in convex or rounded panicles. Coastal plain, Mass. to S. C.—See *E. purpureum.*

Weinmannianum: *E. ligustrinum.*

EUPHORBIA. SPURGE. *Euphorbiaceæ.* Herbs or shrubs or small more or less succulent trees of many classes and kinds (sometimes ranged in several genera), often cactus-like, with milky juice, simple lvs., fls. in cyathia (see *Euphorbiaceæ*), and fr. a 3-parted caps. The species are native in various parts of the world.

The succulent or cactus-like forms are grown in the greenhouse, and for hedges and specimen plants in the South; for cult. see *Succulents.*

The hardy herbaceous species are suitable for the border or rock-garden and thrive in any good garden soil. Seeds may be sown where the plants are to stand and then thinned to about 10 inches.

Poinsettias (*E. pulcherrima*) are propagated by cuttings, usually taken in early summer from young growth of stock that has been kept over winter. These cuttings afford bloom about Christmas time. They should be kept in pots in a temperature of about 65°. Where grown in the open poinsettias may be propagated from April on by canes about 3 feet long stuck in the ground. Other shrubby euphorbias are similarly handled.

canariensis. Shrub or tree to 20 ft., with thick 4–6-angled branches and small black spines, a few foliage lvs. Canary Isls.

Chamæsyce. Prostrate ann. with short thread-like sts.: lvs. roundish: fls. solitary, having whitish appendages. Medit. region.

cœrulescens. Succulent shrub with thick 4–5-angled jointed bluish-glaucous branches, spines to ½ in. long, and triangular scale-like lvs. S. Afr.

corollata (*Tithymalopsis corollata*). FLOWERING S. Per. to 3 ft.: lvs. oblong to linear: fls. in umbels, with white petal-like appendages. Ont. to Fla. and Tex.

Cyparissias (*Tithymalus Cyparissias*). CYPRESS S. Per. to 1 ft.: lvs. linear: fls. in many-rayed umbels, the bracts yellowish. Eu.; nat. in E. U. S., on banks and in cemeteries.—A good ground-cover.

epithymoides (*E. polychroma*). Per. to 1 ft., forming attractive clumps: lvs. oblong, the floral ones often yellow: fls. in umbels. E. Eu.—Showy in the border.

fulgens (*E. jacquinæflora*). SCARLET PLUME. Shrub to 4 ft.: lvs. lanceolate: fls. in cymes, with scarlet petal-like appendages. Mex.—Grown under glass N.

globosa. To 3 in., the fleshy joints globose or club-shaped and about 1 in. diam.: lvs. very small, deciduous: involucre with green white-pitted lobes. S. Afr.

havanensis: *E. lactea.*

heterophylla (*Poinsettia heterophylla*). MEXICAN FIRE-PLANT. Ann. to 3 ft.: lvs. variable, ovate to linear, entire, toothed or fiddle-shaped, the upper lvs. blotched with red and white: fls. in terminal clusters. Ill. to Fla., trop. Amer.—An acceptable flower-garden subject.

Intisy. Shrub with fleshy, globose forked branches, gray-green and with numerous white dots: lvs. small, borne on protuberances. Madagascar.—Intro. in U. S. for test as a rubber-producing plant.

jacquinæflora: *E. fulgens.*

lactea (*E. havanensis*). Cactus-like shrub or tree of candelabra form, the branches 3–4-angled with a marbled white band down the center, bearing short thick spines and no foliage lvs. E. Indies.—Planted only in warm countries or under glass.

Lathyrus (*Tithymalus Lathyrus*). CAPER S. MOLE-PLANT. Ann. to 3 ft.: lvs. lanceolate, the floral ones ovate: fls. in umbels. Eu.; nat. in N. Amer.

marginata (*E. variegata. Lepadenia marginata*). SNOW-ON-THE-MOUNTAIN. Ann. to 2 ft.: lvs. ovate to oblong, the upper ones with white margins: fls. in umbels, with white petal-like appendages, Minn. to Tex.—Popular as a flower-garden subject.

Myrsinites. Fleshy bien. or per., prostrate or decumbent at base, then ascending or erect: lvs. obovate, in spirals, sessile: fls. yellow, in umbels. Eu.

neriifolia. Succulent tree or shrub, with 5-angled sts. and short spines: lvs. thick, obovate-oblong, to 5 in. long: fls. in cymes. E. Indies.

ornithopus. Succulent and spineless little plant, branching near ground into cylindric tuberculate branches to 4 in. long, with long-jointed and short-jointed forms: lvs. rudimentary and soon falling: peduncles 1½–3 in. long, bearing cup-shaped green involucres. S. Afr.

pilosa. Per. to 1½ ft.: lvs. oblong: fls. in umbels. Eu., N. Asia. Var. **major** has golden-yellow foliage.

polychroma: *E. epithymoides.*

pteroneura. Low shrub with jointed angled branches ⅓ in. thick, the lvs. soon falling. Mex.—Grown under glass N.

pulcherrima (*Poinsettia pulcherrima*). POINSETTIA. Shrub to 10 ft. or more: lvs. ovate to lanceolate, entire or lobed, the upper ones narrower and bright red (white, var. **alba**, or pink, var **rosea**) and constituting the showy part of the plant: fls. in cymes. Trop. Amer., Cent. Mex. Var. **plenissima** has fls. transformed into red bracts.

rhipsalioides. Differs from *E. Tirucalli* in having ovate lanceolate lvs. about ¾ in. long. Trop. Afr.

similis. Tree to 30 ft., spiny, with 4–5-angled fleshy branches, the joints to 1½ ft. long: lvs. scale-like or sometimes to 3½ in. long, deciduous. S. Afr.

splendens. CROWN-OF-THORNS. Woody, the climbing sts. to 4 ft. long and armed with spines to 1 in. long: lvs. obovate, soon falling: fls. in cymes, the bracts bright red. Madagascar.—Grown under glass.

stricta (*Tithymalus stricta*). Ann. to 2 ft.: lvs. ovoid to lanceolate: fls. in umbels. Eu.

Tirucalli. MILK-BUSH. INDIAN TREE S. Shrub or tree to 30 ft., with a crown of slender irregular branches, leafless as the narrow lvs. soon fall: fls. in small clusters. Afr.—Grown in the open in S. Fla., under glass in the N.

tridentata. Succulent and spineless little plant; branches from the base to 6 in. long, cylindrical or tapering, with angled tubercles: lvs. ¼ in. or less long, soon falling: peduncles 3–4 at ends of branches, bearing 1 involucre and a pair of bracts. S. Afr.

variegata: *E. marginata.*

EUPHORBIACEÆ. SPURGE FAMILY. A large and important assemblage of herbs, shrubs and trees, sometimes cactus-like, often with milky juice, of about 250 widely distributed genera. The fls. are of various forms, sometimes in cyathia, i.e., an apetalous pistillate fl. is surrounded by several staminate fls. which consist of a single stamen jointed on the pedicel and all inclosed by a corolla-like involucre which often has petal-like appendages; ovary superior and commonly 3-celled: fr. usually a caps. This family includes many plants of economic importance, yielding rubber, edible roots and fruits, and having valuable medicinal and poisonous properties; there are also many ornamental subjects. In some cases, as poinsettia, the showy parts are colored bracts. Those genera cult. with us are Acalypha, Aleurites, Antidesma, Bischofia, Breynia, Codiæum, Dalechampia, Daphniphyllum, Euphorbia, Hemicyclia, Hevea, Homalanthus, Hura, Jatropha, Mallotus, Manihot, Mercurialis, Pedilanthus, Phyllanthus, Ricinus, Sapium, Synadenium, Xylophylla.

EUPHORIA. *Sapindaceæ.* Trop. Asian trees with alternate pinnate lvs., small regular fls. in panicles, and fr. covered with flattened tubercles; grown for the edible fr.

Longans withstand slight frost and also should be protected from the sun in summer; they thrive in protected places in southern Florida and southern California. Propagated by seed, layers and grafting.

Longana (*Nephelium Longana*). LONGAN, LUNGAN. To 40 ft.: lvs. of 2–5 pairs of glossy elliptic to lanceolate lfts. to 1 ft. long: fls. yellowish-white, in terminal panicles: fr. yellow-brown, 1 in. across, with white juicy edible flesh. India.

EUPLOCA. *Boraginaceæ.* Small ann. hispid herbs with alternate entire pubescent lvs. and white salver-shaped solitary fls., the corolla narrowed at orifice; one or two N. American plants sometimes united with Heliotropium.

convolvulacea (*Heliotropium convolvulaceum*). To 1 ft.: lvs. lanceolate or ovate, to 1½ in. long: fls. ½ in. long, fragrant. Wash. to Calif. and New Mex.

EUPTELEA. *Trochodendraceæ.* Asian deciduous shrubs or trees with alternate toothed lvs., fls. in clusters before the lvs., without sepals and petals but with long red anthers, and fr. a samara.

These plants do best in loamy well-drained soil in rather moist positions. Propagated by seeds or by grafting on their own roots. The following stand in southern New England.

Franchetii. To 75 ft.: lvs. roundish-ovate, to 5 in. long, regularly toothed: frs. 1–3-seeded. Cent. China.

polyandra. Differs from above in the lvs. being coarsely and unequally toothed, and the frs. usually 1-seeded. Japan.

EUROTIA. *Chenopodiaceæ.* Small white-tomentose shrubs of Eu. and N. Amer., one rarely planted: lvs. alternate, entire: fls. unisexual, in small clusters borne in spikes.

lanata. WINTER FAT. To 2 ft.: lvs. linear, to 1¼ in. long, revolute: pistillate fls. with tufts of silvery-white hairs. Sask. to Calif. and New Mex.

EURYA. *Theaceæ* (*Ternstrœmiaceæ*). Evergreen shrubs or trees with alternate simple lvs., mostly diœcious fls. in axillary clusters, and berry-like frs.; suitable for greenhouse cult. or in the open in the S. For cult. see *Camellia.*

japonica (*E. latifolia*). Lvs. toothed: fls. small, greenish-white. E. Asia. Var. **variegata** has lvs. variegated with white.

latifolia: *E. japonica.*

ochnacea (*Cleyera japonica*). Lvs. entire: fls. creamy-white, fragrant: berries red. Himalayas to Japan. The lvs. are variegated in var. **variegata.**

EURYALE. *Nymphæaceæ.* One species, very prickly and spiny, somewhat similar to *Victoria regia* but the fls. much smaller and all stamens fertile. **E. ferox.** Lvs. 1–4 ft. across, circular, purple and spiny-ribbed beneath, dark green and uneven above: fls. green outside, bright red inside, about 2 in. across, open by day, prickly outside: fr. many-seeded globular berry, seeds edible. India, China.—Treated as an ann.; propagated by seeds only, planted in rich earth as for nympheas, temperature 70–75° F. Hardy as far north as Philadelphia and St. Louis.

EUSCAPHIS. *Staphyleaceæ.* One deciduous shrub to 10 ft., native in Japan and China and not fully hardy in the N. Propagated by seeds and cuttings of green wood under glass. **E. japonica** (*E. staphyleoides*). Lvs. pinnate, of 7–11 ovate-lanceolate toothed lfts. to 3 in. long: fls. yellowish-green, in terminal panicles to 5 in. across: fr. of 3 reddish leathery pods ½ in. long.

EUSTOMA. *Gentianaceæ.* A few N. American glaucous herbs with opposite lvs. and white or blue bell-shaped fls. in panicles or solitary, with keeled calyx, 5- or 6-lobed corolla, and many-seeded capsular fr.; sometimes grown in the flower-garden.

Russellianum. PRAIRIE GENTIAN. Ann. erect herb to 3 ft.: lvs. ovate to oblong, to 3 in. long: fls. pale purple, about 2 in. across and 2 in. long, erect or flaring. Neb. to Tex.—Showy plant but not often seen in cult.; sometimes treated as bien., the well established seedlings being carried over winter in a frame.

EUSTREPHUS. *Liliaceæ.* Australian vine-like plants woody at base, having alternate lvs. and fls. clustered in axils of upper lvs., the perianth- segms. distinct and fringed. Of easy cult. under glass or in the open in warm climates. Propagated by division or seeds.

latifolius. Lvs. linear-lanceolate, to 4 in. long: fls. white or light blue, ¼ in. long: fr. an orange-colored berry about ½ in. across.

EUTAXIA. *Leguminosæ.* Australian nearly or quite glabrous shrubs, one intro. in Calif.: lvs. small and opposite: fls. yellow, papilionaceous, mostly axillary and solitary or few together. **E. empetrifolia** (*E. diffusa*) is a heath-like bush with lvs. about ¼ in. or less long: fls. ¼ in. or less long, each one with a pair of leaf-like bracts at base: pod to ¼ in. long.

EUTERPE. *Palmaceæ.* Feather-palms of trop. Amer., perhaps 10 species, unarmed, monœcious, with branched spadices below the lvs.: trunk solitary or plant gregarious: fls. white, sessile, in 3's and the middle one pistillate or one of them often abortive; stamens 6, distinct: fr. globose, small, with thin outer flesh or a shell. The name Euterpe is variously interpreted. The species are adapted to greenhouse cult., and should stand in parts of S. Fla. See *Palm.*

edulis. ASSAI PALM. MANICOLE. Clustered palm to 60 ft. and more, with ringed trunks and graceful drooping pinnæ and arching lvs. green on both sides but lighter underneath; pinnæ numerous, singly placed, 15–24 in. long, 1½ in. or less broad, secondary veins strong, all except the uppermost narrowed into long thin points: fr. about ½ in. diam., purple-black. Brazil, Guiana, in forests.

globosa (*Acrista monticola*). Trunk single, to 50 ft., coarsely ringed with lf.-scars: lvs. 5–7 ft. long, much lighter underneath; pinnæ many, 1½–3 ft., long and 2 in. or less broad, the points not prominently thin, secondary veins strong: fr. shining black, about ½ in. thick. Cuba to Grenada.

EUTHAMIA: *Solidago.*

EUTOCA: *Phacelia.*

EVEA: *Cephaelis.*

EVERGREENS: see *Conifers.*

EVERLASTING. IMMORTELLE. Plants used for "dry bouquets" for winter decoration, comprising various kinds that retain their form and color when dried; usually the flowers have chaffy or papery parts. Most of the common everlastings are members of the Compositæ, as Ammobium, Anaphalis, Antennaria, Helipterum, Helichrysum, Xeranthemum. One common kind, Gomphrena, is an amaranth. Statice, of the Plumbaginaceæ, is much used. Cut before the flowers are fully expanded, with long stems, and hang in an airy shady place to cure. Various dry fruits are used with everlastings, as Physalis, Lunaria. Many of the grasses are also employed for dry bouquets, as well as teasels, cat-tails and many other plants from the wild. All the foregoing plants are of simple culture.

EVODIA. *Rutaceæ.* Trees or shrubs, often somewhat Rhus-like, native in E. Asia, Australia and Polynesia, with opposite simple or compound aromatic lvs., small unisexual fls. in cymes or panicles, and fr. of 4–5 carpels.

Some species (as those here described) are hardy in the North and others are greenhouse subjects. Propagated by seeds, cuttings of half-ripened wood, and root-cuttings.

Daniellii. Small tree: lvs. of 7–11 lfts.: fls. white, in terminal corymbs to 6 in. across. N. China, Korea.

Henryi. Tree to 35 ft.: lvs. of 5–9 lfts.: fls. whitish, in panicles to 2½ in. across. Cent. China.

hupehensis. Similar to *E. Henryi* but lvs. light green beneath and fls. smaller in panicles to 6 in. across. Cent. China.

EVOLVULUS. *Convolvulaceæ.* Prostrate or erect herbs or sometimes shrubs, having small alternate lvs. and small blue, rose or white axillary fls. 5-angled or -lobed; native in warm regions.

bocasanus. Herb to 2 ft.: lvs. lanceolate, to 2 in. long, sessile: fls. bright blue with white center, ½ in. across. Trinidad, Venezuela.

EVONYMUS: *Euonymus.*

EXACUM. *Gentianaceæ.* Old World herbs with opposite, simple and entire lvs. and blue or white wide-open fls. solitary or in forking cymes; corolla 4- or 5-lobed: fr. a 2-valved caps. Grown under glass or out-of-doors in warm regions. Propagated by seed.

affine. Bien. to 2 ft.: lvs. to 1½ in. long, ovate: fls. bluish. ½ in. across. Socotra.

macranthum. Bien. to 2 ft.: lvs. to 3 in. long, oblong: fls. purplish-blue, ringed with yellow in throat, 2 in. across. Ceylon.

zeylanicum. Ann. to 2 ft.: lvs. 3 in. long, oval-oblong: fls. blue, 1½ in. across. Ceylon.—Differs from *E. macranthum* in the lobes of corolla obtuse rather than pointed.

EXOCHORDA. PEARL-BUSH. *Rosaceæ.* Asian spirea-like deciduous shrubs with alternate lvs., white fls. in terminal racemes in spring, and fr. a 5-angled caps. with winged seeds.

Pearl-bushes are very ornamental and hardy North, prospering in sunny positions in well-drained soil. Propagated by seeds, by layers, and by cuttings of soft wood.

Alberti: *E. Korolkowi.*

Giraldii. To 15 ft.: lvs. elliptic, to 2½ in. long, petioles to 1 in. long, often red: fls. 1½ in. across; stamens 20–30. China. Var. **Wilsonii** has fls. to 2 in. across and green petioles.

grandiflora; *E. racemosa.*

Korolkowi (*E. Alberti*). To 12 ft.: lvs. oblong, to 3 in. long, petioles ½ in. long: fls. 1½ in. across; stamens 25. Turkestan.

macrantha. Hybrid between *E. racemosa* and *E. Korolkowi.*

racemosa (*E. grandiflora*). To 10 ft.: lvs. elliptic to oblong-obovate, to 2½ in. long, petioles to ½ in. long: fls. to 2 in. across; stamens 15. China.

EXSERTED: sticking out; projecting beyond, as stamens from a perianth; not included.

EYE: the marked center of a flower; a bud on a tuber, as on a potato; a single-bud cutting.

F

FABIANA. *Solanaceæ.* Small heath-like shrubs grown in greenhouses and in the open in mild climates for the numerous small white tubular fls.: lvs. very small, narrow and crowded: native in S. Amer., one grown in S. Calif. where it blooms at different seasons. Easily increased by cuttings taken in Aug.

imbricata. To 8 ft., much branched: lvs. very numerous, scale-like, overlapping: fls. borne singly but in great numbers on the ends of the short branches, ½ in. long, constricted at base. Peru.

FABRICIA: *Leptospermum.*

FAGACEÆ. Beech Family. Six widely distributed genera of woody monœcious plants, with alternate simple lvs., staminate fls. in catkins or heads, pistillate solitary or clustered, 4–7-lobed perianth, 4–20 stamens, inferior 3–7-celled ovary, and fr. a nut inclosed in a cup or bur. The family furnishes valuable timber, edible nuts, medicinal and dyeing products, cork, and numerous ornamental subjects. Genera cult. are Castanea, Castanopsis, Fagus, Lithocarpus, Nothofagus, Quercus. Most of the planted subjects are hardy in the central or northern U. S., but some of them only far S., and comprise some of the most desirable lawn and shade and grove hardwood trees.

FAGARA: see *Zanthoxylum.*

FAGELIA: *Calceolaria.*

FAGOPYRUM. *Polygonaceæ.* European and Asian herbs with alternate lvs., small white fls. in racemes or corymbs, and fr. a pointed triangular achene.

Plants are grown for the seeds from which flour is made and as a cover- or catch-crop in orchards; the following are tender annuals of quick growth. Of easy cultivation on a wide range of soils. Seeds are sown broadcast or in drills late in June or early in July in the northern states.

esculentum. Buckwheat. To 3 ft.: lvs. triangular-ovate, to 3 in. long: fls. white, fragrant, in short dense racemes or clusters mostly near summit of plant. Cent. or N. Asia.

tataricum. India-Wheat. Kangra Buckwheat. To 2 ft.: lvs. broadly arrow-shaped, to 2 in. long: fls. greenish or yellowish, in slender open racemes along the st. India.—It has been known as duckwheat.

FAGUS. Beech. *Fagaceæ.* Tall deciduous monœcious trees with smooth light gray bark, alternate toothed lvs., staminate fls. in drooping heads, and 1 or 2 brown 3-angled nuts inclosed in a prickly involucre; native of the north temp. zone.

Beeches are excellent and emphatic ornamental trees, furnish valuable timber, and the nuts are eaten. They prosper on loam limestone soil. Propagated readily by seeds sown in fall or stratified and kept until spring; protect from vermin. Seedlings should be transplanted to prevent the formation of long taproots. Varieties are grafted on seedling stock under glass.

americana: *F. grandifolia.*

ferruginea: *F. grandifolia.*

grandifolia (*F. americana. F. ferruginea*). American B. Large and characteristic tree: lvs. ovate-oblong, to 5 in. long, dark bluish-green above, turning yellow in autumn. N. B. to Fla. and Tex.—Variable in lf. characters. Differs from the frequently planted European beech in longer coarsely serrate lvs. with more veins (9–14 pairs).

Sieboldii. Japanese B. Lvs. ovate, to 4 in. long: involucre with bract-like appendages at base. Japan.

sylvatica. European B. Lvs. ovate, to 4 in. long, denticulate, shining dark green above, turning reddish-brown in autumn. Eu. to Caucasus. Some of the hort. vars. are: **albo-variegata**, lvs. variegated with white; **asplenifolia**, lvs. very narrow, deeply toothed or lobed; **atropunicea** (var. *atropurpurea*, var. *purpurea*, var. *Riversii*), Purple B., lvs. purple; **borneyensis**, intermediate between vars. *pendula* and *tortuosa;* **fastigiata** (var. *pyramidalis*), of columnar habit; **grandidentata**, lvs. coarsely toothed; **laciniata** (var. *incisa*, var. *heterophylla*), Fernleaf or Cutleaf B., lvs. deeply toothed or lobed or sometimes nearly entire and linear; **latifolia**, lvs. to 6 in. long and 4 in. wide; **luteo-variegata**, lvs. variegated with yellow; **miltoniensis**, drooping form; **pendula**, Weeping B., branches drooping; **purpureo-pendula**, branches drooping, lvs. purple; **roseo-marginata**, lvs. purple edged with pale pink; **rotundifolia**, lvs. nearly orbicular, 1 in. or less long; **tortuosa** (var. *remillyensis*), branches twisted, drooping at tips; **tricolor**, lvs. nearly white, spotted with green and edged with pink; **variegata**, lvs. variegated with white or yellow.

FAIRY BELLS: *Disporum.*

FAIRY FANS: *Eucharidium Breweri.*

FAIRYWAND: *Chamælirium luteum.*

FAME-FLOWER: *Talinum.*

FAMILY. An assemblage of genera that rather closely or uniformly resemble each other in general appearance and technical characters. A few genera are so unlike all others that a family is constituted for them alone, as in the case of Eucryphia, Eucommia, Cercidiphyllum, Casuarina, Punica, Equisetum. Other families are vast associations of genera that are more like each other than they are similar to others, as the great Compositæ or Composite family that comprises well toward 1,000. Opinions differ as to the natural or practicable limits of families as they do also in respect to genera and species; thus the Composite family may be divided into two or more, as the maple genus may be divided into Acer and Negundo. Nature sets no formal limits. More than 300 families of seed-bearing or flowering plants are commonly recognized. The attentive gardener and botanist soon learns to recognize the important natural families and thereby to place a given plant in its proper relationship: this is the beginning of the mastery of the subject. In this book all the families that are represented by genera in the text are placed with the other entries in alphabetic order; the lists of genera under them suggest the family kinships and constitute the best ready definition.

FANWORT: *Cabomba.*

FAREWELL-TO-SPRING: *Godetia amœna.*

FARFUGIUM: *Ligularia.*

FARKLEBERRY: *Vaccinium arboreum.*

FASCIATED: much flattened; an abnormal or teratological widening and flattening of the stem.

FASCICLE: a condensed or close cluster, as of flowers.

FATSIA. *Araliaceæ.* One evergreen shrub or small tree native in Japan, grown under glass in the N. and out-of-doors in mild regions for its prominent foliage. Propagated by seeds, cuttings, and root-cuttings in spring. **F. japonica** (*Aralia japonica. A. Sieboldii*). To 20 ft.: lvs. to 16 in. across, glossy above, palmately cut beyond the middle into 5–9 toothed lobes: fls. whitish, in umbels 1 in. or more across in long panicles. Var. **Moseri** is a compact-growing form. Var. **variegatum** has lvs. marked or bordered with golden-yellow. For *F. papyrifera* see *Tetrapanax papyriferum.*

FAUCARIA. *Aizoaceæ.* Separated from Mesembryanthemum (which see for cult.): plant at first stemless but becoming more or less short-stemmed, the lvs. half-cylindric in cross-section and keeled or 3-angled at end, the fls. large and nearly or quite sessile and bractless; stigmas 5 or 6. **F. tigrina** (*M. tigrinum*). Lvs. ovate-cordate and glaucous-green, spotted or dotted white, very fleshy, to 1½ in. long, ciliate: fls. solitary, yellow; styles 5. S. Afr.

FEATHER-FLEECE: *Stenanthium robustum.*

FEDIA. *Valerianaceæ.* One ann. herb native in the Medit. region and occasionally grown in the flower-garden or as a salad plant. **F. Cornucopiæ** (*F. scorpioides*). AFRICAN VALERIAN. Sts. to 1½ ft. long, often purplish: lvs. ovate-spatulate, to 4 in. long, entire or toothed: fls. red, small, in terminal cymes, stamens 2: fr. about ⅛ in. long.

FEIJOA. *Myrtaceæ.* Two S. American shrubs or trees with opposite simple lvs., solitary fls. with long-exserted stamens, and fr. a berry; one is grown for the edible fr. and as an ornamental. This plant was first named *Orthostemon Sellowianus* by Berg but subsequently changed by him to *Feijoa* because of an earlier *Orthostemon.*

Feijoas are adapted to subtropical dry climates but will withstand several degrees of frost. The best soil is sandy loam rich in humus. Plants should be spaced 15 to 18 feet apart. Propagated by seeds sown in pans or flats, a good soil being silver-sand and well-rotted redwood sawdust; the seedlings should be shaded and transplanted permanently when about 4 inches high. Also increased by layering, whip-grafting, and cuttings of young wood from ends of branches under glass.

Coolidgei: pomological variety of *F. Sellowiana.*

Sellowiana. To 18 ft.: lvs. oval-oblong, to 3 in. long, white-tomentose beneath: fls. to 1½ in. across, the petals fleshy, white-tomentose outside and purplish within, the stamens dark red, handsome: fr. green tinged with red, to 3 in. long. S. Brazil, Paraguay, Uruguay, Argentina.—Successful as a fruit plant in Calif.; stands in N. Fla.

FELICIA. *Compositæ.* African herbs or subshrubs grown in the greenhouse and in the open in warm regions for the attractive daisy-like fls. with blue or white rays and yellow disks: lvs. alternate or opposite, entire or dentate: pappus of bristles. Propagated by seeds and by cuttings.

amelloides (*Agathæa cœlestis*). BLUE DAISY. BLUE MARGUERITE. Subshrub to 3 ft., somewhat hairy: lvs. opposite, oval or obovate, about 1 in. long, entire or nearly so: heads solitary, to 1¼ in. across, rays numerous, sky-blue, on long stalks. S. Afr.

fragilis: *F. tenella.*

petiolata. Subshrub with prostrate branches: lvs. obovate or lanceolate: heads rose changing to blue. S. Afr.—Grown in hanging-baskets.

tenella (*F. fragilis*). Ann. or bien, to 14 in., often prostrate: lvs. narrow-linear, to 2 in. long: heads solitary, rays pale blue. S. Afr.

FEMININE: pistillate (in higher plants); the seed-bearing parent or flower when the sexes are separate.

FENESTRARIA. *Aizoaceæ.* One of the many segregates from the old genus Mesembryanthemum (which see) from S. W. Afr., characterized by a tufted stemless habit with fleshy upwardly thickened lvs. that bear a small more or less colorless or translucid area or "window" at the apex, the lvs. of each pair about equal: fls. large and showy; stigmas 10 or 11. **F. rhopalophylla** (*M. rhopalophyllum*) has white fls. to 1¾ in. diam., the petals about 35 in a single series to ¾ in. long; stigmas filiform, pale yellowish-green.

FENNEL: *Fœniculum vulgare.* **Common Giant:** *Ferula communis.*

FENNEL-FLOWER: *Nigella.*

FENUGREEK: *Trigonella Fœnum-Græcum.*

FENZLIA: *Linanthus dianthiflorus.*

FERDINANDA. *Podachænium eminens.*

FERN: see *Ferns.* **Adders-tongue-:** *Ophioglossum.* **Asparagus-:** *Asparagus plumosus.* **Ball-:** *Davallia bullata.* **Bamboo-:** *Coniogramme japonica.* **Basket-:** *Nephrolepis pectinaza.* **Bears-foot-:** *Humata Tyermannii.* **Beech-:** *Dryopteris Phegopteris.* **Birds-nest-:** *Asplenium Nidus.* **Bladder-:** *Cystopteris.* **Boston-:** *Nephrolepis exaltata* var *bostoniensis.* **Brittle-:** *Cystopteris fragilis.* **Chain-:** *Woodwardia.* **Christmas-:** *Polystichum acrostichoides.* **Cinnamon-:** *Osmunda cinnamomea.* **Claw-:** *Onychium.* **Climbing-:** *Lygodium.* **Cup-:** *Dennstaedtia.* **Curly-grass-:** *Schizæa pusilla.* **Dagger-:** *Polystichum acrostichoides.* **Deer-:** *Blechnum spicant.* **Elephant-ear-:** *Elaphoglossum crinitum.* **Felt-:** *Cyclophorus.* **Floating-:** *Ceratopteris.* **Gold-:** *Pityrogramma.* **Goldie-:** *Dryopteris Goldiana.* **Grape-:** *Botrychium.* **Hacksaw-:** *Doodia aspera.* **Hares-foot-:** *Polypodium aureum.* **Hartford-:** *Lygodium palmatum.* **Harts-tongue-:** *Phyllitis Scolopendrium.* **Hay-scented-:** *Dennstaedtia punctilobula.* **Holly-:** *Cyrtomium falcatum*, and species of *Polystichum.* **Interrupted-:** *Osmunda Claytoniana.* **Licorice-:** *Polypodium glycyrrhiza.* **Lady-:** *Athyrium Filix-femina.* **Lip-:** *Cheilanthes.* **Maidenhair-:** *Adiantum.* **Male-:** *Dryopteris Filix-mas.* **Marsh-:** *Dryopteris Thelypteris.* **New-York-:** *Dryopteris noveboracensis.* **Oak-:** *Dryopteris.* **Oak-leaved-:** *Polypodium quercifolium.* **Ostrich-:** *Pteretis.* **Parsley-, American:** *Cryptogramma acrostichoides.* **Rattlesnake-:** *Botrychium virginianum.* **Resurrection-:** *Polypodium polypodioides.* **Royal-:** *Osmunda regalis.* **Sago-:** *Cyathea medullaris.* **Saw-:** *Blechnum serrulatum.* **Sensitive-:** *Onoclea sensibilis.* **Shield-:** *Polystichum Braunii.* **Silver-:** *Pityrogramma.* **Squirrels-foot-:** *Davallia bullata.* **Staghorn-:** *Platycerium.* **Strap-:** *Polypodium Phyllitidis.* **Strawberry-:** *Hemionitis palmata.* **Sweet-:** *Comptonia asplenifolia.* **Sword-:** *Nephrolepis.* **Tongue-:** *Cyclophorus Lingua.* **Tree-:** *Alsophila, Cyathea.* **Walking-:** *Camptosorus.* **Wall-:** *Polypodium vulgare* and *virginianum.* **Water-:** *Ceratopteris.* **Winter-:** *Conium maculatum.* **Wood-:** *Dryopteris.*

FERNS. Formerly included in the one family *Filices*, but now distributed in several families, as *Polypodiaceæ* which includes most of the common ferns, *Cyatheaceæ* comprising most of the tree-ferns, *Osmundaceæ*, the native royal-ferns and similar kinds, *Schizæaceæ* including the climbing ferns of the Lygodium class. Ferns are perennial plants widely spread in temperate and tropical regions, of perhaps 6,000 or more species.

Gardeners recognize two groups of ferns, the hardy kinds often transplanted from the wild and given conditions as nearly as possible like those in which they grew, and the glasshouse kinds of tropical and warm-temperate origin and that require more or less special skill in the growing. All kinds are raised for the gracefulness and beauty of the foliage, and the gardener therefore aims at luxuriousness in vegetation. They do not arrive at the best state in a dry or parched atmosphere or when exposed to wind. Some kinds, however, withstand untoward and changing conditions, and these are adapted to window gardens and porches; the Boston-fern (Nephrolepis) is one of this class.

In all fern culture, standing water in the pot is to be avoided, as also heavy clay soils. Extremes should be avoided, in air temperature and in moisture conditions. Shade should be provided and protection from wind. For living-room ferns a night temperature of about 55° is to be recommended, with a rise of 10–20° by day in bright weather. Soils for pot ferns should be fibrous; gardeners like to mix fine fibry peat or turfy loam with it; ample drainage should be provided in the bottom. See that the pot does not dry out, or the atmosphere become very dry.

Ferns are propagated by division, by the buds or offsets that form on the fronds of some kinds, and by means of spores. The spores are usually borne on the back of the frond or leaf; when ripe they may be shaken off on paper, or parts of the frond may be cut and placed in dishes or paper bags in a dry protected place until the spores shed. They should be sown on fine sterilized moist soil in well-drained pans or pots. Spores are sown on a well-prepared soil surface and not covered with earth or watered on top; the pans or pots are kept in a close propagating frame until germination takes place, when more air may be admitted. The frame or house may be kept at a temperature of about 65° F. When watering becomes necessary, sterile water should be used. The sporelings should be pricked out—usually at first in little clumps—and transplanted as soon as a deft person can handle them and the first regular foliage appears. From eight months to a year are usually required to produce good ferns from spores.

One desiring a list of the ferns in cultivation, may find the names of the genera under Cyatheaceæ, Marattiaceæ, Ophioglossaceæ, Osmundaceæ, Parkeriaceæ, Polypodiaceæ, Schizæaceæ, and then trace the species in each genus. Any of the native ferns, however, may be transplanted to grounds in the same region.

Plants allied to ferns are in the families Equisetaceæ, Lycopodiaceæ, Marsileaceæ, Salviniaceæ, Selaginellaceæ. The so-called asparagus-fern, common in conservatories and windows, is one of the Lily family, *Asparagus plumosus*.

The American Fern Society publishes a journal.

FEROCACTUS. *Cactaceæ.* Very spiny often large cacti, globular to cylindric, separated from Echinocactus by the axils of the scales on the ovary and fl.-tube being naked rather than woolly, and thick-walled dry fr.; S. U. S. and Mex. They are grown like the echinocacti and are adaptable to similar uses. See *Cacti.*

acanthodes (*Echinocactus acanthodes. E. cylindraceus*). Globular but becoming cylindric and 8 or 9 ft. tall, very spiny, ribs up to 27, spines pinkish to red to white, radials very weak, centrals awl-like: fls. 2 in. long more or less, bell-shaped, yellow to orange. S. Nev. and Calif., Lower Calif.

Covillei. Globular to short-cylindric, to 5 ft., ribs 22–32, spines red to white, radials 5–8 and centrals solitary: fls. 2–3 in. long, red tipped yellow. Mex.

glaucescens (*Echinocactus glaucescens*). Globular, 8–16 in. diam., or sometimes higher than broad, glaucous, ribs 11–15, radials 6, central solitary: fls. nearly 1 in. long, yellow. Mex.

hamatacanthus (*Echinocactus hamatacanthus. E. longihamatus*). Globular to oblong, to 2 ft. high, ribs 13 or 17, radial spines about 12 and needle-like, centrals 4: fls. about 3 in. long, yellow. S. Tex., New Mex., Mex.

Johnsonii (*Echinocactus Johnsonii*). Oblong, to 8 in. high, very spiny, ribs 17–21, radials 10–14, centrals 4–8 and longer and stouter: fls. 2–2½ in. long, deep red to pink. Utah, Nev., Ariz., Calif.

latispinus (*Echinocactus latispinus*). Globular or somewhat depressed, to 16 in. high, ribs 15–23, radials 6–10, centrals 4 or more and stouter: fls. 1 in. or a little more long, bell-shaped, rose to purple. Mex.

Lecontei (*Echinocactus Lecontei*). Cylindric or becoming so, 6–7 ft. high, ribs 20–30, some of the radials bristle-like, others and centrals flattened and mostly appressed: fls. yellow or red, 2 in. or more long. Utah, Ariz., Calif., Mex.

melocactiformis (*Echinocactus melocactiformis*). Cylindric, to 2 ft. diam., bluish-green, ribs about 24, spines 10–12, with 3 or 4 of them more or less central, yellow to brown: fls. 1–1½ in. long, bright yellow and perhaps reddish outside. Mex.

nobilis. Globular, ribs 15, radial spines straight, central solitary: fls. 1–1½ in. long, red with white margins. Probably Mex.—A doubtful plant.

peninsulæ (*Echinocactus peninsulæ*). Cylindric to club-shaped, to 8 ft. or so, ribs 12–30, spines red with yellow tips, radials 11, centrals 4: fls. yellow. Lower Calif.

robustus (*Echinocactus robustus*). Makes large clumps with hundreds of branches, ribs 8, radials about 10 and often thread-like, central about 6 and awl-like: fls. about 1½ in. long, yellowish. Mex.

Stainesii (*Echinocactus Stainesii. E. pilosus*). Globular to columnar, to 4 ft. or more, ribs 13–20, radial spines represented by long white hairs, centrals several: fls. yellow. Mex.

uncinatus (*Echinocactus uncinatus*). Short-cylindric, to 8 in. high, bluish and slightly glaucous, ribs commonly 13, areoles with flat yellow glands surrounded by yellow hairs, central spine usually solitary: fls. about 1 in. long, brownish. W. Tex., Mex.

viridescens (*Echinocactus viridescens*). Nearly globose or somewhat flattened, to 15 in. diam., deep green, ribs 13–21, bearing spines and felt, the spines at first red: fls. greenish-yellow, about ¾ in. long. Calif., Lower Calif.

Whipplei: *Sclerocactus Whipplei.*

Wislizeni (*Echinocactus Wislizeni*). Becoming cylindric, at length elongated and 7 ft. or more, ribs often 25, radials thread-like or needle-like or absent in young plants, centrals several: fls. 2 in. or more long, yellow. W. Tex. to Ariz. and Mex.

FERONIA. *Rutaceæ.* One spiny deciduous tree, **F. Limonia**, the Wood-Apple, of India and Indo-China, planted somewhat in Fla. and Calif. for interest and edible frs.: lvs. small, odd-pinnate, lfts. obovate and obtuse or emarginate, rachis and petiole margined: fls. dull red, in panicles, stamens 8–12: fr. globose or oblate, hard-shelled, to 3 in. diam., with pinkish edible acid pulp used in making jellies; seeds woolly. Suggested as a citrus stock.

FERONIELLA. *Rutaceæ.* Small genus much like Feronia, but evergreen, seeds smooth and the woody rind comprised of a radical structure. **F. lucida** is somewhat known in this country for ornament and as an experimental stock for citrus frs.: small spiny tree: lvs. small, odd-pinnate, lfts. oval or obovate, obtuse or emarginate, rachis and petiole pubescent: fls. white: fr. globose, to nearly 3 in. diam., pulp glutinous and eaten in Java where it is native.

FERTILE: producing their normal sex products, said of pollen-bearing stamens and seed-bearing fruits; a plant that bears good seeds (not sterile).

FERULA. *Umbelliferæ.* Per. thick-rooted herbs with pinnately decompound lvs., small yellow or greenish fls. in compound umbels, and ovate compressed frs.; one species is planted for ornament, others yielding medicines and gums; the edible fennel is Fœniculum. Propagated by seeds sown in spring where plants are to grow.

communis. Common Giant Fennel. To 12 ft.: lvs. very finely divided into linear segms. S. Eu. to Syria.—A striking plant with very finely divided foliage and umbels above it.

FESCUE: *Festuca.*

FESTUCA. Fescue. *Gramineæ.* Mostly tufted per. grasses of temp. regions, with flat or involute lvs. and spikelets borne in narrow panicles; grown in pastures, meadows, lawns, and some kinds planted for ornament. The principal meadow and forage species are *F. elatior*, *F. ovina*, *F. rubra.* See *Grasses.*

alpina: confused name.

amethystina. To 2½ ft.: lvs. about 1 ft. long, involute: panicles about 3 in. long. S. Eu., Asia Minor.

arundinacea. To 6 ft.: lvs. several ft. long and to ⅜ in. wide, flat: panicles to 10 in. long. Eu.

capillata: *F. ovina* var.

duriuscula: *F. ovina* var.

elatior (*F. pratensis*). Tall F. Meadow F. To 5 ft.: lvs. to 1 ft. long and ⅓ in. wide, flat: panicles to 1 ft. long, erect or nodding at top. Eu.; nat. in N. Amer.

geniculata (*F. stipoides*). To 1½ ft.: lvs. to 1 ft. long and ⅛ in. across, flat: panicles to 4 in. long, with awns ¼ in. long, heavy for size of plant. W.Medit. region.

gigantea. To 4 ft.: lvs. to 1 ft. long and ½ in. wide, flat: panicles to 1 ft. long, awns ½ in. long. Eu.; nat. in E. N. Amer.

glauca: *F. ovina* var.

heterophylla: *F. rubra* var.

Myuros. Rats-tail F. Ann. to 2 ft.: lvs. to 5 in. long, involute: panicles to 1 ft. long, one-sided, awns ¼ in. and more long. Eu.; nat. in N. Amer.

ovina (*F. vulgaris*). Sheeps F. To 2 ft.: lvs. to 8 in. long, involute: panicles to 6 in. long, short-awned. Eu., Asia; nat. in N. Amer. Var. **capillata** (*F. capillata, F. tenuifolia*) has hair-like lvs. and awnless spikelets. Var. **duriuscula** (*F. duriuscula*), Hard F., has stiff lvs. Var. **glauca** (*F. glauca*), Blue F., has glaucous foliage.

pratensis: *F. elatior.*

rigida: *Scleropoa rigida.*

rubra. Red F. To 3 ft., stoloniferous: lvs. to 6 in. long, involute: panicles to 5 in. long, sometimes reddish or glaucous, short-awned. Eu., Asia, N. Amer. Var. **heterophylla** (*F. heterophylla*) has basal lvs. involute and st.-lvs. flat.

stipoides: *F. geniculata.*

tenuifolia: *F. ovina* var. *capillata.*

vulgaris: *F. ovina.*

FETERITA: *Holcus Sorghum* var. *caudatus.*

FETID: having a disagreeable odor.

FETTER-BUSH: *Lyonia lucida.*

FEVERFEW: *Chrysanthemum Parthenium.*

FEVERWORT: *Triosteum.*

FICARIA: *Ranunculus Ficaria.*

FICUS. Fig. *Moraceæ.* Trees, shrubs and woody root-clinging vines, with milky sap, and minute fls. and seeds inside a globular or oblong or pyriform fleshy receptacle (or fig) that has a small opening at the apex: lvs. thick or stiff and mostly persistent, often large and showy. Species numerous, native in warm and trop. countries in many parts of the world. Some of the species are among the wonders of the vegetable world, as the banyan (*F. benghalensis*) that sends down aerial roots that make trunks and thus extend the top of the single tree over great areas; others begin as epiphytes, and after strangling the host become self-supporting and make independent trees. Many of the kinds emit aerial roots. In the following entries the lvs. are persistent (evergreen) unless otherwise noted. Other species than those listed here are to be expected within the limits of the U. S.; frs. as well as lvs. are necessary for identification.

Several kinds of ficus trees are planted for shade and ornament in the southermost parts of the United States, and they are frequent in the tropics. The creeping fig, commonly but erroneously known as *F. repens*, is used for covering walls far south, and often also in conservatories. The rubber plant, *F. elastica*, is one of the most popular and indestructible house plants and is grown in great quantities by florists; it is propagated by air-layering, which consists in tying a ball of moss about a young shoot that has been notched or cut for the formation of roots, the shoot being severed from the parent branch when the part is well rooted. Tall and ungainly pot specimens may be shortened in this way, by layering them under the leaves; but it is usually better to discard the old plant and to purchase a new one.

The arboreous species of Ficus also may be grown in the South from air-layers; a small notch is cut in a shoot, moss is placed in the notch and also made into a ball around the place, the work is kept wet for two weeks or so, and then the shoot may be severed and established in a pot. The trailing kinds grow from division of the rooting stems.

Afzelii: *F. eriobotryoides.*

altissima. Large spreading tree with few aerial roots: lvs. thick, oval or elliptic, blade 4–6 in. long: fr. about ¾ in. diam. India.

aurea. Epiphytal at first, making a tree to 60 ft.: lvs. oblong and narrowed at both ends: fr. sessile or nearly so, ⅓ in. diam., yellow. S. Fla.

australis: *F. rubiginosa.*

benghalensis. Banyan. Very large tree, top spreading by secondary trunks: lvs. broad-ovate to elliptic, 4–8 in. long: fr. in pairs, globose, red, about ½ in. diam. India.

benjamina. Large broad shining tree with graceful drooping branches, poplar-like: lvs. oval to elliptic, 2–5 in. long, narrowed to short but not sharp point: fr. becoming red, in var. **comosa** ¾ in. diam., yellow. India.

brevifolia (*F. populnea*). Epiphytal, making tree to 50 ft.: lvs. broadly ovate, cordate at base: fr. on drooping stalks, to ½ in. long, red. S. Fla.

Cannoni. Perhaps *Artocarpus Cannoni*, although greenhouse material under this name seems not to be the same.

carica. FIG (common or pomological F.). Broad irregular deciduous tree to 25 or 30 ft.: lvs. thick, rough above and pubescent underneath, deeply 3–5-lobed: fr. large, variable, edible. Medit. region. See *Fig*.

Chauvierii. Hort. name for a plant something like *F. elastica* with broader oval lvs. with lighter veins: fr. large, red. Perhaps New Caledonia.

clavata. Erect shrub: lvs. oblong-lanceolate or oblanceolate, 4–5 in. long, cuspidate or caudate: fr. about ½ in. diam., yellow. India.

Cunninghamii. Glabrous tree to 80 ft.: lvs. ovate to oblong-elliptic, abruptly acuminate, to 5 in. long and about 2 in. broad, thick, shining above: fr. 1 or 2 in axils, sessile, globular, white becoming purplish, nearly ½ in. diam. Queensland.

diversifolia (*F. lutescens*). MISTLETOE F. Shrub or small tree: lvs. variable, mostly broadly obovate and broad on top, to 2 in. long: fr. ⅓ in. or less diam., yellow. Malaya.—Sometimes grown as pot plant.

elastica. RUBBER-PLANT. Large glabrous tree but grown in its juvenile state as a pot and tub plant: lvs. thick and glossy, oblong or elliptic, 5–12 in. long: fr. about ½ in. long, yellowish. India, Malaya. There is a form with variegated lvs.

eriobotryoides (*F. Afzelii*). Large tree, with lvs. at ends of branches: lvs. stiff, long-oblanceolate, to 1 ft. long and 4 in. broad, lighter colored underneath: fr. to 1½ in. diam., yellow-hairy. Trop. Afr.

falcata. Creeping and rooting, with slender hairy sts.: lvs. thick, oblong and usually angled, unequal-sided, obtuse, 1 in. or less long: fr. ½ in. long, brown or orange. Malaya.—Grown sometimes under glass.

glomerata. CLUSTER F. Thick-topped tree: lvs. ovate to oblong, to 6 or 7 in. long, with strong lateral nerves: fr. about 1 in. diam., reddish, in clusters. India.

Hookeri. Glabrous tree: lvs. broadly elliptic, 5–11 in. long, pale underneath, with short broad apex: fr. to 1 in. diam., in a cup formed of the bracts. India.

indica. Large spreading glabrous tree: lvs. oblong, 4–7 in. long, acuminate, reddish when young: fr. ⅓ in. diam., yellowish-red, with rather large ovate acute bracts at base. Burma, Malaya.—Some of the trees known under this name may be *F. retusa*.

infectoria (*F. lucescens*). Deciduous tree: lvs. thin, ovate or somewhat oblong, 3–5 in. long, base broad: fr. ¼ in. diam., whitish tinged and dotted red. India.

lucescens: *F. infectoria*.

lutescens: *F. diversifolia*.

lyrata (*F. pandurata*). Close-headed tree to 40 ft.: lvs. large, 10–15 in. long, fiddle-shaped, apex large and rounded: fr. nearly 2 in. diam., with white dots. Trop. Afr.—Popular in juvenile state under glass, and grown in open in S. Fla.

macrophylla. MORETON BAY F. Large tree: lvs. oval to broad-oblong, blunt or nearly so or apex very short, to 10 in. long and 4 in. broad, brownish underneath: fr. to 1 in. diam., purple spotted white, peduncled. Queensland.

minima: *F. pumila* var.

Nekbudu (*F. utilis*). Large forest tree with pubescent young parts: lvs. thick, elliptic or nearly obovate, 6–15 in. long, rounded or broad at both ends: fr. about ½ in. diam., pubescent or woolly. Trop. Afr.—Sometimes grown under glass in juvenile state and planted in open far S.

nitida: *F. retusa*.

pandurata: *F. lyrata*.

Parcelli. Shrub, probably deciduous in the open: lvs. thin, ovate or oblong, acuminate, hairy at least underneath, oblique at base, 4–8 in. long, marbled creamy-white: fr. about ½ in. diam., peduncled, in different colors. Pacific Isls.

populnea: *F. brevifolia*.

princeps. Tree or shrub, listed in Calif.: lvs. long-ovate to oblanceolate, to 15 in. or more long, obscurely 5–7-nerved, short-acuminate, cuneate at base, entire; petiole 5–6 in. long; stipules lanceolate, glabrous, or hairy inside. Brazil.

pseudopalma. Shrub or small tree, mostly unbranched with stiffish long lvs. clustered at top and solitary or twin frs. in the axils: lvs. to 2 ft. or more long and 4 in. broad, acuminate, long-tapering to base, coarsely notched, the young ones very slender. Philippines.

pumila (*F. repens*). Creeping, and clinging to walls by means of roots, the fruiting branches erect: lvs. on creeping sts. 1 in. or less long and cordate-ovate, those on fruiting sts. 2–4 in. long and elliptic or oblong and not cordate: fr. to 2 in. long, yellowish, pyriform. China, Japan, Australia. Common in greenhouses and in the open far S. Var. **minima** is a slender small-lvd. form of the creeping stage.

quercifolia. Shrub, more or less prostrate: lvs. elliptic or ovate, lobed and notched on sides, 2–6 in. long: fr. to ½ in. diam., peduncled. Burma.—Grown under glass.

radicans. Trailing: lvs. oblong-lanceolate, about 2 in. long, base rounded or notched. Origin unrecorded.—Useful in vases; a form with variegated foliage.

religiosa. PEEPUL. BO-TREE. Large glabrous tree: lvs. round-ovate with a projection or tail half as long as body of blade: fr. ½ in. diam., purple. Sacred tree of India.

repens: *F. pumila*.

retusa (*F. nitida*). Attractive glabrous thick-topped evergreen tree much planted for shade and avenues in American tropics and also in S. Fla.: lvs. small, broadly ovate or somewhat rhomboid, 2–4 in. long: fr. ⅓ in. long, yellow or reddish, with obtuse bracts at base. India, Malaya.

Roxburghii. Low spreading tree or great bush: lvs. broad-ovate to nearly orbicular, to 15 in. long and 12 in. broad, pubescent underneath: fr. 2 in. diam., depressed-globose, brown or purplish, borne in clusters on trunk and branches. India.

rubiginosa (*F. australis*). Broad tree, top spreading by means of aerial roots, but often remaining bushy: lvs. oval or elliptic, 3–4 in. long, rusty-pubescent underneath: fr. ⅓ in. diam., warty. Australia.

sapida. Glabrous tree: lvs. oblong-lanceolate, 2–3 in. long and to 1 in. broad, acuminate: fr. globular, to nearly ½ in. diam., peduncled. Costa Rica.

Sycamorus. SYCAMORE. Round-headed large tree: lvs. ovate and subcordate, 3-ribbed, 4–10 in. long: fr. in leafless clusters, about ¾ in. long, edible. Egypt, Syria.—In S. Fla. usually deciduous in early spring and late summer, the new lvs. coming at same time.

textilis: listed name.

ulmifolia. Tall rough-twigged shrub or somewhat tree-like: lvs. various, mostly oblong or elliptic, 5–7 in. long, very rough on both surfaces, dentate or sometimes lobed: fr. about ½ in. long, orange-red or purplish. Philippines.

utilis: *F. Nekbudu*.

velutina. Tree: lvs. oblong, short-acute or obtuse, 4–5 in. or more long, obtuse or subcordate at base, glabrous above and rusty soft-pubescent underneath, petiole pubescent and 1 in. long. Colombia.

villosa. Scandent or creeping shrub: lvs. ovate-oblong or longer, 5–7 in. long, rounded at base, acuminate, brownish-velvety underneath as are also the shoots: fr. ½ in. diam., yellow, in clusters. Malaya.

Wendlandi: a hort. name.

FIDDLE-WOOD: *Citharexylum spinosum*.

FIESTA-FLOWER: *Nemophila aurita*.

FIG. The pomological or commercial fig is not a fruit in the strict botanical sense but a hollow fleshy receptacle with the many true fruits or "seeds" on the inside of it, and an opening at the top through which passes the insect that pollinates the minute flowers. The fig fruit grows on the young shoots as if it were a branch. The cultivated fig is one of the great genus Ficus (*F. carica*), which see.

It is a small very broad tree or large bush with soft wood.

Propagation is by means of hardwood cuttings taken in autumn, much after the way of grapes. In two to four years, bearing plants may be expected. The trees are usually planted about 18 to 25 feet apart. Figs stand considerable frost, and seedling or inferior varieties grow out-of-doors without protection as far north as Virginia and Maryland. Many of the varieties fruit on young sprouts, and, inasmuch as the roots endure cold, these varieties may give a few figs in the northern states. Figs have been fruited in the open ground in Michigan with good winter protection. In cold countries the figs should be laid down in winter, particularly if the temperature is likely to go ten degrees below frost. For such treatment the trees are made to branch close to the ground, and the branches are then bent down and covered with earth and a mound is made over the central or trunk part. In Louisiana, Texas, California the fig is grown in regular orchard plantations for commercial purposes.

FIG, HOTTENTOT-: *Carpobrotus edulis.* **Indian-**: *Opuntia Ficus-indica.* **-Marigold**: *Mesembryanthemum.*

FIGWORT: *Scrophularia.*

FILAMENT: thread, particularly the stalk supporting the anther.

FILAREE: *Erodium cicutarium* and *moschatum.*

FILBERTS are fruits of species of Corylus (which see), particularly of *C. maxima* in which the husk is much longer than the nut itself; the nuts of other species are cobs (a form of *C. Avellana*) and hazelnuts. Some of the hazelnuts are native in America; but the usual filberts and cobs are European and western Asian. Filberts can be grown in this country, but in the East the yield has not been satisfactory as a rule, because of disease, lack of adaptable varieties, tenderness to northern climates, and perhaps other causes; it is probable, however, that many of the disabilities will be overcome with the breeding of adaptable varieties and further study of the subject. In parts of Oregon filbert growing on a considerable basis is now fairly well established. Filberts and cobnuts are not ordinarily distinguished in this country, but the true filbert is an oblong nut, whereas the cob is roundish and usually angular and contained in a shorter husk.

FILIFORM: thread-like, long and very slender.

FILIPENDULA. Meadowsweet. *Rosaceæ.* Per. herbs native in the north temp. zone, having alternate pinnate lvs., small fls. in large terminal panicles in late spring and summer, and 1-seeded achenes; grown in the hardy border. Propagated by seeds and by division of old plants.

camtschatica (*Spiræa camtschatica. S. gigantea*). To 10 ft.: lvs. with ovate-cordate 3–5-lobed terminal lft. and lateral lfts. usually wanting: fls. white. Manchuria, Kamtchatka.

hexapetala (*Spiræa* and *Ulmaria Filipendula*). Dropwort. To 3 ft., rootstock tuberous: lvs. fern-like, of numerous small pinnatifid lfts.: fls. white. Eu., Asia. Var. **flore-pleno** has double fls.

purpurea (*Spiræa palmata*). To 4 ft.: lvs. with large 5–7-lobed terminal lft. and few unlobed or no lateral lfts.: fls. pink or purplish. Japan. Var. **alba** has white fls. Var. **elegans** has white fls. with red stamens.

rubra (*Spiræa lobata*). Queen-of-the-Prairie. To 8 ft.: lvs. with large 7–9-parted terminal lft. and lobed lateral lfts.: fls. peach-blossom pink, with conspicuous stamens, very attractive. Pa. to Ga. and Ky. Var. **venusta** (*Spiræa venusta*) has deep pink fls.

Ulmaria (*Spiræa Ulmaria*). Queen-of-the-Meadow. To 6 ft.: lvs. with large 3–5-lobed terminal lft. and toothed lateral lfts., white-tomentose beneath: fls. white. Eu., Asia; nat. in E. N. Amer. Var. **aureo-variegata** has lvs. variegated with yellow. Var. **plena** has double fls.

FILIX: *Cystopteris.*

FIMBRIATE: fringed.

FINOCCHIO: *Fœniculum vulgare* var. *dulce.*

FIORIN: *Agrostis palustris.*

FIR: *Abies.* **China-**: *Cunninghamia.* **Douglas-**: *Pseudotsuga taxifolia.* **Joint-**: *Ephedra.* **Summer-**: *Artemisia sacrorum* var. *viride.*

FIRE-CRACKER, FLORAL: *Brevoortia Ida-Maia.*

FIRE-PLANT, MEXICAN: *Euphorbia heterophylla.*

FIRETHORN: *Pyracantha.*

FIREWEED: *Epilobium angustifolium.*

FIRMIANA. *Sterculiaceæ.* Trees with alternate lvs., unisexual or polygamous small fls. without petals in axillary panicles, and membranaceous fr. which opens into leaf-like carpels; grown in the S. as a shade or lawn tree. Propagated by seeds.

platanifolia: *F. simplex.*

simplex (*F. platanifolia. Sterculia platanifolia*). Chinese Parasol-Tree. Phoenix-Tree. To 50 ft., deciduous: lvs. platanus-like, palmately 3–5-lobed, to 1 ft. across: fls. small, greenish: fr. to 5 in. long, separating into 4 leaf-like bodies that bear the round wrinkled seeds along the margins. China, Japan. In var. **variegata** the lvs. are variegated with white.

FISSIPES: *Cypripedium acaule.*

FITTONIA. *Acanthaceæ.* Hairy low or creeping herbs with opposite entire lvs. having white or colored veins and small tubular 2-lipped fls. borne beneath bracts in slender spikes; native of S. Amer.

Fittonias are grown as choice foliage plants in the greenhouse, often under benches, and should be kept shaded and the temperature never allowed to drop below 55°. Propagated easily by stem-cuttings which should contain one joint.

argyroneura: *F. Verschaffeltii* var.

gigantea. To 1½ ft., erect: lvs. oval, dark green veined with carmine, short-pointed.

Verschaffeltii. Creeping and rooting: lvs. ovate or oval, to 4 in. long, dark green veined with deep red, obtuse. Var. **argyroneura** is veined with white and var. **Pearcei** is glaucous beneath with carmine veins.

FITZROYA. *Pinaceæ.* One evergreen tree or sometimes shrubby in cult. **F. cupressoides** (*F. patagonica*). Lvs. spreading or overlapping, ⅛ in. long, dark green above and with 2 white bands beneath: cones globose, ⅓ in. across. S. Chile. For cult. see *Conifers.* Adaptable only to the lower S. and Calif. It belongs to the Cupressus tribe, with Thuja and Chamæcyparis.

FIVE-SPOT: *Nemophila maculata.*

FLACOURTIA. *Flacourtiaceæ.* Shrubs or trees with alternate simple lvs., small bisexual or polygamous fls. in racemes or clusters, and fr. a berry-like drupe, the pulp of which is made into jams and preserves. It is not particular as to soil but will not withstand frost. Propagated by seeds and budding.

indica (*F. Ramontchi*). RAMONTCHI. GOVERNORS-PLUM. BATOKO-PLUM. To 25 ft., often with long slender spines: lvs. ovate, to 3 in. long: fls. yellowish: fr. deep maroon colored, to 1 in. across. S. Asia, Madagascar.

Ramontchi: *F. indica*.

sepiaria. Shrub, usually spiny: lvs. obovate, 1½ in. long: fr. ½ in. across. India.

FLACOURTIACEÆ. FLACOURTIA FAMILY. Trop. trees and shrubs of both hemispheres, of about 70 genera, characterized by alternate simple lvs., regular bisexual or unisexual fls. having 4 or more sepals and petals or without petals, numerous stamens, superior 1-celled ovary and fr. mostly a berry or drupe; placed near Cistaceæ in the series. Azara, Berberidopsis, Carrierea, Idesia, Oncoba and Poliothyrsis are cult. for ornament, Dovyalis (Aberia) and Flacourtia for the edible fr.; and Taraktogenos for the curative oil.

FLAG, BLUE: *Iris*. **Crimson**: *Schizostylis*. **Spiral**: *Costus*. **Sweet**: *Acorus Calamus*. **Yellow**: *Iris Pseudacorus*.

FLAMBOYANT: *Delonix regia*.

FLAME-TREE: *Brachychiton acerifolium*.

FLANNEL-BUSH: *Fremontia californica*.

FLAX. To gardeners the flaxes are annual and perennial plants grown for the bright showy bloom. They are species of Linum. The flax of commerce is *Linum usitatissimum*, an annual grown for two classes of products,—the fiber of the bast in the stem from which flax-fiber and fine linen are derived, and the seeds from which linseed oil and linseed cake and meal are manufactured. These are not horticultural products. In North America flax is raised mostly in Minnesota, the Dakotas and Canada. Seed is sown directly in the field when the weather is warm, as in May and June, and the crop should be ready in one hundred days or less.

FLAX, NEW ZEALAND: *Phormium tenax*. **Yellow**: *Reinwardtia indica*.

FLEABANE: *Erigeron*.

FLEECE-FLOWER: *Polygonum*.

FLEECE, MOUNTAIN: *Polygonum amplexicaule*.

FLEECE-VINE, CHINA: *Polygonum Auberti*.

FLEMINGIA. *Leguminosæ*. Herbs or shrubs, often twining, with lvs. commonly of 3 digitate lfts. but sometimes simple, red or purple papilionaceous fls. and short swollen pods; native in tropics of Old World and intro. in S. U. S.

strobilifera. Shrub to 10 ft.: lvs. simple, ovate, to 3½ in. long, silky beneath: fls. purple, hidden by large bracts, in racemes to 6 in. long: pods to ½ in. long. India, Malaya.

FLEXUOUS, FLEXUOSE: having a more or less zigzag or wavy form; said of stems of various kinds.

FLOATING HEART: *Nymphoides*.

FLOERKEA: *Limnanthes Douglasii*.

FLOPPERS: *Bryophyllum pinnatum*.

FLORAS-PAINTBRUSH: *Emilia sagittata*.

FLORETS: individual flowers of composites and grasses; also other very small flowers that make up a very dense form of inflorescence.

FLORIFEROUS: flower-bearing.

FLOSS-SILK TREE: *Chorisia speciosa*.

FLOWER-OF-AN-HOUR: *Hibiscus Trionum*.

FLOWER-OF-JOVE: *Lychnis Flos-Jovis*.

FLY-POISON: *Amianthium muscœtoxicum*.

FOAM-FLOWER: *Tiarella cordifolia*.

FŒNICULUM. *Umbelliferæ*. Herbs native in the Old World, having pinnately decompound lvs., small yellow fls. in compound umbels, and narrow prominently ribbed frs.; one species is grown for the lvs. and aromatic seeds which are used in flavoring; lvs. and lf.-bases sometimes eaten. Propagated by seeds in spring.

officinale: *F. vulgare*.

vulgare (*F. officinale*). FENNEL. Per. but grown as an ann., to 5 ft.: lvs. 3–4-pinnate into linear thread-like segms. S. Eu. Var. **dulce**, FLORENCE F. or FINOCCHIO, has the base of the lvs. much enlarged and thickened and, when blanched, serves as article of food. Var. **piperitum**, CAROSELLA, is grown for the young sts. which are eaten.

FOLIACEOUS: leaf-like; said particularly of sepals and calyx-lobes and of bracts that in texture, size or color look like small or large leaves.

FOLLICLE: dry dehiscent pericarp opening only on the front suture.

FONTANESIA. *Oleaceæ*. Two Asian deciduous somewhat Ligustrum-like shrubs with opposite entire lvs., small white fls. in narrow leafy panicles in May-June, and fr. a flat winged nutlet.

Fontanesias thrive in any good garden soil. Propagated by seeds, layers, and cuttings of green wood under glass.

californica: *F. Fortunei*.

Fortunei (*F. californica*). To 15 ft.: lvs. lanceolate or ovate-lanceolate, to 4 in. long, shining. China; hardy N.

phillyreoides. To 10 ft.: lvs. ovate-lanceolate to oblong, to 3 in. long, grayish-green. Asia Minor; less hardy.

FORCING. Plants are forced when made to grow or bloom outside their normal season, particularly in advance of the season, by some artificial means. The mere imitation of the natural conditions under which any plant grows may not constitute forcing. Growing in greenhouses is not necessarily forcing; it may be only protection. The word forcing has come to be associated with particular crops and sometimes quite independently of its proper restricted meaning; thus we speak of the forcing of tomatoes, cucumbers, melons, bulbs. A forcing-house is only a glass-house: its use determines its title or designation.

FORESTIERA (*Adelia*). *Oleaceæ*. American deciduous (seldom evergreen) trees or shrubs with opposite lvs., small yellowish diœcious or imperfect fls. without petals in clusters or racemes before the lvs., and fr. a small black or dark purple drupe with scant flesh. Only *F. acuminata* is hardy North without protection. They thrive best in moist locations. Propagated by seeds and layers.

acuminata. To 30 ft.: lvs. to 4 in. long, acuminate: fr. ½ in. long. Ill. to Ga. and Tex.

ligustrina. To 10 ft.: lvs. to 1½ in. long, obtuse: fr. ⅓ in. long. Tenn. to Fla.

neo-mexicana. To 10 ft.: lvs. to 1½ in. long, acute or obtuse: fr. ⅙ in. long. Tex. to New Mex. and Colo.

FORESTRY. The growing and utilizing of forests, with all the science, craft and commerce consequent thereto. The forest is a crop, making use of land, and is therefore agriculture in its broad sense. In its general relations it is also within the realm of political economy inasmuch as great permanent forests are almost necessarily public domains, and it is directly concerned in the conservation and utilization of natural resources as well as with governmental problems. These domains are to be kept and utilized in the interest of all the people, in consideration with all related questions. Silviculture is the science and practice of raising forests, one of the main departments or components of forestry. Arboriculture (which see) is properly not within the realm of forestry, although popularly confused with it, but rather a department of horticulture. Farm forestry is that smaller application having to do with the raising and using of wood-lots.

FORGET-ME-NOT: *Myosotis.* **Creeping:** *Omphalodes verna.*

FORSYTHIA. GOLDEN-BELLS. *Oleaceæ.* Deciduous shrubs of the Old World with opposite, simple or 3-parted lvs., showy yellow fls. deeply 4-parted into oblong corolla-lobes, appearing before the lvs., and fr. a woody caps. with winged seeds.

Forsythias are amongst the showiest spring-blooming shrubs and are hardy North. They are not particular as to soil. Propagated by cuttings of young wood in summer, of ripe wood in fall and winter, by seeds, and the drooping sorts by rooting at the tips.

europæa. To 6 ft., with erect branches having lamellate pith: lvs. to 3 in. long, entire or with few shallow teeth. Albania.

decipiens: *F. suspensa* var.

Fortunei: *F. suspensa* var.

intermedia. Hybrid between *F. suspensa* and *F viridissima:* to 10 ft., with arching or spreading branches having lamellate pith: lvs. to 5 in. long, sometimes 3-parted. Var. **primulina** has pale yellow fls. crowded at base of branches. Var. **spectabilis** has bright yellow fls. more than 1 in. long.

ovata. Very early: lvs. ovate to broad-ovate, to 2½ in. long, serrate, not lobed: fls. solitary, amber-yellow. Korea.

Sieboldii: *F. suspensa* var.

suspensa. To 10 ft., with hollow drooping branches: lvs. to 4 in. long, toothed, often 3-parted: fls. golden-yellow. China. Commonly planted. Var. **atrocaulis** has dark purple branchlets. Var. **decipiens** (*F. decipiens*) has solitary deep yellow fls. Var. **Fortunei** (*F. Fortunei*), is of more erect habit, often with 3-parted lvs. Var. **Sieboldii** (*F. Sieboldii*) has more slender drooping or trailing branches.

viridissima. To 10 ft., with erect branches having lamellate pith: lvs. to 6 in. long, toothed above middle: fls. greenish-yellow. China. In var. **variegata** the lvs. are variegated with white.

FORTUNELLA. KUMQUAT. *Rutaceæ.* Four known or recognized small evergreen fruit-trees or shrubs native probably in S. E. China, differing from Citrus in few-celled ovary with but 2 ovules in each cell, characteristic hollowed stigma and smaller frs. Grown in the orange belt, but somewhat hardier than the sweet orange particularly when grown on trifoliata (Poncirus) stock: lvs. lanceolate or somewhat broader. The attractive aromatic frs. are used for preserves and may be eaten raw. Kumquats make ornamental tub plants. Full grown plants reach a height of 10 or 12 ft. They hybridize with other citrus fruits; see *Citrangequat* and *Limequat.* For general culture, consult *Citrus fruits,* page 155.

crassifolia. MEIWA K. Shrub, with or without spines: lvs. thick and trough-like, petioles narrowly winged: frs. slightly ovoid, to 1½ in. diam., cells 6 or 7; pulp-vescicles oval or ovate.

Hindsii. Spiny small tree, wild on Hongkong and adjacent mainland, grown somewhat for curiosity: lvs. oval-elliptic, petiole winged: fr. less than 1 in. diam., subglobose, orange-red, with 3 or 4 cells, with few nearly juiceless small pulp-vescicles.

japonica (*Citrus japonica*). ROUND and MARUMI K. Much branched shrub with or without spines: lvs. to 3 in. long, blunt-pointed and relatively broad: fr. round, to about 1¼ in. diam., without rudiments of style, and 5–6 cells.

margarita. OVAL and NAGAMI K. Shrub or small tree, nearly or quite thornless: lvs. longer than in *F. japonica* and relatively narrower and more pointed: fr. oval or oblong, to 1 in. cross diam., with persistent rudiment of style, cells 4 or 5.

FOTHERGILLA. *Hamamelidaceæ.* N. American deciduous shrubs with alternate simple coarsely toothed witch-hazel-like lvs., white fls. without petals borne in dense terminal heads or spikes in which the stamens are the conspicuous part, and fr. a beaked caps.

Fothergillas are hardy and thrive in moist soils. Propagated by seeds, by layers which will not root for two years, and *F. Gardeni* by suckers and root-cuttings.

alnifolia: *F. Gardeni.*

carolina: *F. Gardeni.*

Gardeni (*F. alnifolia. F. carolina*). To 3 ft.: lvs. to 2 in. long, pale beneath: fls. before lvs. Va. to Ga.

major. To 10 ft.: lvs. to 4 in. long, glaucous beneath: fls. with lvs. Ga.

monticola. To 6 ft.: lvs. to 4 in. long, light green beneath: fls. with lvs. N. C. to Ala.

parvifolia. To 2 ft.: lvs. to 2¼ in. long, gray-pubescent beneath: fls. before lvs. N. C. to Fla.

FOUNTAIN-PLANT: *Russelia equisetiformis.*

FOUQUIERIA. *Fouquieriaceæ.* A few spiny shrubs or trees in Mex., one extending into the desert regions of S. W. U. S. and there planted for hedges. **F. splendens.** OCOTILLO. COACH-WHIP. VINE-CACTUS. JACOBS-STAFF. Shrub of many sts. to 20 ft. with slender rigid spines bearing clusters of small lvs. in their axils which soon fall: fls. scarlet, to 1 in. long, the stamens exserted, in terminal racemes or panicles to 10 in. long: fr. ¾ in. long. For *F. columnaris,* see *Idria.*

FOUQUIERIACEÆ. FOUQUIERIA FAMILY. Two genera of spiny trees and shrubs, often leafless, with bisexual fls. having 5 sepals, 5-lobed corolla, 10–17 stamens, superior 3-celled ovary and capsular fr. It has mostly been associated with Tamaricaceæ, but has lately been placed in the sequence near Polemoniaceæ. Fouquieria and Idria are sometimes planted.

FOUR-O'CLOCK: *Mirabilis Jalapa.*

FOXGLOVE: *Digitalis.*

FOXTAIL, MEADOW: *Alopecurus pratensis.*

FRAGARIA. Strawberry. *Rosaceæ.* Low per. herbs with rooting runners, lvs. of 3 lfts., white or reddish sometimes more or less imperfect fls. in small clusters on radical peduncles, and fr. a berry formed of the fleshy receptacle bearing the seed-like frs. on the surface; a few grown for ornament and the edible fr. For cult. see *Strawberry.*

californica. To 5 in.: lfts. silky-pubescent beneath: fls. ½ in. across: fr. ½ in. across, the achenes in shallow pits. Calif.

chiloensis. To 8 in.: lfts. thick and glossy, silky beneath: fls. to 1 in. across: fr. ¾ in. across, the achenes in shallow pits. Alaska to Patagonia. Var. **ananassa** comprises most of the common garden strawberries, with larger frs.; hybridization may have modified them.

elatior: *F. moschata.*

Grayana: *F. virginiana* var. *illinoensis.*

illinoensis: *F. virginiana* var.

indica: *Duchesnea indica.*

mexicana. To 4 in.: lfts. silky beneath: fls. about ⅓ in. across: fr. ⅓ in. across, the achenes superficial. Mex.

moschata (*F. elatior*). Hautbois S. To 1 ft.: lfts. silky beneath: fls. usually diœcious, standing above foliage: fr. musky, the achenes superficial, hull strongly reflexed. Eu.

vesca. To 1 ft.: lfts. slightly silky beneath: fls. ½ in. across: fr. sometimes white, ½ in. across, the achenes superficial. Eu.; nat. in E. N. Amer.—Here belong the races of strawberries known as Alpine, Everbearing and Perpetual.

virginiana. To 8 in.: lfts. becoming glabrous: fls. to ¾ in. across: pedicels bearing appressed hairs: fr. ½ in. across, the achenes in deep pits. Stout forms with spreading hairs on the pedicels are known as var. **illinoensis** (*F. illinoensis, F. Grayana*). E. N. Amer.—Supposed to have entered into some of the garden strawberries.

FRANCISCEA: *Brunfelsia.*

FRANCOA. *Saxifragaceæ.* Herbaceous perennials from Chile with lyrate lvs. and terminal dense racemes of white or pink fls.; suitable for outdoor planting in mild climates. Propagated by seeds sown in spring in a cool house or frame; also by division.

appendiculata. To 2½ ft.: fls. pale rose, usually not spotted.

glabrata: *F. ramosa.*

ramosa (*F. glabrata*). To 3 ft.: infl. pubescent; fls. white, in spikes 2 ft. long and 1 in. thick.—The sprays of fls. are much used for table decoration; incorrectly called Bridal Wreath. Var. **hybrida** has larger pure white fls.

sonchifolia. To 2 ft.: lf.-stalks with broad wings at base: fls. pink marked with darker color.

FRANGIPANI: *Plumeria.*

FRANKENIA. *Frankeniaceæ.* Evergreen more or less heath-like per. herbs or subshrubs with small entire lvs. opposite or in 4's, small inconspicuous fls., and capsular frs.; seldom grown under glass and perhaps in the open in mild regions.

pulverulenta. Sts. straggling, to 1½ ft. long: lvs. many, to ¼ in. long, close together: fls. pink, less than ¼ in. long. S. Eu. to India, S. Afr.

FRANKENIACEÆ. Frankenia Family. Herbs or subshrubs of 4 genera in warm countries, with often heath-like lvs., small bisexual fls. having 4–7 sepals and petals, mainly 6 stamens, superior 1-celled ovary, and fr. a caps. inclosed in the calyx. In natural sequence it is placed near Hypericaceæ and Tamaricaceæ. Frankenia may be cult.

FRANKLINIA: *Gordonia alatamaha.*

FRASERA. Columbo. *Gentianceæ.* N. American large stout herbs with opposite or whorled simple and entire lvs. that are mostly basal, and white, yellowish or bluish fls. in panicled clusters on tall single sts.; corolla rotate and 4-parted; sometimes transplanted from the wild and usually of simple handling.

Parryi (*Swertia Parryi*). To 3 ft.: lvs. to 8 in. long, white-margined: fls. greenish-white, the lobes spotted with black around the yoke-shaped fringed gland, in broad panicles to 1 ft. long. S. Calif.

speciosa (*Tessaranthium speciosum. Swertia radiata*). To 5 ft.: lvs. to 1 ft. long: fls. greenish-white spotted with purple, with fringed glands, in narrow panicles to 2 ft. long. Ore. to Mont. and Calif.

FRAXINELLA: *Dictamnus albus.*

FRAXINUS. Ash. *Oleaceæ.* Deciduous trees with opposite mostly pinnate lvs., small not showy bisexual or unisexual fls. in panicles and in some species in early spring before the lvs., and fr. a 1-seeded winged samara; mostly native in the north temp. zone but some of them extending to the tropics. Shade and timber trees are in the genus, and many interesting hort. forms. The following species are hardy N. unless otherwise stated.

Ashes are valuable as street or lawn trees and succeed in good fairly moist soil. They transplant readily. Propagated by seeds which should be stratified and sown the following year. The named sorts are grafted in spring on seedling stocks or budded in summer.

alba: *F. americana.*

americana (*F. alba. F. novæ-angliæ*). White A. To 120 ft.: lvs. of 5–9 lfts. to 6 in. long, glaucous beneath: fls. diœcious, before the lvs., without petals, the calyx persistent on fr.: fr. linear-oblong, to 2 in. long. N. S. to Fla. and Tex. Var. **ascidiata** has lfts. somewhat hollow or pitcher-shaped at base. Var. **subcoriacea** has thick lfts. silvery-white beneath.

angustifolia. To 75 ft.: lvs. of 7–13 lanceolate lfts. to 3 in. long: fls. before the lvs., without calyx or corolla: fr. oval-oblong, to 1½ in. long. S. Eu., N. Afr., W. Asia; not hardy N. Var. **lentiscifolia** (*F. lentiscifolia*) has lfts. further apart. Var. **australis** (*F. australis*) has lfts. slightly pubescent beneath.

anomala. Single-leaf A. To 20 ft., with slightly winged branchlets: lvs. usually of 1 broad-ovate lft. to 2½ in. long: fls. with the lvs., without petals, the calyx persistent on fr.: fr. oblong, ¾ in. long. Colo. to Calif.; not hardy far N.

arbutifolia: *F. pennsylvanica.*

atrovirens: *F. excelsior* var. *crispa.*

aucubæfolia: *F. pennsylvanica* var.

australis: *F. angustifolia* var.

Biltmoreana. To 50 ft.: lvs. of 7–11 lfts. to 6 in. long, pubescent beneath: fls. diœcious, before the lvs., without petals, with calyx persistent in fr.: fr. linear-oblong, to 1½ in. long. N. J. to Ga. and Ala.

Bungeana. To 15 ft.: lvs. usually of 5 broad-ovate lfts. to 1½ in. long: fls. with or after lvs., with petals: fr. oblong, 1 in. long. China.

californica: *F. oregona.*

caroliniana (*F. platycarpa*). Water A. To 50 ft.: lvs. of 5–7 lfts. to 5 in. long: fls. diœcious, before the lvs., without petals, the calyx persistent on fr.: fr. oval to oblong, to 2 in. long, winged to base. Swamps, Va. to Fla. and Tex.; not hardy in the N.

chinensis. To 50 ft.: lvs. of 5–9 lfts. to 4 in. long: fls. with or after lvs., without petals, with calyx: fr. lanceolate, to 2 in. long. China. Var. **rhynchophylla** has larger lvs.

cuspidata. To 20 ft.: lvs. of 7 lfts. to 2½ in. long: fls. fragrant, with or after lvs., with petals united into tube: fr. oblong, 1 in. long. Tex. to Mex.; to be planted only far S.

dipetala. To 15 ft., with 4-sided branchlets: lvs. usually of 5 lfts. to 1¾ in. long: fls. with the lvs., with 2 white petals: fr. oblanceolate, 1 in. long. Calif.; to be planted only in mild climates.

Elonza. Small tree, the branchlets with whitish warts: lvs. of 9–13 lfts. to 3 in. long: fr. oblong. Of uncertain origin.

excelsior. EUROPEAN A. To 140 ft., with black buds: lvs. of 7–11 lfts. to 5 in. long: fls. before lvs., without calyx or corolla: fr. oblong, 1½ in. long. Eu., Asia Minor. A few of the hort. vars. are: **asplenifolia**, lfts. linear; **aurea**, branchlets yellow; **aurea-pendula**, branchlets yellow, drooping; **aurea-variegata**, lvs. variegated or edged with yellow; **crispa** (var. *atrovirens*, var. *cucullata*), lfts. small and curled or twisted; **diversifolia** (var. *simplicifolia laciniata*, *F. monophylla*, *F. heterophylla*), lvs. of 1–3 cut-toothed lfts.; var. **erosa**, lfts. narrow, jagged or cut-toothed; **nana** (*F. polemoniifolia*), dwarf, lfts. small; **pendula** (var. *Wentworthii*), branches drooping; **spectabilis**, habit pyramidal; **verrucosa**, branches warty; **verticillata** (*F. verticillata*), lvs. clustered.

floribunda. To 120 ft.: lvs. of 7–9 lfts. to 6 in. long, the rachis slightly winged: fls. with or after lvs., in panicles to 1 ft. long, with corolla: fr. linear, about 1 in. long. Himalayas; adapted only far S.

Greggii. To 25 ft.: lvs. of 3–7 leathery lfts. to ¾ in. long: fls. before lvs., without corolla, with calyx: fr. oblong, to ⅔ in. long. Tex., N. Mex.; to be planted only far S.

heterophylla: *F. excelsior* var. *diversifolia.*

lanceolata: *F. pennsylvanica* var.

lentiscifolia: *F. angustifolia* var.

longicuspis. To 50 ft.: lvs. of 5–7 lfts. to 4 in. long, the lowest pair much smaller: fls. with or after lvs., with corolla and minute calyx: fr. linear-oblong, 1½ in. long. Japan.

mandshurica. To 100 ft.: lvs. of 9–11 lfts. to 5 in. long, rusty-tomentose at base: fls. diœcious, before the lvs., without calyx or corolla: fr. oblong-lanceolate, to 1½ in. long. N. E. Asia.

Mariesii. To 25 ft.: lvs. usually of 3–5 close lfts. to 3 in. long, pale beneath: fls. with or after the lvs., with corolla and minute calyx: fr. oblanceolate, to 1 in. long, purplish. China; not hardy N.

monophylla: *F. excelsior* var. *diversifolia.*

nigra (*F. sambucifolia*). BLACK A. To 75 ft.: lvs. of 7–11 lfts. to 5 in. long, rusty-tomentose at base: fls. diœcious, before the lvs., without calyx or corolla: fr. oblong, to 1½ in. long, winged to base. Newf. to W. Va. and Ark., in low lands.

novæ-angliæ: *F. americana.*

oregona (*F. californica*). To 75 ft.: lvs. of 5–9 sessile lfts. to 6 in. long, pubescent beneath: fls. diœcious, before the lvs., without petals, with calyx: fr. 2 in. long, winged nearly to base. Wash. to Calif.; not hardy far N.

Ornus (*Ornus europæa*). FLOWERING A. To 60 ft.: lvs. usually of 7 lfts. to 3 in. long: fls. fragrant, with the lvs., with linear white petals and with calyx: fr. linear or lanceolate, 1 in. long. S. Eu., W. Asia.

oxyacanthifolia: *F. xanthoxyloides.*

parvifolia: *F. rotundifolia.*

Paxiana. To 60 ft.: lvs. of 7–9 sessile lfts. to 7 in. long: fls. with or after lvs., with corolla and large calyx: fr. linear, 1 in. long. China, Himalayas.

pennsylvanica (*F. pubescens. F. arbutifolia. F. Richardi*). RED A. To 60 ft.: lvs. of 5–9 lfts. to 6 in. long, pubescent beneath: fls. diœcious, before the lvs., without petals, with calyx: fr. to 2½ in. long, winged nearly to base. N. S. to Ga. and Miss. Var. **aucubæfolia** has lvs. mottled with yellow. Var. **lanceolata** (*F. lanceolata. F. viridis*). GREEN A. Lfts. narrower, pubescent only on midrib beneath. Me. to Fla. and Tex.

platycarpa: *F. caroliniana.*

platypoda. To 70 ft.: lvs. of 7–11 sessile lfts. to 4 in. long, petioles enlarged at base: fls. diœcious, before the lvs., without petals, with calyx: fr. oblong, to 2 in. long, winged to base. China.

polemoniifolia: *F. excelsior* var. *nana.*

potamophila. To 30 ft.: lvs. of 9–11 lfts. to 2 in. long: fls. before the lvs., without calyx or corolla: fr. oblong, to 2 in. long. Turkestan.

pubescens: *F. pennsylvanica.*

pubinervis. Tree: lvs. of 5–11 lfts. to 4 in. long: fls. with lvs., having corolla: fr. oblanceolate, 1½ in. long. Japan.

quadrangulata. BLUE A. To 80 ft. or more, the branches 4-angled: lvs. of 7–11 lfts. to 5 in. long: fls. bisexual, before the lvs., without calyx or corolla: fr. oblong, to 2 in. long, winged to base. Mich. to Ark.

Richardi: *F. pennsylvanica.*

rotundifolia (*F. parvifolia*). To 15 ft.: lvs. of 7–13 sessile lfts. to 1¼ in. long: fls. before the lvs., without calyx or corolla: fr. oblong, 1¼ in. long. S. Eu., W. Asia; hardy in cent. region. Var. **pendula** has drooping branches.

sambucifolia: *F. nigra.*

sogdiana. Small tree: lvs. of 7–11 lfts. to 2½ in. long: fls. before the lvs., without calyx or corolla: fr. oblong, 1½ in. long. Turkestan.

syriaca. Small tree: lvs. of 3–5 lanceolate lfts. to 4 in. long: fls. before the lvs., without calyx or corolla: fr. obovate, to 1½ in. long. Asia.

texensis. To 50 ft.: lvs. of usually 5 lfts. to 3 in. long: fls. diœcious, before the lvs., without petals, with calyx: fr. oblong, to 1 in. long. Tex.

velutina. To 50 ft.: lvs. of 3–5 lfts. to 1½ in. long, pubescent beneath: fls. diœcious, before the lvs., without petals, with calyx: fr. oblong, ½ in. long. Ariz., New Mex.; not hardy N.

verticillata: *F. excelsior* var.

viridis: *F. pennsylvanica* var. *lanceolata.*

xanthoxyloides (*F. oxyacanthifolia*). Small tree: lvs. of 5–9 lfts. to 1½ in. long, the rachis winged: fls. before the lvs., without petals, with calyx: fr. linear-oblong, to 2 in. long, winged to base. W. Asia; not hardy N.

FREESIA. *Iridaceæ.* S. African tender herbs with bulb-like corms, linear basal and st.-lvs., and white or yellow, very fragrant, erect funnelform fls. in raceme-like spikes which are bent at right angles to st.

Freesias are forced under glass for the late winter and early spring bloom, but bulbs do not withstand the previous potting and cold treatment required by hyacinths and tulips. They should be kept cool and moist when growing, and the soil well drained. Bloom may be expected ten or twelve weeks after planting if bulbs are strong. Several bulbs or corms are planted together in pots, pans or boxes. Started in late winter or early spring, they are useful for porch- and window-boxes. After blooming and ripening, gradually dry off the plant, shake out the corms and keep for subsequent planting. Seeds should give blooming corms in second or third year. The offsets reproduce the stock rapidly.

Armstrongii. Differs from *F. refracta* in having fls. with white tube orange at base and segms. margined with rose-purple.

hybrida. A hort. group containing many hybrid or variant forms known as "colored freesias," the fls. variously tinted and veined with shades of rose, purple, brown, blue and orange.

refracta. To 1½ ft.: fls. greenish-yellow to bright yellow, to 2 in. long, the segms. unequal. Var. **alba** has white fls. with gradually narrowed tube while the white fls. of var. **xanthospila** have abruptly narrowed tube. The fls. of var. **Leichtlini** are pale yellow and abruptly narrowed and of var. **odorata** bright yellow.

FREMONTIA (*Fremontodendron*). *Sterculiaceæ.* Two evergreen shrubs with alternate usually palmately lobed lvs., showy yellow fls. without petals, solitary in the axils, and capsular fr. **F. californica.** FLANNEL-BUSH. To 10 ft.: lvs. to 1 in. long, densely tomentose beneath: fls. to 2 in. across. Calif. **F. mexicana** differs in the glands at the base of the calyx not being hairy. S. and Lower Calif.—Fremontias require rather dry soil. They are not hardy N. Propagated by seeds or cuttings of green wood under glass.

FREMONTODENDRON: *Fremontia.*

FREYCINETIA. *Pandanaceæ.* Diœcious shrubs climbing or scrambling, largely in Australia and New Zeal., of many species, the sts. rooting: lvs. long-linear and mostly serrate or spinescent, sheathing at base: fls. in terminal spadices: fr. an aggregate oblong mass or cone of woody or somewhat fleshy berry-like bodies. **F. Banksii** is a tall climber on trees and over rocks, the spinose-serrate lvs. towards ends of branches. New Zeal.

FRINGE-BELL: *Schizocodon soldanelloides.*

FRINGE-TREE: *Chionanthus.*

FRITILLARIA. FRITILLARY. *Liliaceæ.* Bulbous simple-stemmed herbs with alternate or whorled lvs. and nodding bell-shaped often oddly colored fls. solitary or in racemes or umbels, the perianth-segms. distinct; native in north temp. zone.

Most of the species are hardy and of easy cultivation in good garden soil; they are usually early spring-flowering. Most kinds should be lifted and divided every two or three years. Propagated by offsets, rarely by seeds.

agrestis. STINK BELLS. To 1½ ft.: lvs. oblanceolate, mostly near base of st.: fls. yellowish-green, to 1¼ in. long, in 3–5-fld. racemes, having disagreeable odor. Calif.

camschatcensis. To 1½ ft.: lvs. lanceolate: fls. livid wine-purple, 1¼ in. long, in 1–3-fld. racemes. Siberia.

coccinea: *F. recurva* var.

delphinensis: *F. tubæformis.*

glauca. To 8 in.: lvs. oblong-lanceolate, glaucous: fls. purple marked with greenish-yellow, ¾ in. long, in 1–3-fld. racemes. Ore.

imperialis. CROWN IMPERIAL. To 4 ft., having strong odor: lvs. lanceolate: fls. purplish, brick- or yellow-red, to 2 in. long, borne on curved stalks under a whorl of lvs. at top of st. Persia.—An interesting old-fashioned plant, persisting for years.

japonica. Low: lvs. lanceolate: fls. yellow spotted with brown, drooping, solitary and terminal. Japan.

lanceolata. To 2 ft.: lvs. ovate-lanceolate: fls. dark purple mottled with greenish-yellow, to 1½ in. long, in 1–4-fld. racemes. B. C. to Calif. Var. **gracilis** has smaller fls.

liliacea. WHITE F. To 1 ft.: lvs. linear to oblanceolate: fls. dull white, ¾ in. long, fragrant, in 1–5-fld. racemes. Calif.

meleagris. CHECKERED-LILY. SNAKES-HEAD. To 1½ ft.: lvs. linear to oblanceolate: fls. checkered and veined with purplish or maroon, to 3 in. across. in 1–3-fld. racemes. Eu., Asia. Var. **alba** has white fls. and **purpurea** purplish.

pallidiflora. To 15 in.: lvs. oblong, the upper lanceolate: fls. yellow, checkered inside, 1½ in. long, in 1–6-fld. racemes. Siberia.

parviflora. To 2½ ft.: lvs. linear or linear-lanceolate: fls. purplish or greenish, ½ in. long, in long racemes. Calif.

pluriflora. PINK F. ADOBE-LILY. To 1 ft.: lvs. oblong-lanceolate: fls. pink-purple, to 1¼ in. long, in 4–12-fld. racemes. Calif.

pudica (*Ochrocodon pudicus*). YELLOW F. To 9 in.: lvs. narrowly oblanceolate: fls. yellow or orange tinged with purple, ¾ in. long, in 1–3-fld. racemes. B. C. to Calif. and N. Mex.

pyrenaica. To 1½ ft.: lvs. linear, glaucous: fls. dark purple spotted with green, usually solitary. Pyrenees.

recurva. SCARLET F. To 2½ ft.: lvs. linear to linear-lanceolate: fls. scarlet checkered with yellow, to 1½ in. long, in 3–6-fld. racemes. S. Ore. to Calif. Var. **coccinea** has more brilliantly scarlet fls.

tenella. To 1 ft.: lvs. linear: fls. purple outside or yellowish-green spotted with purple, inside yellowish spotted purple, 1 in. long, solitary or in pairs. S. E. Eu.

tubæformis (*F. delphinensis*). To 1 ft.: lvs. oblanceolate to linear: fls. purple spotted and checkered with yellow, often solitary. Alps.

FRŒLICHIA. *Amaranthaceæ.* American ann. or bien. herbs, woolly or silky, with opposite lvs. and small fls. in dense spikes borne in panicles; of little ornamental value but may be listed.

floridana. Ann. to 6 ft.: lvs. few, linear, to 5 in. long: spikes to 2½ in. long. Ga., Fla.

FROGS-BIT: *Hydrocharis.*

FROND: leaf of fern, and frequently applied to palms and similar plants; sometimes used in the sense of foliage.

FRUIT: the ripened pericarp or pericarps with the adnate parts; the seed-bearing organ or body. In horticultural usage, a fruit is an edible body or product developed from a flower, independently of its morphology, sometimes with other parts associated with the seed-bearing organ.

FUCHSIA. *Onagraceæ.* Shrubs and trees native in Mex. to S. Amer. and New Zeal., but usually treated under glass essentially as herbs, with simple lvs., usually showy hanging fls. in shades of rose, red and purple, sometimes white, exserted stamens and pistil, and fr. a berry.

Fuchsias are grown in the cool greenhouse and often bedded out in summer, and in mild climates they are outdoor subjects. They are sometimes trained to large pyramids with a central stem; and when grown permanently in the open they are useful for covering walls and fences. For window-garden and conservatory use in pots new plants are commonly started each year. Propagated by cuttings of soft green wood in pots or boxes or on benches. If plants are to be kept over winter, the branches should be cut back after blooming.

arborescens (*F. syringæflora*). To 18 ft.: lvs. lanceolate-oblong, to 8 in. long: fls. pink or purplish, ½ in. long, in erect terminal panicles. Mex.

coccinea. Lvs. narrow-ovate, about 2 in. long, pointed, dentate, with very short hairy petioles, twigs also hairy: fls. 1–3 in the axils, the narrow pointed sepals scarlet, petals purplish, rolled and much shorter. Probably Brazil.—The name *coccinea* may be applied to forms of *F. magellanica.*

conica: *F. magellanica* var.

corallina: hort. form of *F. magellanica.*

corymbiflora. To 6 ft., requiring support: lvs. ovate-oblong, large: fls. deep red, to 4 in. long, in long drooping corymbs. Peru. Var. **alba** is listed.

excorticata. Tree to 40 ft.: lvs. ovate-lanceolate, to 5 in. long: fls. to 1¼ in. long, petals small. New Zeal.

fulgens. To 4 ft.: lvs. broadly ovate, to 7 in. long: fls. red, to 3 in. long, in short racemes. Mex.

globosa: *F. magellanica* var.

gracilis: *F. magellanica* var.

hybrida (*F. speciosa*). Lvs. ovate, to 4 in. long: fls. with crimson calyx and purple, rose or white petals, sometimes double, to 3 in. long, stamens long-exserted. Various cultigens; probably of hybrid derivation from forms of *F. magellanica* and *F. fulgens;* common in conservatories and windows.

lycioides: *F. rosea.*

macrostemma: *F. magellanica.*

magellanica (*F. macrostemma*). To 20 ft. when trained on walls but usually a low shrub, thinly pubescent or glabrous: lvs. ovate-lanceolate, to 2 in. long, sinuate-dentate: fls. with red calyx and blue petals, 1–2 in. long, the stamens long-exserted. Peru to Tierra del Fuego. Var. **conica** (*F. conica*) has ovate lvs., the scarlet calyx-tube widest at base, and dark purple petals. Var. **globosa** has ovate lvs. and small red-purple fls. with nearly globose buds. Var. **gracilis** is a slender graceful form with scarlet calyx and purple petals. Var. **Riccartoni** grows to 10 ft. high and is very floriferous.—This species, in various forms, is much planted in the open in Calif.

microphylla. To 6 ft.: lvs. ovate or round, less than 1 in. long: fls. deep red, ½ in. long, drooping. Mex., Cent. Amer.

minima: a listed name.

parviflora. Shrubby: lvs. small, the obtuse mostly entire blades oval and less than 1 in. long on longer petioles: fls. less than ½ in. long, pink and purple, solitary, sepals reflexed. Mex.

procumbens. TRAILING F. Sts. prostrate and trailing: lvs. round-ovate, ¾ in. long: fls. pale orange with purple calyx-lobes, petals lacking, to ¾ in. long, erect and solitary. New Zeal.

pumila: probably one of the many forms of *F. magellanica*.

recurva: listed name.

reflexa: listed name.

Riccartoni: *F. magellanica* var.

rosea (*F. lycioides*). Shrub with horizontal branches: vs. oval to lanceolate, more or less acute, entire, about 1 in. or less long: fls. small, axillary, sepals becoming reflexed, the shorter corolla purple-violet. Chile.

serratifolia. Tall shrub: lvs. oblong to lanceolate, toothed, pale beneath with reddish midvein and petioles: fls. with calyx red at base becoming pink and white at tips. Peru.

speciosa: *F. hybrida*.

splendens. Lvs. broadly ovate, to 5 in. long: fls. scarlet with small greenish petals, to 1½ in. long, the stamens long-exserted. Mex., Guatemala.

syringæflora: *F. arborescens*.

tenella: hort. form of *F. magellanica*.

Thompsonii: form of *F. magellanica* var. *gracilis*.

thymifolia. To 3 ft.: lvs. ovate-lanceolate or orbicular, to 2 in. long: fls. purplish-red, ½ in. long. Mex.

triphylla. To 1½ ft.: lvs. oblanceolate, small: fls. cinnabar-red, 1½ in. long, in terminal racemes. W. Indies. Var. **purpurascens** is listed.

FUCHSIA, CALIFORNIA: *Zauschneria californica*. Cape: *Phygelius capensis*.

FUGACIOUS: falling or withering away very early.

FUMARIA. FUMITORY. *Fumariaceæ*. Ann. and bien. herbs with soft finely dissected lvs. and small 1-spurred fls. in racemes; occasionally grown for medicinal uses. Propagated by seeds.

officinalis. To 3 ft. producing small underground tuber: fls. purplish tipped with crimson. Eu.; nat. in N. Amer.

FUMARIACEÆ. FUMITORY FAMILY. Five genera of herbs native in the north temp. zone and S. Afr., allied to the Poppy family, having dissected thin or flaccid lvs., irregular bisexual fls. with 2 scale-like sepals, 4 petals of which the 2 inner are crested and one or both of the outer spurred, 6 stamens, superior 1-celled ovary, and capsular frs. The genera Adlumia, Corydalis, Dicentra are cult. to some extent for ornament, and one Fumaria is officinal.

FUMITORY: *Fumaria*. Climbing: *Adlumia fungosa*.

FUNASTRUM: *Philibertia clausa*.

FUNGI AND FUNGICIDES. Plant life in its complexity ranges all the way from the oak tree with its millions of cells divided into specialized tissue to the single-celled bacterium that may be too small to be seen except under the very highest power of the microscope. But size may make no fundamental difference for both these types of plants live, breathe, and use food for growing and reproducing. One difference, however, between the higher and the lower types is of great importance to the gardener—the presence or absence of the green coloring matter that enables the plant to manufacture its own food. Such plant-forms as slime-molds, bacteria, and true fungi do not have this substance, and are therefore dependent on other plants or animals for their food. Certain of them live on dead organic matter and are then known as saprophytes; many of these are of great assistance to man, for they aid in such important processes as making bread, curing cheese, tanning leather, fermenting sugars and in many other ways. On the other hand, those that attack living plants or animals, and which are known as parasites or pathogenes, may cause the loss of a crop. Among such organisms are those that cause the wilt of eggplant, the black-leg of cabbage, the late blight of potato and the blight of the chestnut tree.

Slime-molds (myxomycetes) are nothing more than a naked mass of protoplasm that engulfs the small particles that it digests. When time comes to fruit, the mass is broken up into innumerable small pellets which become inclosed in a wall and serve as a resting stage until there is a favorable time for reproduction. This pellet or spore, as the fruit-body of a mold is known, then swells until it bursts, thereby liberating another minute mass of protoplasm that may gain entrance into the tissue of a living plant and cause such a disease as club-root of cabbage or the powdery scab of potatoes.

Bacteria that cause plant diseases are rod-shaped bodies with more or less rounded ends, and far too small to be seen by the unaided eye. The different species vary in size but one-ten-thousandths of an inch in length and half that in width is not unusually small. The bacteria reproduce by fission, in which each individual merely divides in the middle and each offspring repeats the operation. This multiplication proceeds so rapidly that colonies an inch in diameter may soon be formed. Among the bacterial diseases of plants are crown-gall of many crops, black-rot of cabbage, angular leaf-spot of cucumbers, Stewart's sweet corn disease, and more than two hundred other plant troubles.

True fungi usually are composed of spider-web-like threads, as those of bread mold. Each type of fungus has its characteristic way of fruiting which may differ as widely in appearance as does a bean seed and an acorn. The spores usually are extremely abundant. They germinate by sending out a tube that may enter the plant epidermis directly or pass through a breathing-pore or wound. The smuts of grain, late blight of potatoes, spotting of the bean pods, blackening of rose leaves, and the scabbing of apples are a few of the almost endless list of diseases caused by fungi.

A few diseases of plants are caused by animals. The most common example is the root nematode that causes swellings on the roots of many plants. In the North it is found only in the greenhouses where the ground does not freeze, but in the South it may attack most of the garden crops.

A very destructive group of diseases is the result of organisms or substances known as virus. The virus is carried in the sap of the diseased plant, and in most cases is disseminated by means of sucking insects, especially aphids. The virus destroys or injures the green coloring matter in small sections of the leaf, so that the foliage becomes mottled with yellow and sometimes much distorted because of uneven growth. Among such diseases are mosaic, leaf-roll, and yellows.

Diseases exhibit various types of symptoms. Some of them result in spots or blotches on the leaves, others produce cankers on the stems and roots, others spotting of the fruit or tubers, and many cause wilting and dying of branches, vines or whole plants. Complete descriptions of the symptoms even of the most common plant maladies would require a large volume. Therefore if a rot, scab, canker, blight, mildew, or wilt is present on any particular crop, and the grower is not sure of the cause, he should have his County Agricultural Agent visit him to aid in making the diagnosis and prescribing control measures, or he should send fresh material to his State Agricultural College, United States Department of Agriculture or other agency, for identification.

Growers sometimes think that weather and the soil are the cause of disease, but this is not the case; yet many parasites are very susceptible to the influence of temperature, humidity and soil reaction. Bean anthracnose, late blight of potatoes, and downy-mildew of cucurbits are a few of the many diseases that are more severe in rainy weather. Other troubles, as potato scab, are worse in dry weather. Onion smut is not present in the far South because it needs low temperature for best development. Tomato wilt, on the other hand, rarely is found in the northern tier of states and Canada. Club-root of cabbage requires an acid soil for severe infection and is controlled by a heavy application of hydrated lime, while potato scab increases rapidly as the soil becomes more alkaline. Similarly, many other disease organisms differ in their environmental requirements so that each horticulturist should become familiar with the conditions that check the growth of any given parasite.

The mode of dissemination of parasites is very important to the grower; he may be able to hinder their entrance into his soil or his vegetable seeds. Among the agents of dissemination are splashing rain, running water, wind, moving soil, cultivation, animals, tools, seeds, tubers, cuttings, manure, diseased plant refuse, weeds, and insects. A few parasites are distributed by nearly all these agencies, but it is more common for each organism to have a specific means of getting from one place to another, and here is an opportunity of checking its spread.

The wintering period is a time when many pathogenes may be attacked successfully if the grower is acquainted with the place and the stage in which the organisms live. Most of them are able to remain alive in old diseased leaves or other plant parts. Many are carried on or in the seed or tubers. Other ways of wintering are in the soil, in hibernating insects, in living roots of weed hosts, on alternate hosts, and in cankers of living plants.

To kill the pathogenes, the seeds or tubers may be treated, the soil sterilized, or the growing plants sprayed or dusted. The materials employed in these processes are known as fungicides, and are relatively few in number. The common ones are copper, sulfur, mercury, formaldehyde, and heat as hot water, steam or dry air.

Copper is employed mostly in the form of copper sulfate (blue vitriol) which, after being dissolved in water, is mixed with a lime suspension to make bordeaux mixture. When this suspension is broken up into a fine mist under high pressure and is sprayed over the leaves, it dries on so firmly that it does not wash off even during the heaviest rains. Sometimes the copper sulfate is heated to drive off most of the water that may be present, and then is ground into an extremely fine dust which is mixed with hydrated lime, or with lime and calcium arsenate, to be used as a copper-lime dust in the place of the liquid spray. Copper in the copper carbonate form occasionally is mixed with the surface soil in the greenhouse or hotbeds to hinder damping-off of young plants. The same preparation may be dusted on seeds to kill fungi or bacteria.

Sulfur is used chiefly in spraying fruit-trees rather than vegetables. Commercial firms boil it with lime and make what is known as lime-sulfur, which is diluted with water and applied as a spray. In some greenhouses electric hot plates are placed at intervals and pure sulfur is heated in dishes set on the plates. This liquid sulfur floats through the air until it covers plants growing there and which need protection. Sulfur also is applied as dust, being first ground very fine and then used alone or mixed with a filler. This fungicide is very toxic against all powdery-mildew fungi, but is almost worthless against downy-mildew.

Mercury is employed in many forms, but particularly as mercuric chloride (corrosive sublimate). One tablet is dissolved in a pint of water or 1 ounce in 7½ gallons of water to make the usual concentration of 1-1000. Seeds and tubers are dipped in this solution for disinfection. It may also be sprinkled on the surface soil of greenhouses to aid in controlling damping-off. It is very poisonous. Mercurous chloride (calomel) has been used for tuber disinfection and also as an application on lawns where the grass has been killed by a fungus. Commercial firms make many forms of organic mercury compounds for disinfecting seeds or sterilizing soil.

Formaldehyde in various dilutions is employed for treating seeds and for disinfecting soil. In seed treatment it has been replaced to a great extent by corrosive sublimate. In soil disinfection, 1 gallon of formaldehyde is mixed with 49 to 99 gallons of water depending on the severity of the disease to be combated. One-half gallon to 1 gallon of the dilute solution is poured over each square foot of the soil to be treated. The soil is then covered for twenty-four hours after which the fumes are permitted to escape before seeds are planted.

When fungi are difficult to kill with chemicals or when they grow under the seed-coat, heat is applied for tuber and seed disinfection. The cabbage black-leg organism can be destroyed only by dipping the seed in hot water (122° F.) for twenty or more minutes. Loose smuts of wheat and barley require a similar treatment, although not so long. Potatoes are treated by heating the corrosive sublimate or the formaldehyde solutions in which they are to be disinfected. Steam is forced into the soil either through pipes or under a steam pan to kill the soil pathogenes that may be present. Such soil sterilization is of particular importance in greenhouses where cropping continues throughout the year and long crop rotations cannot be practiced. See *Insects and Insecticides.*

FUNKIA: *Hosta.*

FUNNELFORM: with tube gradually widening upward and passing insensibly into the limb like a trumpet, as in many flowers of Convolvulus; infundibuliform.

FURCRÆA. *Amaryllidaceæ.* Succulent plants native in the warm parts of Amer., having lvs. in basal rosettes and whitish or greenish fls. in terminal panicles on tall scapes, the perianth-segms. slightly united at base; they usually bloom only once and then die. Bulblets are commonly borne in the fl.-clusters. Cult. as for *Agave*, from which the Furcræas differ in the rotate whitish fls. rather than funnelform and colored and in character of stamens; propagated by bulblets.

altissima: *F. inermis.*

Bedinghausii. Trunk to 3 ft.: lvs. to 2 ft. long and 3 in. wide, rough-margined: infl. to 15 ft.; fls. 1½ in. long. Mex.

gigantea. Nearly trunkless: lvs. to 8 ft. long and 8 in. wide, with few distant prickles: infl. to 25 ft.; fls. 1½ in. long. Brazil. Var. **medio-picta** (*F. Watsoniana*) is unarmed and is variegated with cream-color.

inermis (*F. altissima*). Trunk very short: lvs. to 3 ft. long and 3 in. broad, nearly entire: infl. to 10 ft. high; fls. 1 in. long. Trop. Amer.

Lindenii: *F. Selloa* var. *marginata.*

pubescens. Nearly trunkless: lvs. to 5 ft. long and 3 in. broad, toothed: infl. to 20 ft. high; fls. 2¼ in. long. Mex.

Roezlii. Trunk to 6 ft.: lvs. to 4 ft. long and 5 in. wide, rough-margined: infl. to 15 ft.; fls. 1¾ in. long. Mex.

Selloa. Trunk to 5 ft.: lvs. to 4 ft. long and 3 in. wide, with curved teeth: infl. to 20 ft. high; fls. 1½ in. long. Colombia. Var. **marginata** (*F. Lindenii*) has lvs. margined with white or yellow.

Watsoniana: *F. gigantea* var. *medio-picta.*

FURROWED: with longitudinal channels or grooves.

FURZE: *Ulex.*

FUSIFORM: spindle-shaped; narrowed both ways from a prominent or swollen middle, as dahlia roots.

FUSTIC: *Chlorophora tinctoria.*

G

GACHIPAES: *Guilielma Gasipaes.*

GAGEA. *Liliaceæ.* Small bulbous herbs of Eu., N. Afr. and Asia, with usually 1 developed lf. to a bulb, the others forming bracts under the umbel of mostly yellow fls., the perianth-segms. distinct. Cult. as for *Ornithogalum.*

lutea: *G. silvatica.*

silvatica (*G. lutea*). To 1 ft.: lf. to 1½ ft. long and ⅓ in. wide: fls. yellow, ½ in. long, in umbels of 1–7, in spring. Eu. to Himalayas.

GAILLARDIA. *Compositæ.* American herbaceous annuals, biennials and perennials with alternate and basal lvs., toothed and spotted or dotted, and large showy solitary heads, the rays yellow and red, 3-toothed, the disk purple; pappus of awned scales.

Gaillardias grow best in light open well-drained soil and full sunlight, and are favorites for cut-flowers. The annual species are propagated by seed sown in the open where the plants are to stand or started earlier under glass; the perennials by seeds, by cuttings in August or September, or by division; sometimes root-cuttings are employed in early spring.

amblyodon. Ann. to 2 ft., hairy: lvs. oblong, to 3 in. long, entire or nearly so, sessile and auriculate: heads 2 in. across, rays brown-red throughout. Tex.

aristata (*G. grandiflora. G. lutea. G. maxima. G. perennis*). Per. to 3 ft., hairy: lvs. lanceolate to spatulate, to 5 in. long, entire or pinnately cut: heads to 4 in. across, rays yellow. Minn. to B. C. and New Mex.

Drummondii: *G. pulchella.*

grandiflora: *G. aristata.*

kermesina splendens: probably a form of *G. aristata.*

Lorenziana. A form of *G. pulchella* var. *picta* with ray-fls. and sometimes disk-fls. enlarged and tubular.

lutea: *G. aristata.*

maxima: *G. aristata.*

perennis: *G. aristata.*

picta: *G. pulchella* var.

pulchella (*G. Drummondii*). Ann. to 20 in., soft-pubescent: lvs. oblong to spatulate, to 4 in. long, entire or cut: heads 2 in. across, rays yellow with rose-purple at base. Kans. and La. to Ariz. Var. **picta** (*G. picta*) has large heads in different shades.

sanguinea: a listed name.

GALACTITES. *Compositæ.* Thistle-like herbs native in the Medit. region, with purple heads in corymbs or panicles, the marginal fls. sterile and ray-like; pappus plumose. One species is sometimes grown for ornament. Propagated by seeds.

tomentosa. Ann. or bien. to 2 ft., sts. white-tomentose: lvs. pinnately lobed or parted into very spiny lobes, green and more or less white-marked above, white-tomentose underneath: heads to 1½ in. across, bracts of involucre spiny-tipped.

GALANTHUS. Snowdrop. *Amaryllidaceæ.* Spring-blooming bulbs with 2 or 3 basal lvs. and solitary white fls., the perianth-segms. distinct, the 3 inner ones overlapping and appearing tubular and thus differing from the snowflake or Leucojum. Hardy and of easy cult. in usual garden soil. Bulbs should be planted in autumn 3–4 in. deep. Other species than the following are offered abroad.

byzantinus. Lvs. broad, glaucous, with recurved margins: fls. with oblong white outer segms. ¾ in. long, inner segms. green. S. E. Eu.

Elwesii. Giant S. To 1 ft. and more: lvs. 8 in. long and ¾ in. across, very glaucous: fls. 1¼ in. long, the inner segms. green on sinuses and lower half. Asia Minor.

nivalis. Common S. To 1 ft.: lvs. to 9 in. long and ¼ in. wide: fls. 1 in. long, the inner segms. green on sinuses. Eu. to Caucasus.

GALATELLA: *Aster dracunculoides.*

GALAX. *Diapensiaceæ.* One stemless evergreen per. herb native from Va. to Ga., **G. aphylla.** Lvs. basal and tufted, heart-shaped to nearly orbicular, to 5 in. across, stiff, shining and turning a beautiful bronze color in autumn: fls. small, white, in spike-like racemes on scapes to 2½ ft. high. The lvs. are extensively collected for use in floral decorations, and the plant makes good ground-cover. Sometimes grown in rock-gardens and colonized in woods; hardy well N. Propagated by division.

GALAX, FRINGED: *Schizocodon soldanelloides.*

GALEANDRA. *Orchidaceæ.* Trop. American epiphytes with jointed leafy sts. and fls. in a loose terminal infl., the sepals and petals similar, the lip funnel-shaped; for cultural directions see *Orchids.*

lacustris. To 20 in.: lvs. about 10 in. long: fls. about 2 in. across, in pendulous racemes; sepals white- or violet-green; lip white veined with yellow and with yellow spur to 1 in. long, Apr.–June. Brazil.

GALEGA. *Leguminosæ.* Per. herbs with pinnate lvs., blue or white papilionaceous fls. in racemes, and cylindrical pods; grown for ornament. Seeds may be sown in spring where plants are to stand, or roots may be divided.

bicolor. To 3 ft.: lfts. oblong-linear: fls. with deep blue standard and bluish-white wings and keel. W. Asia.

officinalis. Goats-Rue. To 3 ft.: lfts. oblong, stipules lanceolate: fls. purplish-blue. Eu., W. Asia; hardy N. Var. **alba** or **albiflora** has white fls., **carnea** rose-colored double fls., and **Hartlandii** has variegated lvs. when young and lilac fls.

orientalis. To 4 ft.: lfts. ovate, stipules ovate: fls. purplish-blue, nodding. Caucasus.

persica: a confused name applied to a white-fld. form; possibly *G. officinalis.*

GALEORCHIS: *Orchis spectabilis.*

GALE, SWEET: *Myrica Gale.*

GALINGALE: *Cyperus.*

GALIUM. Bedstraw. *Rubiaceæ.* Slender mostly weak herbs with usually square sts., whorled sessile lvs. and very small deeply 4-parted wheel-shaped fls. in panicles; a few species sometimes grown in rock-gardens, and as cut-flowers to give a filmy effect in bouquets. Propagated by seeds and division; of ordinary cultural requirements.

boreale. NORTHERN B. Per. to 3 ft., stoloniferous: lvs. in 4's, lanceolate, to 1½ in. long: fls. white. N. N. Amer.

Mollugo. WHITE B. FALSE BABYS-BREATH. Per. to 3 ft.: lvs. in 8's or 6's, oblanceolate to linear, to 1 in. long, bristle-tipped: fls. white. Eu.; nat. in N. Amer.—Often confused with *Gypsophila paniculata*, although very different.

verum. YELLOW B. Per. to 3 ft., sts. often decumbent: lvs. in 8's or 6's, linear, to 1 in. long, bristle-tipped: fls. yellow. Eu.; nat. in N. Amer.

GALPHIMIA: *Thryallis.*

GALTONIA. *Liliaceæ.* S. African bulbous herbs with basal lvs. and white or greenish fls. in loose racemes terminating a tall scape, the perianth-segms. partially united.

Galtonias succeed in rich moist soil and in northern regions should be heavily mulched in winter. Propagated by offsets or by seeds.

candicans (*Hyacinthus candicans*). GIANT SUMMER-HYACINTH. To 4 ft.: lvs. to 3 ft. long and 2 in. across: fls. white, fragrant, to 1½ in. long, in summer or autumn.

GALVEZIA. *Scrophulariaceæ.* Shrubs with lvs. opposite or in 3's and corolla with palate more or less closing throat, saccate, gibbous or spurred at base: plants from Peru and Ecuador and from the Calif. region, allied to Antirrhinum.

speciosa (*Antirrhinum speciosum*). Evergreen shrub to 7 ft., glabrous or pubescent: lvs. in 3's, ovate, entire, to 1½ in. long: fls. scarlet, 1 in. long, saccate at base, in terminal infl. Isls. off Calif., and planted in those parts.

GAMOLEPIS. *Compositæ.* S. African small shrubs or herbs with alternate lvs., mostly pinnately cut, and yellow solitary heads of ray- and disk-fls.; pappus none. One species is grown for the fls., sometimes employed in edgings. Propagated by seeds.

Tagetes. Glabrous ann. to 1 ft., very floriferous: lvs. to 1½ in. long, pinnately parted into linear segms.: heads bright yellow or orange, ¾ in. across.

GAMOPETALOUS: corolla of one piece, as in morning-glory and snapdragon; petals united.

GARBANZO: *Cicer arietinum.*

GARBERIA. *Compositæ.* One branching shrub to 6 ft., native in Fla. and sometimes used in ornamental plantings. G. **fruticosa** (*Liatris fruticosa*). Lvs. alternate, spatulate or obovate, about 1 in. long, leathery, pale: heads pale purple or pink, about ½ in. long, in dense cymes, of disk-fls.; pappus of bristles.

GARCINIA. *Guttiferæ.* Trees of many species native in the tropics of the Old World, with opposite simple usually thick lvs., polygamous fls., and fr. a hard berry pulpy within; one species is grown for its edible fr. and the juice of others yields the gamboge of commerce; a number of the species give promise as pomological plants for occidental regions.

Mangosteens require a tropical climate and a moist but well-drained soil. Propagated by seeds which should be sown in pots and the seedlings shaded and grown to about 2 feet high before transplanting. As mangosteens root slowly, it is best to inarch on roots of related species of Garcinia. Budding may also be practiced.

Mangostana. MANGOSTEEN. To 30 ft.: lvs. leathery, glossy, with many cross veins, to 10 in. long: bisexual fls. rose-pink, 2 in. across: fr. reddish-purple, 2–3 in. across, having 5–7 white crimson-veined segms. resembling an orange. Malay region.—Highly prized where it can be grown but it is not yet much planted in American tropics; within the continental U. S., grown only under protection for its general interest. The fruit is highly desirable.

GARDEN. In its historical significance a garden is a plant-growing area of small or limited dimensions, usually inclosed, connected with a residence or having relationships with the family. Ornamental subjects, fruits and vegetables for household use, plantings constituting part of the setting for a home or building, are the essential components of it; and gardening is the rearing, establishing and maintenance of the plants and care of the area devoted to them. In modern time, however, the word garden has taken on an expanded meaning, involving much larger areas and commercial undertakings, and the older more restricted unit is often called the home garden. The kinds of plants or crops now constitute the main distinction between commercial gardening and agriculture, and there is no clear line of demarcation; yet one ordinarily and properly thinks of a home and a pleasure-ground, personal satisfactions, and a particular kind of skilled training, when employing the words garden, gardener, gardening. See *Horticulture*, *Landscape-Gardening*.

The home garden should be useful in the degree to which it expresses the sentiments of its maker or proprietor; a garden planned without regard to personality may not fulfill the requisite. To accomplish essential results the garden-maker must be well prepared to meet the requirements of the plants and to defend them against injury, insect and disease; to this end he must be informed by the latest bulletins and books on the subject.

GARDENIA. *Rubiaceæ.* Shrubs or small trees with lvs. opposite or in 3's and large yellow or white fls. solitary or in corymbs, with salverform or tubular corolla and 5–11-lobed limb; native in warm regions of eastern hemisphere.

Gardenias were formerly very popular greenhouse specimens and are now grown indoors for cut-flowers and out-of-doors in warm climates. They require a warm close house with a night temperature of about 65°. Buds should be kept pinched off until late in September when they are allowed to set, and will produce bloom for midwinter. Propagated by cuttings containing three or four buds and kept over bottom heat. Frequent syringing is employed.

florida: *G. jasminoides.*

Fortunei: *G. jasminoides* var. *Fortuniana.*

grandiflora. Tree: lvs. lanceolate, shining: fls. white, large, fragrant, 6-parted: fr. oblong. Cochin-China.—The plant cult. under this name is probably *G. jasminoides.*

jasminoides (*G. florida. G. radicans. Warneria* or *Varneria augusta*). CAPE-JASMINE. Evergreen shrub to 6 ft.: lvs. lanceolate or obovate, to 4 in. long, thick: fls. waxy-white, to 3 in. across, often double, fragrant: fr. ovate. China. Var. **Fortuniana** (*G. Fortunei*) has larger fls.

radicans: *G. jasminoides.*

Thunbergia. To 10 ft.: lvs. elliptic, to 6 in. long: fls. white, fragrant, 3–4 in. across and long-tubed, calyx spathe-like: fr. ovoid, woody, crowned with calyx, 2 in. or more long. S. Afr.

Veitchii: hort. name for a form of *G. jasminoides.*

GARDOQUIA BETONICOIDES: *Brittonastrum mexicanum.*

GARLAND-FLOWER: *Hedychium coronarium.*

GARLIC (*Allium sativum*). Rather small onion-like plant but with flat leaves and a thinly covered bulb that breaks up into separable parts or "cloves." The plant is native in southern Europe. For relationships, see *Onion.*

The bulbs are used in cookery. They are often seen in the stores in long braids, held together by their dry tops. Propagated by the cloves or bulblets, which are planted in early spring in any good garden land. Seed is not available, as it is rarely produced.

GARLIC, FALSE: *Nothoscordum.* **Giant:** *Allium Scorodoprasum.* **Wild:** *Allium canadense.*

GARRYA. SILK-TASSEL BUSH. The only genus of *Garryaceæ.* Evergreen shrubs native in W. N. Amer., having opposite unlobed lvs., unisexual fls. without petals borne in catkin-like racemes, and fr. a dry berry-like body.

Garryas are grown for ornament but not hardy North. They do best in sunny sheltered positions. Propagated by cuttings of half-ripened wood, by layers, and by seeds.

elliptica. To 8 ft. and more: lvs. elliptic, to 3 in. long, leathery, densely woolly beneath, becoming glabrous and shining above, wavy-margined: staminate catkins to 8 in. long; pistillate spikes dense, to 4 in. long. Ore. to Calif.

laurifolia (*G. macrophylla*). To 20 ft., shrub or tree-like, branchlets pubescent: lvs. oblong or narrower, to 6 in. long, glabrous or soon becoming so, mostly obtuse: lower bracts resembling the lvs. Mex.

macrophylla: *G. laurifolia.*

Thuretii. Hybrid between *G. elliptica* and a W. Indian species: lvs. long and narrow, to 4 in.: pistillate spikes slender.

GAS-PLANT: *Dictamnus albus.*

GASTERIA. *Liliaceæ.* S. African succulents, stemless or nearly so, with long 2-ranked thick lvs. crowded in rosettes and red or rose fls. in loose racemes. For cult. see *Succulents;* grown as fancier's plants.

acinacifolia. Lvs. to 14 in. long and 2 in. wide, with few dots: infl. 4 ft. high, fls. to 2 in. long.

disticha: *G. lingua.*

lingua (*G. disticha*). Lvs. to 10 in. long and 2 in. wide, white spotted: infl. 3 ft. high.

maculata. Lvs. to 8 in. long and 2 in. wide, spotted or white at base: infl. 4 ft. high.

pulchra. Sts. leafy, to 1 ft. and more: lvs. to 1 ft. long and 1 in. wide, white spotted: infl. to 3 ft., branched.

sulcata. Lvs. to 4 in. long and 1 in. wide, with small greenish dots: infl. to 2½ ft.

verrucosa. Lvs. to 6 in. long and ¾ in. wide, the surface roughened by many white tubercles: infl. 2 ft. high.

GASTONIA: *Trevesia palmata.*

GASTROCHILUS. *Orchidaceæ.* Epiphytes with short leafy sts. and fls. in many-fld. racemes, the sepals and petals similar, the lip toothed or fringed and with sac-like base. For cult. see *Orchids.*

bellinus (*Saccolabium bellinum*). Lvs. to 8 in. long and 1 in. wide: fls. 1½ in. across, in 4–7-fld. racemes; sepals and petals greenish-yellow spotted with purple; lip white spotted with red, Feb.–Mar. Burma.

GAULTHERIA. *Ericaceæ.* Evergreen little shrubs or herb-like, adapted to the rock-garden, having alternate or sometimes opposite lvs., urn- or bell-shaped fls., and bright colored berry-like capsular frs.; an aromatic oil is derived from several species.

Moist sandy or peaty soils and partial shade are desirable. Propagated by seeds, layers, suckers, division, and by cuttings of half-ripened wood.

Miqueliana. Woody evergreen to 1 ft.: lvs. elliptic to obovate, crenate-serrate: fls. white or pinkish, nodding, less than ¼ in. long: fr. white. Japan.

oppositifolia. To 8 ft., much branched: lvs. opposite, ovate or oblong-ovate, to 2½ in. long, cordate at base, leathery: fls. white, ⅙ in. long, in mostly panicled racemes. New Zeal.

procumbens. WINTERGREEN. CHECKERBERRY. TEABERRY. Sts. creeping: lvs. oval, to 2 in. long, shining above: fls. white, ¼ in. long, solitary and nodding, May–Sept.: fr. scarlet. Newf. to Man. and Ga.

rupestris. To 4 ft., much branched, rarely prostrate: lvs. variable, oblong to ovate, to 2 in. long, leathery: fls. white, in racemes. New Zeal.

Shallon. SALAL. To 2 ft.: lvs. ovate, to 5 in. long: fls. white or pink, ⅖ in. long, in panicled racemes, May–June: fr. purple turning black. Alaska to Calif.

GAURA. *Onagraceæ.* Several N. American herbs with alternate simple lvs., small white or rose fls. in spikes or racemes, and nut-like caps.; sometimes grown in the wild-garden or hardy border. Propagated by seeds and division.

coccinea. Per. to 2 ft.: lvs. oblong or lanceolate, to 1½ in. long: fls. pink, white or scarlet, ½ in. long. S. D. to Mex.

Lindheimeri. Per. to 4 ft.: lvs. lanceolate, to 3½ in. long: fls. white, ¾ in. long, in loose terminal spikes. La., Tex.

GAUSSIA. *Palmaceæ.* Two monœcious unarmed tall feather-palms of Cuba and Porto Rico, both intro. in S. Fla.: trunk enlarged at base, tapering above: spadices in the axils of lower lvs., branched, becoming spreading or deflexed; fls. in 2's to 5's on the branches, the lowest commonly pistillate; stamens 6: fr. obovoid-oblong, small. See *Palm* for cult.

attenuata (*Aeria attenuata*). LLUME PALM. To 80 ft. and more, slender above; the roots produce spine-like protrusions: lvs. 3–4 ft. long; pinnæ many, close together, 12–16 in. long and about 1 in. broad, acute: fr. orange-red, about ⅝ in. long. Porto Rico, on limestone hills and ridges.

princeps (*G. splendens*). Less tall: pinnæ almost horizontal but pointing in different directions, with cushion-like swelling at base: fr. about ½ in. or less long. Limestone mts. and cliffs, W. Cuba, making long aerial roots.

splendens: *G. princeps.*

GAYA. *Malvaceæ.* Herbs, shrubs or rarely trees, having alternate simple lvs., yellow or white axillary or terminal fls., and fr. of many carpels; native in S. Amer. and one in New Zeal., the latter planted in S. Calif.

Lyallii (*Plagianthus Lyallii*). LACEBARK. Deciduous tree to 30 ft., pubescent: lvs. ovate, to 4 in. long, deeply crenate: fls. white, to 1 in. across, in clusters of 3–5 or rarely solitary. New Zeal. Var. ribifolia has deeply lobed or cut lvs.

GAYFEATHER: *Liatris.*

GAYLUSSACIA. HUCKLEBERRY. *Ericaceæ;* separated by some authors in *Vacciniaceæ.* American shrubs with alternate usually entire lvs., white or reddish fls. in axillary racemes in spring, and fr. a blue or black berry-like drupe crowned by the persistent calyx-lobes; distinguished from Vaccinium by the 10-celled ovary instead of usually 4–5-celled in the latter.

Huckleberries should have shady locations in peaty or sandy soil. They do not thrive on limestone lands. Propagated by seeds, layers, division, and the evergreen sorts by cuttings of half-ripe wood under glass.

baccata (*G. resinosa*). BLACK H. To 3 ft., deciduous, the branches sticky when young: lvs. to 2 in. long: fls. reddish, ovoid, in dense drooping racemes to 1 in. long: fr. black, shining. Newf. to Ga.

brachycera. BOX H. To 1½ ft., the st. creeping, evergreen: lvs. to 1 in. long: fls. white or pink, cylindrical, in short racemes: fr. blue. Pa. to Va.

dumosa. To 1½ ft., the st. creeping and glandular-pubescent, deciduous: lvs. to 2 in. long: fls. white, pink or red, bell-shaped, in loose racemes: fr. black. Newf. to Fla. and La.

frondosa. DANGLEBERRY. To 6 ft., deciduous: lvs. to 2¼ in. long: fls. greenish-purple, bell-shaped, in racemes to 3 in. long: fr. blue, bloomy. N. H. to Fla.

resinosa: *G. baccata.*

ursina. BUCKBERRY. To 6 ft.: lvs. to 4 in. long: fls. whitish or reddish, bell-shaped, in racemes to 2 in. long: fr. black, shining. N. C., S. C.

GAZANIA (*Meridiana*). *Compositæ.* Herbaceous perennials, seldom annuals, with entire or pinnately cut lvs. and solitary heads on long sts.; ray-fls. white, yellow, orange, scarlet, opening in sunshine, closing at night; disk-fls. dark; pappus of scales; native in S. Afr.

Gazanias are grown in the flower-garden and for edgings. Propagated by seeds, division and also by cuttings taken in summer from shoots near the crown of the plants. The kinds in cultivation are not clearly understood.

longiscapa. Stemless: lvs. white-woolly below, lanceolate or pinnately cut: heads large, on glabrous peduncles longer than lvs., rays orange with dark spot at base.

rigens. Sts. short and branching, densely leafy or diffuse: lvs. white-woolly below, spatulate or occasionally pinnatifid: heads 1½ in. across, on glabrous peduncles longer than lvs., rays orange with a brown-black white-eyed spot at base, varying to yellow, blooming throughout the year in warm climates.

splendens. Supposed hybrid: to 1½ ft.: lvs. silky white beneath, linear-spatulate: heads large, rays orange with black and white spot at base.

GEIGER-TREE: *Cordia Sebestena.*

GEITONOPLESIUM. *Liliaceæ.* Somewhat woody twining shrubs, of 1 or 2 species in Australia and Pacific Isls., grown in Calif.: segms. of perianth 6, oblong, distinct, outer ones often hooded.

cymosum. Lvs. alternate, linear to ovate, to 3 in. long: fls. purplish-green, ⅓ in. long, drooping, in loose terminal cymes: fr. a dark blue berry ½ in. across.

GELSEMIUM. *Loganiaceæ.* Twining shrubs with commonly opposite entire lvs., fragrant funnelform fls. solitary or in small cymes, and capsular frs.; grown in the S. as a cover for porches and banks and sometimes under glass. Propagated by cuttings under glass and by seeds. One species in E. Asia and 2 in E. N. Amer.

sempervirens. CAROLINA YELLOW JESSAMINE. Evergreen: lvs. lanceolate, to 4 in. long, shining above, narrowed at base: fls. bright yellow, to 1½ in. long, blooming throughout the season, borne on scaly pedicels; calyx-lobes obtuse: fr. ¾ in. or more long, short-beaked. Va. to Fla., Tex. and Cent. Amer.—A second species, *G. Rankinii*, has recently been distinguished, N. C. to Fla. and Ala., marked by lvs. rounded at base, pedicels scaly only on lower part, calyx-lobes narrow and acuminate, fr. about ½ in. long and long-beaked.

GEMMINGIA: *Belamcanda chinensis.*

GENIOSTOMA. *Loganiaceæ.* Shrubs ranging from Madagascar to Pacific Isls., with opposite lvs., small fls. in axillary clusters or cymes, and capsular frs.; one species grown in Calif.

ligustrifolium. To 12 ft., glabrous: lvs. ovate, to 3 in. long, entire, paler beneath: fls. greenish-white, ⅙ in. across. New Zeal.

GENIP: *Genipa americana, Melicocca bijuga.*

GENIPA. GENIP (see also *Melicocca*). *Rubiaceæ.* Trop. American trees with large opposite lvs., white or yellowish large fls. in cymes, the corolla salverform with 5–6 lobes, and fr. a berry which is eaten fresh, made into preserves or drinks in its native lands.

Genipa can be grown only in the tropics without protection or risk, and grows best in rich loam with abundant moisture. Propagated by seeds and by shield-budding.

americana. To 50 ft.: lvs. obovate to oblong, to 1 ft. long: fls. white or pale yellow, 1 in. across, silky: fr. brown, to 3 in. across. Trop. Amer. where it is called "Marmalade-Box" and "Genipap."

GENIPAP: *Genipa americana.*

GENISTA. BROOM. *Leguminosæ.* Ornamental shrubs with simple or trifoliolate lvs., papilionaceous yellow or white fls. in racemes, and flattened pods; they differ from Cytisus in technical characters.

Brooms are adapted to dry situations and mild climates. Propagated by seeds, layers, and greenwood cuttings under glass. The Genista of florists is *Cytisus canariensis.*

æthnensis. To 20 ft., the branches almost leafless: fls. golden-yellow, fragrant, axillary along the branches, July–Aug. Sicily, Sardinia.

alba: *Cytisus albus.*

Andreana: *Cytisus scoparius* var. *Andreanus.*

anglica. To 3 ft., sometimes procumbent, spiny: fls. in few-fld. racemes. Eu.

canariensis: *Cytisus canariensis.*

capitata: *Cytisus supinus.*

cinerea. To 3 ft.: fls. bright yellow, in terminal racemes to 8 in. long, Apr.–June. S. Eu., N. Afr.

dalmatica: *G. silvestris* var *pungens.*

elegans: hort. name.

florida. To 5 ft., branches striped: fls. yellow, in dense many-fld. racemes, Apr.–July. Spain.

fragrans: *Cytisus fragrans.*

hispanica. SPANISH B. To 2 ft., the branches spiny: fls. golden-yellow, in terminal heads or clusters, in May–June. S. W. Eu. Var. **nana** is a dwarf form.

juncea: *Spartium junceum.*

maderensis: *Cytisus maderensis.*

monosperma. To 10 ft., almost leafless: fls. white, fragrant, in short lateral racemes, in early spring. Spain, N. Afr. Hort. forms are **alba** and **pendula.**

multiflora: *Cytisus multiflorus.*

ovata. To 4 ft., hairy, the branches striped: fls. yellow, in short racemes. E. Eu.

palmensis: *Cytisus filipes.*

pilosa. Prostrate: fls. yellow, in short racemes, May–July. Eu.

præcox: *Cytisus præcox.*

prostrata: *Cytisus decumbens.*

racemosa: *Cytisus racemosus.*

radiata. To 2 ft., much branched: fls. yellow, in 3–10-fld. heads, May–July. S. Eu.

sagittalis. To 1 ft., the branches broadly 2-winged: fls. yellow, in terminal racemes, June–July. Eu., W. Asia.

scoparia: *Cytisus scoparius.*

sessilifolia: *Cytisus sessilifolius.*

sibirica: *G. tinctoria.*

silvestris. Spiny: fls. in racemes to 4 in. long. S. E. Eu. Var. **pungens** (*G. dalmatica*) is more spiny.

stenopetala: *Cytisus maderensis* var. *magnifoliosus.*

sulphurea: listed name.

tinctoria (*G. sibirica*). Dyers-Greenweed. To 3 ft., the branches striped: fls. yellow, in many-fld. racemes panicled at the ends of the branches, in summer. Eu., W. Asia; nat. in N. Amer.

Veitchii fragrans: hort. name.

GENTIAN: *Gentiana.* **Horse:** *Triosteum.* **Prairie:** *Eustoma Russellianum.*

GENTIANA. Gentian. *Gentianaceæ.* Per. and ann. herbs with mostly opposite, simple and entire lvs. and blue or purple, rarely yellow or white fls.; corolla 4–5-lobed and with plaits, teeth or appendages in the sinuses.

Gentians are grown mostly as rock-garden subjects and not common in gardens in this country. They require good drainage with plenty of moisture and a cool temperature, as the planted kinds are mostly mountain or alpine plants. Some species require special treatment, determined by personal experience, and are grown only by fanciers. Propagated by seed sown as soon as ripe and which are small and slow in germinating. The genus abounds in good blues. Some of the plants known as gentians may be Centaurium.

acaulis (*G. excisa*). Stemless G. Per. to 4 in.: lvs. elliptic or lanceolate: fls. solitary, dark blue spotted inside, 2 in. long. Alps and Pyrenees.—By some authors divided into several species.

alba: *G. flavida.*

Andrewsii (*Dasystephana Andrewsii*). Closed G. Per. to 2 ft.: lvs. ovate to lanceolate: fls. purplish-blue, nearly or quite closed, 1½ in. long, in terminal sessile clusters or in upper axils. E. N. Amer.

angulosa: *G. verna* var. *alata.*

angustifolia. Per., stoloniferous: lvs. linear-oblong: fls. blue spotted with green. Alps.

asclepiadea. Per. to 1½ ft.: lvs. ovate-lanceolate: fls. dark blue, 1½ in. long, solitary in the axils and resembling leafy racemes. S. Eu., Caucasus. Var. **alba** has white fls.

bavarica. Per. to 3 in.: lvs. ovate: fls. solitary, deep blue, 1 in. long. Cent. Eu.

Bigelovii (*Dasystephana Bigelovii*). Per. to 1 ft.: lvs. oblong to linear: fls. purple, 1 in. long, solitary in axils and forming a many-fld. spike. Colo. to Ariz.

Burseri. Per. to 1 ft.: lvs. elliptic-ovate: fls. yellowish, calyx spathe-like. Pyrenees.

calycosa (*Dasystephana calycosa*). Per. to 1 ft.: lvs. ovate: fls. dark blue spotted with green, to 1½ in. long, solitary. B. C. to Mont. and Calif.

campestris. Ann. to 6 in.: lvs. ovate-lanceolate, to 1¼ in. long, entire, sessile: fls. bright purple, erect, 1 in. and more long, in abundance. Eu.—Good for the rock-garden.

Clusii. One of the segregates from *G. acaulis* but scarcely differing.

crinita. Fringed G. Bien. to 3 ft., with long slender roots that are broken in ordinary transplanting: lvs. obovate to lanceolate: fls. solitary, bright blue, 2 in. long, the lobes conspicuously fringed. E. N. Amer.

cruciata. Per. to 10 in.: lvs. ovate-lanceolate: fls. dark blue, ¾ in. long, in axillary clusters. Eu., N. Asia.

dahurica: *G. Olivieri.*

decumbens. Per. to 10 in.: lvs. oblong or elliptic: fls. blue, about 1 in. long, in clusters, calyx spathe-like. Himalayas.

depressa. Per. to 2 in.: lvs. elliptic: fls. solitary, blue, 1¼ in. long. Himalayas.

detonsa. Per. to 2 ft.: lvs. oblong: fls. blue, ¾ in. long, in terminal and axillary clusters. Himalayas.

elegans: *G. thermalis.*

excisa: *G. acaulis.*

Farreri. Per., stoloniferous, the sts. ascending: lvs. linear, the pairs connate at base: fls. solitary, blue with white throat and yellowish-white band on the petals, to 2½ in. long. China.

Fetisowi. Tall per.: lvs. lanceolate: fls. deep blue, 1½ in. long, in terminal and axillary clusters. China.

flavida (*G. alba. Dasystephana flavida*). Per. to 3 ft.: lvs. ovate-lanceolate: fls. greenish or yellowish-white, to 2 in. long, in clusters. Ont. to Va. and Mo.

Freyniana. A hort. form of *G. septemfida* with larger less fringed fls.

frigida. Per. to 6 in.: lvs. spatulate-linear: fls. whitish, few together. Carpathian Mts.

gelida. Per. to 6 in.: lvs. ovate-lanceolate: fls. yellowish-white, in clusters. Caucasus.

Kesselringi. Per. to 8 in.: lvs. lanceolate: fls. whitish dotted violet outside, in terminal clusters. Turkestan.

Kurroo. Tufted per. to 7 in.: lvs. lanceolate to linear: fls. blue spotted with white inside, 1–3 together. Himalayas.

Lagodechiana. Listed as a dwarf or creeping plant with large pale blue fls.

linearis (*Dasystephana linearis*). Per. to 2 ft.: lvs. linear or linear-lanceolate: fls. blue, to 2 in. long, in terminal clusters. N. B. to Md. and Minn.

lutea. Per. to 6 ft.: lvs. ovate: fls. yellow, 1 in. long, in dense umbel-like cymes, calyx spathe-like. Eu., Asia Minor.

macrophylla. Per. to 1 ft.: lvs. lanceolate, to 1 ft. long: fls. pale blue, in terminal clusters. Siberia.

Menziesii. Slender, to 15 in., ascending: lvs. narrow-oblong to lanceolate, to 1½ in. long: fls. blue, 1 in. long, 1 or 2 at an insertion. Calif., Ore.

nivalis. Ann. to 4 in.: fls. solitary, blue, ⅔ in. long. Eu.

Olivieri (*G. dahurica*). Lvs. narrowly lanceolate: fls. dark blue, in umbel-like cymes. Asia.

Parryi (*Dasystephana Parryi*). Per. to 16 in.: lvs. linear-lanceolate to ovate: fls. bright blue, about 2 in. long, 1–6 together. Wyo. to Utah.

phlogifolia. Per. to 10 in.: lvs. lanceolate-oblong: fls. blue, in terminal 3–7-fld. cymes. E. Eu.

Pneumonanthe. Per. to 1 ft.: lvs. oblong-lanceolate to linear: fls. deep blue lined outside with green, 1½ in. long, in the axils of upper lvs. forming a raceme-like cyme. Eu., N. Asia.

Porphyrio (*Dasystephana Porphyrio*). Per. to 1½ ft.: lvs. linear: fls. bright blue often spotted with brown, 2 in. long, solitary and terminal. Pine barrens, N. J. to Fla.

Przewalskii. A few in. high: lvs. oblong to oblong-linear: fls. blue with cream-colored anthers, to 2½ in. long, in terminal clusters of 1–3. China.

puberula (*Dasystephana puberula*). Per. to 1½ ft.: lvs. lanceolate: fls. blue, 1½ in. long, sessile in upper axils and forming a dense spike. Ohio to Sask.

Purdomi: listed name.

Saponaria (*Dasystephana Saponaria*). Per. to 2½ ft.: lvs. lanceolate or oblong: fls. blue, 2 in. long, in terminal and axillary clusters. Ont. to Fla. and La.

scabra. Lvs. ovate, rough-toothed: fls. dark blue, in clusters. E. Asia. Var. **Buergeri** is a form with narrower fls.

sceptrum. Per. to 4 ft.: lvs. oblong-lanceolate: fls. dark blue often dotted with greenish, 1 in. long, in clusters. B. C. to Calif.

septemfida. Per. to 1½ ft.: lvs. ovate-lanceolate: fls. dark blue, to 2 in. long, in terminal clusters. Asia.

sino-ornata. Stoloniferous per. with sts. to 7 in. long: lvs. in rosettes, linear-lanceolate: fls. yellowish-white marked irregularly with purple, to 2¼ in. long, solitary and terminal. Mts., China.

straminea. Per. to 1 ft.: lvs. linear-oblong: fls. pale yellow, 2 in. long, 1 or 2 together. China.

thermalis (*G. elegans. Anthopogon thermalis*). Ann. to 1 ft.: lvs. obovate: fls. deep blue streaked with lighter, 2 in. long, solitary. Colo. to Ariz.

tibetica. Per. to 1½ ft.: lvs. lanceolate: fls. yellowish-white tinted lilac, crowded in upper axils. E. Himalayas.

verna. Tufted per. to 3 in.: lvs. ovate: fls. dark blue, solitary, 1 in. long. Eu. Var. **alata** (*G. angulosa*) is taller with winged calyx.

Walujewi. Lvs. elliptic or lanceolate: fls. whitish dotted with pale blue, crowded in a terminal cluster. Turkestan.

GENTIANACEÆ. Gentian Family. About 70 genera of herbs or rarely shrubs, of wide distribution, with mostly opposite simple and entire lvs. and regular bisexual gamopetalous fls. having 4–12 sepals, petals and stamens, superior 1-celled ovary, and capsular frs. Some of the best blues among fls. are in this family. A few genera are grown for ornament although of minor importance except for special uses, as Centauridium, Chironia, Eustoma, Exacum, Frasera, Gentiana, Menyanthes, Nymphoides.

GENUS (plural, *genera*). A more or less closely related and definable group of plants comprising one or more species, and the name of which becomes the first word of the binominal employed in horticultural and botanical literature. Thus *Citrus* is a genus comprising the citrus fruits, and some of the species are *Citrus sinensis* the sweet orange, *C. aurantifolia* the lime, *C. paradisi* the grapefruit. The oaks belong to genus *Quercus:* the white oak is *Quercus alba*, Spanish red oak *Q. rubra*, live oak *Q. virginiana*. Rosa is the genus of the roses, Pinus of the pines, Lilium of the lilies, Delphinium of larkspurs, Lycopersicon of tomatoes, Mentha of mints, Fragaria of the strawberries. In some cases the technical genus name has become also the common or vernacular name, as Begonia, Petunia, Chrysanthemum, Dahlia, Iris, Grevillea, Gladiolus, Verbena, Crinum, Magnolia, Rhododendron. By bearing in mind that the first of the two words in the Latin or botanical designation of a plant is the generic name, the gardener arrives at the first step in tracing plants in books and indices, as he must know a man's surname to find him in the directory. See *Species* and *Family*. Something like 10,000 or more genera are commonly recognized among seed-bearing or flowering plants.

GEONOMA. *Palmaceæ*. Feather-palms or feather-veined, unarmed, stoloniferous, cespitose or trunk solitary, slender but usually not very tall, the sts. ringed and commonly reed-like, monœcious or diœcious, with variable foliage and sometimes lvs. entire and bifid, when pinnatisect the pinnæ or segms. frequently with broad not petiole-like bases: spadices below the lvs. for the most part, the fls. in pits or depressions on the branches; stamens 6, connate: fr. small, globose, oblong or ellipsoid, 1-seeded, dark purple or black. Trop. Amer., perhaps 100 species, mostly woods palms. Some of the species stand in shady protected places in S. Fla., and they are grown under glass making attractive small tub specimens. See *Palm*.

elegans. Graceful palm, caudex to 6 ft. and very thin: lvs. 10–14 in number close together at apex of trunk, dark green, 1½–2½ ft. long, with broad and narrow divisions intermingled; pinnæ 3–5, broad-lanceolate, to 10 in. long, 1-nerved and with several secondary nerves, the terminal largest: spadices from the axils of lowermost lvs.: fr. oblong, dark purple, about ⅓ in. long. Brazil. Var. **robusta** is a larger plant, with more and broader pinnæ or segms., the narrow ones ⅓ in. broad and others much broader.

gracilis (*G. Riedeliana*). Slender, with single st., 4 ft., 1½ in. thick, naked: lvs. in a terminal crown, 2½ ft. long, regularly pinnate; pinnæ many, 1 ft. long and ½ in. or less broad, long-acuminate, 3-nerved, curving. Probably Brazil.—Closely allied to *G. Schottiana* and differs mostly in technical characters.

imperialis: hort. name for a palm from Colombia.

princeps. Slender but stout, 4 or 5 ft., st. naked: lvs. 2½ ft., arching, regularly pinnate but terminal pinnæ broader or confluent; pinnæ about 50, green both sides, strong 3- or more ribbed, 18–20 in. long, main ones 1 in. or less broad, long-pointed. Peru.

Pynaertiana: hort. name for a simple-lvd. Malayan palm, with light green foliage: lvs. about 28 in. long and 10 in. broad.

Riedeliana: *G. gracilis*.

Schottiana. Caudex single, 9–16 ft. and 1 in. thick more or less: lvs. long and gracefully curving, regularly pinnate; pinnæ 30–50 or more, and sharp-pointed, 10–12 in. long and about ½ in. broad, curving: fr. ellipsoidal, about ½ in. long. Brazil, in several forms.

GEOPRUMNON: *Astragalus mexicanus*.

GEORGINA: *Dahlia*.

GERANIACEÆ. Geranium Family. Herbs, sometimes semi-woody, of about 12 genera widely distributed over the world; known to cult. in the ornamental genera Erodium, Geranium and Pelargonium, and species of Erodium have forage value. The family is characterized by its bisexual mostly regular polypetalous fls., usually 5 sepals and petals and stamens 5, 10 or 15, superior 3–5-lobed ovary, and capsular fruit. The geranium tribes are of simple culture. The true geraniums and the erodiums are mostly hardy plants in the East, but pelargoniums need house treatment except in California and similarly mild climates.

GERANIUM. Cranesbill. *Geraniaceæ*. Herbs ann. or per., with palmately lobed or divided lvs., pink or purplish fls. 1–2 in the axils, having 10 stamens, 5-celled ovary with 2 ovules in each cell, and long-beaked frs.

Grown in the hardy border or rock-garden. Propagated by seeds and root-division; the cultivated perennials should be transplanted from the seed-bed in early spring. They are mostly hardy plants, and some of them are introduced weeds. See *Pelargonium*, to which the greenhouse and florists' geraniums belong.

aconitifolium. Per. to 1½ ft.: lvs. deeply 7-lobed: fls. white, ½ in. or less across. Eu.

albiflorum. Per. to 1½ ft.: lvs. deeply 7-lobed: fls. white veined with pink, about ½ in. across. S. Siberia.

anemonefolium. Per. to 1½ ft.: lvs. 5-parted: fls. pale purple. Canary Isls.

argenteum. Silver-leaved C. Per. or bien. to 5 in.: lvs. 5–7-parted, hoary and silky on both sides: fls. pink with darker veins, 1 in. across. N. Italy.

armenum: *G. psilostemon*.

carolinianum. Ann. to 1½ ft.: lvs. 5–7-parted: fls. pale pink or whitish, to ¼ in. across. N. Amer.

cinereum. Per. to 6 in.: lvs. 5–7-parted, glaucous: fls. pink with dark stripes, about 1 in. across. Pyrenees.

citriodorum: *Pelargonium acerifolium*.

collinum. Per., somewhat decumbent, to 1½ ft.: lvs. deeply 7-parted: fls. purplish-violet, the veins deeper, less than ½ in. across. E. Eu.

dissectum. Ann. to 2 ft.: lvs. 5–7-parted: fls. purple, to ¾ in. across. S. Eu.; nat. in N. and S. Amer.

Endressi. Per. to 1½ ft.: lvs. deeply 5-lobed: fls. rose, ⅓ in. across. Pyrenees.

eriostemon (*G. platyanthum*). Per. to 2 ft.: lvs. deeply 5-lobed: fls. violet-blue, 1 in. across. Siberia to China.

Fremontii. Per., 1 ft. or more high: lvs. 5–7-parted: fls. rose-purple, 1 in. across. Rocky Mts.

grandiflorum. Per. 1 ft. or more: lvs. deeply 5-lobed: fls. lilac with purple veins, to 1½ in. across. N. Asia.

gymnocaulon. Per. to 1½ ft.: lvs. 5-parted: fls. deep violet, to ¾ in. long. W. Asia.

ibericum. Per. to 1½ ft.: lvs. 7-lobed nearly to base: fls. purple, 1¼ in. long. S. W. Asia. Var. **album** has white fls.

incisum. Per. to 2 ft.: lvs. 3–5-parted, the lfts. often cut: fls. pink or purple, ½ in. long. B. C. to Calif.

lancastriense: *G. sanguineum* var. *prostratum.*

Lowii: name for a hort. form having bright rose fls. with violet center.

macrorrhizum. Per. to 1½ ft., with long thick root: lvs. 5–7-lobed nearly to base: fls. magenta. S. Eu.

maculatum. Per. to 2 ft.: lvs. deeply 3–5-lobed: fls. rose-purple, 1 in. across. N. Amer. Var. **album** has white fls.

nepalense. Per. with decumbent or ascending sts. to 1½ ft. long: lvs. deeply 5-lobed: fls. rose-purple, to ⅔ in. across. Mts. of Asia.

phæum. Per. to 2 ft.: lvs. deeply 5–7-lobed: fls. dark blue or almost black, with white spot at base of each petal. Eu.

platyanthum: *G. eriostemon.*

platypetalum. Per. to 2 ft.: lvs. 5-lobed beyond middle: fls. dark purple, ¼ in. long. China.

pratense. Per. to 3 ft.: lvs. 7-parted: fls. purple, about ½ in. across. Eurasia. Var. **album** has white fls.

prostratum: *G. sanguineum* var.

psilostemon (*G. armenum*). Per. to 2 ft.: lvs. deeply 5-lobed: fls. dark red, spotted with black at base, about 1½ in. across. Armenia.

pusillum. Prostrate much branched ann.: lvs. 5–9-parted, the lfts. 3-lobed: fls. blue-purple, ¼ in. across. Eu. to Himalayas.

Pylzowianum. Per. to 1 ft.: lvs. 5-parted, the lfts. 3-lobed: fls. purple, 1¼ in. across. China.

Richardsonii. Per. to 3 ft.: lvs. 3–5-parted: fls. white, 1 in. across. W. N. Amer.

Robertianum (*Robertiella Robertianum*). Herb-Robert. Red Robin. Ann. or bien. to 1½ ft.: lvs. 3-parted, the lfts. deeply cut: fls. red-purple, about ¼ in. long. N. Amer., Eurasia, N. Afr., mostly in woods or coppices.

sanguineum. Per. to 1½ ft., covered with spreading white hairs: lvs. 5–7-parted: fls. reddish-purple. Eurasia. Var. **album** has white fls. Var. **prostratum** (*G. lancastriense, G. prostratum*) is a dwarfer form with lighter colored fls.

sessiliflorum. Per. to 4 in.: lvs. all basal, deeply 5–7-parted: fls. white, to ½ in. across. Andes of S. Amer.

sylvaticum. Per. to 2½ ft.: lvs. deeply 7-lobed: fls. violet, about 1 in. across. Eu., Asia.

Traversii. Per. to 1½ ft., gray-pubescent: lvs. 7-parted to about the middle: fls. rose or white, 1 in. across. Chatham Isl. (New Zeal.)

Wallichianum. Prostrate per.: lvs. 3–5-parted, the lfts. deeply toothed: fls. purple, to 2 in. across. Himalayas.

Wilfordi. Procumbent ann.: lvs. 3-parted, the lfts. deeply toothed: fls. white striped with rose, ½ in. across. Manchuria.

Willardi. Per. to 1½ ft.: fls. rosy-red. Botanical position unknown.

GERANIUM, BEEFSTEAK-: *Begonia Rex-cultorum.* **California-:** *Senecio Petasitis.* **Feather-:** *Chenopodium Botrys.* **Florists:** *Pelargonium.* **Mint-:** *Chrysanthemum Balsamita.* **Strawberry-:** *Saxifraga sarmentosa.*

GERARDIA: *Aureolaria pedicularia;* other Gerardias belong in Agalinis but apparently not in cult.

GERBERIA (*Perdicium*). *Compositæ.* Herbaceous perennials with lvs. in basal tufts, the solitary pink, yellow or orange heads on scapes, with 1 or 2 rows of ray-fls.; pappus of bristles; native in S. Afr. and Asia.—Name commonly but not originally spelled *Gerbera.*

Gerbera is grown in a temperate greenhouse and out-of-doors in mild or protected places. It may survive the northern winters if given a protection of leaves and decomposed manure. Propagated by seeds or by cuttings of side shoots.

anandria. Differing from *G. Kunzeana* in the woolly involucral bracts and pale pappus. China.

Jamesoni. Transvaal Daisy. Barberton Daisy. To 1½ ft., hairy: lvs. very woolly beneath, to 10 in. long, pinnately lobed or parted: heads orange-flame color, to 4 in. across. Transvaal. Var. **hybrida** is listed as an improved form with white, pink, orange, salmon, ruby-red-violet fls.—Not hardy in northernmost states; sometimes bloomed under glass.

Kunzeana. Diœcious: lvs. oblong or ovate, lobed or lyrate-pinnatifid, very woolly beneath: bracts of involucre glabrous; pappus brown. Himalayas.

GERMANDER: *Teucrium.*

GESNERIA: see *Corytholoma cardinalis, Nægelia.*

GESNERIACEÆ. Gesneria Family. Mostly trop. herbs, rarely shrubs or trees, of about 84 genera, having simple lvs. which are frequently colored above or underneath, tubular usually 5-lobed showy gamopetalous often irregular corolla, 4 stamens, superior or inferior ovary, and commonly fleshy frs. Plants of several genera are grown for ornament chiefly under glass, as Achimenes, Alloplectus, Columnea, Conandron, Corytholoma, Episcia, Haberlea, Isoloma, Mitraria, Nægelia, Ramondia, Rhabdothamnus, Saintpaulia, Sinningia, Streptocarpus, Trichosporum, Tussacia.

GESNOUINIA. *Urticaceæ.* Canary Isl. shrubs or trees with alternate entire lvs. and unisexual fls. borne 3 together in an involucre in spikes or panicles; sometimes grown in the open in S. Calif. for ornament and interest. Propagated by cuttings.

arborea (*Parietaria arborea*). Tree to 20 ft.: lvs. lanceolate, to 5 in. long and 2 in. wide, white-tomentose beneath: fls. in large terminal panicles.

GEUM. Avens. *Rosaceæ.* Per. erect herbs often with runners, with pinnate basal lvs. and small st.-lvs., yellow, white or red fls. in corymbs or solitary, and fr. an achene with long persistent style; native in temp. and cold regions and adapted to rock-gardens, and the taller ones for rear borders; some of them are good flower-garden subjects. Of easy cult. Propagated by seeds and by division.

atroccccineum: probably *G. chiloense.*

atrosanguineum: *G. chiloense.*

Borisii. Hybrid between *G. reptans* and *G. bulgaricum:* fls. bright yellow.

bulgaricum. To 2 ft.: lvs. with very large heart-shaped terminal lft. and numerous small lateral lfts.: fls. nodding, bright yellow or orange. Bulgaria.

canadense. To 2½ ft.: lvs. 3–5-parted into toothed or lobed lfts.: fls. white, about ½ in. across. N. S. to La.

chiloense (*G. atrosanguineum*). To 2 ft.: lvs. with large terminal toothed lft. and many smaller lateral lfts., hairy: fls. scarlet, to 1½ in. across. Chile. Var. **plenum** has double fls. A favorite garden form is Mrs. Bradshaw.

ciliatum (*G. triflorum. Sieversia ciliata*). To 1½ ft.: lvs. of numerous lfts. deeply cut into linear-lanceolate silky-ciliate segms.: fls. purplish, to ¾ in. across. N. Amer.

coccineum. Lvs. with large heart-shaped terminal lft. and smaller lobed lateral lfts.: fls. bright red, 1 in. across. S. Eu., Asia Minor.—The plants commonly grown under this name are *G. chiloense.*

Eweni: hort. name for a form with light orange fls.

Heldreichii: hort. name for a form with orange-red fls: 8 in. Said to be a form of *G. montanum.*

japonicum. To 3 ft.: lvs. with a large heart-shaped 3–5-lobed terminal lft. and small lateral lfts.: fls. yellow. Japan.

Kolbianum: listed as a plant with deep orange-red fls.; said to be a hybrid.

macrophyllum. To 3 ft.: lvs. with large 3–7-lobed terminal lft. and 3–6 main lateral lfts.: fls. yellow, to ¾ in. across. N. Amer., N. Eu.

montanum (*Sieversia montana*). To 1 ft.: lvs. with large terminal heart-shaped lft. and much smaller lateral lfts.: fls. golden-yellow, to 1½ in. across. S. Eu.

Peckii (*Sieversia Peckii*). To 2 ft.: lvs. with large orbicular toothed terminal lft. and few or no lateral lfts.: fls. yellow, to 1 in. across. Me., N. H.

pyrenaicum. To 1½ ft.: lvs. with large heart-shaped toothed terminal lft. and smaller lateral lfts.: fls. yellow, nodding. Pyrenees.

reptans (*Sieversia reptans*). To 6 in., with long runners: lvs. with large 3-lobed deeply toothed lft. and small lateral lfts.: fls. yellow, to 1½ in. across. Eu.

rivale. To 3 ft.: lvs. with terminal and 2 upper lateral lfts. much larger, toothed and lobed: fls. purplish, nodding, to 1 in. across. N. Amer., N. Eu., Asia.

Rossii (*Sieversia Rossii*). To 7 in.: radical lvs. interrupted-pinnate and glabrous, the lfts. 3-lobed: fls. yellow, 1 to a st. Arctic regions.

sibricum: hort. name: fls. bright red, coppery: to 10 in.

strictum. To 5 ft.: lvs. with larger terminal lft. and 4–6 lateral lfts.: fls. yellow, to ¾ in. across. N. Amer., N. Asia.

tirolense: reported as a hybrid.

triflorum: *G. ciliatum.*

urbanum. To 2 ft.: lvs. with coarsely toothed often 3-parted lfts.: fls. yellow, about ½ in. across. Eu., Asia.

GEVUINA (also but not originally spelled *Guevina*). *Proteaceæ.* One evergreen tree native in Chile and occasionally grown in S. Calif. **G. Avellana.** Chilean Nut. Chile Hazel. To 40 ft.: lvs. alternate, odd-pinnate, shining: fls. white, in axillary racemes: fr. coral-red, about size of cherry, the seed with edible kernel.—Propagated by seeds or cuttings of green wood under glass.

GHERKIN: *Cucumis.*

GILIA. *Polemoniaceæ.* Herbs with alternate entire or divided lvs. and blue, yellow, pink or white funnelform or salverform fls.; grown in the flower-garden, mostly annuals. Of easy cult. Seeds are sown where plants are to grow, in sunny open places.

abrotanifolia. Ann. to 2 ft.: lvs. 3-pinnately dissected into very narrow segms.: fls. pale blue, in dense terminal clusters. Calif.

achilleæfolia. Ann. to 2 ft., glandular-pubescent: lvs. 2-pinnately dissected into linear segms.: fls. blue, in dense terminal clusters. Calif.

aggregata. Per. or bien. to 2½ ft.: lvs. 1–2-pinnately dissected into linear segms.: fls. scarlet varying to white, in a long thyrse. W. N. Amer.

androsacea: *Linanthus androsaceus.*

californica: *Leptodactylon californicum.*

capitata. Ann. to 2½ ft.: lvs. 2–3-pinnately dissected into linear segms.: fls. light blue, in heads about 1 in. across at end of naked peduncles. Wash. to Calif.

coccinea: *Collomia biflora.*

coronopifolia: *G. rubra.*

densiflora: *Linanthus grandiflorus.*

densifolia (*Hugelia densifolia*). Per. to 2 ft., woolly-tomentose when young: lvs. linear and rigid, entire or lobed: fls. deep blue, in dense clusters. Calif.

dianthoides: *Linanthus dianthiflorus.*

grandiflora: *Collomia grandiflora.*

laciniata. Ann. to 8 in.: lvs. 2-pinnately dissected into linear segms.: fls. rose, blue, pale lilac to white, in few-fld. clusters. Peru, Chile, Argentina.

linearis: *Collomia linearis.*

liniflora: *Linanthus liniflorus.*

micrantha: *Linanthus parviflorus.*

multicaulis. To 1½ ft., branching from base: lvs. pinnately parted into linear segms.: fls. blue or pinkish, in few-fld. clusters. Calif.

nivalis: a white-fld. form of *G. tricolor.*

pulchella. Per. to 2 ft.: lvs. pinnately dissected into linear segms.: fls. crimson to white, in a narrow panicle. Mont. to Wash.

rigidula. Per. to 1 ft.: lvs. pinnately divided into linear rigid segms.: fls. blue, rotate, scattered. Tex. to Mex.

rubra (*G. coronopifolia. Ipomopsis auarantiaca, elegans* and *sanguinea*). Standing-Cypress. Bien. or per. to 6 ft.: lvs. pinnately dissected into needle-like segms.: fls. scarlet, yellow dotted with red inside, in a narrow terminal panicle. S. C. to Fla. and Tex.

squarrosa: *Navarretia squarrosa.*

tricolor. Birds-Eyes. Ann. to 2½ ft.: lvs. 2-pinnately dissected into linear segms.: fls. with lilac or violet lobes, yellowish tube and throat marked with purple, borne in loose clusters. Calif. Var. rosea has rose fls.

GILIBERTIA. *Araliaceæ.* Shrubs or trees with simple, entire or 3-lobed lvs., small fls. in umbels, and berry-like frs.; grown under glass or in the open far S. For cult. see *Polyscias.*

japonica (*Dendropanax japonicum*). Lvs. entire or 3-lobed, about 3 in. long: fls. in umbels about 1 in. across. Japan.—Planted in Calif.

GILLENIA (*Porteranthus*). *Rosaceæ.* Two N. American per. erect branching herbs with 3-lobed or -parted lvs. and white or pinkish long-stalked fls. in terminal panicles; grown in the wild- or about rock-gardens and of easy cult. Propagated by seeds and by division.

stipulata. American Ipecac. To 4 ft.: lfts. cut-lobed, the stipules broad and leaf-like: fls. to ½ in. across. N. Y. to Ga. and La.

trifoliata. Indian Physic. Similar to preceding but lfts. toothed and stipules small and awl-shaped. Ont. to Ga. and Mo.

GILLIFLOWER: *Mathiola incana.*

GILL-OVER-THE-GROUND: *Nepeta hederacea.*

GINANNIA: *Notholcus.*

GINGER: *Zingiber.* **Wild:** *Asarum.*

GINKGO. *Ginkgoaceæ.* One deciduous resinous tree native in China, **G. biloba** (*Salisburia adiantifolia*), the Maidenhair-Tree. To 120 ft.: lvs. fan-shaped, long-stalked, cut or divided in middle: staminate fls. in catkins: frs. drupe-like, long-stalked, yellowish. Hort. forms are: **aurea** with bright yellow lvs.; **fastigiata** of pyramidal habit; **laciniata** with deeply divided lvs.; **macrophylla** with larger lvs.; **pendula** with pendulous branches; **variegata** with lvs. variegated yellow.—Grown as a street or ornamental tree, hardy N. and of easy cult. in good soil. Propagated by stratified seeds, layers, cuttings, and named vars. by grafting and budding. The pistillate tree is undesirable because of the strong-smelling frs., and propagation by cuttings rather than by seeds is, therefore, sometimes advised.

GINKGOACEÆ. Ginkgo Family. Only 1 genus of 1 species, Ginkgo, grown for ornament. The family was founded in 1897; the genus had theretofore been placed in the Coniferæ (which is now separated into Ginkgoaceæ, Taxaceæ, Pinaceæ). In geologic times the ginkgoes were widespread in several species.

GINSENG. Two woods species of Panax (which see) grown for the roots which are much prized by the Chinese for medicinal uses. The native American species is chiefly grown or gathered in the United States and Canada for export. The plants are readily raised when provided with shade and constant moisture, but in land well drained of surface water. Slat or lath sheds afford good sun protection. The soil should be fertile and deep for the production of the best roots. The plant is grown from seeds that are commonly stratified or buried about a year and then sown in beds; but a good proportion may germinate the first year if sown as soon as ripe and not allowed to become dry. Autumn or spring are proper times for transplanting to permanent quarters, where the plants may stand four or five inches apart in either direction. The root matures for market in about five years; but some of the profit in ginseng culture has come from raising seeds, which should be produced rather freely at three years and abundantly at five years and thereafter; and seedlings may be sold at one and two years old.

GIRASOLE is the plant commonly known as Jerusalem artichoke but it is not an artichoke and has nothing to do with Jerusalem: it is supposed that Jerusalem, in this relation, is a corruption of the Italian name girasole. The plant is a stout tall-growing perennial, *Helianthus tuberosus* (which see), hardy throughout the country. The "artichokes" are the subterranean potato-like tubers which are nutritious alike to man and beast. It persists and becomes a weed unless the ground is completely cleaned of tubers when the crop is harvested. Propagation is by the tubers, planted in autumn or spring. On good ground the crop needs little attention except to keep down the competing weeds. The yield is heavy and should be valuable.

GLABROUS: not hairy or pubescent or tomentose; incorrectly used in the sense of smooth (not rough).

GLADIOLUS. Gladiolus, Gladioli. *Iridaceæ.* Cormous plants of perhaps 200 species, abundant in S. Afr. and others in trop. Afr. and Medit. region, now very popular for summer and autumn bloom and also for earlier flowering under glass. Many specific names are known to be in the country, as recorded below, but the common garden or hortulan gladiolus does not now represent a single species in its original form, but a modification or probably a series of blends of a few species that were early introduced to cult. or that have proved to be specially useful for horticultural purposes. It is probable that *G. blandus*, *G. cardinalis*, *G. dracocephalus*, *G. psittacinus*, *G. purpureoauratus*, *G. oppositiflorus*, *G. Saundersii*, *G. primulinus* have mostly contributed to the origin of the common hortulan gladioli. One of the early forms, a reputed hybrid, was *G. gandavensis;* and subsequently as the complexion of the modified hortulan kinds began to assume its present character, such names as *G. hybridus*, *G. Lemoinei*, *G. Nanceianus*, *G. Childsii*, *G. Froebelii*, *G. turicensis* and *G. princeps* were current but they are of little interest to contemporaneous growers. The kinds of hortulan gladioli are numerous now and of great excellence, the merits residing particularly in the shape of the flower, its size and color and markings, substance, season, keeping qualities, size and character of spike. With the exception of *G. primulinus*, in various degrees of modification, one does not now recognize straight botanical species in the common garden gladioli. In recent years many species have been intro. from Afr. by seeds. This important group of plants is represented in the American Gladiolus Society.

The flower of the gladiolus is borne from a green spathe of two leaves or valves. The perianth has 6 colored parts all united below into a tube which is mostly curved; the 3 upper parts or segments are larger than the 3 lower and often arched or hooked over them. The stamens are 3, attached deep in the tube, and the anthers are long and slender. Stigmas are 3. The ovary is inferior, 3-celled, ripening into a 3-valved many-seeded capsule.

Gladioli are tender and should be grown between the spring and autumn frosts, although the corms often persist even in northern states if well protected with ground covering. Open sunny exposure is best. Strong corms set in good earth the first of May yield plants that should begin to bloom by late July or the first of August. The ground should be well prepared and have good drainage. The use of stable manure the year previous should produce good results, but it should not be applied with the corms. The corms are planted as soon as the ground becomes warm, or in succession for later bloom, 3 to 6 inches deep; the greater depth is advisable only on warm open land and with strong corms; the plants usually stand up better with the deeper planting. For strong specimen spikes the plants may go 5 to 8 inches apart, but for mass effects they may be grown twice as thick. Planted 5 inches deep and 3 to 5 inches apart, the plants probably will not require staking. If considerable quantities are to be grown, the plants may be in rows that are wide enough apart to allow of easy tillage by hand or horse.

Before freezing weather the plants are lifted, the tops are removed, and the corms are stored in a cool dry place until spring. See that the corms are firm, clean and dry and well cured before being put away.

Named varieties or particular colors are propagated by means of the cormlets that form around the old corms or bulbs. The cormlets are planted in drills in spring, taken up in autumn and stored as are the regular flowering corms. In the second or third year the plants should bloom. New varieties or strains are grown from seeds, which are sown and plants handled as are the cormlets.

The gladiolus is well adapted to use as cut-flowers. The flowers open in the morning, and then the spike may be cut before it has bloomed much, with a long stem. Remove the old flowers. Provide fresh cool water daily, cut off a little of the stem end, and all the buds on the spike will open.

alatus. Little plant, to 1 ft. or less: lvs. linear and rigid, basal or 2 or 3 on st.: fls. 3–5, dark red and pink, segms. very unequal, lower segms. green and pink, upper segm. to 1½ in. long. S. Afr.

angustus. Sts. simple, 2–3 ft.: lvs. linear, to 2 ft. long and ¼ in. or less broad: fls. 2–6, long-tubed, white, 3 lower segms. purple-marked. S. Afr.

blandus. Sts. to 2 ft. long, sometimes branched: lvs. about 4, to 1 ft. long and ¾ in. wide: fls. 4–8, white and red-tinged, sometimes pure white and sometimes pink, segms. acute, upper one ¾ in. broad and others narrower. S. Afr.

callistus. Stout, to 3 ft. and more; allied to *G. blandus*, but differs in greater size, more robust branched infl., 3 upper segms. blotched at throat, anthers declined and violet: lvs. plane, glabrous, ensiform: perianth-tube somewhat curved, segms. white with pale rose tint, the 3 upper ones with red spots. Cape Province.

cardinalis. Sts. to 4 ft. long: lvs. 2–3 ft., glaucous-green: fls. 5–10 or more, bright scarlet and crimson, upper segm. largest and hood-shaped, lower ones white-blotched. S. Afr., sometimes hanging from cliffs.—Early intro. to cult. and supposed to be one of the parents of *G. gandavensis*.

Colvillei. Rather small, very early flowering, spikes short: fls. open or flaring with pointed segms., scarlet with oblong blotches at base. Hybrid *G. tristis* var. *concolor* with pollen of *G. cardinalis*, one of the earliest garden forms. Var. **albus**, The Bride, has white fls. This old strain is still in cult.; hardy in the middle S. There are several forms of it.

communis. St. to 2½ ft.: lvs. 3 or 4, about 1 ft. or less long: fls. 4–8, about 1½ in. long, narrow, bright purple, segms. nearly equal in length, anther shorter than filament. France, Germany; hardy in middle sections.

Cooperi. Much like *G. psittacinus*, but perianth-tube longer and segms. more acute. S. Afr.

cuspidatus. St. simple, 2–3 ft.: lvs. 3 or 4, linear and rigid, to 2 ft.: fls. 4–8, white or pale pink, tube 2–3 in. long and segms. shorter, 3 lower segms. purple-blotched. S. Afr.

Davisoniæ. Lvs. sword-shaped or linear-lanceolate, sparingly minutely pubescent, 10–12 in. long and to ½ in. or more broad, mostly basal: spike simple, to 10 in. long, 7–11-fld., the fls. nearly erect, rose-colored, the 3 inferior segms. somewhat lined and spotted and about 1 in. long. Cape Province.

debilis. Very slender, simple, to 1½ ft.: lvs. 3, with long point, one of them equalling or exceeding the st.: fls. 1–3, white, two of segms. with lilac or red spot, segms. about ¾ in. long. S. Afr.

dracocephalus. St. simple, 2 ft. or less: lvs. to 1½ ft. long and 1 in. broad: fls. few. yellowish-green and spotted dull purple, tube much curved and 2 in. or less long, upper segms. hooded and to 1 in. broad. S. Afr.

gandavensis. An old garden form that long persisted and plants of similar character are yet seen: sturdy late-blooming plant with broad lvs.: spike dense and rather long: fls. of medium size, bright red and red-yellow, streaked and pencilled, the upper segms. horizontal or hooded. Hybrid, *G. psittacinus* being stated as one parent and *G. cardinalis* the other, but *G. oppositifolius* may be involved; important foundation of much later breeding.

gracilis. St. very slender, to 2 ft.: lvs. 2–3, linear and apparently terete, rigid: fls. 2–5, fragrant, pale blue or lilac, segms. unequal, limb to 1½ in. long, the lowest longest and prominently cuspidate. S. Afr.

grandis. St. slender and terete, to 2½ ft.: lvs. 2–3, linear, strongly ribbed, to 1½ ft. long: fls. 1–5, fragrant, yellowish and tinged purplish-brown, tube to 2½ in. long and segms. shorter. S. Afr.

hirsutus. St. hairy, simple, to 2 ft.: lvs. 4–6, rigid and very strongly ribbed, short, hairy: fls. 3–6, bright red, tube 1½ in. long and segms. of similar length. S. Afr.

hortulanus. HORTULAN or GARDEN GLADIOLI. An inclusive group, for the prevailing cult. kinds of gladiolus to which no recognized botanical specific name will now apply, which cannot be included in any of the species. They are perhaps descendants more or less directly from *G. psittacinus*, variously obscured and modified. They are large strong very floriferous plants of sturdy growth, and heavy spikes of fls. in many shades and markings, but most of them with tints of lilac and violet, the upper segms. sometimes hooded and often the fl. spread wide open. There are hundreds of named vars. or seedlings.

ignescens. Much like *G. psittacinus* in fl., but with very long narrow lvs. which are 5 or 6 and nearly or quite basal: st. 2–3 ft.: spikes 2–4-fld., very open: perianth scarlet, 3 in. long, the upper segm. horizontal. Madagascar.

illyricus (*G. Reuteri*). To 1½ ft. or more: lvs. 6–10 in. long, slender, sheaths 2-edged: fls. 4–8, reddish changing to bluish, the basal segm. somewhat acute and exceeding the obtuse lower lateral segms., anthers shorter than filaments. Eu.

imbricatus. To nearly 3 ft.: lvs. 2 or 3, one of them developed into a rather broad ribbed blade about equalling st.: fls. 6–10, purple-red, opening wide, lower segms. with lighter marks, anther shorter than the filament. Eu.

inflatus. Lvs. 3, very narrow or subterete and rigid, the longest exceeding the st.: fls. 1–4, pink, the curved tube to 1 in. long, and the limb of equal or somewhat greater length, 3 upper segms. to ¾ in. broad. S. Afr.

Leichtlini. St. 2 ft.: lvs. 4, about 12 in. long and less than 1 in. broad: fls. 6–8, bright red, the 3 lower smaller segms. red at tip, then yellow, and bearing minute red spots. Transvaal.

oppositiflorus. St. 3–4 ft., sometimes branched: lvs. about 4, to 1½ ft. long and 1 in. broad: fls. many in a 2-sided spike, white, about 3 in. long, segms. acute. S. Afr.

orchidiflorus. St. mostly simple, to 1½ ft.: lvs. 3 or 4, linear, to 1 ft. long: fls. 4–6, greenish-yellow, tube ½ in. long, upper segm. hooded and 1 in. long, 3 lower ones decurved. S. Afr.

paluster (*G. triphyllus*). To 1½ ft.: lvs. about 3, lowest one rather broad, ribbed, and about equalling the st.: fls. 3–5, purple-red, with short curved tube and lower segms. rather longer, perianth not flaring, anther shorter than filament. Eu.

primulinus. St. 2–4 ft., stout: lvs. about 3, to 1½ ft. long and 1 in. broad: fls. 3–5, primrose-yellow throughout, upper segms. hooded and 2 in. long and more than 1 in. broad, 3 lower much smaller and deflexed, central upper segm. drooping like an eye-lid. Rain-forests, trop. Afr.—Now entering into horticultural kinds with notable results. See *G. Quartinianus*.

psittacinus. St. 3–4 ft.: lvs. about 4, rigid, to 2 ft. long and 2 in. broad: fls. several or many, 3 in. or more long, upper segms. hooded and dark crimson, lower much smaller mixed red and yellow. S. Afr.—Early cult.

Quartinianus. St. 2–3 ft., strong: lvs. 3 or 4, rigid, to 1½ ft. long and ¾ in. broad: fls. 6–9, blood-red to pale yellow, 3 in. or more long, upper segms. hooded, lower ones deflexed and much smaller. Trop. Afr.—*G. primulinus* is thought by some to be a color-form of this species.

recurvus. St. slender, to 2 ft.: lvs. 3, middle one 1 ft. or more long, lowest little more than a sheath: fls. 3–6, fragrant, about 3 in. long, 3 upper segms. broad and lilac, lower segms. yellow with mauve or lilac markings. S. Afr.

Reuteri: *G. illyricus*.

Saundersii. St. 2–3 ft.: lvs. 4–6, strongly ribbed, to 2 ft. long and 1 in. broad: fls. 6–8, bright scarlet with large white blotch on 3 lower shorter segms., upper segms. acute and 1 in. broad. S. Afr.

segetum. CORNFLAG. St. 2 ft. and more: lvs. 3 or 4, about 1 ft. long: fls. bright purple, open or flaring, the segms. obovate-obtuse, anther longer than filament. Medit. region; sometimes seen S.

triphyllus: *G. paluster*.

tristis. St. simple, to 2 ft.: lvs. 3, terete, to 1½ ft. long, 3–5-ribbed: fls. 3 or 4, fragrant, yellowish-white with purplish on the keels, the curved tube to 2 in. long. Var. concolor. Fls. nearly or quite white. S. Afr.

undulatus. Little plant, 1 ft. high: lvs. 4–6, to 1 ft. long and ¾ in. broad: fls. 4–6, about 3 in. long, milk-white with red keels. S. Afr.

villosus. St. simple, to 2 ft.: lvs. 3, the lower without blade, the others to 1 ft. long and linear, sheaths hairy: fls. 3 or 4, bright red or lilac, about 2 in. long. S. Afr.

Watsonius. St. very slender, to 1½ ft.: lvs. about 3, one of them with blade to 1 ft. long, the others little more than sheaths: fls. 1–4, bright red, the curved tube to 2 in. long, wide open, the segms. acute. S. Afr.

GLADWIN: *Iris fœtidissima.*

GLAND: properly a secreting part or prominence or appendage, but often used in the sense of gland-like.

GLASSWORT: *Salicornia.*

GLAUCIDIUM. *Ranunculaceæ.* A small herbaceous genus native in Japan and China, having alternate lvs., solitary fls. with 4 petal-like sepals, no petals, and numerous stamens, and fr. a follicle. One species is sometimes grown in the rock-garden.

palmatum. Per. to 2 ft. and more: lvs. palmately lobed, maple-like: fls. rich violet, large. Japan.

GLAUCIUM. HORNED-POPPY. SEA-POPPY. *Papaveraceæ.* Glaucous herbs with orange-colored juice, lobed or dissected lvs., and large yellow or red solitary fls.; grown as annuals in the flower-garden. They thrive in any garden soil in sunny locations. Propagated by seeds.

corniculatum (*G. phœniceum*). Ann. to 1½ ft.: fls. red with black spot at base of each petal: fr. bristly-hairy, linear. Eu.

flavum (*G. luteum*). Per. or bien. to 3 ft.: fls. golden-yellow or orange, 2 in. across: fr. linear, to 1 ft. long. Eu.; nat. in E. N. Amer. Var. **tricolor** has parti-colored fls.

leiocarpum. Per. to 1½ ft.: fls. yellow: fr. to 4 in. long. Medit. region.

luteum: *G. flavum.*

phœniceum: *G. corniculatum.*

tricolor: *G. flavum* var.

GLAUCOTHEA: *Erythea armata.*

GLAUCOUS: covered with a "bloom" or a whitish substance that usually rubs off. See *Pruinose.*

GLAUX. *Primulaceæ.* One succulent but not showy closely lvd. per. herb native in salt-marshes and sea-coasts of the northern hemisphere. **G. maritima.** To 1 ft., pale or glaucous: lvs. opposite, oval or oblong, to ½ in. long: fls. with purplish or white calyx and no petals, very small, solitary in the axils; sometimes planted in brackish places.

GLAZIOVA: *Syagrus.*

GLECOMA: *Nepeta hederacea.*

GLEDITSIA. HONEY LOCUST. *Leguminosæ.* Large broad-headed deciduous usually spiny trees with pinnate lvs., small greenish polygamous fls. mostly in racemes, and large flattened pods.

Honey locusts are planted as specimens and for shade; they are adapted to most soils, but *G. sinensis* and *G. horrida* are not hardy North. Propagated by seeds which should previously be soaked in hot water, or rare varieties may be grafted on *G. triacanthos.*

aquatica (*G. monosperma*). WATER or SWAMP LOCUST. To 60 ft., with simple somewhat flattened spines to 5 in. long: pods oval, 1–2 in. long, usually with 1 seed. S. C. to Fla. and Tex.

caspica. To 40 ft., very spiny: pods to 8 in. long, curved. W. Asia.

horrida (*G. japonica*). To 70 ft., with simple or branched somewhat flattened spines to 4 in. long: pods to 1 ft. long, twisted. Japan, China.

japonica: *G. horrida.*

macracantha. To 50 ft., with large spines: pods to 1 ft. long, somewhat convex. China.

monosperma: *G. aquatica.*

sinensis. To 40 ft., with conical often branched spines: pods to 7 in. long, almost straight. China.

texana. Hybrid between *G. triacanthos* and *G. aquatica*: pods to 5 in. long, straight.

triacanthos. HONEY or SWEET LOCUST. To 140 ft., with simple or 3-branched spines to 4 in. long, unarmed in var. **inermis**: pods to 1½ ft. long, becoming twisted. Pa. to Fla. and Tex. Var. **Bujoti** has drooping branchlets.

GLIRICIDIA. *Leguminosæ.* Trees and shrubs native in trop. Amer., with pinnate lvs., papilionaceous fls. in racemes, and flat pods with thickened margins; grown for ornament in warm regions and along roadsides and boundaries.

maculata: *G. sepium.*

sepium (*G. maculata*). MADRE. To 30 ft.: fls. pink, or lilac, and white, in profusion in spring before the lvs.: pods to 5 in. long. Cent. Amer., Colombia.

GLOBE-FLOWER: *Trollius europæus.*

GLOBULARIA. *Globulariaceæ.* Herbs and subshrubs with alternate lvs. and small fls. in globular heads; native mostly in the mts. of S. Eu. and Asia. Adapted to the rock-garden where they need partial shade and well-drained soil. Propagated by seed or division.

Alypum. To 2 ft., shrubby: lvs. oblong, 3-toothed at apex or entire: fls. violet-blue, the heads to ¾ in. across. S. Eu.

cordifolia. Prostrate subshrub to 4 in.: lvs. obovate or spatulate, about 1 in. long, notched only at tip: fls. blue, the heads about ½ in. across. S. Eu.

nana. Prostrate, sts. woody: lvs. club-shaped, entire, ⅙ in. or less long: fls. bluish, the heads ½ in. across. S. Eu.

nudicaulis. Per. to 10 in.: lvs. obovate, to 3 in. long, entire: fls. blue, the heads to ¾ in. across. S. Eu.

trichosantha. GLOBE-DAISY. Per. to 8 in.: lvs. spatulate, to 1 in. long, finely toothed: fls. blue, the heads about ½ in. across. Asia Minor.

vulgaris. Per. to 1 ft.: lvs. obovate or lanceolate, nearly entire: fls. blue, rarely white. S. Eu., Caucasus.

GLOBULARIACEÆ. GLOBULARIA FAMILY. Three genera of herbs and shrubs native in S. Eu. and S. W. Asia, with alternate simple lvs., bisexual fls. in dense bracted heads, having 5-parted calyx, 2-lipped gamopetalous corolla, 4 stamens, superior 1-celled ovary, and fr. a nutlet inclosed in the calyx. The family is placed near Acanthaceæ in the natural sequence. Only Globularia is grown for ornament.

GLOMERATE: in dense or compact cluster or clusters.

GLORIOSA. GLORY-LILY. *Liliaceæ.* Climbing herbs with tuberous roots, lvs. prolonged into tendrils, and red or yellow lily-like fls. solitary in the axils of the upper lvs., the perianth-segms. distinct and reflexed or spreading.

Glory-lilies are grown under glass, and out-of-doors in the South. Tubers should be potted from January to March for bloom in summer and autumn. Propagated by offsets or division of the tuber.

Roehrsiana: a garden plant; probably a form of *G. Rothschildiana*.

Rothschildiana. Lvs. broadly lanceolate: fls. crimson, yellow and whitish at base, to 3 in. long, the perianth-segms. broadly lanceolate and sometimes wavy-margined, strongly reflexed. Trop. Afr.

superba. Lvs. lanceolate: fls. yellow changing to red, to 3 in. long, the perianth-segms. narrowly lanceolate and much crisped, usually reflexed. Trop. Afr. and Asia. Var. **grandiflora** is a hort. form.

GLORY-BOWER: *Clerodendrum*.

GLORY-BUSH: *Tibouchina*.

GLORY-FLOWER: *Eccremocarpus*.

GLORY-OF-THE-SNOW: *Chionodoxa*.

GLOSOCOMIA: *Codonopsis clematidea*.

GLOTTIPHYLLUM. *Aizoaceæ*. Genus separated from Mesembryanthemum (which see for cult.): per., stemless or nearly so: lvs. soft and pulpy, long, entire, mostly tongue-shaped or strap-shaped, yellowish-green: fls. large, yellow; stigmas 7–10. S. Afr.

linguiforme (*M. linguiforme*). Lvs. 2-ranked, tongue-shaped, 3 in. long, deflexed: fls. short-stalked; styles 8.

longum (*M. longum. M. pustulatum*). Lvs. long-tongue-shaped, depressed or erect, to 4 in. long, often pustulate or blistered at the base: fls. long-stalked; styles 9.

GLOXINIA: *Sinningia*.

GLUME: a small chaff-like bract; in particular, one of the two empty bracts at the base of the grass spikelet.

GLYCERIA (*Panicularia*). MANNA-GRASS. *Gramineæ*. Mostly tall per. grasses with flat lvs. and spikelets borne in terminal panicles; native in wet places in Eu., Asia and N. Amer. They are coarse meadow grasses of moist lands, and sometimes planted for ornament in wettish places. See *Grasses*.

aquatica (*G. spectabilis*). Differs from its American representative, *G. grandis*, in the larger pale spikelets. Eu., Asia.

grandis. REED MEADOW-GRASS. To 5 ft.: lvs. to 1 ft. long and ½ in. wide, rough above: panicles 1 ft. or more long, the spikelets usually purple. N. Amer.

spectabilis: *G. aquatica*.

GLYCINE. *Leguminosæ*. Herbs twining or erect, with pinnate lvs., papilionaceous not showy fls. in axillary racemes, and narrow long pods which are constricted between the seeds; native in Old World tropics.

One species is grown as a forage and cover-crop, green-manure, and the seeds sometimes for human food. Seeds should be sown in drills 18–20 inches apart in rows 2½–3 feet apart after danger of frost is over.

Apios: *Apios tuberosa*.

floribunda: *Wisteria floribunda*.

hispida: *G. Max*.

Max (*G. Soja. G. hispida. Soja Max*). SOYBEAN. Hairy ann. to 6 ft., erect: lvs. of 3 ovate lfts.: fls. white or purple, not conspicuous: pods to 3 in. long, brown and hairy, hanging. China, Japan.—Much grown.

sinensis: *Wisteria sinensis*.

Soja: *G. Max*.

GLYCOSMIS. *Rutaceæ*. Small spineless evergreen trees or shrubs, one of them a good ornamental under glass and in the open in Fla.: lvs. pinnate: fls. small, white and fragrant, in panicles; stamens 10: fr. berry-like. **G. pentaphylla** (*G. cochinchinensis*), India, Malaya and Philippines, is a bush: lfts. mostly 5–7 but sometimes only 1, long lance-oblong to 6 in. long: fr. about ⅓ in. diam., pinkish and translucent, with 1 or 2 seeds.

GLYCYRRHIZA. LICORICE, LIQUORICE. *Leguminosæ*. Per. herbs or subshrubs with pinnate lvs., papilionaceous fls. in axillary racemes or spikes, and short flattened pods; one species is grown for economic purposes, the roots furnishing licorice.

Licorice should be grown in rich moist soil. Propagated by division of the roots as well as by seeds.

glabra. To 3 ft.: lfts. ovate: fls. pale blue. Medit. region.

GLYPTOSTROBUS. *Pinaceæ*. One small Chinese tree differing from the genus Taxodium chiefly in the elongated rather than peltate cone-scales. **G. pensilis** (*G. sinensis. G. heterophylla*). Lvs. deciduous, linear and 3-ranked or imbricated and scale-like on the fruiting branches: cones ovoid, ¾ in. long. Once planted in N. C., and may stand in protected places as far north as N. Y.

GMELINA. *Verbenaceæ*. Trees and shrubs of Asia and Australia, sometimes planted on our southern borders: lvs. opposite: fls. yellow or brownish, irregular, 2-lipped, in panicled cymes or racemes: fr. a fleshy drupe.

arborea. Deciduous tree to 60 ft.: lvs. cordate-ovate, to 9 in. long, entire, pubescent beneath: panicles to 1 ft. long: fr. ¾ in. long. India, Malaya.

GNAPHALIUM. *Compositæ*. Woolly herbs of wide distribution, having alternate lvs. and heads of small obscure disk-fls.; pappus of bristles; somewhat on the order of everlastings. Sometimes planted for ornament.

lanatum: *Helichrysum petiolatum*.

Leontopodium: *Leontopodium alpinum*.

sylvaticum. Per. to 1½ ft.: lvs. linear, to 2 in. long: heads ¼ in. long, in spikes, bracts of involucre yellowish with brown spot toward tip. Eu., N. Asia, N. E. N. Amer.

GNETACEÆ. GNETUM FAMILY. Three widely distributed genera, of which only Ephedra is occasionally cult., although this genus has recently been segregated in a separate family, Ephedraceæ. It includes the remarkable Welwitschia (or Tumboa) of S. W. trop. Afr. The family is one of the gymnosperms (with the conifers). Trees or shrubs with large or scale-like lvs., unisexual fls., and fleshy or winged frs. The plants have little ornamental value.

GOAT-NUT: *Simmondsia californica*.

GOATS-BEARD: *Aruncus, Tragopogon*.

GOATS-RUE: *Galega officinalis*.

GOBO: *Arctium Lappa*.

GODETIA. *Onagraceæ*. Ann. flower-garden herbs related to Œnothera, commonly erect, with narrow alternate lvs., showy bright red, lilac, purple or white diurnal fls. in leafy racemes or spikes, and capsular frs.

Godetias should have light soil and sunny exposure. Propagated by seeds sown where wanted or under glass for transplanting.

amœna. FAREWELL-TO-SPRING. Slender to 3 ft., mostly an open grower, with scattered fls.: lvs. linear to lanceolate, to 2 in. long: fls. lilac-crimson or red-pink varying to white, to 2 in. across, often double: caps. 1½ in. or more long, slender. Calif. to B. C. Var. **Lindleyi** has a large spot in center of petals.

Bottæ. Slender, to 3 ft.: lvs. linear to lanceolate, to 2½ in. long: fls. pink or light crimson, to 2 in. across. S. Calif.

densiflora: *Boisduvalia densiflora.*

grandiflora (*Œnothera Whitneyi*). Stout, to 1 ft., compact and very leafy: lvs. oblong, to 1½ in. long: fls. aggregated, rose-red varying to white, with darker blotch in center of petals, to 5 in. across: caps. sessile, less than 1 in. long. Calif.—Known in several dwarf or condensed cult. forms.

lepida. Rather tall, erect, branched, the st. flattened above: lvs. oblong- to ovate-lanceolate: fls. rather close together near ends of branches, about 1¼ in. across, petals pale purplish with darker spot in middle at end: caps. short and thick, gray-hairy. Calif.—Little known in cult.

Lindleyi: *G. amœna* var.

parviflora. Branching from base, the sts. a few in. to 2 ft. or more long: lvs. narrow-lanceolate to linear, to 1 in. long: fls. rose-red, to ¾ in. long. Calif.

quadrivulnera. Simple or branched, to 18 in.: lvs. obovate or oblong, the upper ones much narrower: fls. scattered or separated, lilac or pale crimson with darker spot near apex of more or less dentate petals, about ¾ in. across: caps. sessile, 4-sided, ½–1 in. long. Calif. to Columbia River.—Little seen in cult.

rubicunda is a lilac-crimson color-form of *G. amœna.*

Schwaminii is a more or less double-fld. pink form of *G. amœna.*

viminea. Strict, short-branched, to 3 ft., sts. whitish: lvs. linear to lanceolate, entire: fls. purple or crimson with dark center, petals to 1 in. long. Calif., Ore.

Whitneyi: *G. grandiflora.*

GOLD-DUST: *Alyssum saxatile.* **-Tree:** *Aucuba japonica* var. *variegata.*

GOLDEN-BELLS: *Emmenanthe penduliflora, Forsythia.* **-Chain:** *Laburnum anagyroides.* **-Club:** *Orontium aquaticum.* **-Cup:** *Hunnemannia fumariæfolia.* **-Eardrops:** *Dicentra chrysantha.* **-Glow:** *Rudbeckia laciniata* var. *hortensia.* **-Shower:** *Cassia Fistula.* **-Star:** *Chrysogonum virginianum.* **-Stars:** *Bloomeria crocea.* **-Top:** *Lamarckia aurea.* **-Tuft:** *Alyssum saxatile.* **-Wave:** *Coreopsis Drummondii.*

GOLDENRAIN-TREE: *Kœlreuteria paniculata.*

GOLDENROD: *Solidago.*

GOLDENSEAL: *Hydrastis canadensis.*

GOLDFIELDS: *Baeria.*

GOLD-FLOWER: *Hypericum Moserianum.*

GOLDILOCKS: *Linosyris vulgaris.*

GOLDTHREAD: *Coptis.*

GOMESA. *Orchidaceæ.* Brazilian epiphytes with 2–3-lvd. pseudobulbs and yellowish-green fls. in pendulous racemes, the dorsal sepal and petals similar, the lip shorter than sepals; do best in the temperate house. See *Orchids.*

planifolia. Pseudobulbs about 2 in. high: fls. yellowish-green, in many-fld. racemes to 8 in. long, the sepals and petals partially united and slightly wavy, the lip with 2 crests, June–July.

GOMPHOCARPUS. *Asclepiadaceæ.* Per. herbs or subshrubs differing from Asclepias in the hoods without crests or appendages; one species grown out-of-doors in Calif.

textilis. To 3 ft.: lvs. opposite, linear-lanceolate, about 3 in. long: fls. white with violet-lobed crown: fr. bladdery, pale green with bristly hairs, to 4 in. long. Habitat unknown.

GOMPHOLOBIUM. *Leguminosæ.* Australian shrubs with simple or compound lvs., yellow or red papilionaceous fls., and ovoid or globular inflated pods; one species may be planted in S. Calif.

latifolium. Large glabrous shrub: lvs. digitate, of 3 linear or linear-lanceolate lfts. to 2 in. long: fls. yellow, 1 in. or more across, in loose racemes, the keel densely fringed.

GOMPHRENA. *Amaranthaceæ.* Erect or prostrate per. and ann. herbs, *G. globosa* grown as an "everlasting," having clover-like, white, red or violet heads; useful for bedding, for cut-fls. and for winter decoration. For cult. see *Everlastings;* grown readily from seeds.

decumbens. Ann., prostrate or decumbent, the much branched sts. to 2 ft. long: lvs. oblong or oval, to 3 in. long: heads subtended by 2 bracts, white, ½ in. or less across. Tex., Mex. to S. Amer.

globosa. Globe Amaranth. Ann., erect, branching, somewhat stiff, to 1½ ft.: lvs. oblong to elliptic, to 4 in. long, ciliate on edge: heads subtended by 2 leafy bracts, purple, orange, rose, white, variegated, about 1 in. across, not as papery as most everlastings. Old World tropics. Var. **aurea** has yellow fls.

Haageana. Per. to 2½ ft. but grown as ann.: lvs. oblanceolate to oblong-linear, to 4 in. long: heads subtended by 2 bracts, light red with yellow florets, 1 in. across. Tex., Mex.

nitida. Ann. to 2½ ft., usually erect: lvs. obovate to oval, to 2½ in. long: heads subtended by 2 lvs., bracts white, ½ in. across. Ariz. to Mex.

GONGORA. *Orchidaceæ.* Trop. American epiphytes having pseudobulbs which bear 2 plaited upright lvs. and a pendulous raceme from near the base, the fls. with the dorsal sepal and the small petals attached to the column, the lateral sepals spreading and the lip with 2 horned lobes and the central lobe saccate; grown in the temperate greenhouse. For cult. see *Orchids.*

Charlesworthii: *G. Scaphephorus.*

galeata (*Acropera Loddigesii*). Pseudobulbs about 2½ in. long: lvs. to 1 ft. long and 2½ in. wide: fls. brownish-yellow, in racemes to 8 in. long, June–Aug. Mex.

Scaphephorus (*G. Charlesworthii*). Pseudobulbs 3 in. long: fls. yellowish-white spotted purple-brown, fragrant, in 12–20-fld. racemes to 2 ft. long. Peru.

GONIOLIMON: *Limonium.*

GONIOPHLEBIUM: *Polypodium subauriculatum.*

GOOBER: *Arachis hypogæa.*

GOODENIACEÆ. Goodenia Family. Herbs, subshrubs or rarely shrubs of 12 genera mostly in Australia, characterized by bisexual fls. with very small calyx, 5-lobed corolla, 5 stamens, inferior or partially superior 1–2-celled ovary, and fr. a caps., drupe or nut. The genus Leschenaultia may be planted in S. U. S.

GOODIA. *Leguminosæ.* Australian shrubs with compound lvs. of 3 entire lfts., papilionaceous fls. in racemes, and flat pods; one species is grown in S. Calif. for ornament.

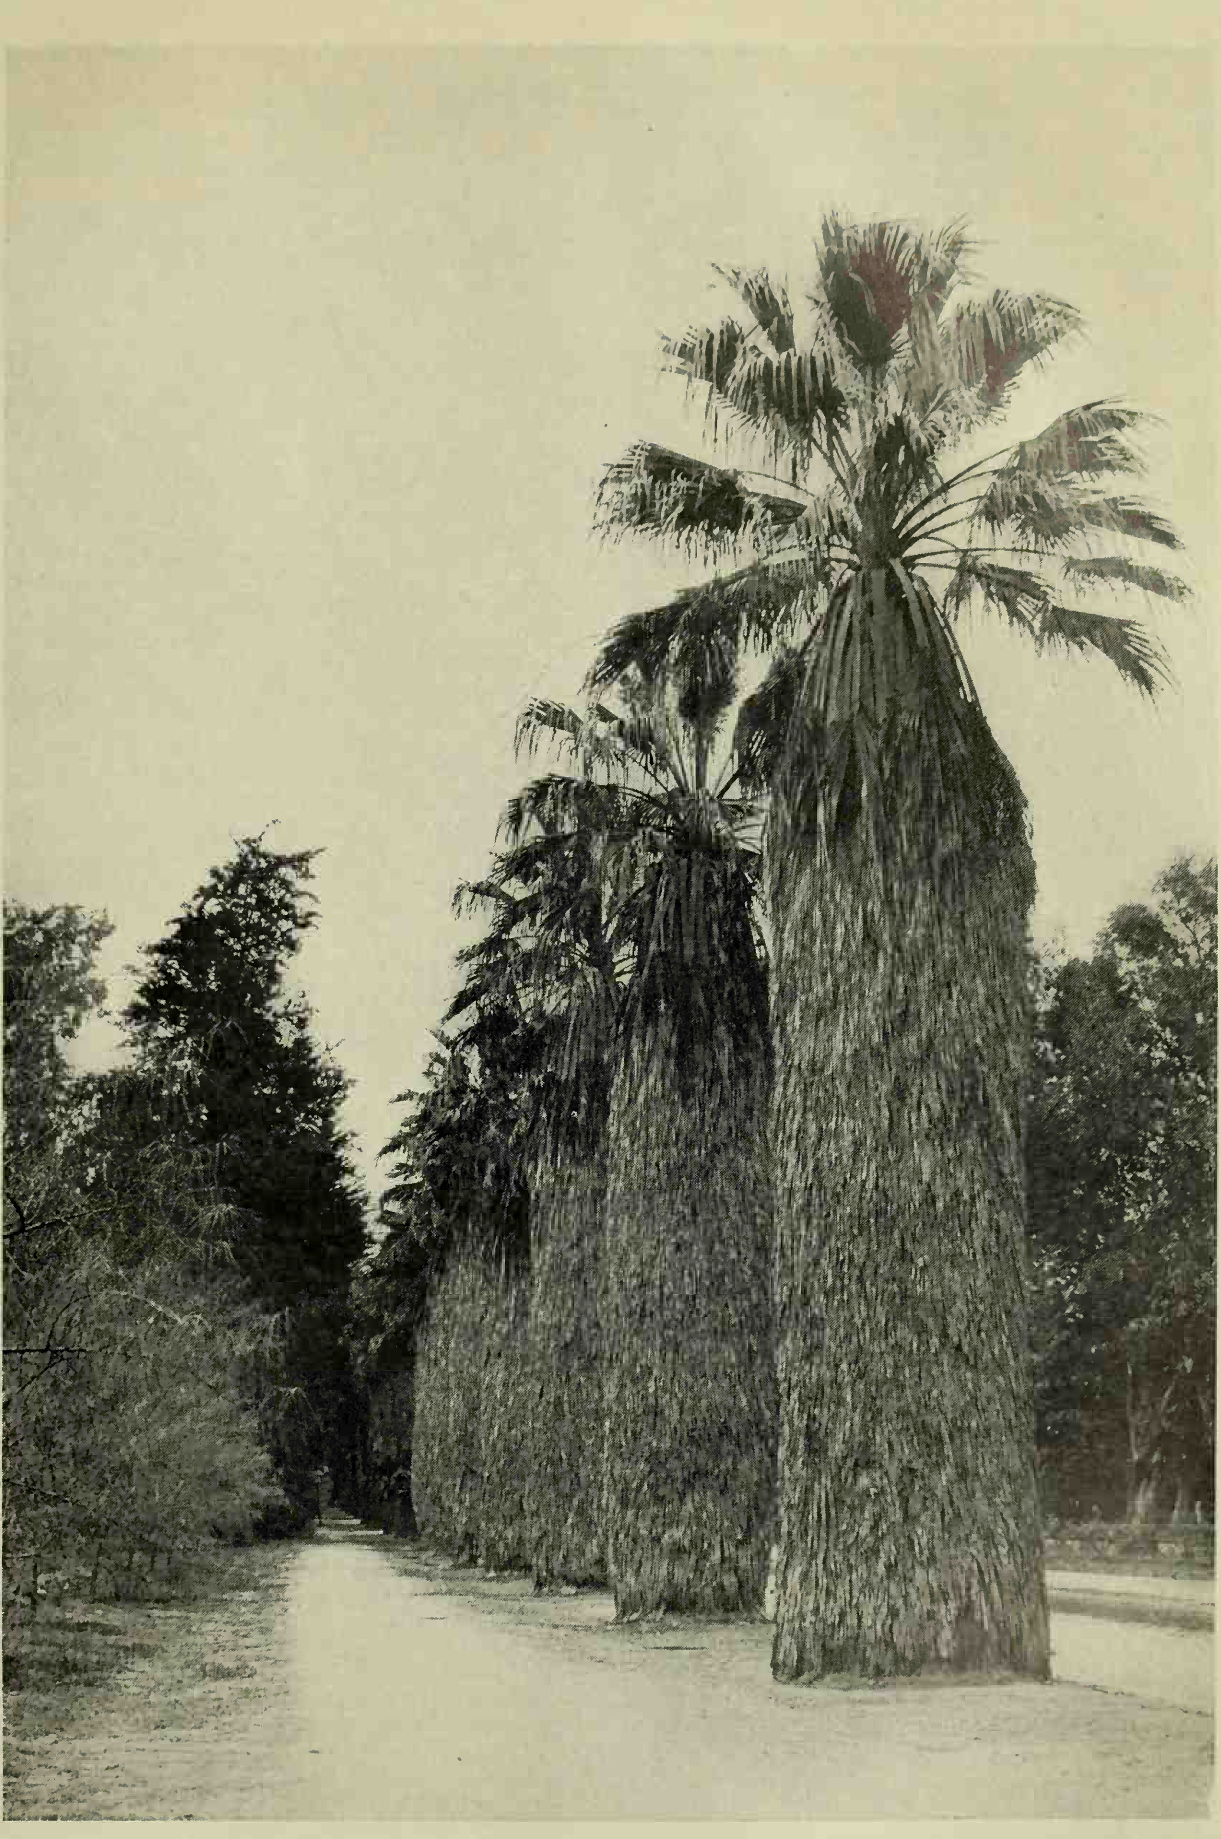
lotifolia. Tall, much branched: lfts. ovate, to ¾ in. long: fls. yellow, the standard purple at base, in racemes to 4 in. long: pods to 1 in. long.

GOOD KING HENRY: *Chenopodium Bonus-Henricus.*

GOODYERA: *Epipactis, Hæmaria.*

GOORA NUT: *Cola acuminata.*

GOOSEBERRY: *Ribes;* see *Currant.* **Barbados-:** *Pereskia aculeata.* **Cape-:** *Physalis peruviana* and



VIII. California Fan-Palm. — *Washingtonia filifera* in its characteristic stateliness and beauty when planted so that it may develop and remain naturally

pruinosa. Ceylon-: *Dovyalis hebecarpa.* Hill-: *Rhodomyrtus tomentosa.* Otaheite-: *Phyllanthus acidus.* -Tree: *Phyllanthus acidus.*

GOOSEFOOT: *Chenopodium.*

GORDONIA. *Theaceæ* (*Ternstrœmiaceæ*). Trees or shrubs in warm Asia and 2 in the U. S., with alternate simple lvs., showy white fls. solitary in the axils, and capsular frs.; the American species below are hardy in the southern states and succeed in moist peaty or sandy soil. Propagated by seeds, layers or greenwood cuttings under glass.

alatamaha (*Franklinia alatamaha. G. pubescens*). The specific name is commonly but not originally spelled *altamaha.* Tree to 20 ft., deciduous: lvs. to 6 in. long, bright green and shining above, pale beneath, turning scarlet in autumn: fls. 3 in. across, very short-stemmed. Ga., but now known only in cult.; hardy to Mass.; blooms in autumn.

anomala: *G. axillaris.*

axillaris (*G. anomala*). Large evergreen shrub: lvs. to 6 in. long, dark green above: fls. to 3 in. across, nearly sessile. S. China.

Lasianthus. LOBLOLLY BAY. To 60 ft., evergreen: lvs. to 6 in. long, dark green and shining above: fls. 2½ in. across, long-stemmed. Va. to Fla. and La.

pubescens: *G. alatamaha.*

GORMANIA. *Crassulaceæ.* A few low per. sedum-like plants of W. U. S., with horizontal rootstocks, spatulate to ovate or nearly orbicular flat blunt lvs. similar in the basal and cauline parts but the latter smaller: fls. yellow to red, in terminal clusters; petals 5, united at base, and stamens 10: carpels many-seeded.

laxa. Green and glabrous, to 12 in. high: lvs. spatulate, about ¾ in. long: fls. pink or red, nearly ½ in. long, in a loose cluster 4 in. across. Ore.

obtusata (*Sedum obtusatum*). Green or somewhat glaucous, to 6 in. high: lvs. spatulate, to ¾ in. long: fls. yellow, with acute or acuminate segms. little longer than filaments, in a rather narrow cluster. Calif., in the Sierras.

oregana (*Sedum oreganum*). Green, to 6 in. high: lvs. spatulate-cuneate, less than ¾ in. long: fls. bright yellow fading pink, the narrow long segms. much surpassing the stamens, in a compound cluster to 3 in. across. N. Calif. to Alaska.

GORSE: *Ulex.*

GOSSYPIUM. COTTON. *Malvaceæ.* Trop. shrubs, or woody herbs, sometimes tree-form, of eastern and western hemispheres, with alternate lvs. which are palmately lobed or ribbed, large white, yellow or purplish fls. in an involucel of bracts, and capsular frs. or "bolls" whose seeds bear fleece or lint furnishing the cotton of commerce, and sometimes with an additional fuzz or wool. The different species and races are supposed to be extensively hybridized, and the botany of the genus is difficult. The origin of the cult. cottons is not well understood.

Cotton is grown as an annual field crop in the southern United States. It requires a long season and plenty of moisture throughout the growing period, and dry weather for harvesting. About 1 bushel of seed is customary to plant an acre. The rows should be 3–4 feet apart and the plants in the row 1–2 feet apart. It is rarely grown as an ornamental plant, and it usually does not thrive in economic collections under glass; it is strictly not a horticultural subject and is not further discussed in this Hortus.

arboreum. TREE C. of INDIA. To 10 ft., with trailing branches: lvs. 3–7-lobed two-thirds or more their depth: fls. purple-red, the bracts of involucel united at base: seeds with persistent fuzz. Old World.

barbadense. SEA-ISLAND or TREE C. To 8 ft.: lvs. 3–5-lobed half or more their depth: fls. yellow tinged purple, bracts of involucel nearly or quite distinct: seeds without persistent fuzz, bearing a long staple. Trop. Amer.

brasiliense. Closely resembling *G. barbadense* but with larger lvs. and fls.: lvs. glabrous, cordate, lobes 5 and acuminate and the middle one longest. Trop. Amer.

herbaceum. LEVANT C. Ann. herb: lvs. 5–7-lobed less than half their depth: fls. yellow with purple center, bracts of involucel joined at base: seeds with persistent gray fuzz. Arabia, Asia Minor.

hirsutum. UPLAND C. Ann. or mostly so, to 5 ft.: lvs. 3-lobed about half their depth: fls. white or light yellow, becoming pink or purple, the involucel bracts not united: seeds with persistent greenish fuzz. Trop. Amer.; probably the principal source of American upland cottons. Var. **religiosum** is of trailing or climbing habit, with pubescent lvs. and rust-colored fuzz.

indicum. CHINESE or INDIAN C. Small ann. or per.: lvs. 3-lobed to about half their depth: fls. yellow, in involucel bracts united at base: seeds with persistent reddish fuzz. E. Asia.

mexicanum. MEXICAN C. Shrubby: lvs. 3–5-lobed to about one-third their depth: fls. pale yellow or white tinged pink, bracts of involucel not joined: seeds with persistent gray fuzz. Mex.

obtusifolium. CEYLON or ORIENTAL C. Shrub: lvs. 3–5-lobed to less than half their depth: fls. yellow with purple center, involucel bracts united: seeds with pubescent gray or reddish fuzz. Ceylon.

peruvianum. PERUVIAN C. Lvs. divided half or three-fourths their depth: fls. yellow, involucel bracts distinct; seeds with persistent gray, rusty or greenish fuzz. Cent. and S. Amer.

punctatum. JAMAICA C. Woody: lvs. divided one-half their depth: fls. yellow with brown center, involucel bracts distinct: seeds with persistent gray or rusty fuzz. Trop. Amer., Afr.

vitifolium. Closely resembling *G. barbadense* but the lvs. hairy beneath and fls. often thrice longer than involucel. Trop. Amer.

GOURD. A general or indefinite name applied to various kinds of cucurbits, plants allied to the pumpkins, cucumbers and melons. The yellow-flowered gourds of American gardens are *Cucurbita Pepo* var. *ovifera;* the white-flowered gourds are *Lagenaria leucantha.* The snake or serpent gourds are either *Lagenaria leucantha* or *Trichosanthes Anguina.* White or wax gourd is *Benincasa hispida.* Dishcloth gourds are Luffas, mostly *L. cylindrica.* The maté gourd of Paraguay, used as a utensil, is a small form of *Lagenaria leucantha.* Gooseberry gourd is *Cucumis Anguria,* hedgehog gourd *C. dipsaceus,* cranberry gourd *Abobra tenuifolia* and ivy gourd *Coccinia cordifolia.* Calabash gourds are *Lagenaria leucantha,* but the calabash itself is not a gourd but the fruit of a tropical tree, *Crescentia Cujete.* Sometimes the word gourd is applied in a general way to all the cultivated species of Cucurbita. In North America the word is employed for fruits grown as ornaments or curiosities rather than for food.

All the gourds denoted above are annual plants (or treated as such) of the simplest cultivation, requiring the treatment accorded pumpkins, cucumbers and melons. Seeds are commonly sown where the plants are to stand, as soon as the weather is warm and settled. If wanted earlier, they may be started in pots or boxes, but they do not transplant readily if the roots are disturbed. All of them are frost tender. The vines make good screens and covers if given support. See *Cucurbita, Pumpkin.*

GOURLIEA. *Leguminosæ.* Probably only one species, native of Chile. **G. spinosa** (*G. chilensis. G. decorticans* and var. *subtropicalis. Lucuma spinosa*). Small spiny tree to 12 ft.: lvs. of 3 pairs of small ovate lfts.: fls. orange-yellow streaked red, in short loose racemes: fr. about 1 in. diam., brownish. In S. Calif.

GOUTWEED: *Ægopodium Podagraria.*

GOVERNORS-PLUM: *Flacourtia indica.*

GRABOWSKIA. *Solanaceæ.* Spiny shrubs with entire sometimes fleshy lvs., small funnel-shaped violet, pale blue or whitish fls. with exserted stamens, and fr. a berry; native in S. Amer., one grown in Calif. for ornament.

boerhaaviæfolia (*G. glauca*). Lycium-like shrub with graceful drooping habit, axillary spines ¼ in. long: lvs. oval to oblong, to 1½ in. long, gray-green: fls. white or pale blue, inconspicuous, in clusters or solitary: fr. to ½ in. long. Peru.

glauca: *G. boerhaaviæfolia.*

GRAFTAGE (French *greffage*) comprises the general subject of propagating or growing plants by means of a cutting or part taken from one plant and inserted on another. The reasons for the operation are chiefly two: to perpetuate a variety or variation (as Fameuse apple or Caractacus rhododendron) that does not come true from seed and is not readily raised from cuttings; to propagate a species that does not produce seed in its adopted country and does not grow acceptably from cuttings. It differs from the making of cuttings in the fact that the severed part, or cion, grows on another plant, or stock, rather than in the soil; the particular variety or species does not grow on its own root.

There are two general kinds of grafting, differing in practice but not in principle,—one of which inserts a piece of branch in the stock (grafting proper), and one that employs only a bud with little or no wood attached (budding). In both cases the success of the operation depends on the growing together of the cambium of the cion (or cutting) and that of the stock. The cambium is the new and growing tissue which lies underneath the bark and on the outside of the growing wood. Therefore, the line of demarcation between the bark and the wood should coincide when the cion and stock are joined. The greater part of grafting and budding is performed when the cion or bud is nearly or quite dormant, that is, usually in winter and early in spring, and budding may be undertaken then, or late in summer when the buds have nearly or quite matured.

When the parts are joined, the wounded or exposed surfaces are securely covered with wax or bandage to prevent evaporation as well as to hold the cions and surfaces securely in place. A good wax for covering the exposed parts is made as follows: Resin 4 parts by weight; beeswax, 2 parts; tallow, 1 part. In making the wax, the materials are first broken up and melted together. When thoroughly melted the liquid is poured into a pail or tub of cold water. It soon becomes hard enough to handle, and it is then pulled and worked over until it becomes tough or "gets a grain," at which stage it attains the color of very light-colored manila paper. When wax is applied by hand, the hands must be well greased. Hard cake tallow is the best material for this purpose. In top-grafting large trees in the open, it is well to carry a reserve supply of tallow when waxing, by smearing the backs of the hands before entering the tree.

Melted paraffin has lately been employed with good results to cover even green not dormant cions,—buds, wounds and all. This prevents loss of moisture and allows grafting to be undertaken over a good part of the year.

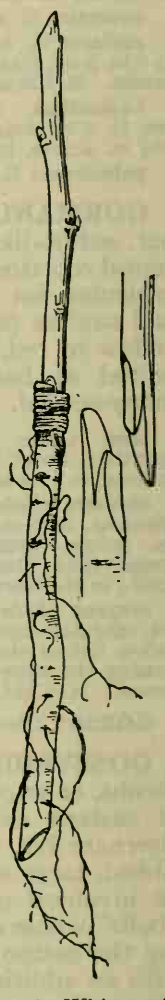


Fig. 1. Whip-graft. At right, the stock and cion ready to be joined. Left, the parts put together and tied.

As the prime object of grafting is to perpetuate a kind of plant that does not reproduce itself from seed or of which seed is very difficult to obtain, cions or buds are therefore taken from this plant and set into whatever kind of stock is available on which they will grow. Thus, if one wants to propagate the Fameuse apple, one does not for that purpose sow seeds of it, but takes cions or buds from a Fameuse tree and grafts them into some other apple tree. The stocks are usually obtained from seeds. In the case of the apple, young plants are raised from seeds obtained mostly from cider mills, without reference to the variety from which they came. When the seedlings have grown to a certain age, they are budded or grafted; and thereafter they bear fruit like that of the tree from which the cions were taken. In this example the cion and stock are of the same species, *Pyrus Malus*, but in other cases the two may represent quite different kinds of plants; and in that case one must make sure that the two parts are congenial the one to the other. Thus, the pear is made dwarf by grafting it on the quince; *Magnolia Soulangeana* varieties may be grown on *M. acuminata;* spruces of different species may be successfully grafted on the Norway spruce.

Grafting proper, as we have seen, is the insertion of a small branch (or cion), usually bearing more than one bud. In grafting on small stocks, it is customary to employ the whip-graft (Fig. 1). Both stock and cion are cut across diagonally, and a split made in each, so that one fits into the other. The graft is tied securely with a band, and then, if it is above ground, it is also carefully waxed.

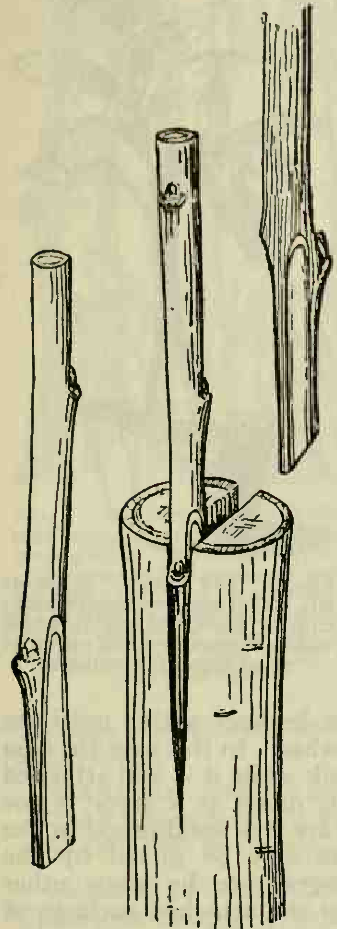

Fig. 2. Cleft-graft. Stock in center, with one cion set and another one to be set on the right; at the left, to show how the cion is shaped.

In larger limbs or stocks out-of-doors the usual method is the cleft-graft. This consists in cutting off the stock, splitting it from the top for a short distance and inserting a wedge-shaped cion in one or both sides of the split, taking care that the cambium layer of the cion matches that of the stock. The exposed surfaces are then securely covered with wax. Grafting in the open is usually performed early in the spring, just before the buds swell. The cions should have been cut before this time, when they were perfectly dormant. Cions may be stored in sand in the cellar or in the ice house, or they may be buried in the field. The object is to keep them fresh and dormant until they are wanted.

If it is desired to change the top of an old plum, apple or pear tree to some other variety, it is usually accomplished by means of the cleft-graft (Fig. 2). If the tree is very young, budding or whip-grafting may be employed. On an old top the cions should begin to bear when three or four years old. All the main limbs should be grafted. It is important to keep down the suckers or water-sprouts from around the grafts, and part of the remaining top should be cut away each year until the top is entirely changed over (which will result in two to four years).

For grafting small mostly pot-grown material under glass the veneer-graft is commonly employed (Figs. 3, 4). The cion is cut to a slant at the lower end and then shaved or champered to correspond with a matrix in the stock. The two are bound together, with raffia or waxed cord, and as the subjects are usually kept close in a frame to prevent drying out, the work is not sealed with wax. Many woody ornamental plants are grafted in this fashion.

Budding consists in inserting a bud underneath the bark of the stock, and the commonest practice is that shown in the illustration. Budding is mostly performed in July, August and early September, when the bark is still loose or will peel. Twigs are cut from the tree which it is desired to propagate, and the buds are cut off with a sharp knife, a shield-shaped bit of bark (with possibly a little wood) being left with them (Fig. 5). The bud is then shoved into a slit made in the stock, and it is held in place by tying with soft strand. In two or three weeks the bud will have "stuck" (that is, it will have grown fast to the stock), and the strand is cut to prevent its strangling the stock. Ordinarily the bud does not grow until the following spring, at which time the entire stock or branch in which the bud is inserted is cut off an inch above the bud; and the bud thereby receives all the energy of the stock. Budding is the commonest grafting operation in nurseries. Seeds of peaches may be sown in spring, and the plants which result will be ready for budding the same August. The following spring, or a

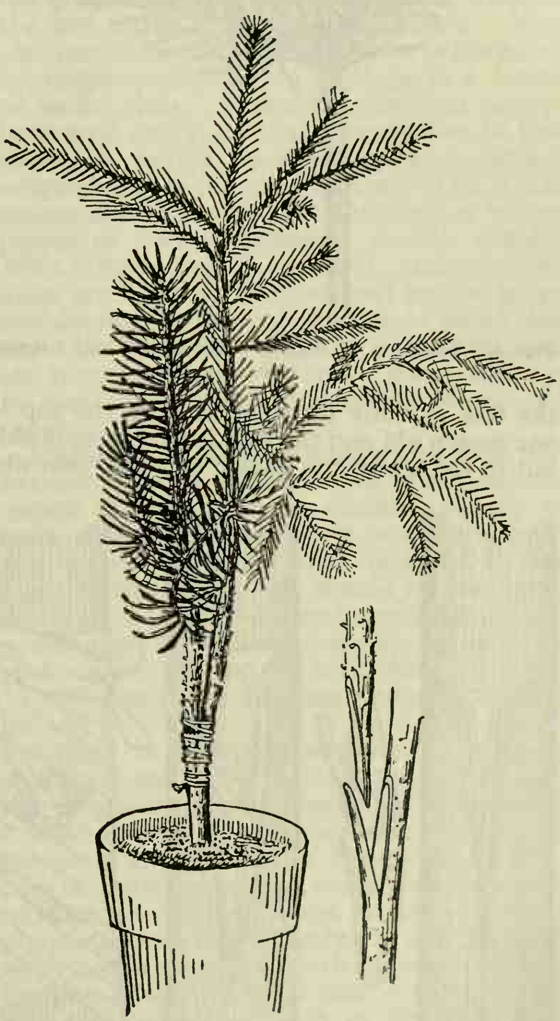

Fig. 3. Veneer-graft, or side-graft; method of making the cuts is shown in the detail.—Norway spruce.

year from the planting of the seed, the stock is cut off just above the bud (which is inserted near the ground), and in the fall of that year the tree is ready for sale; that is, the top is one season old and the root is two seasons old, but in the trade it is known as a one-year-old tree. In apples and pears the stock is usually two years old before it is budded, and the tree is not sold until the top has grown two or three years. Budding may be performed also in the spring, in which case the bud grows the same season. Budding is always undertaken in young branches or parts, preferably in those not more than one year old.

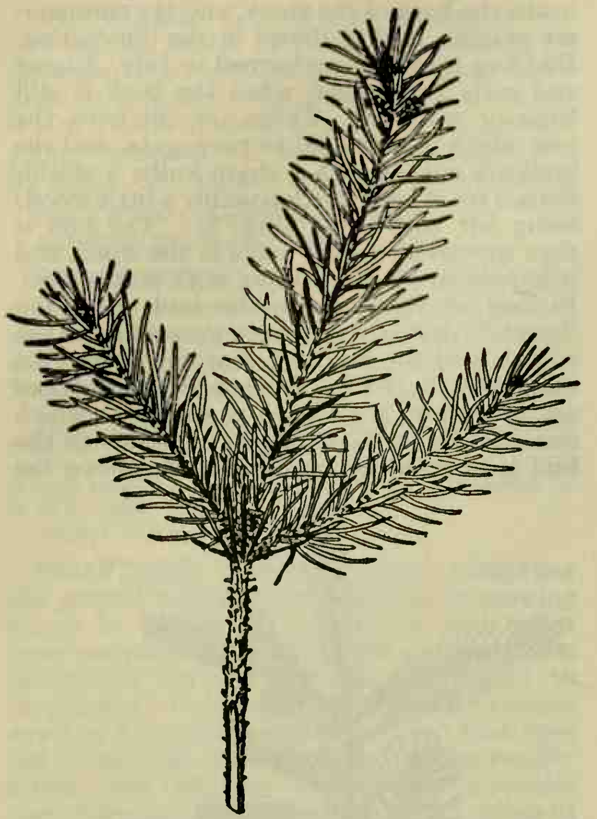

FIG. 4. The cion of Fig. 3.—About one-half natural size.

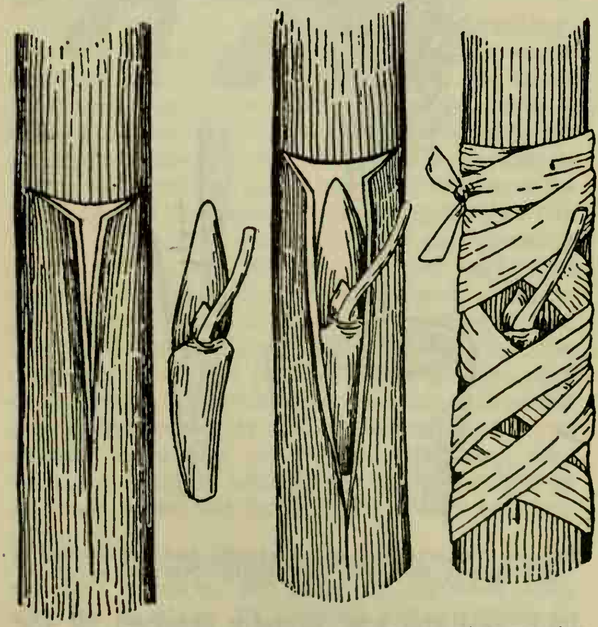

FIG. 5. Budding. Left: the bark opened to receive the bud; the bud; the bud inserted; tied.

Many other fashions of preparing the stock and cutting the cion are employed for particular plants and to satisfy the preference of the grafter. The consultant interested in the subject may consult the Standard Cyclopedia of Horticulture and other more detailed writings.

Inarching, sometimes called "grafting by approach," is a special method when union between cion and stock takes place slowly and with difficulty and the cion must therefore be kept active until the two are grown together. In this case the cion is joined to the stock while it is still attached to its parent plant, much as a layer is not severed until roots are well established in the ground. The parts may be joined by the tongue of a whip-graft or by some other method (sometimes the attached surfaces of cion and stock being only cut away to young wood) and then tied together securely and waxed. When union has taken place, the cion is cut back at the top and it is severed from its own branch; it is then permanently transferred to the stock. Fig. 6 illustrates the method.

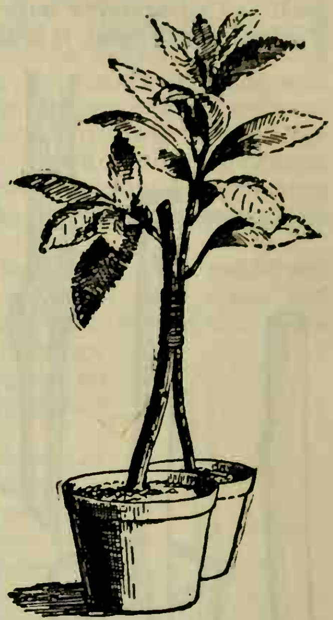

FIG. 6. The inarch. Stock at left, which has been headed back; cion or inarch at right, which will be severed from its own root when union is complete.

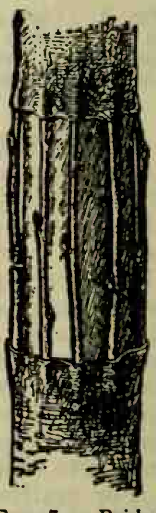

FIG. 7. Bridge-grafting, in which the cions are inserted under the bark.

Bridge-grafting is not a method of propagation but only a means of healing or overcoming wounds. Oftenest it is employed when a tree is girdled. The wound is trimmed away on either edge to fresh clean bark and wood, and long cions cut wedge-fashion at either end are slipped underneath the bark below and above the wound as in Fig. 7, or nailed in exposed channels as detailed in Fig. 8. The bark over the cion-ends is then firmly tied to keep them securely in place, and sometimes a small tack is driven through either end of the cions. The work is then waxed over to protect wound and cions alike. Shoots should be prevented from growing from the cions. In due time the wound is bridged by the ring of cions, and eventually should be completely covered by a new solid growth of wood. G. W. Peck writes in Cornell Extension Bulletin No. 154 and from which Fig. 8 is adapted: "It is a waste of time to bridge-graft a tree with small undeveloped puny cions. If large one-year-old shoots are not available, two-year-old vigorous growths will be found to give good satisfaction."

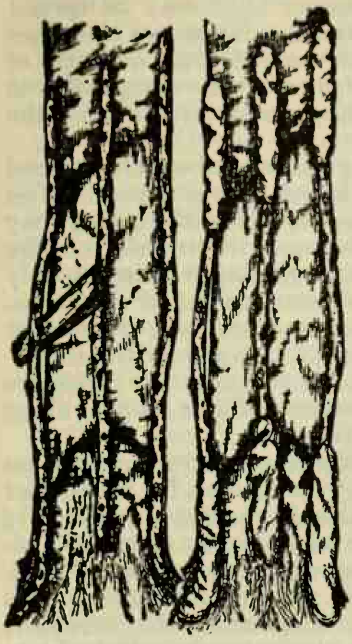

FIG. 8. Another form of bridge-grafting, a process of repair not of propagation. The cions are nailed at the ends, and then waxed as at the right. To allow for movement of the trunk, a wedge is sometimes placed under the cions at the middle to make them bulge or curve outward.

GRAHAMIA: *Helenium aromaticum.*

GRAM: *Phaseolus aureus* and *Mungo.*

GRAMINEÆ: see Grasses.

GRAMMATOPHYLLUM. *Orchidaceæ.* Epiphytes having pseudobulbs, thick strap-shaped lvs., and showy fls. in loose many-fld. racemes, the sepals and petals nearly equal, the lip smaller. For cult. see *Orchids.*

speciosum. Fls. to 7 in. across, yellow spotted with brown, the fl.-scape to 6 ft. high and bearing as many as 100 fls. Malaya, Philippine Isls.

GRANADILLA: *Passiflora.*

GRAPE. Species of Vitis (which see) grown for the berry-like fruits. The grape in some of its many species, hybrids and races is grown over the greater part of North America except the regions of extreme cold. Of the native species, the Fox grape type (*Vitis Labrusca*) is of greatest importance and with its hybrids is the mainstay of grape-growing east of the Rocky Mountains, reaching its greatest perfection in the fruit regions of the Hudson Valley and in proximity to the Great Lakes. The Old World grape (*V. vinifera*) grows to advantage only in the mild climate of the Pacific coast and adjacent parts, particularly California where it is grown very extensively, making up nearly three-fourths of the commercial grape crop of the United States. The native Muscadine grape (*V. rotundifolia*) is grown in the cotton-belt as a home and local fruit but has little general commercial importance. These groups comprise three cultural classes. To these classes may be added the growing of grapes under glass, for which a separate discussion is required.

Soils of various kinds yield good grapes provided they are fairly deep and well drained. Sandy or gravelly clay loams are most desired. Usually better success results in soils not too fertile, as the resulting over-vegetative condition is likely to be non-fruitful and difficult to control. Grapes are naturally drought-resistant.

Propagation of most of the eastern-grown varieties of grapes is by stem-cuttings about one foot in length made from prunings. These are taken in winter and are stored in moist sand or sawdust to callus. The cuttings are planted out in the nursery-row in early spring, placing the top bud level with the surface of the ground; they make marketable vines at the end of the first or second season. New and rare varieties are sometimes propagated by single-eye hardwood cuttings in a frame or under glass. Muscadine cuttings cannot be rooted easily, so that propagation of this species is mainly by stem-layers, a method adapted also to the other species. Old World grapes must be grafted on cuttings or young plants of native American stocks, usually *Vitis riparia* and *V. rupestris*, otherwise the vines are likely to be destroyed by the grape root-louse (Phylloxera), in regions where the pest has been introduced. If the viniferas are grown on their own roots, propagation is by means of cuttings of dormant one-year-old canes.

Planting and distance vary with region and variety. Either one-year or two-year-old rooted cuttings may be planted, usually in early spring. In the East rows are commonly 8–10 feet apart with vines 8 to 10 feet apart in the rows which should extend north and south. On arbors and against buildings a vine may occupy more space. Muscadine grapes are planted 12 x 12 feet, or even 15 x 20 feet with vigorous varieties on rich ground.

Tillage is a prime requisite. The most successful cultural method is to plow or disk the vineyard in late autumn or early spring and till continuously throughout the growing season or until the last of July when a cover-crop of clover, oats, rape, cowhorn turnips or a mixture of some of them is sown. Home plantings may be successful in sod provided the vines are mulched with manure or straw to keep down the grass and if they receive nitrate. Nitrate of soda at the rate of 1 pound to the vine applied in early spring helps to stimulate growth on poorer soils. Potash is sometimes beneficial. A complete fertilizer may also benefit the vines indirectly by its effect on the cover-crop.

Pruning of the vine is essential to success in grape-growing. To understand the pruning of American vineyard grapes, the operator must grasp this principle: *Fruit is borne on wood of the present season, which arises from wood of the previous season.* To illustrate: A growing shoot or cane of 1930, makes buds. In 1931 a shoot arises from each bud; and near the base of this shoot the grapes are borne (1 to 4 clusters on each shoot). While every bud on the 1930 shoot may produce shoots or canes in 1931, only the strongest of these new canes bear fruit. The skilled grape-grower can tell by the looks of his cane (as he prunes it in winter) which buds will give rise to the best grape-producing wood the following season. The larger and stronger buds usually give best results; but if the cane itself is very big and stout, or if it is very weak and slender, he does not expect good results from any of its buds. A hard well-ripened cane the diameter of a man's little finger is the best size. Another principle to be mastered is this: *A vine should bear only a limited number of clusters,*—say 30 to 80. A shoot bears clusters near its base; beyond these clusters the shoot grows on into a long leafy cane. An average of two clusters may be reckoned to a shoot. If the vine is strong enough to bear 60 clusters, 30 good buds must be left at the pruning (which is December to late February).

The essential operation of pruning a grape vine, therefore, is each year to cut back a limited number of good canes to a few buds, and to cut off entirely all the remaining canes or wood of the previous season's growth. If a cane is cut back to 2 or 3 buds, the stub-like part that remains is called a spur. Present systems, however, cut each cane back to 8 or 10 buds (on strong varieties), and 3 or 4 canes are left,—all radiating from near the head or trunk of the vine. The top of the vine does not grow bigger from year to year, after it has once covered the trellis, but is cut back to practically the same number of buds each year. Since these buds are on new wood, it is evident that they are each year farther and farther removed from the head of the vine. To obviate this difficulty, new canes are taken out each year or two from near the head of the vine, and the two-year or three-year-old wood is cut away.

At planting the vine is cut back to 3 or 4 eyes, and the roots are well shortened in. The hole in which the plant is to be set should be large enough to allow a full spreading of the roots. Fine soil should be worked around the roots and firmed with the feet. If the season should be dry, a mulch of coarse litter may be spread around the vine. If all the buds start, the strongest one or two may be allowed to grow. The canes arising from these buds should be staked and allowed to grow through the season; or in large plantations the first-year canes may be allowed to lie on the ground. The second year one cane should be cut back to the same number of eyes as the first year. After growth begins in the spring, two of the strongest buds should be allowed to remain. These two canes now arising may be grown to a single stake through the second summer, or they may be spread horizontally on a trellis. These are the canes which form the permanent arms or parts of the vine. From them start the upright shoots which, in succeeding years, are to bear the fruits.

Training of the grape must be distinguished from pruning, although one is dependent on the other. A dozen systems of training may be practiced on the same trellis and from the same style of pruning,—for training is only the disposition or arrangement of the parts. On arbors, it is best to carry one permanent arm or trunk from each root over the framework to the peak. Each year the canes are cut back to short spurs (of 2 or 3 buds) along the sides of this trunk.

In the East grapes are grown mostly on two-wire trellises; the lower wire is 2½ feet above the ground and the second wire 2½ feet higher. The wires are attached to 7–8-foot posts at intervals of every three vines. There are various systems of training. In one of the best, known as the four-cane Kniffin system, a single trunk is brought to the top wire. From this trunk four canes are allowed to grow, two at the level of each wire, one being tied along the wire in each direction at each level. These four side arms are renewed every year, using the new canes that arise from spurs near the trunk. In this and in other systems of trellis pruning it is aimed to leave about 30 to 40 buds to the vine. On arbors more buds are left as the vines have more room. In pruning arbor vines about half or three-quarters of the previous season's growth is removed, always leaving the more vigorous wood.

The vinifera grapes require much the same mode of pruning as the others except that in field culture they are usually not trained on wires or even to posts. The old trunk is kept short and stump-like, by constant pruning forming a head of short branches and spurs. The canes are cut back every year nearly to this head. A mature head after four or more years will bear 5 to 20 spurs, depending on variety, vigor, distance of planting and other factors.

In harvesting table grapes the mature clusters are cut carefully from the vines with a knife or shears and placed in shallow boxes or trays which are hauled to the packing-house. A large part of the eastern crop is packed in climax baskets and sold either in the local or general market. Grape-juice factories take large quantities of grapes in some districts. Much of the California crop is dried for raisins.

Yields vary greatly. In the East vines trained on trellises may be expected to yield at the rate of 10 to 20 pounds (25–60 bunches) of fruit to the vine, or 3–5 tons an acre depending on the variety and the vigor of the vines. Individual vines on arbors may yield more than this. Some long-keeping varieties, as Catawba, can be held in common storage at about 40° F. for three to five months. At 30° F. an even longer storage season is possible. In California the acre yields are usually greater than in the East.

Because of the great variation in hardiness, ripening season, and resistance to disease the planter, in choosing varieties, should be sure that they are adapted to his particular region. Many varieties are self-sterile so that two or more should be planted near together. Varieties are listed below in order of their ripening. Commercial varieties are starred.

Short-season varieties for the East of more than average hardiness: Moore Early, Winchell, Champion, Early Daisy, Campbell Early, Jessica, Lucile, Lady.

Varieties adapted to fruit regions of New England, New York and Michigan: Winchell, *Moore Early, Campbell Early, Diamond, *Worden, *Delaware, *Concord, Herbert, *Niagara, Agawam, Barry, *Catawba.

Varieties requiring a long season to be grown only in regions south of New York: Iona, Missouri Reisling, Catawba, Pocklington, Jefferson, Goethe, Triumph.

Varieties recommended for Florida: Csaba, Brilliant, R. W. Munson, Ives, *Carman, *Ellen Scott, Armalaga, Fern, Herbemont.

Muscadine varieties for planting in the South: Eden, Scuppernong, Thomas, Flowers, James, Mish.

Varieties of bunch grapes successful in the southern states: Moore Early, Winchell, Diamond, Brighton, Delaware, Ives, Carman, Catawba, Jefferson, Herbemont.

Vinifera varieties grown as table grapes on the Pacific Coast: Mission, Muscat of Alexandria, Malaga, Thompson Seedless, Flame Tokay, Purple Cornichon, Emperor, Almeria.

Varieties of good keeping quality: Vergennes, Catawba, Mills, Herbert, Barry, Agawam, Canandaigua, Dutchess, Lindley.

In many parts of the East, grapes yield sufficient fruit for home use without spraying of any kind. Frequently, however, the diseases black-rot and downy-mildew may largely destroy fruit and foliage. Control of both is possible by thorough spraying with bordeaux mixture, 4 pounds copper sulfate, 4 pounds slaked lime, 50 gallons water. This should be applied when the plants are in bloom and several times later at two- to three-week intervals. The grape root-worm is often a destructive pest. Spraying the foliage with powdered lead arsenate 3 pounds to 50 gallons water, when the injury is first seen on the leaves, will help control the insect.

Under glass, or in "the grapery," various kinds of *Vitis vinifera* may be grown successfully either with heat or without it. With careful choice of varieties and the protection that may be given both vine and fruit, and the skill that is likely to be applied by the gardener in such circumstances, superior grapes for the table may be produced; it is an old and accepted method in horticultural annals, although it has fallen into relative disuse.

The grapery may be a glass lean-to against a building or wall, or a separate independent structure. The method of growing is the same in either case. The vines are set about 4 feet asunder in a single row or line in the space between the central walk and the side of the structure. The roots are supposed to feed both inside and outside the house, openings being left in the foundation to allow them to reach the outer border. A good deeply prepared outside border several feet wide is required, and it has been customary to underlay this with a sloping cement, brick or rubble bottom to insure quick drainage of surface water; much of course depends on the particular place and climate. Weeds and bushes should not be allowed to grow on the border. One strong cane is trained up under the glass roof but hanging some 18 inches below it. This vine is pruned to spurs. The number of clusters is controlled by the pruning; and if there is likely to be too many, some of the buds may be removed. If the grapery is heated, clusters may be left to ripen on the vines till November and December. Usually the vines are laid down and covered for the winter, the heat being discontinued. The leading variety for growing under glass is Black Hamburg, particularly for the cold grapery. Alexandria, Barbarossa, Chasselas Musque, Gros Coleman, Muscat Hamburg, are among those more particularly adapted to the warm grapery or long-ripening season.

GRAPEFRUIT: *Citrus paradisi*; see *Citrus Fruits* (page 156).

GRAPE, OREGON-: *Mahonia nervosa.* **Sea-:** *Coccolobis uvifera.* **Tail-:** *Artabotrys.*

GRAPTOPETALUM. *Crassulaceæ.* Segregate from the American species formerly included in Cotyledon, native in Ariz. and Mex., distinguished particularly by rotate corolla with petals united at base and illustrated with dots or transverse bands: stemless or nearly so, with thick lvs. forming a small rosette as in Echeveria. Five or 6 species are known; Byrnesia (which see) has been placed in this genus by the latest writer. The graptopetalums are little known in cult., but will be prized by fanciers of succulents as fast as available. **G. Orpetii** is recently described, and growing in Calif.: rosettes to about 3 in. diam., the lvs. acuminate and cuspidate, glabrous: fl.-sts. about 3 in. tall: fls. about ½ in. across, yellow marked red. Ariz.

GRAPTOPHYLLUM. *Acanthaceæ.* Shrubs with opposite often colored lvs. and red or purple tubular 2-lipped fls. in short cymes or panicles; native in Australia and Polynesia. One is grown in the greenhouse and is now a common shrub in trop. Amer. Propagated by cuttings.

hortense: *G. pictum.*

pictum (*G. hortense*). To 8 ft.: lvs. oval, to 6 in. long, entire, purplish or green marked with yellow: fls. purple or crimson, 1½ in. long, stamens exserted. New Guinea.

GRASS: see *Grasses.* **Aleppo-:** *Holcus halepensis.* **Barnyard-:** *Echinochloa Crus-galli.* **Basket-:** *Oplismenus compositus.* **Beach-:** *Ammophila.* **Beard-:** *Andropogon, Polypogon.* **Bent-:** *Agrostis.* **Bermuda-:** *Cynodon Dactylon.* **Blue-:** *Poa.* **Blue-eyed-:** *Sisyrinchium.* **Bottle-brush-:** *Hystrix patula,* **Brome-:** *Bromus.* **Canary-:** *Phalaris.* **Carpet-:** *Axonopus compressus.* **Centipede-:** *Eremochloa ophiuroides.* **Citronella-:** *Cymbopogon Nardus.* **Cloud-:** *Agrostis nebulosa.* **Colorado-:** *Panicum texanum.* **Cotton-:** *Eriophorum.* **Dune-:** *Elymus arenarius.* **Eel-:** *Vallisneria.* **Esparto-:** *Stipa tenacissima.* **Feather-:** *Stipa.* **Finger-:** *Chloris.* **Fish-:** *Cabomba caroliniana.* **Fountain-:** *Pennisetum Ruppelii.* **Guinea-:** *Panicum maximum.* **Hair-:** *Agrostis hiemalis.* **Hares-tail-:** *Lagurus ovatus.* **Herds-:** *Phleum pratense.* **Hungarian-:** *Setaria italica* var. *nigrofructa,* **Johnson-:** *Holcus halepensis.* **June-:** *Poa pratensis.* **Lawn-, Korean:** *Zoysia japonica.* **Lemon-:** *Cymbopogon citratus.* **Lyme-:** *Elymus.* **Manila-:** *Zoysia Matrella.* **Manna-:** *Glyceria.* **Mascarene-:** *Zoysia tenuifolia.* **Meadow-:** *Poa.* **Meadow-, Reed:** *Glyceria grandis.* **Means-:** *Holcus halepensis.* **Melic-:** *Melica.* **Napier-:** *Pennisetum purpureum.* **Natal-:** *Tricholæna rosea.* **Oat-, Tall:** *Arrhenatherum elatius.* **-of-Parnassus:** *Parnassia.* **Orchard-:** *Dactylis glomerata.* **Palm-:** *Setaria palmifolia.* **Pampas-:** *Cortaderia.* **Para-:** *Panicum barbinode.* **Pepper-:** *Lepidium.* **Plume-:** *Erianthus.* **Quake-:** *Bromus brizæformis.* **Quaking-:** *Briza.* **Rabbit-tail-:** *Lagurus ovatus.* **Ravenna-:** *Erianthus Ravennæ.* **Reed-:** *Phragmites communis.* **Rescue-:** *Bromus unioloides.* **Rhodes-:** *Chloris Gayana.* **Ribbon-:** *Phalaris arundinacea* var. *picta.* **Ruby-:** *Tricholæna rosea.* **Rye-:** *Lolium.* **St.-Augustine-:** *Stenotaphrum secundatum.* **Scurvy-:** *Cochlearia.* **Silk-:** *Agrostis hiemalis.* **Spear-:** *Poa alpina, Stipa.* **Spike-:** *Demazeria sicula, Leptochloa fascicularis.* **Squirrel-tail-:** *Hordeum jubatum.* **Star-:** *Aletris, Hypoxis.* **Sudan-:** *Holcus sudanensis.* **Switch-:** *Panicum virgatum.* **Tape-:** *Vallisneria.* **Tunis-:** *Holcus virgatus.* **Uva-:** *Gynerium sagittatum.* **Velvet-:** *Notholcus lanatus.* **Vernal-, Sweet:** *Anthoxanthum odoratum.* **Whitlow-:** *Draba verna.* **Winter-, Peruvian:** *Phalaris stenoptera.* **Wire-:** *Eleusine indica, Poa compressa,* **Witch-:** *Panicum capillare.* **Zebra-:** *Miscanthus sinensis* var. *zebrinus.*

GRASSES. *Gramineæ.* Horticultural grasses are the kinds grown for ornament and interest in distinction from the pasture and meadow grasses, the forage or fodder kinds, and the cereal grains. Two general purposes are served by the ornamental grasses,—the flower-garden interest, and the lawn-planting interest.

The grasses that find place in the flower-garden are mostly hardy annuals, prized for their feathery or otherwise ornamental sprays which are employed as greenery in living bouquets or dried and used in winter bouquets being prepared as are the other "everlastings" (which see). These annual grasses are grown readily from seeds, usually sown where the plants are to stand in open sunny places. Sometimes the smaller kinds are grown to maturity in pots for table decoration, the little brizas and the delicate kinds of aspris and agrostis being well adapted to the purpose. The leading annual grasses listed as ornamentals are in Agrostis, Anthoxanthum, Aspris, Avena, Brachypodium, Briza, Bromus, Chloris, Coix, Demazeria, Echinochloa, Eleusine, Eragrostis, Euchlæna, Festuca, Holcus, Hordeum, Koeleria, Lagurus, Lamarckia, Oryza, Panicum, Paspalum, Pennisetum, Phalaris, Polypogon, Scleropoa, Secale, Setaria, Syntherisma, Triticum, Zea, Zizania.

The grasses adapted to yard, landscape or border planting are mostly large-growing perennial species; and some of them also yield excellent material for dry bouquets, as the bottle-brush-grass (Hystrix), eulalia (Miscanthus), and pampas-grass. In warm countries the bamboos are commanding examples. See *Bamboo.* The perennial grasses are usually multiplied by division of the clumps or by the stolons or offsets that may arise; seeds (when procurable) should give blooming plants the second year. Important perennial grasses are Agrostis, Aira, Alopecurus, Ammophila, Ampelodesma, Anatherum, Andropogon, Anthoxanthum, Arrhenatherum, Arundinaria, Arundo, Axonopus, Bambusa, Brachypodium, Briza, Bromus, Cephalostachyum, Chloris, Chusquea, Cortaderia, Cymbopogon, Cynodon, Cynosurus, Dactylis, Dendrocalamus, Elymus, Eragrostis, Eremochloa, Erianthus, Euchlæna, Festuca, Glyceria, Gynerium, Holcus, Hordeum, Hystrix, Koeleria, Leptochloa, Lolium, Melica, Miscanthus, Molinia, Neyraudia, Notholcus, Oplismenus, Panicum, Paspalum, Pennisetum, Phalaris, Phleum, Phragmites, Phyllostachys, Poa, Saccharum, Sasa, Setaria, Stenotaphrum, Stipa, Thamnocalamus, Thysolæna, Tricholæna, Trisetum, Uniola, Zoysia.

A third class of grasses comprises the sod-forming kinds employed in the making of sward for lawns, but in this case the plants are not raised and treated separately and need not be separately listed here. See *Lawn.* The meadow and pasture grasses are of the same or similar nature and often the same species, but these kinds are not directly within the purview of this work.

A fourth set of grasses comprises the large forage kinds. These are not specially discussed in this book, although the species are entered. Important fodder and forage grasses are entered under the genera Echinochloa, Eleusine, Euchlæna, Holcus, Panicum, Pennisetum, Setaria, Zea, as well as the herbage of the small grains in the genera Avena, Hordeum, Oryza, Secale, Triticum.

A fifth group includes the cereal grains and sugar-cane, not included here beyond brief accounts of the species under their generic headings, as Avena, Holcus, Hordeum, Oryza, Saccharum, Secale, Triticum, Zea.

GRASS-NUT: *Brodiæa laxa.*

GRASSWORT, STARRY: *Cerastium arvense.*

GRATIOLA. *Scrophulariaceæ.* Herbs with opposite sessile lvs., white or pinkish fls. solitary in the axils, having entire or 2-lobed upper lip and 3-lobed lower lip, and fr. a caps.; rarely cult.

officinalis. Per. to 1 ft., with creeping rhizomes: lvs. lanceolate, toothed: fls. pink or white, with yellow throat, to ¾ in. long, pedicelled. Eu., Asia.

GREASEWOOD: *Audibertia polystachys.* In the West applied also to other plants that are not horticultural subjects and not included here.

GREENBRIER: *Smilax.*

GREENHOUSE. A glasshouse or structure in which plants are maintained or grown. Originally the word was applied to those houses in which plants are merely preserved or kept green in the winter, but this signification is now little known in America. Special types of glasshouses are the conservatory, in which plants are kept or displayed; stove or hothouse, in which plants are grown in a high temperature; the propagating pit, in which the multiplication of plants is carried forward; forcing-house in which special plants are made to yield their products far out of their natural period or sequence; and the houses of various temperatures, as cold, cool and intermediate.

GREENOVIA: see under *Sempervivum.*

GREENS. Pot-herbs are sometimes known as "greens," particularly those that come in early spring when green food is specially welcome. Such greens may be spinach, kale, dandelion, dock, pigweed and other plants grown or gathered that make acceptable eating when cooked in a pot. Accounts of the most important of these plants will be found under their appropriate alphabetic entries.

Christmas greens, or "green," are various kinds of plants that hold their foliage and color in winter and can be employed in decoration. Some of these plants are grown for the purpose, but the larger part of the durable ones are gathered from the wild including such kinds as holly, laurel, galax, smilax. The indiscriminate and destructive gathering of such wildings is to be discouraged, and other means of Christmas decoration should be developed for the large undertakings. It is more important to the education and the sentiment of the people that wild life be protected than that showy temporary public displays of this nature, of growths unrelated to plant-growing and environment, be multiplied.

GREGORIA: *Douglasia Vitaliana.*

GREIGIA. *Bromeliaceæ.* S. American terrestrial herbs with stiff lvs. in rosettes and rose-colored fls. in a simple infl. For cult. see *Bromeliaceæ;* sometimes grown for ornament and oddity.

sphacelata. To 3 ft.: lvs. spreading or recurving, spiny-margined: fls. rose, in dense axillary heads, bracts spiny. Chile.

vulcanica. St. very short: lvs. 2 ft. or more long spiny-margined, white-scaly beneath: fls. with white tube and red spreading segms., in heads to 3 in. across. Colombia.

GREVILLEA. *Proteaceæ.* Shrubs and trees with alternate lvs., bisexual fls. borne in pairs in a raceme and having long filiform showy styles, and fr. a leathery follicle; native in Australia and New Caledonia.

Grown for ornament and avenue trees in warm regions and sometimes as juvenile pot-plants in the greenhouse. Propagated by seeds.

Banksii. Shrub or tree to 20 ft.: lvs. with 3–11 linear or lanceolate segms. to 4 in. long, margins revolute, silky-tomentose beneath: fls. red, in dense terminal secund racemes to 4 in. long. Queensland. Vars. **alba** and **Forsteri** are listed.

bipinnatifida. Shrub to 4 ft., sometimes prostrate: lvs. to 4 in. long, pinnately cut into 9–21 oblong or pinnatifid segms.: fls. red, in loose secund racemes to 4 in. long, sometimes panicled. W. Australia.

crithmifolia. Shrub to 4 ft.: lvs. to 1 in. long, pinnately cut into 3–5 narrow-linear segms.: fls. in short dense sessile racemes. W. Australia.

Endlicheriana. Shrub to 7 ft.: lvs. linear, to 4 in. long, silvery-pubescent on both sides: fls. in dense racemes to ¾ in. long, said to be mauve. W. Australia.

eriostachya. Shrub to 6 ft.: lvs. narrow-linear, to 8 in. long, usually pinnately cut into 3–5 segms.: fls. in dense secund terminal tomentose racemes to 6 in. long. W. Australia.

Hilliana. Tree to 60 ft.: lvs. entire, deeply divided at end into 2 or 3 lobes, or pinnatifid into 5–7 lobes, to 1 ft. long, silvery-pubescent beneath: fls. red varying to pink and white, in dense cylindrical axillary racemes to 8 in. long. Queensland, New S. Wales.

juniperina (*G. sulphurea*). Small shrub: lvs. spreading, linear, stiff and pungent-pointed, to 1 in. long, margins revolute, silky-pubescent beneath: fls. pale yellow or tinged with red, in very short sessile racemes. New S. Wales.

leucopteris. Shrub to 8 ft.: lvs. 1 ft. or more long, pinnate into narrow-linear segms. to 10 in. long, tomentose beneath: fls. in loose many-fld. panicled racemes to 4 in. long, said to be white. W. Australia.

obtusifolia. Spreading or procumbent much branched shrub: lvs. oblong-linear, margins revolute, rusty-pubescent beneath: fls. in short loose secund racemes. W. Australia.

oleoides. Shrub: lvs. linear or lanceolate, to 4 in. long, margins recurved, tomentose beneath: fls. bright red, in short nearly sessile racemes. New S. Wales, Victoria.

ornithopoda. Glabrous shrub: lvs. to 3½ in. long, divided into 3 lanceolate lobes: fls. small, in short axillary racemes, said to be white. W. Australia.

paniculata. Shrub to 8 ft.: lvs. 1–2-divided into 3 terete pungent-pointed segms.: fls. small, in axillary short racemes. N. Australia.

polybotrya. Tall shrub: lvs. oblong or oblong-lanceolate, to 1½ in. long: fls. in dense cylindrical panicled racemes or spikes to 2 in. long. N. and W. Australia.

punicea. Small shrub: lvs. oblong or nearly oval, to 2 in. long, margins recurved, tomentose beneath: fls. bright red, in short dense racemes. New S. Wales.

robusta. SILK-OAK. Tree to 150 ft. but sometimes grown as a decorative pot and florists plant: lvs. fern-like, 2-pinnate into lanceolate entire or lobed segms. with recurved margins: fls. orange, in secund racemes to 4 in. long on short leafless branches. Queensland, New S. Wales.—Formerly much grown from seeds in pots under glass as a decorative subject.

rosmarinifolia. Shrub to 6 ft.: lvs. linear, to 1½ in. long, margins revolute, silky-pubescent beneath: fls. reddish, in short dense sessile racemes. New S. Wales.

sulphurea: *G. juniperina.*

Thelemanniana. Shrub to 5 ft.: lvs. to 2 in. long, divided into many linear segms.: fls. pink tipped with green, in secund terminal racemes to 1½ in. long. S. and W. Australia.

Wilsoni. Glabrous shrub to 5 ft.: lvs. 2–3-ternately divided into linear stiff pungent-pointed segms. to 1 in. long: fls. in loose racemes. W. Australia.

GREWIA. *Tiliaceæ.* Trees and shrubs native to warm regions in the Old World, with alternate simple lvs., small fls. solitary or cymose, and fr. a drupe; sometimes planted for ornament.

caffra. Shrub or small tree: lvs. oblong, to 3 in. long, finely toothed: fls. purple. S. Afr.; grown in S. Calif. and similar regions.

occidentalis. Shrub: lvs. ovate, to 2 in. long, toothed: fls. purple. S. Afr.; to be grown in mild climates.

parviflora. Shrub to 8 ft.: lvs. ovate, to 5 in. long, toothed: fls. pale yellow. China, Korea; stands in S. New England.

GREYIA. *Melianthaceæ.* Small S. African trees and shrubs with alternate simple lvs., showy fls. in axillary racemes, and fr. a leathery caps.; one showy species is planted for ornament in the S. and Calif. or sometimes under glass. Propagated by seeds or cuttings of half-ripened wood.

Sutherlandii. Small tree but blooming as a little bush: lvs. orbicular to oblong, to 3 in. long, heart-shaped at base, coarsely and irregularly toothed: fls. bright scarlet, petals about ½ in. long, in dense racemes to 10 in. long, the showy stamens long-exserted.

GRINDELIA. Gum-Plant. *Compositæ.* Coarse per. herbs native in W. N. Amer., with alternate lvs. and rather large solitary heads (usually gummy) of yellow ray- and disk-fls.; pappus of deciduous awns or bristles.

Sometimes grown for ornament in the regions where they grow, succeeding on poor land. Propagated by division, cuttings or seed.

integrifolia. To 3 ft.: lvs. spatulate to lanceolate, basal to 1 ft. long, entire or toothed: heads to 2½ in. across. B. C. to Ore.

latifolia: *G. robusta* var.

nana. To 1½ ft.: lvs. oblanceolate, to 2½ in. long: heads to ⅓ in. across. Wash. to Wyo. and Calif.

robusta. To 2 ft.: lvs. ovate to lanceolate, to 2 in. long, toothed: heads 1½ in. across, involucre with conspicuous leafy bracts. Calif. Var. **latifolia** (*G. latifolia*) has larger clasping lvs.

GRISELINIA. *Cornaceæ.* Evergreen shrubs or trees native in New Zeal. and Chile, allied to Aucuba, with alternate leathery shining lvs., small diœcious fls. in panicles or racemes, and fr. a berry; grown out-of-doors in Calif.

littoralis. To 50 ft.: lvs. ovate or oblong-ovate, to 4 in. long: panicles to 3 in. long. New Zeal. Var. **variegata** is listed.

lucida. To 25 ft.: lvs. ovate or oblong, to 7 in. long, very unequal at base: panicles to 6 in. long, the pistillate fls. without petals. New Zeal.

GRISLEA: *Combretum coccineum.*

GROMWELL: *Lithospermum.* **False:** *Onosmodium.*

GROSSULARIA: *Ribes.*

GROUND-CEDAR: *Lycopodium complanatum.* **-Cover:** see *Lawn.* **-Pine:** *Lycopodium obscurum.* **-Pink:** *Phlox subulata.*

GROUNDNUT: *Apios tuberosa, Arachis hypogæa, Panax trifolium.*

GROUNDSEL: *Senecio.* **-Bush:** *Baccharis halimifolia.* **Giant:** *Ligularia Wilsoniana.*

GRUGRU: *Acrocomia aculeata.*

GRUMIXAMEIRA-TREE: *Eugenia Dombeyi.*

GUABA: *Inga vera.*

GUAIACUM. Lignum-Vitæ. *Zygophyllaceæ.* A half dozen trop. American trees and shrubs with very hard resinous wood, pinnate lvs. and small blue or purple fls., fr. a strongly angled caps.; sometimes planted for ornament and interest in S. Calif. and S. Fla. One species natively reaches the keys of Fla.

guatemalense. Small tree to 16 ft.: lfts. 4–6 pairs, linear-oblong: fls. before the lvs., several together from the axils, azure-blue, petals glabrous: fr. reddish or orange, obovate, about ½ in. or more long. Guatemala.

officinale. Tree to 15 or 30 ft.: lfts. 2–3 pairs, to 2 in. long, oval to broad-obovate: fls. blue or rarely white, ½ in. long, in clusters at ends of twigs, petals slightly tomentose at least at tip: fr. yellow, broadly obcordate or unequal-sided, to ¾ in. long. W. Indies, N. S. Amer.

GUAMA: *Inga laurina.*

GUANABANA: *Annona muricata.*

GUAVA: *Psidium.* **Chilean:** *Myrtus Ugni.*

GUAYMOCHIL: *Pithecellobium dulce.*

GUAYULE: *Parthenium argentatum.*

GUEVINA: *Gevuina.*

GUILANDINA: *Cæsalpinia Crista.*

GUILIELMA. *Palmaceæ.* Probably 3 species in trop. Amer., of monœcious spiny feather-palms, allied to Bactris: tall, cespitose or trunk solitary, ringed, gray, very spiny: petiole and rachis spiny: spadix from lowermost axils or just beneath the crown, the peduncle spiny; fls. thickish, the staminate (stamens 6) and pistillate intermixed but ends of branches staminate: fr. ovoid, oblong or ovoid-conic, drupe-like with edible flesh; seed 1. For cult. see *Palm.*

Gasipaes (*Bactris Gasipaes. G. speciosa. G. utilis* is probably the same). Pejibaye or Gachipaes. An important fruit-tree in Cent. and S. Amer., known under many vernacular names: trunks mostly few or several, sometimes single, to 60 ft., carrying attractive crown of arching-drooping foliage: lvs. 8–12 ft. long, deep green above, somewhat lighter underneath; pinnæ many, strongly ribbed, bifid at apex, setose on ribs and margins: fr. 1–2 in. long, ovoid to inverted top-shaped, yellow, orange, brownish-red, in heavy hanging clusters, of superior quality; a seedless form is known. Little known in U. S.

speciosa: *G. Gasipaes.*

utilis: see *G. Gasipaes.*

GUINEA-HEN WEED: *Petiveria alliacea.*

GUIZOTIA. *Compositæ.* Trop. African herbs with opposite sessile lvs. and yellow heads of ray- and disk-fls., solitary or clustered; pappus none. One species is sometimes cult. for the seeds, which yield oil.

abyssinica (*G. oleifera*). Ann. to 5 ft.: lvs. lanceolate, to 9 in. long, toothed: heads ¾ in. across, in corymbs.

oleifera: *G. abyssinica.*

GUM: *Nyssa.* **Arabic Tree:** *Acacia arabica.* **-Plant:** *Grindelia.* **Sweet:** *Liquidambar Styraciflua.* **-Tree:** *Eucalyptus.*

GUMBO: see *Okra.*

GUMI: *Elæagnus multiflora.*

GUNNERA. *Haloragidaceæ.* Per. herbs with creeping rhizomes, radical lvs., small mostly unisexual fls. in spikes or panicles, and drupaceous frs.

Some of the kinds are grown for the bold foliage effects of large clumps. Rich moist soil is necessary, and preferably a sunny position. Winter protection should be provided, and they are not hardy in the North. Propagated by division and seed.

chilensis (*G. scabra*). Lvs. palmately lobed and cut, to 6 ft. across, the fleshy petiole to 6 ft. long and covered with stiff hairs: fls. in spikes to 3 ft. high: fr. red. Chile, Ecuador, Colombia.

manicata. Differs chiefly in the lvs. being peltate and the petiole covered with reddish spiny hairs. S. Brazil.

scabra: *G. chilensis.*

GUTENBERGIA: *Erlangea cordifolia.*

GUTTA-PERCHA: *Palaquium;* also other plants not mentioned in this book.

GUTTIFERÆ (incl. *Clusiaceæ*). Garcinia Family. Woody plants in the tropics of both hemispheres, a few of which are planted in our southernmost parts: lvs. mostly opposite or whorled and simple, often thick and mostly evergreen: fls. regular, polypetalous, sometimes bisexual but plants for the most part diœcious or polygamous, solitary or cymose, the stamens prevailingly many and distinct or somewhat united: fr. drupe-like, berry-like or sometimes capsular, 2-celled or more, the styles more or less united. Hypericaceæ is sometimes united with this family. With us the genera Calophyllum, Garcinia and Mammea are planted.

GUZMANIA. *Bromeliaceæ.* Trop. American terrestrial or epiphytic herbs with stiff lvs. in basal rosettes and yellow or white fls. in spikes borne amongst the lvs., often showily bracted; grown under glass. Cult. as for *Bromelia* and *Tillandsia.*

lingulata. Epiphytic with stout st.: lvs. to 1½ ft. long and 1 in. wide: fls. with yellowish tube and purplish limb, in dense drooping heads, the bracts red. Trop. Amer.

musaica. Terrestrial, rarely epiphytic, stemless: lvs. to 20 in. long and 3 in. wide, transversely lined above with dark green and beneath with purple: fls. yellowish, the bracts golden-yellow striped with rose. Colombia.

GYMNADENIA: *Habenaria.*

GYMNADENIOPSIS: *Habenaria.*

GYMNOCALYCIUM. *Cactaceæ.* A genus of the Echinocactus subtribe, of more than a score of S. American species, known by the naked axils of scales on ovary and fr., ribs usually broad and tubercled, spines stout and mostly awl-like, fls. white, yellow or pink, with a definite but short tube and borne from upper areoles: plant simple or cespitose, mostly globular. Cult. as for Echinocactus. See *Cacti.*

denudatum (*Echinocactus denudatus*). Somewhat globose or depressed, to 6 in. diam., ribs 5–8, spines 5 or 8 and all radial, appressed: fls. white or pale rose. S. Brazil to Argentina.

gibbosum (*Echinocactus gibbosus*). Usually taller than broad, to 8 in. high, but sometimes depressed, ribs 12–14, spines 7–12 and all radial: fls. white to pinkish, something over 2 in. long. Argentina.

Mostii (*Echinocactus Mostii*). Depressed-globose, 2 in. or more high and about twice as thick, ribs 11–14, radials 7–9, central solitary, all brownish: fls. bell-shaped, pale red, to 3 in. long. Argentina.

multiflorum (*Echinocactus multiflorus*). Simple or cespitose, depressed to globular to short-columnar, 3½ in. or more high, ribs 10–15, spines 7–10 and all radial: fls. about 1½ in. long, pinkish to nearly white. Brazil to Argentina.

Schickendantzii (*Echinocactus Schickendantzii*). Usually simple and sometimes depressed, to 4 in. diam., ribs mostly 7, spines 6 or 7 and all radial: fls. white or pinkish, 2 in. long. Argentina.

GYMNOCLADUS. *Leguminosæ.* Two deciduous trees, one from E. Asia and the cult. species native in E. N. Amer. from N. Y. south. **G. dioica** (*G. canadensis*). KENTUCKY COFFEE-TREE. To 100 ft.: lvs. bipinnate, the lfts. ovate: fls. regular, greenish-white, the racemes of the pistillate tree to 1 ft. long and of the staminate to 4 in.: pods to 10 in. long, red-brown. Var. **variegata** has variegated foliage.—Propagated by seeds and cuttings.

GYMNOGRAMMA: *Pityrogramma;* also *Coniogramme japonica.*

GYMNOSPERMS: *Conifers, Cycads, Ginkgoaceæ, Pinaceæ, Taxaceæ.*

GYMNOSPORIA. *Celastraceæ.* Trees and shrubs bearing alternate simple leathery lvs., small greenish or yellowish fls. in axillary cymes, and capsular frs.; a few species may be planted in warm regions. Propagated by seeds and cuttings.

cassinoides (*Catha* and *Celastrus cassinoides*). Erect glabrous evergreen shrub: lvs. ovate, acute, serrate: pedicels very short, 2 or 3 in the axils; fls. white. Canary Isls.

serrata. Evergreen shrub to 6 ft. or more, sometimes spiny: lvs. ovate to oblanceolate, finely toothed, to 3 in. long: fls. whitish. Abyssinia.

GYMNOTHRIX: *Pennisetum.*

GYNANDROPSIS (*Pedicellaria*). *Capparidaceæ.* Cleome-like herbs, differing in the fact that the torus is prolonged beyond the insertion of petals and sepals into a stem-like part or androphore on which the stamens are borne, making a peduncle-like base for the gynophore (or pistil-bearing extension). Native in warm parts of the world, one of them sometimes cult. as a Cleome and by some authors referred to that genus.

speciosa (*Cleome speciosa*). Ann. to 2 ft. or more, grown for ornament in warm countries: very like *Cleome spinosa* but glabrous or at least not glandular and not spiny, the androphore ¼–⅓ in. long and beyond the insertion of stamens the very long gynophore projects: petals pink or white. Mex., Cent. Amer.

GYNERIUM. *Gramineæ.* Tall per. grasses with long flat lvs. and diœcious spikelets borne in large terminal plume-like panicles; differs from Cortaderia, the true pampas-grasses, in technical characters of the florets; native in trop. Amer. One is sometimes planted for ornament in warm countries. See *Grasses.*

argenteum: *Cortaderia Selloana.*

jubatum: *Cortaderia rudiuscula.*

saccharoides: *G. sagittatum.*

sagittatum (*G. saccharoides*). UVA-GRASS. To 40 ft.: lvs. to 6 in. long and 3 in. wide, edges finely toothed: panicles to 3 ft. long, the branches drooping, pistillate very silky. Trop. Amer.

GYNOPOGON: *Alyxia.*

GYNURA (*Crassocephalum*). *Compositæ.* Trop. herbs or rarely subshrubs with alternate entire or lobed lvs., solitary or clustered heads of disk-fls. and not very showy; pappus of white bristles.

Gynuras are grown under glass as foliage plants. They need plenty of light to bring out the color in the foliage; the soil and moisture requirements are similar to those for coleus or geraniums. They are easily grown from cuttings of growing shoots, also from seeds if obtainable.

aurantiaca. VELVET-PLANT. Stout, branching, to 3 ft., densely velvety with violet or purple hairs: lvs. ovate, jagged-toothed: heads to ¾ in. across, in loose terminal clusters, yellow or orange. Java; escaping in warm regions.

GYPSOPHILA. *Caryophyllaceæ.* Hardy ann. and per. herbs, very branching or spreading, slender, with scant foliage when in bloom: fls. small and numerous, axillary or paniculate, rosy or white; native in Eu., Asia and N. Afr.

A few species are grown for the dainty mist-like effects in rock-gardens, in the border, and as trimming in bouquets. Propagated by seeds, division and sometimes by cuttings.

acutifolia. Per., tall and much branched, the infl. glandular: lvs. narrow-lanceolate and acute, to 5 in. long and 1 in. or more broad, obscurely 3-nerved: fls. larger than in *G. paniculata*, white. Caucasus.

alpigena: listed name.

altissima. Per. to 2 ft.: lvs. to 3 in. long and ¼ in. wide: fls. white, in many-fld. panicles. E. Eu. to Cent. Asia.

cerastioides. MOUSE-EAR G. Per., downy, creeping, to about 4 in. high: lvs. obovate, soft-hairy on both sides: fls. to ⅔ in. across, white with pink veins. Himalayas.

collina. Subshrubby, to 1 ft. or more: lvs. linear, rather fleshy: fls. white or pink, in panicles. E. Eu.

Ehrlei: a double-fld. form of *G. paniculata*.

elegans. Ann. to 1½ ft., with upright forking sts.: lvs. lanceolate: fls. white or rosy, ¼ in. or more across. Caucasus. Color vars. are **rosea**, **alba grandiflora** and **carminea**.—Good bouquet plant; grown somewhat under glass.

fratensis: hort. name for a pink-fld. creeping form to 3 in. high.

libanotica. Per. to 1 ft., much branched, glaucous: lvs. stiff and fleshy, about ½ in. long and ⅙ in. wide: fls. pink. Asia Minor.

Manginii. Per., roots thick, fleshy: lvs. smooth, glaucous: fls. rather large, light rose, in small panicles. Siberia.

muralis. Ann., diffusely branched, to 1 ft.: lvs. very small and narrow: fls. solitary, axillary, rosy. Eu.; adventive in E. U. S.

paniculata. BABYS-BREATH. Per. with large root, diffusely branched, to 3 ft. or more, glaucous: lvs. linear-lanceolate, to 4 in. long and ⅜ in. broad, sharp-pointed: fls. white, in loose panicles. Eu., N. Asia; escaped in N. Amer. Var. **flore-pleno** has double fls. See *Galium Mollugo*.

perfoliata (*G. scorzonerifolia*). Per., tall, usually smooth but sometimes hairy near top: lvs. perfoliate: fls. purplish. Medit. region.

prostrata: *G. repens*.

repens (*G. prostrata*). Per. to 6 in., trailing or prostrate, not glaucous: lvs. linear: fls. white or rosy, in few-fld. panicles. Alps and Pyrenees. Var. **monstrosa** is larger and var. **rosea** has rose fls.

scorzonerifolia: *G. perfoliata*.

Steveni. Per. to 1 ft., somewhat glaucous: lvs. linear, keeled: fls. white. Caucasus.

Sundermanni: listed name.

transsylvanica. Erect: lvs. linear, keeled: fls. in clusters, with colored calyx. E. Eu.

trichotoma. Erect, glaucous: lvs. broad-oblong: fls. very small, in branching panicles. Asia Minor.

H

HABENARIA. Rein or Fringed Orchis. *Orchidaceæ.* Terrestrial orchids with tuberous roots and leafy sts. and fls. of various sizes and colors in terminal racemes or spikes, two petals usually smaller than the sepals, the lip entire or lobed or fringed and spurred at base; grown in bog-gardens or moist places out-of-doors. There are various interpretations of the genus, resulting in several generic names. See *Orchids.*

blephariglottis. White Fringed O. To 2½ ft.: lvs. to 8 in. long and ¾ in. wide: fls. pure white, the lip and petals fringed, July–Aug. Newf. to Fla. and Miss.

bracteata (*H. viridis* var. *bracteata. Cœloglossum bracteatum*). Satyr O. To 2 ft.: lvs. to 5 in. long: fls. greenish with white spur, in spikes to 5 in. long, May–Sept. N. N. Amer., Eu.

ciliaris (*Blephariglottis* and *Platanthera ciliaris*). Yellow Fringed O. To 2½ ft.: lvs. to 8 in. long and ¾ in. wide: fls. orange or yellow, the petals and lip fringed, the spur to 1½ in. long, in spikes to 6 in. long, July–Aug. Vt. to Fla. and Tex.

clavellata (*Gymnadeniopsis clavellata*). Club-spur O. To 1½ ft.: lvs. to 6 in. long: fls. greenish or whitish, in spikes to 2 in. long, July–Aug. Newf. to Fla. and La.

conopsea (*Gymnadenia conopsea*). Fragrant O. To 1½ ft.: lvs. linear: fls. rose or violet-purple, fragrant, May–June. Eu., N. Asia.

dilatata (*Limnorchis* and *Platanthera dilatata*). White Bog O. To 2 ft.: lvs. to 1 ft. long and ½ in. wide: fls. white, the spur about as long as the entire lip, in 10–20-fld. racemes, June–Sept. N. N. Amer.

fimbriata (*Blephariglottis grandiflora. Platanthera fimbriata*). Large Purple Fringed O. To 5 ft.: lvs. to 10 in. long and 3 in. wide: fls. lilac or rarely white, fragrant, the lip fringed to about middle, June–Aug. Newf. to N. C.

flava (*Perularia flava*). To 2 ft.: lvs. to 1 ft. long and 3 in. wide: fls. with greenish petals and greenish-yellow sepals, in spikes to 6 in. long, June–July. N. S. to Fla. and La.

Hookeri (*Lysias Hookeriana*). To 15 in., with 2 basal oval lvs. to 5½ in. long: fls. yellowish-green, the spur about ⅓ in. long, June–Sept. N. S. to Pa. and Ia.

hyperborea (*Limnorchis hyperborea*). Northern Green O. To 3 ft.: lvs. to 1 ft. long and ¾ in. wide: fls. greenish, the spur about as long as lip, May–Aug. N. N. Amer.

lacera (*Blephariglottis lacera*). Ragged or Green Fringed O. To 2 ft.: lvs. to 8 in. long and 1½ in. wide: fls. greenish-yellow, lip deeply fringed, spur ⅔ in. long, June–July. Newf. to Ga. and Ark.

odoratissima (*Gymnadenia odoratissima*). Small Fragrant O. Similar to *H. conopsea* but much smaller, with deep red-purple fls. Eu.

psycodes (*Blephariglottis* and *Platanthera psycodes*). Small Purple Fringed O. To 3 ft.: lvs. to 10 in. long and 3 in. wide: fls. lilac or rarely white, fragrant, the lip fringed, the spur about ⅓ in. long, July–Aug. Newf. to N. C. and Tenn.

HABERLEA. *Gesneriaceæ.* A few herbaceous tufted perennials with basal lvs. and nodding tubular irregularly 5-lobed fls. borne on scapes; native in the Balkans.

Ferdinandi-Coburgii. Differs from *H. rhodopensis* in smaller size, lvs. glabrous above, smaller dark blue fls. with upper lip twice as broad as long.

rhodopensis. To 6 in., soft-hairy: lvs. obovate- or ovate-oblong, to 3 in. long, coarsely toothed, thick: fls. pale lilac, 1 in. long and broad.

HABROTHAMNUS: *Cestrum elegans* and *fasciculatum.*

HACKBERRY: *Celtis.*

HACKMATACK: *Larix laricina.*

HACQUETIA. *Umbelliferæ.* One European per. herb sometimes grown in the rock-garden and propagated by division. **H. Epipactis.** To 8 in.: lvs. basal, deeply palmately lobed: fls. yellow, polygamous, in short-stalked umbels subtended by large involucral lvs., Apr.–May.

HÆMANTHUS. Blood-Lily. *Amaryllidaceæ.* African low bulbous herbs with broad basal lvs. and red or white fls. in dense heads terminating the solid scape, the perianth-tube short; grown for the summer and autumn bloom.

The plants should have a night temperature of 50–55°. Bulbs should be rested over winter and started into growth in spring. Propagated by offsets.

albiflos. To 1 ft.: lvs. thick and fleshy, to 8 in. long and 4 in. wide, ciliate on edges: fls. white, ¾ in. long, in heads 2 in. across. S. Afr.

coccineus. To 10 in.: lvs. thick and fleshy, to 2 ft. long and 8 in. broad: fls. red, 1 in. long, in heads to 3 in. across. S. Afr.

Katharinæ. To 1 ft.: lvs. thin, to 14 in. long and 6 in. broad: fls. bright red, 2½ in. long, in heads to 9 in. across. S. Afr.

puniceus. To 15 in.: lvs. thin, to 1 ft. long and 4 in. wide: fls. pale scarlet to white, 1 in. long, in heads to 4 in. across. S. Afr.

HÆMARIA. *Orchidaceæ.* Terrestrial orchids with creeping rootstocks, basal lvs., and fls. in spikes, the lip with wide claw and pouch-like sac at base; grown for the attractive foliage. For cult. see *Orchids.*

discolor. Lvs. to 3 in. long and 1 in. wide, dark green above and bright purple beneath: fls. Sept.–Dec. Singapore to S. China. Var. **Dawsoniana** (*Goodyera Dawsoniana*) has larger lvs. veined with red.

HÆMATOXYLUM. *Leguminosæ.* One species is employed for the heartwood which is used in making dyes and for medicinal purposes; sometimes planted in warm countries for ornament. **H. campechianum,** Logwood, Bloodwood Tree, is a tree to 45 ft. high, with pinnate lvs. of 2–4 pairs of obovate usually emarginate lfts. to 1 in. long, bright yellow fragrant fls. in axillary racemes, and flat pods narrowed at both ends, to 1¼ in. long. Cent. Amer. and W. Indies.—Propagated by seeds.

HAKEA. *Proteaceæ.* Australian evergreen shrubs with alternate lvs., bisexual fls. borne in pairs in short axillary racemes or clusters, and woody capsular frs.; differs from Grevillea chiefly in the long terminal wings on the seeds.

Hakeas are grown out-of-doors in southern United States and withstand slight frost. They are drought-resistant and do best in light well-drained soil. Propagated by seeds in winter or early spring and the seedlings kept in boxes for the first year. As the capsules are very hard, they must be dried for some time before discharging the seeds. Hakeas may also be propagated by cuttings. Well adapted to California.

acicularis (*H. sericea*). Tall shrub, similar to *H. gibbosa* but with nearly glabrous instead of hairy branchlets, and differing from *H. pugioniformis* in the glabrous perianth. New S. Wales, Victoria, Tasmania.

auriculata. Shrub to 2 ft. or more: lvs. cuneate, to 3 in. long, prickly-toothed or -lobed, auriculate at base: fls. in clusters. W. Australia.

cristata. Shrub to 8 ft.: lvs. broad-obovate to oblong, to 3 in. long, prickly-toothed, stiff and glaucous: fls. white, in short racemes. W. Australia.

cucullata. Shrub to 14 ft.: lvs. cordate-orbicular, to 4 in. across, entire or prickly-toothed, sessile, stiff: fls. in clusters. W. Australia.

dactyloides. Tall shrub: lvs. linear- or oblong-lanceolate, to 4 in. long, prominently 3-nerved, stiff: fls. numerous. New S. Wales.

elliptica. Shrub to 10 ft.: lvs. oval, to 4 in. long and 2 in. wide, parallel-veined, wavy-margined, rusty-pubescent when young: fls. white, in sessile clusters. W. Australia.

erinacea. Shrub to 3 ft.: lvs. to 1 in. long, of 3–5 cylindrical stiff segms. which are entire or divided: fls. in sessile clusters. W. Australia.

eucalyptoides: *H. laurina.*

gibbosa. Shrub to 10 ft.: lvs. needle-like, to 3 in. long, entire, stiff and spiny-tipped: fls. white, in sessile clusters. New S. Wales, Victoria.

glabella. Shrub to 15 ft.: lvs. obovate or oblong, to 3 in. long, usually prickly-toothed, auriculate at base: fls. white. W. Australia.

ilicifolia: *H. varia.*

incrassata. Shrub to 3 ft.: lvs. linear-lanceolate or oblong-linear, to 2 in. long, entire, thick: fls. in sessile clusters. W. Australia.

laurina (*H. eucalyptoides*). Sea Urchin. Shrub or tree to 30 ft.: lvs. lanceolate or narrow elliptic, to 6 in. long and 1 in. wide, parallel-veined, entire: fls. crimson, in sessile globose clusters, with long yellow styles. W. Australia.

marginata. Shrub to 8 ft.: lvs. lanceolate, to 1½ in. long, with prominent midrib and margins, thick and stiff. W. Australia.

multilineata. Tall shrub: lvs. linear-lanceolate to oblong, to 8 in, long, with many small nerves, pubescent, thick: fls. in spike-like racemes to 3 in. long. S. and W. Australia.

pectinata: *H. suaveolens.*

platysperma. Lvs. cylindrical, to 5 in. long, thick and stiff: fls. in sessile clusters. W. Australia.

propinqua. Tall shrub: lvs. needle-like, to 1½ in. long, rather thick and smooth, crowded: fls. very small, clustered. New S. Wales.

pugioniformis. Shrub to 8 ft.: lvs. needle-like, to 2 in. long, stiff and spiny-tipped: fls. white, in sessile clusters, the styles long, differing from *H. gibbosa* in the pubescent perianth. New S. Wales, Victoria, Tasmania.

ruscifolia. Shrub to 8 ft.: lvs. ovate-oblong to lanceolate, to 1 in. long, entire and spiny-tipped: fls. white, small, in dense clusters. W. Australia.

saligna. Shrub to 8 ft.: lvs. oblong or lanceolate, to 6 in. long, entire, pale or grayish-green: fls. white, small, in dense clusters, the styles long. Queensland, New S. Wales.

sericea: *H. acicularis.*

suaveolens (*H. pectinata*). Shrub to 10 ft.: lvs. needle-like, to 4 in. long, usually branched into stiff spiny-tipped segms.: fls. white, fragrant, in dense racemes. W. Australia.

trifurcata. Shrub to 10 ft., much branched: lvs. cylindrical, to 3 in. long, divided into 3 segms., stiff; sometimes with few flat oblong lvs.: fls. in sessile clusters. W. Australia.

varia (*H. ilicifolia*). Shrub to 8 ft.: lvs. to 2 in. long, prickly lobed or pinnatifid: fls. small, in clusters. W. Australia.

HALERPESTES: *Ranunculus Cymbalaria.*

HALESIA (*Mohrodendron*). Silver-Bell. Snowdrop-Tree. *Styracaceæ.* Attractive deciduous shrubs or trees with alternate toothed lvs., white bell-shaped drooping fls. in axillary clusters on branchlets of previous year in spring, and fr. a dry winged drupe.

Only *H. carolina* and *H. monticola* are hardy North. The species prefer rich well-drained soil with some shelter. They transplant readily. Propagated by seed as soon as ripe or stratified, by layers, root-cuttings or cuttings of green wood from forced plants.

carolina (*H. tetraptera*). To 40 ft.: lvs. ovate to ovate-oblong, to 4 in. long: fls. to ¾ in. long, with shallow corolla-lobes: fr. 4-winged, to 1½ in. long. W. Va. to Fla. and Tex. Var. **Meehani** has smaller wrinkled lvs. and smaller fls.

diptera. To 30 ft.: lvs. oval or obovate, to 5 in. long: fls. 1 in. long, corolla deeply lobed: fr. 2-winged, to 2 in. long. S. C. to Fla. and Tex.

hispida: *Pterostyrax hispida.*

monticola. To 100 ft.: lvs. oval or oblong, to 11 in. long: fls. to 1 in. long, with shallow corolla-lobes: fr. 4-winged, 2 in. long. N. C. to Ga. and Tenn.

tetraptera: *H. carolina.*

HALIMODENDRON. Salt Tree. *Leguminosæ.* One deciduous ornamental shrub from salty plains of Cent. Asia. **H. halodendron** (*H. argenteum*). To 6 ft.: lvs. of 2–4 oblanceolate lfts. to 1½ in. long, the petiole becoming spiny: fls. papilionaceous, pale purple, in lateral 2–3-fld. racemes: pods inflated, to 1 in. long.—Hardy N.; propagated by seeds, layers, cuttings over bottom heat, or by grafting on laburnum or caragana.

HALORAGIDACEÆ. Water Milfoil Family. Widely distributed herbs, mostly aquatic, of about 8 genera, of which Gunnera and Myriophyllum are grown for the ornamental foliage and habit. The family is very diverse in character of lvs., has regular often very small bisexual or unisexual fls., the calyx with 2–4 lobes, 2–4 separate petals or none, 1–8 stamens, inferior 1–4-celled ovary, and fr. a small nut or drupe. Three genera are represented by native species in N. E. U. S. and many of them are in the southern hemisphere.

HAMAMELIDACEÆ. Witch-Hazel Family. Shrubs and trees of about 20 genera mostly in warm temp. regions, evergreen or deciduous: lvs. alternate, simple: fls. bisexual or unisexual, in heads or racemes, with 4–5 sepals and separate petals, or petals lacking, 4 or more stamens, and 2-celled ovary: fr. a 2-beaked woody caps. The family contains many ornamental genera, as Corylopsis, Distylium, Fothergilla, Hamamelis, Liquidambar, Loropetalum, Parrotia, Parrotiopsis, most of them hardy N.

HAMAMELIS. Witch-Hazel. *Hamamelidaceæ.* Deciduous small trees or shrubs with simple toothed lvs., yellow fls. in axillary nearly or quite sessile clusters blooming in autumn or very early spring, and capsular frs. ripening in the late season or autumn following; native in N. Amer. and E. Asia and hardy N.; sometimes planted for ornament and screens.

They thrive mostly in rather moist soil. Propagated by seeds which require two years to germinate, by layers, or by grafting on stock of *H. virginiana*.

arborea: *H. japonica* var.

japonica. To 30 ft.: lvs. to 4 in. long, becoming glabrous beneath: fls. to ¾ in. long, Jan.–Mar. Japan. Var. **arborea** (*H. arborea*) has larger lvs. and calyx deep purple inside. Var. **Zuccariniana** is tree-like, with calyx greenish-yellow inside.

mollis. To 30 ft.: lvs. to 6 in. long, gray-tomentose beneath: fls. to ¾ in. long, Jan.–Mar., the calyx red inside. China.

vernalis. To 6 ft., bearing suckers: lvs. to 5 in. long, nearly glabrous beneath: fls. to ½ in. long, Jan.–Mar., calyx dark red inside. Mo. to La. and Okla.

virginiana. To 15 ft.: lvs. to 6 in. long, pubescent only on veins beneath: fls. to ¾ in. long, Sept.–Oct., calyx brownish-yellow inside. E. N. Amer. to Tex. —A tenacious common coarse bush, very attractive for its late autumn bloom.

HAMATOCACTUS. *Cactaceæ.* One species, known from Echinocactus by its thin ribs, funnelform fl. and naked axils of fl.-scales, small red berry and tuberculated seeds. See *Cacti.* **H. setispinus** (*Echinocactus setispinus*). Globose to short-cylindric, to 6 in. high, ribs commonly 13, radial spines 12–16 and slender, centrals longer and 1–3: fls. yellow, between 2 and 3 in. long, tube not longer than limb, scales fimbriate. S. Tex., Mex.

HAMELIA. *Rubiaceæ.* Evergreen shrubs native in warm parts of Amer., with opposite or whorled entire lvs., tubular 5-lobed red or yellow fls. in terminal branching cymes, and fr. a small berry.

A few species are grown out-of-doors in southernmost United States. Propagated by seeds and cuttings of half ripe wood under glass.

erecta (*H. patens*). SCARLET-BUSH. To 25 ft., gray-pubescent: lvs. oval or ovate, to 6 in. long: fls. scarlet or orange, to ¾ in. long: fr. dark red or purple, ¼ in. long, ovoid. Fla. to Brazil.—It has been confused in cult. with Ixora.

patens: *H. erecta.*

sphærocarpa. To 12 ft., hairy: lvs. oblong, to 4 in. long, undulate: fls. orange-yellow, 1 in. long: fr. purplish-black, globose. Peru.

HAMOSA: *Astragalus austrinus.*

HARBINGER-OF-SPRING: *Erigenia bulbosa.*

HARBOURIA. *Umbelliferæ.* One per. herb with ternately decompound lvs., small yellow fls. in long-stalked umbels, and compressed ribbed frs.; sometimes grown in sunny places in the rock-garden. **H. trachypleura.** To 2 ft.: ultimate lf.-segms. thread-like. Mts. Colo., Wyo.

HARDENBERGIA. *Leguminosæ.* Australian vines with pinnate lvs. of 3–5 lfts. or sometimes reduced to 1, small papilionaceous fls. in long racemes, and linear pods.

Grown in the greenhouse or in the open in the South; common in southern California. They require peaty well-drained soil if grown under glass. Propagated by seeds, and by greenwood cuttings in spring under glass.

Comptoniana (*Kennedia Comptoniana*). Lfts. 3 or 5, ovate to narrow-lanceolate: fls. blue or violet: pods to 2 in. long. Var. **alba** has white fls.

monophylla (*Kennedia monophylla. K. ovata*). Lft. 1, ovate to lanceolate: fls. violet or rose. Var. **alba** has white fls. and var. **rosea** pink.

HARDHACK: *Spiræa tomentosa.*

HARDHEADS: *Centaurea nigra.*

HAREBELL: *Campanula rotundifolia* and others.

HARICOT: *Phaseolus vulgaris.*

HARIOTA: *Hatiora.*

HARPALIUM: *Helianthus scaberrimus.*

HARPEPHYLLUM. *Anacardiaceæ.* Diœcious trees with pinnate leathery lvs., fls. in compact axillary panicles, 10 stamens, 4-celled fr. with 2 of the cells small and sterile; 2 species in S. Afr., now and then planted in warm climates.

caffrum. KAFIR-PLUM. Attractive tree to 30 ft. with glossy lvs.: lfts. lanceolate, to 2½ in. long: fls. white or greenish: fr. dark red, size and shape of large olive, edible.—Grown in S. Calif. and S. Fla. for ornament.

HARRISIA. *Cactaceæ.* Arching or vine-like night-blooming cacti with angled or fluted branches, areoles bearing slender needle-like spines: fls. large and showy, funnelform, white or pinkish, borne singly at areoles near end of branches, the tube scaly. Near a score of species, Fla. to Argentina. See *Cacti.*

Bonplandii (*Cereus Bonplandii*). Erect at first, becoming arching or clambering, to 10 ft. and more, sts. to 3 in. diam. and strongly 4-angled, spines 6–8: fls. white, closing soon after sunrise, to 8 or 9 in. long. Brazil, Paraguay, Argentina.

eriophora (*Cereus eriophorus*). To about 1 ft. high, main st. 1½ in. or more diam., ribs 8 or 9, spines 6–9, with dark tips: fls. white inside and pale pink outside, to 7 in. long. Cuba.

gracilis (*Cereus gracilis. C. repandus*). Much branched, to 20 ft., ribs 9–11, spines 10–16 and black-tipped: fls. white, corolla 8 in. long, tube nearly 1 in. with hairs in the axils of its scales. Jamaica.

Martinii (*Cereus Martinii*). Much branched and clambering, 6 ft. or more, radials short, central solitary and about 1 in. long, old sts. terete and spineless: fls. about 8 in. long, white or tinged pink. Argentina.

tortuosa (*Cereus tortuosus*). Erect but soon arching, branches to 1½ in. diam., ribs commonly 7, spines 6–10 and awl-like: fls. white to pink, dull outside, to 6 in. long. Argentina.

HARTMANNIA: *Œnothera.*

HARTOGIA: *Agathosma.*

HARTWEGIA. *Orchidaceæ.* Trop. American epiphytes with pseudobulbs or fleshy sts. bearing 1 lf. and fls. in racemes, the lip saccate at base; grown in the warm greenhouse. See *Orchids.*

purpurea. To 1 ft.: lvs. to 2½ in. long, greenish-brown spotted with red: fls. purple-red, in 3–10-fld. racemes longer than lvs., June–Aug. Mex., Guatemala.

HASTATE: of the shape of an arrow-head but the basal lobes pointed or narrow and standing nearly or quite at right angles; halberd-shaped.

HATIORA (*Hariota*). *Cactaceæ.* A few spineless cacti of the Rhipsalis group, the fls. without tube and rotate and petals erect, the fls. and terete slender branches always terminal; fls. open only in sunlight, blooming in winter and early spring under glass in U. S. Employed and cult. the same as Rhipsalis. See *Cacti.*

salicornioides (*Rhipsalis salicornioides*). Epiphyte: sts. to 6 ft. or more, cylindric, much branched and diffuse, the branchlets 1 in. long more or less and club-shaped with pedicel-like base: fls. about ⅓ in. long, salmon-colored. S. E. Brazil.

HAW, BLACK-: *Viburnum prunifolium* and *rufidulum*. -Medlar: *Cratægomespilus*. Possum-: *Ilex decidua*.

HAWKS-BEARD: *Crepis*.

HAWKWEED: *Hieracium*. Golden Yellow: see *Tolpis barbata*.

HAWORTHIA. *Liliaceæ*. S. African succulent plants without sts., the thick lvs. in dense rosettes which are sometimes elongated, and small white or greenish fls. in simple or panicled racemes on scapes. For cult. see *Succulents;* fancier's plants.

attenuata. Lvs. to 3 in. long and ¾ in. across, 30–40 in a rosette, with white tubercles on back: fls. rosy, the infl. to 2 ft. high.

coarctata. St. elongated to 8 in.: lvs. to 2½ in. long and ¾ in. across, white-warty: fls. lined with red, in simple infl. to 1 ft. high.

cymbiformis. Lvs. to 1½ in. long and ¾ in. across, very thick, entire, pale and glaucescent: fls. very pale pink striped with green, in a simple infl. to 1 ft. high.

margaritifera. Variable species with lvs. to 3 in. long and 1 in. or more broad, 30–40 in a rosette, white-tubercled on both surfaces: fls. in rather dense racemes that may be 6 in. long.

turgida. Lvs. to 1 in. long and ⅓ in. broad, 20–30 in dense rosettes, rounded and somewhat keeled underneath, lined with paler green toward top on upper side: fls. on very short pedicels in a few-fld. raceme.

HAWTHORN: *Cratægus*. India-: *Raphiolepis indica*. Water-: *Aponogeton distachyus*. Yeddo-: *Raphiolepis umbellata*.

HAZEL, CHILE: *Gevuina Avellana*. Winter: *Corylopsis*. Witch-: *Hamamelis*.

HAZELNUT: *Corylus;* see *Filbert*.

HEAD: a short dense spike about as broad as long; capitulum.

HEAL-ALL: *Prunella vulgaris*.

HEARTSEASE: *Viola tricolor* var. *hortensis*.

HEART-SEED: *Cardiospermum*.

HEART-SHAPED: cordate; ovate in general outline but with 2 rounded basal lobes; has reference particularly to the shape of the base of a leaf or other expanded part.

HEATH: *Erica*. Irish-: *Daboëcia cantabrica*. Spike-: *Bruckenthalia spiculifolia*.

HEATHER: *Calluna*. Mock-: *Ericameria ericoides*.

HEBE. *Scrophulariaceæ*. Shrubs or small trees of the southern hemisphere, mainly native in New Zeal., formerly united with Veronica but differing in the mostly evergreen and woody character, leathery always opposite lvs., fls. white to pink, in axillary racemes or spikes or small heads, and in technical characters of the caps. They should no longer be called Veronicas. With the exception of *H. formosa*, the names here listed are of New Zeal. species or derivatives from them.

Several New Zealand names have recently been listed in California but it is not known whether they have come into general cultivation. Those now named in Hebe are *H. Carsei*, *divergens*, *evenosa*, *Haastii*, *Hectori*, *Matthewsii*, *Menziesii*, *pubescens*, *rigidula*, *subalpina*. Others are *Veronica acutiflora*, *monticola*, *Muelleri*. Some of the names of hebes may represent horticultural forms.

Hebes are extensively grown out-of-doors in mild climates, as in California, and sometimes under glass in the North. Several kinds are used as evergreen hedges. Propagated by seeds and by cuttings, those taken from mature plants in autumn blooming the following summer.

albicans (*Veronica albicans*). To 4 ft., much branched: lvs. imbricated, to 1 in. long and ½ in. across, glaucous, entire: fls. white, in many-fld. racemes. By some considered a hybrid; much like *H. amplexicaulis*.

amabilis (*Veronica amabilis*). To 15 ft. or more: lvs. to 4 in. long and 1 in. across, entire: fls. white, ⅓ in. across, in racemes to 6 in. long. Considered to be a hybrid race issuing from *H. elliptica* and *H. salicifolia*.

amplexicaulis (*Veronica amplexicaulis*). To 3 ft., sometimes decumbent: lvs. imbricated, to 1 in. long and ⅔ in. across, glaucous, entire, very thick: fls. white, ¼ in. across, in spikes to 1½ in. long.

Andersonii (*Veronica Andersonii*). Regarded as a garden hybrid between *H. salicifolia* and *H. speciosa:* fls. white tipped with violet. Var. **variegata** has lvs. variegated with creamy-white.

angustifolia (*Veronica angustifolia*). To 8 ft., much branched: lvs. to 3½ in. long and ¼ in. across, keeled beneath, entire: fls. pale lilac, ⅙ in. across, in racemes to 5 in. long.

anomala (*Veronica anomala*). To .5 ft., much branched: lvs. to ¾ in. long and ⅕ in. across, keeled and shining: fls. white or pale pink, ⅓ in. across, in spikes forming short panicles.—Very like *H. buxifolia*.

Balfouriana (*Veronica Balfouriana*). To 3 ft.: lvs. ovate, to ¾ in. long, entire, shining above: fls. pale blue, ½ in. across, in racemes to 3 in. long.

Barkeri (*Veronica Barkeri*). Shrub: lvs. to 2 in. long and ⅔ in. across: fls. pale lilac, ¼ in. across, in racemes to 2 in. long. Cultigen.

Bollonsii (*Veronica Bollonsii*). To 5 ft., much branched: lvs. to 3 in. long and ¾ in. across, edges thickened: fls. pale lilac, ⅓ in. across, in racemes to 4 in. long.

Buchanani (*Veronica Buchanani*). To 1 ft., much branched: lvs. imbricated, about ¼ in. long and broad: fls. white, ⅕ in. across, in short spikes.

buxifolia (*Veronica buxifolia*). To 5 ft.: lvs. imbricated, to ⅓ in. long and ¼ in. across, stiff and thick, entire: fls. white, ⅓ in. across, in spikes to 1 in. long.

carnea (*Veronica carnea*). Apparently a garden hybrid with *H. speciosa* as one parent: fls. rose.

carnosula (*Veronica carnosula*). To 3 ft., often decumbent: lvs. imbricated, to ¾ in. long and ⅔ in. across, glaucous: fls. white, ¼ in. across, in dense spikes.

chathamica (*Veronica chathamica*). To 1½ ft., with prostrate or trailing sts.: lvs. oval, to 1 in. long: fls. purple, ¼ in. across, in racemes to 1 in. long. Var. **erecta** is listed.

Colensoi (*Veronica Colensoi*). To 1½ ft.: lvs. to 1½ in. long and ½ in. across, nearly entire, glaucous beneath: fls. white, ¼ in. across, in racemes about 1½ in. long.

cupressoides (*Veronica cupressoides*). To 6 ft.: lvs. scale-like, 1/15 in. long or to ¼ in. on young plants: fls. pale purple or rarely white, ⅙ in. across, in small terminal heads.

Darwiniana (*Veronica Darwiniana*). Small shrub: lvs. to ¾ in. long and ⅓ in. across, entire, glaucous: fls. white, ¼ in. across, in dense racemes to 1½ in. long.

decumbens (*Veronica decumbens*). To 3 ft., decumbent and much branched: lvs. to ¾ in. long and ⅓ in. across, margins bright red: fls. white, ¼ in. across, in racemes to 1 in. long.

Dieffenbachii (*Veronica Dieffenbachii*). To 4 ft., much branched: lvs. to 4 in. long and 1 in. across: fls. lilac, ¼ in. across.

diosmæfolia (*Veronica diosmæfolia*). To 5 ft. or more, much branched: lvs. to 1 in. long and ⅙ in. across: fls. white or pale blue, ¼ in. across, in corymbose racemes 1 in. long.

Dorrien-Smithii (*Veronica Dorrien-Smithii*). Small straggling shrub: lvs. to 3 in. long and 1¼ in. across, ciliate at margins: fls. white or lavender, ⅕ in. across, in racemes as long as lvs.

elliptica (*Veronica elliptica*. *V. decussata*). To 20 ft., much branched: lvs. to 1¼ in. long and ½ in. across: fls. white or veined purple or pale blue, ⅔ in. across, in racemes to 1½ in. long. Variegated forms are listed.

formosa (*Veronica formosa*). To 4 ft., evergreen: lvs. oval to lanceolate, to 1 in. long, nearly entire: fls. pale lilac, in short racemes. Tasmania.

Gibbsii (*Veronica Gibbsii*). To 1½ ft.: lvs. imbricated, to ¾ in. long and ½ in. across, glaucous, white-ciliate: fls. white, ⅕ in. across, in dense-fld. spikes.

gigantea (*Veronica gigantea*). Tree to 50 ft.: lvs. to 5 in. long and ½ in. across, coarsely toothed when young: fls. white, ⅕ in. across, in racemes to 5 in. long.

gracillima (*Veronica gracillima*). Much branched shrub: lvs. to 2½ in. long and ⅓ in. across: fls. ¼ in. across, in racemes to 5 in. long. Probably a hybrid between *H. angustifolia* and *H. salicifolia.*

Hulkeana (*Veronica Hulkeana*). To 3 ft.: lvs. ovate, to 2 in. long, toothed: fls. pale lilac, to ¼ in. across, in panicles to 1 ft. long.

lævis (*Veronica lævis*). To 5 ft.: lvs. to ⅔ in. long and ⅓ in. across, stiff, entire: fls. white, ¼ in. across, in racemes to 1½ in. long.

leiophylla (*Veronica leiophylla*). To 12 ft.: lvs. to 1¼ in. long and ⅓ in. across: fls. white, ⅕ in. across, in racemes to 4 in. long. Var. **strictissima** differs in more acute lvs. and more upright racemes.

Lewisii (*Veronica Lewisii*). To 6 ft., the branches gray-pubescent: lvs. to 2½ in. long and 1 in. across, margins with white line: fls. pale blue, ⅓ in. across, in racemes to 2½ in. long.

macrantha (*Veronica macrantha*). To 2 ft.: lvs. to 1 in. long, toothed: fls. white, ¾ in. across, in 3–8-fld. racemes.

macrocarpa (*Veronica macrocarpa*). To 8 ft.: lvs. to 6 in. long and 1 in. across: fls. white, to ⅓ in. across, in racemes to 7 in. long. Var. **latisepala** (*Veronica latisepala*) has shorter racemes and fls. deep violet.

macroura (*Veronica macroura*). To 5 ft.: lvs. to 3 in. long and 1¼ in. broad: fls. white or bluish, ⅙ in. across, in dense racemes to 4 in. long.

obtusata (*Veronica obtusata*). To 3 ft.: lvs. to 2 in. long and 1 in. across, with white-hairy margins: fls. bluish-white, ⅕ in. across, in racemes to 2½ in. long.

parviflora (*Veronica parviflora*). Shrub or tree to 20 ft.: lvs. to 2½ in. long and ¼ in. across, entire: fls. white, ⅙ in. across, in racemes to 3 in. long.

pimeleoides (*Veronica pimeleoides*). To 1½ ft., often prostrate, much branched: lvs. to ⅓ in. long, glaucous: fls. dark purple-blue, ¼ in. across, in spikes to 1 in. long.

pinguifolia (*Veronica pinguifolia*). To 4 ft., often decumbent: lvs. imbricated, to ¾ in. long and ½ in. across, glaucous: fls. white, ⅓ in. across, in dense spikes longer than lvs.

rakaiensis (*Veronica rakaiensis*). To 6 ft.: lvs. linear-lanceolate, to 1 in. long, entire, shining above: fls. white, ¼ in. across, in racemes to 2 in. long.—Close to *H. Traversii.*

rotundata (*Veronica rotundata*). To 6 ft.: lvs. to 4 in. long and 1¼ in. across: fls. purple or lilac, ¼ in. across, in racemes to 6 in. long.—Much like *H. macrocarpa*, but caps. almost orbicular and rounded at top.

rupicola (*Veronica rupicola*). To 4 ft.: lvs. to 1 in. long and ⅓ in. across, entire: fls. ¼ in. across, in racemes to 2 in. long.

salicifolia (*Veronica salicifolia*). To 12 ft., much branched: lvs. to 6 in. long and ¾ in. across: fls. white tinged lilac, ⅙ in. across, in racemes 6 in. or more long. Var. **communis** does not differ from the type. In var. **longiracemosa** the racemes are 1 ft. or more long.

speciosa (*Veronica speciosa. V. imperialis* is a garden name). To 5 ft.: lvs. to 4 in. long and 1¾ in. across, entire, shining: fls. dark reddish- or violet-purple, ⅓ in. across, in racemes about 4 in. long.

Townsoni (*Veronica Townsoni*). To 6 ft.: lvs. to 3 in. long and ⅓ in. across: fls. white, ¼ in. across, in racemes to 6 in. long.

Traversii (*Veronica Traversii*). Small shrub: lvs. to 1 in. long and ⅛ in. across, entire: fls. white, ¼ in. across, in racemes to 3 in. long. Var. **elegans** is a slender form with narrower lvs.

vernicosa (*Veronica vernicosa*). To 3 ft., often decumbent: lvs. to ⅔ in. long and ⅓ in. across, entire: fls. white, ⅓ in. across, in racemes to 1½ in. long.

HEBENSTRETIA. *Scrophulariaceæ.* Many kinds of herbs or shrubs with narrow lvs. and yellow or white fls. in dense terminal spikes, the corolla split and 4-lobed, calyx spathe-like; mostly from S. Afr.

Seed should be sown outside in April or inside if earlier results are desired; treated as annuals.

comosa. Per. to 4 ft., with woody sts.: lvs. lanceolate, to 2 in. long, toothed: fls. yellow or white with orange-red blotch on limb, ½ in. long, in spikes to 6 in. long, fragrant at night.

dentata. Similar to *H. comosa* but to 4 ft. high, with lvs. linear and toothed only above middle.

HEDEOMA. *Labiatæ.* Ann. or per. American herbs with opposite small lvs. and small blue or purple 2-lipped fls. in axillary clusters.

Drummondii. Sts. to 16 in.: lvs. linear to oval, to ¼ in. long: fls. pinkish, to ¼ in. long. Tex.

HEDERA. IVY. *Araliaceæ.* Evergreen shrubs climbing by rootlets, with alternate entire or lobed lvs., small greenish fls. in umbels which are panicled or racemed, and fr. a berry; planted as a wall cover, for borders of shrubberies and for ground-cover in shady places, and sometimes as a house and conservatory subject.

Ivy thrives best in rich moist soil. Propagated by cuttings, layers, and seeds which usually do not germinate until the second year. Slow-growing species or forms are sometimes grafted on common stocks.

algeriensis: *H. canariensis.*

arborea: *H. Helix* var. *arborescens.*

azorica: *H. canariensis.*

canariensis (*H. algeriensis. H. azorica*). Lvs. ovate, to 6 in. across, entire or shallowly 3–7-lobed, heart-shaped at base: fr. black. Canary Isls., N. Afr.; adapted to Calif. Var. **variegata** has lvs. edged with yellowish-white.

colchica. Lvs. broadly ovate, to 10 in. long, entire or slightly lobed, heart-shaped at base: fr. black. Caucasus, Persia; for southern states. Var. **dentata** has lvs. remotely toothed.

Helix. ENGLISH I. Lvs. usually 3–5-lobed and margins entire, to 4 in. long, on fruiting branches ovate and unlobed, often with light colored veins: fr. black. Eu., Asia, N. Afr.; stands in protected places in N. Y. and New England but does not attain great size. Runs into many forms, a few of which are: **arborescens** (*H. arborea*), erect, not climbing; **argenteo-variegata**, lvs. variegated or edged with white; **aureo-variegata** (var. *chrysophylla*), lvs. yellow or variegated with yellow; **baltica**, small-lvd. hardy form; **Caenwoodiana**, with small blackish-green lvs. and white veins; **canescens**; **chrysocarpa**, fr. yellow; **conglomerata**, with small crowded lvs.; **digitata**, lvs. digitately 5-lobed; **gracilis**, lvs. rather small, turning bronzy; **hibernica**, lvs. to 6 in. across, with short lobes; **maculata**, lvs. spotted and striped with yellowish-white; **marmorata**, lvs. blotched with yellowish-white; **palmata**, with dull green digitately lobed lvs.; **pedata**, lvs. pedately 5-lobed, with long middle lobe; **tortuosa**, lvs. nearly entire, curled and twisted.

himalaica. Lvs. 2–5-lobed or oblong and unlobed on flowering branches: fr. yellow. Himalayas; stands only far S.

HEDGE. A hedge is a dense permanent row or line of living plants, ordinarily trimmed into more or less formal shape, answering the purpose of a fence, a screen or a windbreak. It is comprised of durable woody plants that make a thick intertangled or impenetrable growth and that withstand shearing. Hedges proper are to be distinguished from edgings, which are low and sometimes temporary lines about walks, flower-beds and borders.

For evergreen hedges the most serviceable plant in general in North America is probably the arbor-vitæ. For choice hedges about the grounds, particularly outside the northern states, some of the retinosporas are useful; also yews. One of the most satisfactory of coniferous plants for hedges is the common hemlock, which stands shearing well and makes a very soft and pleasing mass. Other plants that hold their leaves and are good for hedges are the common box and the privets. The dwarf variety of box can be kept down to a height of 6 inches to a foot for any number of years and is useful for edgings. The larger-growing varieties make excellent hedges 3, 4 and 5 feet high. The ordinary privet or prim holds its leaves well into the winter in the North. The so-called Californian privet holds its leaves rather longer and stands better along the sea-shore, but it is less hardy than the other. In the southern states, nothing is better than *Citrus* (or *Poncirus*) *trifoliata*. Some of the barberries are excellent hedge plants, particularly *Berberis Thunbergii* with its good autumn color (*B. vulgaris* is a host of wheat rust). Native plants of the region often make acceptable hedges.

For hedges of deciduous plants, the most common species are the buckthorn, the European thornapple or cratægus, osage-orange, and various kinds of roses, particularly *Rosa rugosa*. Near the sea in California, *Lavatera assurgentiflora* is employed as a wind-break.

To obtain a good hedge, it is necessary to have a thoroughly well-prepared deep soil, to set the plants close, and to shear them at least twice every year. Arbor-vitæ may be set 1–2½ or 3 feet apart, and hemlock spruce much the same; and these distances may be taken as a general guide for many other plants.

The hedge should be trimmed the year after it is set, although it should not be cut very closely until the plants reach the desired or permanent height. Thereafter it should be sheared into the desired form in spring or autumn. If the plants are allowed to grow a year or two without trimming, they lose the lower leaves and become open and straggly. Osage-orange and some other plants are plashed—that is, the plants are set at an angle rather than perpendicularly, and they are wired together in such a way that they make an impenetrable barrier just above the surface of the ground.

Hedges are much less employed in North America than in Europe, and for several reasons. The climate is relatively dry, and most hedges do not thrive so well here as there; labor is high-priced, and the trimming is likely to be neglected; farms are so large that much fencing is required; timber and wire are cheaper than live hedges. However, they are grown with good effect about home grounds.

HEDGE-THORN: *Carissa Arduina.*

HEDRAIANTHUS: *Edraianthus.*

HEDYCARYA. *Monimiaceæ.* Trees or shrubs sometimes planted in Calif.: lvs. opposite: fls. diœcious, in axillary cymes or racemes: fr. composed of several drupes borne on the receptacle: native in New Zeal., Australia and Pacific Isls.

arborea. To 40 ft.: lvs. oblong or obovate, to 5 in. long, coarsely toothed, leathery: fls. to ½ in. across: drupes bright red, ½ in. long. New Zeal.

HEDYCHIUM. GINGER-LILY. *Zingiberaceæ.* Robust trop. invading per. herbs with strong rootstocks and leafy sts., the fls. borne in bracts on terminal spikes or panicles and having 1 broad petal-like staminode or lip and prominent but smaller lateral ones.

Grown in the greenhouse or frostless countries out-of-doors; prized for the showy flowers and fragrance. They require rich soil and plenty of water or may even be immersed up to the crown. Propagated by division of the roots. See *Zingiberaceæ.*

aurantiacum. To 10 ft.: lvs. to 1½ ft. long and 1 in. wide: fls. orange, the corolla-tube ¾ in. and segms. 1 in. long, filament bright red, in spikes to 6 in. long. India.

chrysoleucum (*H. coronarium* var. *chrysoleucum*). Differs from *H. flavescens* in the base of lip and lateral staminodes deep orange-yellow. India.

coccineum. To 6 ft.: lvs. to 20 in. long and 2 in. wide: fls. red, the corolla-tube 1 in. and segms. 1 in. long, filament pink, in dense spikes to 10 in. long. India. Var. **angustifolium** has shorter lvs. and brick- or salmon-red fls.

coronarium. GARLAND-FLOWER. To 6 ft.: lvs. to 2 ft. long and 5 in. wide: floral bracts large and firm and closely imbricated, with 4–6 white very fragrant fls. under each one; perianth-tube 2–3 in. long; lip large and broad, nearly 2 in. long and 1½ in. broad, 2-lobed and sometimes with smaller lobes, sometimes tinged yellow on lower part; filament with anther shorter than lip: spike somewhat ovate, to 1 ft. long. Trop. Asia; nat. extensively in trop. Amer.

elatum. To 12 ft. or more: lvs. to 2 ft. long and 2½ in. wide: fls. yellowish-white, the corolla-tube 1 in. and segms. ¾ in. long, filament pink, in loose spikes to 1 ft. long. India.

ellipticum. To 5 ft.: lvs. to 14 in. long and 5 in. wide: fls. yellowish-white, the corolla-tube to 3 in. and lobes 1 in. long, filament purple, in dense spikes 4 in. long. India.

flavescens (*H. coronarium* var. *flavescens*). Fls. to 5½ in. long, yellowish, with color deeper in basal part; lip obovate-orbicular, 2-lobed, narrowed to claw; filament with anther slightly exceeding lip, yellow. India, Mascarene Isls.

flavum. To 5 ft.: lvs. to 14 in. long, slender-pointed: spike oblong, the imbricate bracts oblong-ovate and nearly obtuse, 2½ in. long and 2 in. broad; lip obcordate, suddenly narrowed into a short claw, yellow with orange patch in center and below; filament and anther about as long as lip. India.—Other plants have been known as *H. flavum.*

Gardnerianum. Lvs. to 1½ ft. long and 6 in. wide: fls. light yellow, the corolla-tube 2 in. and segms. 1½ in. long, with long-exserted red filament, in spikes to 1½ ft. long. India.

glaucum (*H. gracile* var. *glaucum*). To 5 ft.: lvs. to 10 in. long and 3 in. wide, glaucous beneath: fls. white, the corolla-tube 1 in. and segms. 1¼ in. long, filament red, in loose spikes to 8 in. long. India.

gracile. To 2 ft.: lvs. to 5 in. long and 1½ in. wide, glaucous beneath: fls. greenish-white, the corolla-tube 1 in. and segms. ¾ in. long, filament red, in spikes to 4 in. long. India.

Greenei. To 6 ft.: lvs. to 10 in. long and 2 in. wide: fls. with corolla-tube 1½ in. long and dark red lip 1½ in. long, the linear lobes lighter red, filament red, in dense spikes to 5 in. long. India.

maximum (*H. coronarium* var. *maximum*). Differs from *H. coronarium* in the broader lvs., ciliate bracts, large fls. with lateral staminodes frequently bearing a lobe or tongue from the center, filament tinged pink; lip nearly 2¾ in. long and 1¾ in. broad. India.

spicatum. To 3 ft.: lvs. to 16 in. long and 4 in. wide: fls. yellow, the corolla-tube 3 in. and segms. 1 in. long, filament reddish, in loose spikes to 8 in. long. India. Var. **acuminatum** has lvs. tomentose beneath and purple corolla-lobes.

thyrsiforme. To 6 ft.: lvs. to 14 in. long and 5 in. wide: fls. white, the corolla-tube 1 in. and lobes 1 in. long, filament white, in dense spikes to 4½ in. long. India.

villosum. To 8 ft.: lvs. to 14 in. long and 4 in. wide: fls. with white corolla-tube to 2½ in. long and yellow segms. 1¼ in. long, filament purple, in loose spikes to 10 in. long. India.

HEDYSARUM. *Leguminosæ.* Per. herbs or subshrubs native in the north temp. zone, with pinnate lvs., showy papilionaceous fls. in axillary racemes, and flat pods which separate into joints.

Of easy cultivation in sunny well-drained soil. Propagated by seeds and division. Sometimes planted in borders for ornament.

coronarium. French-Honeysuckle. Per. or bien. to 4 ft.: lfts. elliptic, 3–7 pairs: fls. deep red, fragrant, in summer. Eu. Var. **album** has white fls.

multijugum. To 5 ft.: lfts, obovate, to ½ in. long, 10–20 pairs: fls. violet or purple, in summer. Mongolia.

obscurum. To 1 ft.: lfts. oblong, 5–9 pairs: fls. purple, in summer. Eu.

pabulare. To 2½ ft.: lfts. oblong, 4–7 pairs, to ¾ in. long: fls. purple, ½ in. long, in early summer. Mont. to New Mex.

utahense. To 2 ft.: lfts. oval or oblong, 5–8 pairs, to 1 in. long: fls. rose-purple, to ¾ in. long. Utah, Ida.

HEDYSCEPE. *Palmaceæ.* One unarmed attractive monœcious feather-palm of Lord Howe Isl. in the S. Pacific. From Howea the genus differs in having flexuosely branched spadices, the fls. hardly in pits; ovule attached on wall: fr. larger, about 2 in. long with oblique-lateral stigmatic point, and other technical differences. **H. Canterburyana** (*Kentia Canterburyana*). Tall stout palm with a dense crown of arched recurving lvs.: pinnæ numerous, green both sides, narrow-lanceolate and acuminate, drooping at ends. Grown in Fla. and S. Calif.

HEERIA: *Schizocentron elegans, Heterocentron roseum.*

HEIMIA. *Lythraceæ.* Two trop. American glabrous shrubs with small opposite or whorled lvs., yellow solitary fls. having horn-like appendages at base of calyx-lobes, and capsular frs.; sometimes planted in S. Calif.

myrtifolia. To 3 ft.: lvs. linear or lanceolate, to 2 in. long: fls. ⅙ in. long. Brazil.

salicifolia. To 10 ft.: lvs. linear-lanceolate or lanceolate, to 3½ in. long: fls. to ¾ in. long. Mex. to Argentina.

HELENIUM. Sneezeweed. *Compositæ.* Coarse erect herbaceous annuals and perennials with alternate, toothed or entire lvs. and yellow or brownish heads, mostly radiate, either solitary or in flat-topped clusters in summer and fall; pappus of scales; native in N. and S. Amer.

Heleniums thrive well in fairly rich soil and a sunny situation; they may be propagated by seeds, cuttings and division. They are useful for rear borders and wild-gardens.

aromaticum (*Grahamia aromatica*). Glaucous, much branched: lvs. linear-lanceolate, upper entire, lower pinnately cut: heads of yellow disk-fls. Chile.

autumnale (*H. grandiflorum*). Per. to 6 ft.: lvs. lanceolate or ovate-lanceolate, to 5 in. long, mostly toothed, decurrent on st.: heads to 2 in. across, numerous, rays lemon-yellow to bright yellow, disk yellow, Que. to Fla. and Ariz. Var. **grandiflorum** has large fls. Var. **nanum præcox** is dwarf and early blooming. Var. **pumilum** grows to 2 ft. high. Var. **rubrum,** fls. deep red. Var. **striatum** has rays striped with crimson. Var. **superbum,** fls. large.

Bigelovii. Per. to 4 ft.: lvs. lanceolate, to 10 in. long, decurrent on st.: heads to 2½ in. across, rays yellow, disk brown or brownish-yellow. Calif.

californicum: *H. puberulum.*

grandiflorum: *H. autumnale.*

Hoopesii (*Dugaldia Hoopesii*). Per. to 3 ft.: lvs. oblong-lanceolate, to 10 in. or more long, entire, not decurrent: heads 1 to several, 3 in. across, yellow. Rocky Mts. to Ore. and Calif.

nudiflorum. Per. to 3 ft.: lvs. lanceolate to linear-lanceolate, to 6 in. long, nearly entire, decurrent on st.: heads to 1½ in. across, in clusters, rays drooping, yellow, brown-purple or striped, disk brownish or purplish. N. C. to Fla. and Tex. Var. **grandicephalum striatum,** to 5 ft., heads 2 in. across.

puberulum (*H. californicum*). Per. to 5 ft.: lvs. lanceolate or linear, decurrent: heads solitary, globose, red-brown, ½ in. across, rays reflexed and inconspicuous. Calif.

pumilum: *H. autumnale* var.

tenuifolium. Ann. to 2 ft., very leafy: lvs. thread-like, to 1½ in. long, entire, often whorled: heads to 1 in. across, clustered, yellow. Va. to Fla. and Tex.; northward as a weed.

HELIAMPHORA. *Sarraceniaceæ.* One insectivorous per. native in British Guiana, rarely seen in greenhouse collections. The plant requires much moisture and does best in pots plunged in moss under a bell-glass. Propagated by single crowns. **H. nutans.** To 2 ft.: lvs. or pitchers basal, tubular, winged in front, with very small lid, veined with red: fls. white or pale rose, nodding, several together.

HELIANTHELLA. *Compositæ.* Per. herbs with alternate or opposite lvs. or sometimes the scape leafless, and long-stalked solitary heads of yellow ray-fls. and yellow or brownish disk-fls.; pappus of scales; native in W. N. Amer. Propagated by seeds or division.

Parryi. To 1 ft.: lvs. oblanceolate, to 4 in. long: disk to ¾ in. across, rays ½ in. long. Colo. to Ariz.

quinquenervis. To 2 ft.: lvs. ovate-lanceolate, to 9 in. long: disk to 2 in. across, rays 1 in. long. S. D. to New Mex.

uniflora. To 2 ft.: lvs. oblong-lanceolate, to 5 in. long: disk purple, rays 1 in. long. Mont. to New Mex.

HELIANTHEMUM. Sun-Rose. *Cistaceæ.* Herbs or diffuse low subshrubs adapted to border planting and rock-gardens or for ground-cover, in N. Amer. and Medit. and adjacent regions, having small simple lvs. and yellow, white, rose or purple fls. in terminal racemes in summer.

In the North winter protection is advisable. They thrive in a sunny exposure on dry limestone soil. Propagated by division, greenwood cuttings and seeds. One of the sun-roses (*H. nummularium*) is hardy and common in the North.

alpestre. To 6 in.: lvs. ovate-lanceolate, to ¾ in. long: fls. yellow, ½ in. across. Mts. of S. Eu.

alyssoides. Lvs. ovate-lanceolate: fls. bright yellow, 1½ in. across. S. W. Eu.

appenninum (*H. polifolium. H. pulverulentum*). To 15 in. or sts. procumbent: lvs. oblong, to 1¼ in. long, gray-tomentose: fls. white, 1 in. across. Eu., Asia Minor. Var. **roseum** (*H. rhodanthum*) has reddish fls.

Chamæcistus: *H. nummularium.*

formosum: *H. lasianthum.*

grandiflorum: *H. nummularium* var.

guttatum. To 6 in.: lvs. oblong-lanceolate, to 3 in. long: fls. yellow, often with red spot at base of petals. Medit. region.

halimifolium (*Cistus halimifolius*). To 2 ft.: lvs. oblong to lanceolate, white-tomentose when young: fls. yellow with dark spots on petals, 1¼ in. across. S. Eu., N. Afr.

lasianthum (*H. formosum*). To 3 ft.: lvs. oval to lanceolate, to 1½ in. long: fls. yellow blotched with purple at base, 1½ in. across. Portugal.

mutabile: *H. nummularium* var.

nummularium (*H. Chamæcistus. H. vulgare. H. variabile*). To 1 ft.: lvs. ovate to lanceolate, to 2 in. long, gray-tomentose beneath: fls. yellow, 1 in. across. Medit. region; hardy N. and the common species in cult. Var. **albo-plenum**, fls. double white; **aureum**, fls. deep yellow; **cupreum**, fls. copper-colored often variegated with yellow; **grandiflorum** (*H. grandiflorum*), lvs. ovate, fls. 1¼ in. across; **macranthum**, fls. white blotched with yellow at base; **multiplex**, fls. double; **mutabile** (*H. mutabile*), fls. rose changing to lilac or nearly white; **roseum**, fls. pale rose and **roseum-plenum** with double fls.; **stramineum**, lvs. whitish beneath, fls. with dark yellow spot at base.

ocymoides (*Cistus algarvensis*). To 3 ft.: lvs. oblong-lanceolate, about ½ in. long, gray-pubescent: fls. bright yellow with purple base, 1 in. across. Spain, Portugal.

pilosum. Low subshrub: lvs. linear to oblong, ¾ in. long: fls. white with yellow spot at base of petals, 1 in. across. S. W. Eu., N. Afr.

polifolium: *H. appenninum.*

præcox. Lvs. ovate-lanceolate, to 1½ in. long: fls. yellow, spotted at base. Medit. region.

pulverulentum: *H. appenninum.*

rhodanthum: *H. appenninum* var. *roseum.*

rosmarinifolium. To 2 ft.: lvs. linear, to 1 in. long, white-tomentose below: fls. of two kinds, with and without petals, the former ½ in. across. S. C. to Fla. and Tex.

Tuberaria. Per.: lvs. oval-lanceolate, to 3 in. long, gray-tomentose beneath: fls. yellow, 1½ in. across. S. Eu.

umbellatum. To 2 ft.: lvs. linear or linear-lanceolate, to 1¼ in. long, gray-tomentose beneath: fls. white, 1 in. across. Eu.

variabile: *H. nummularium.*

vulgare: *H. nummularium.*

HELIANTHUS. SUNFLOWER. *Compositæ.* Erect mostly tall coarse ann. and per. herbs with solitary or clustered heads of yellow ray-fls. and yellow, brown or purple disk-fls., blooming in late summer and autumn; pappus of deciduous scales or awns; native in the western hemisphere, mostly N. American. Several species are grown in borders and masses for the showy bloom and one for the edible underground tubers; seeds of the common annual sunflower are sometimes used for poultry-feed, oil and other purposes.

No special culture is required for sunflowers. Any ordinary ground and exposure suits them well. Seeds of annuals are sown where the plants are to stand as soon as the weather is settled, or they may be started under glass two to four weeks in advance if earlier results are desired. Perennials should bloom the year following seed-sowing; they may also be divided, and some species are propagated by root-stolons or offsets.

acutifolius: listed name.

angustifolius. SWAMP S. Per. to 7 ft., sts. rough: lvs. linear, to 7 in. long, entire: heads solitary or few, to 3 in. across, disk purple. Swamps, N. Y. to Fla. and Tex.

annuus (*H. lenticularis*). COMMON GARDEN S. Ann. to 12 ft.: lvs. ovate, to 1 ft. long, toothed, rough on both sides: heads 1 ft. or more across, disk brownish-purple. Minn. to Wash. and Calif. Var. **citrinus**, rays primrose-yellow. Var. **nanus**, dwarf, fls. mostly double. Var. **globosus fistulosus**, heads globular and very large. Var. **variegatus**, lvs. variegated.

argophyllus. SILVERLEAF S. Ann. to 6 ft., gray-silky-pubescent: lvs. ovate to lanceolate, to 6 in. long, slightly toothed: heads 3 in. or more across, disk brownish-purple. Tex.

atrorubens (*H. sparsifolius*). DARKEYE S. Per. to 5 ft., rough-hairy: lvs. ovate or oblong-lanceolate, to 10 in. long, toothed, petioles margined: heads clustered, 2 in. across, disk purple. Va. to Fla. and La.

californicus. Per. to 11 ft.: lvs. oblong to lanceolate, to 9 in. long, pubescent, entire: heads clustered, to 3 in. across, disk yellowish. Calif.

cucumerifolius: *H. debilis.*

debilis (*H. cucumerifolius*). CUCUMBER-LEAF S. Ann. to 4 ft., rough-hairy, branches sometimes mottled purple and white: lvs. ovate or triangular, to 4 in. long, toothed: heads solitary, to 3 in. across, disk brown or purplish. Fla. to Tex. Var. **cupreatus** has coppery-red heads. Var. **purpureus** has pink to purple ray-fls.

decapetalus (*H. multiflorus*). THINLEAF S. Per. to 5 ft.: lvs. ovate to ovate-lanceolate, to 8 in. long, toothed, pubescent beneath: heads numerous, to 3 in. across, disk yellowish. Que. to Ga. and Mo. Double forms are vars. **flore-pleno** and **grandiflorus**. Var. **maximus** has large fls. with pointed rays.

divaricatus. Per. to 7 ft.: lvs. lanceolate or ovate-lanceolate, to 8 in. long, toothed, pubescent beneath, rough above: heads solitary or few, 2 in. across, disk yellow. Me. to Fla. and La.

doronicoides. Per. to 7 ft.: lvs. oblong to ovate, to 8 in. long, toothed, rough on both sides: heads numerous, to 4 in. across, disk yellow. Ohio to Ark.

Dowellianus. Per. to 2 ft.: lvs. ovate or ovate-lanceolate, to 5 in. long, toothed, slightly pubescent: heads to 2½ in. across, disk yellow. D. C. to Ga.—Like *H. occidentalis.*

giganteus. GIANT S. Per. to 12 ft., rough-hairy: lvs. lanceolate, to 6 in. long, toothed: heads several, to 3 in across, disk yellowish. Me. to Fla. and La.

grosse-serratus. Per. to 10 ft., sts. glaucous: lvs. lanceolate, to 8 in. long, toothed, pubescent beneath, rough above: heads several, to 3 in. across, disk yellowish. Me. to Tex.

lætiflorus. SHOWY S. Per. to 8 ft., rough-hairy: lvs. ovate-lanceolate, to 10 in. long, toothed: heads several, to 4 in. across, disk yellow. Pa. to Minn.

lenticularis: *H. annuus.*

macrophyllus: *H. strumosus.*

Maximiliani. Per. to 12 ft.: lvs. lanceolate, to 7 in. long, toothed or entire, rough on both sides: heads to 3 in. across, disk yellowish. Minn. to Tex.

microcephalus (*H. parviflorus*). Per. to 6 ft.: lvs. lanceolate or ovate-lanceolate, to 7 in. long, toothed, rough above, pubescent beneath: heads several, to 1¼ in. across, disk yellow. Pa. to Ga. and La.

mollis. ASHY S. Per. to 5 ft., white-pubescent: lvs. ovate to lanceolate, to 5 in. long, toothed: heads solitary or few, to 3 in. across, disk yellowish. Mass. to Ga. and Tex. Var. **grandiflorus** is listed.

multiflorus: *H. decapetalus.*

orgyalis. Per. to 10 ft.: lvs. linear, to 16 in. long, nearly entire, rough, drooping: heads numerous, 2 in. across, disk brown or purplish. Mo. to Colo. and Tex.

parviflorus: *H. microcephalus.*

perennis: a hort. name.

petiolaris. PRAIRIE S. Ann. to 3 ft., rough-hairy: lvs. ovate to ovate-lanceolate, to 3 in. long, entire or toothed: heads 3 in. across, disk brown. Minn. to Ore. and Calif.

questifolius: a hort. name.

rigidus: *H. scaberrimus.*

rigidus japonicus: trade name.

scaberrimus (*H. rigidus. Harpalium rigidum*). STIFF S. Per. to 8 ft., rough-hairy: lvs. ovate to lanceolate, to 1 ft. long, toothed: heads solitary or few, to 3 in. across, disk purple or brown. Ill. to Ga. and Tex.—In garden forms somewhat double.

scaberrimus (*H. rigidus*). STIFF S. Per. to 8 ft., rough-hairy: lvs. ovate to lanceolate, to 1 ft. long, toothed: heads solitary or few, to 3 in. across, disk purple or brown. Ill. to Ga. and Tex.—In garden forms sometimes somewhat double.

sparsifolius: *H. atrorubens.*

strumosus (*H. macrophyllus*). Per. to 7 ft.: lvs. ovate or ovate-lanceolate, to 8 in. long, toothed, rough above, pubescent beneath: heads several, to 4 in. across, disk yellow. Me. to Ga. and Ark.

tuberosus. GIRASOLE. JERUSALEM ARTICHOKE. Per. to 12 ft., producing edible subterranean potato-like tubers: lvs. ovate to ovate-oblong, to 8 in. long, toothed, rough above, pubescent beneath: heads several, to 3½ in. across, disk yellow. N. S. to Ga. and Ark.—See *Girasole.*

HELICHRYSUM. Everlasting. *Compositæ.* Herbs or shrubs native in the Old World, with usually alternate entire lvs. and solitary or clustered heads of yellow disk-fls., involucral bracts imbricated and often petal-like and bright colored; pappus of bristles.

A few species are grown in the flower-garden and for everlastings to use in the winter bouquet. Propagated by seeds sown out-of doors or started under glass for earlier bloom, and the last species also by cuttings.

angustifolium. Whiteleaf E. Per. to 1 ft., woody at base: lvs. linear, margins revolute, white-tomentose: heads yellow, ⅛ in. across, in corymbs. Medit. region.

bracteatum. Strawflower. Ann. to 3 ft.: lvs. oblong-lanceolate, green: heads solitary, to 2½ in. across, yellow, orange, red or white, as indicated by varietal names **album, bicolor, luteum, purpureum, roseum.** Australia. Var. **monstrosum** (*H. monstrosum*) has double fls. Var. **nanum** is dwarf.

glomeratum. To 1½ ft., woody: lvs. lanceolate, ciliate: heads lemon-yellow, in crowded corymbs. Mts., S. Afr.

lanatum. To 15 in., woody at base: lvs obovate, white-woolly: heads bright yellow, in corymbs to 4 in. across. S. Afr.

monstrosum: *H. bracteatum* var.

petiolatum (*Gnaphalium lanatum*). To 2 ft. or more, woody at base, the sts. flexuose and decorative in hanging-baskets lvs. ovate, white-woolly: heads cream-white, in corymbs to 2 in. across. S. Afr.—Commonly propagated by cuttings and fls. may not be produced.

HELICODICEROS (*Megotigea*). *Araceæ.* One species native in the Medit. region, sometimes grown under glass as a curiosity; the fls. have a very offensive odor. **H. muscivorus** (*Arum crinitum*). Twist-Arum. Tuberous herb to 1½ ft.: lvs. pedately parted: spathe contracted at throat and bent horizontally, the limb pale purple covered with long white hairs, the tube spotted.

HELICONIA (*Bihai*) *Musaceæ.* Stout trop. American herbs with large banana-like lvs., bisexual fls. clustered in the axils of large stiff boat-shaped or conduplicate often woody bracts, and fr. a caps. which breaks up into berry-like parts.

Heliconias are sometimes grown in the greenhouse, or out-of-doors in warm regions for the foliage effects, making large clumps if given room. The plants thrive well in rich loam with plenty of water. Propagated by division of the roots, and by seed when available.

aureo-striata. Sts. striped green and yellow: lvs. with transverse veins striped bright yellow. Native country unknown: probably a form of *H. Bihai.*

Bihai. Wild Plantain. Balisier. To 18 ft.: lvs. to 3 ft. and more long and 1 ft. wide, long-petioled: fls. greenish or greenish-yellow, inclosed in the scarlet ovate-lanceolate deeply boat-shaped bracts to 6 in. long. Trop. Amer.

illustris. Lvs. with midrib and transverse veins marked with pink. S. Sea Isls. Botanical position uncertain. Var. **rubricaulis** has red sts.

psittacorum. To 4 ft. or less: lvs. to 1½ ft. long and 2 in. wide, long-petioled: fls. greenish-yellow, inclosed in shining-red narrow-lanceolate deeply boat-shaped bracts to 3 in. long. Trop. Amer.

Sanderi. Resembling *H. illustris* but lvs. marbled with pink. New Guinea, but botanical identity doubtful.

HELIOCEREUS. *Cactaceæ.* A small group of Mexican and Cent. American bushy cacti differing from Cereus, among other things, in having a scaly or spiny ovary: sts. usually procumbent or clambering but sometimes erect under cult., branches strongly angled or ribbed, spines all alike: fls. diurnal, funnelform, mostly scarlet. They hybridize with other cacti. See *Cacti.*

amecamensis (*Cereus amecamensis*). Ribs 3–5, spines many: fls. white, greenish outside, the tube nearly 1½ in. long, segms. nearly 3 in. long. Mex.

elegantissimus (*Cereus coccineus*). Sts. to 8 in. high and branches often decumbent and to 2 in. broad and commonly 3- or 4-angled, spines needle-like: fls. scarlet, to 6 in. broad, style red, stigma-lobes white. Mex.

speciosus (*Cereus speciosus. C. speciosissimus*). Branching at base, ribs 3–5 and undulate, spines numerous and becoming yellow or brownish: fls. scarlet, 6–7 in. long, stigma-lobes red. Mex., probably Cent. Amer.

HELIOPSIS. *Compositæ.* Herbaceous sunflower-like perennials blooming in summer, with opposite coarsely toothed lvs. and showy heads of long yellow ray-fls. and disk-fls. partly inclosed in chaffy bracts; pappus none or a toothed border; native to N. Amer. Cult. as for *Helianthus.*

helianthoides (*H. lævis*). Per. to 5 ft., nearly glabrous: lvs. ovate, to 6 in. long, sometimes roughish above: heads to 2½ in. across, numerous. Ont. to Fla. and Tenn. Var. **Pitcheriana** (*H. Pitcheriana*), fls. deeper yellow.

lævis: *H. helianthoides.*

Pitcheriana: *H. helianthoides* var.

scabra. Differs from *H. helianthoides* chiefly in being rough-hairy and the heads few or solitary. Me. to N. J. and New Mex. Vars. are **excelsa,** chrome-yellow, nearly double; **gratissima,** pale yellow; **imbricata,** dwarf, fls. 3 in. across, golden-yellow; **major,** larger than type; **zinniæflora,** double-fld.

HELIOTROPE: *Heliotropium.* Garden-: *Valeriana officinalis.* Winter-: *Petasites fragrans.*

HELIOTROPIUM. Heliotrope. *Boraginaceæ.* Herbs or shrubs with mostly alternate simple lvs. and small often very fragrant violet, purple or white fls. in coiled racemes and cymes, corolla naked in the throat; some of them are popular in greenhouses and borders and others are weedy plants.

The greenhouse heliotropes are treated as annuals and require abundant heat and light rich soil. Propagated by cuttings and seeds; the latter may be sown indoors and the seedlings transplanted. Strong plants may be set out and the new growths pegged to the ground where they will form roots.

amplexicaule (*H. anchusæfolium*). Per., yellowish-hairy: lvs. lanceolate to linear-lanceolate, sessile: fls. violet. ¼ in. across. Argentina.

anchusæfolium: *H. amplexicaule.*

arborescens (*H. peruvianum*). Common H. Per. to 4 ft.: lvs. oval or oblong-lanceolate: fls. violet or purple varying to white, ⅛ in. long, vanilla-scented. Peru.—Common under glass and sometimes planted out.

convolvulaceum: *Euploca convolvulacea.*

corymbosum. Perhaps a form of *H. arborescens* but by gardeners thought to be distinguished by its longer narrower lvs. distinctly narrowed at base: fls. violet or purple varying to white, ¼ in. long, narcissus-scented. Peru.

europæum. Ann. to 1 ft., pubescent: lvs. oval, long-stalked: fls. white, ⅛ in. across. Eu.; nat. in E. U. S.

peruvianum: *H. arborescens.*

HELIPTERUM. Everlasting (which see). *Compositæ.* Flower-garden annuals, often cut early and dried for winter bouquets, with mostly alternate entire lvs. and solitary or clustered heads of yellow disk-fls., the involucral bracts often petal-like and colored; pappus plumose; native in S. Afr. and Australia.

Culture is simple. Seeds usually are sown where plants are to grow but may be started indoors for earlier results. Plants may stand 6–12 inches apart.

anthemoides. To 1 ft., with per. rootstock, glabrous: lvs. linear: heads to 1 in. across, solitary, the bracts white tinged brown. Australia.

corymbiflorum. To 1 ft., white-woolly: lvs. linear or lanceolate: heads small, in corymbs, bracts white. Australia.

Humboldtianum (*H. Sandfordii*). To 1½ ft.: lvs. linear, white-tomentose: heads small, in clusters, bracts yellowish-green. Australia.

Manglesii (*Rhodanthe Manglesii*). Swan River E. Slender, to 1½ ft., glabrous: lvs. ovate: heads not clustered, to 1½ in. across, bracts white to bright pink. Australia. Var. **maculata,** bracts spotted red.

roseum (*Acroclinium roseum*). Stout, to 2 ft., glabrous: lvs. linear to lanceolate: heads not clustered, to 2 in. across, bracts rose or white. Australia.

Sandfordii: *H. Humboldtianum.*

HELLEBORE: *Helleborus.* **False:** *Veratrum.*

HELLEBORUS. Hellebore. *Ranunculaceæ.* Per. herbs with thick fibrous roots, mostly basal palmately divided lvs., large fls. with 5 petal-like sepals, inconspicuous petals and many stamens, and fr. a follicle; native in Eu. and Asia.

Hellebores bloom in early spring or in winter in mild climates, although *H. niger* is very hardy and persistent. They thrive in partially shaded moist situations in good soil. Propagated by division of roots, preferably in late summer or fall; also by seeds. Hellebores may also be forced under glass.

atrorubens: *H. orientalis* var.

fœtidus. To 1 ft.: lvs. leathery, borne on st.: fls. green or marked purple, to 1 in. long. W. Eu.

hybridus: mentioned name.

lividus. To 1½ ft.: lvs. 3-parted, toothed, borne near bottom of plant: fls. pale green, in a cluster. Corsica.

niger. Christmas-Rose. To 1½ ft.: lvs. basal, divided into 7 or more oblong evergreen lfts., the st. with few small lvs.: fls. white or purplish with green petals, to 2½ in. across, solitary. Eu.

orientalis. Differs from *H. niger* in having branched fl.-sts. without lvs. and fls. 2–6 together. Asia Minor. Var. **atrorubens** (*H. atrorubens*). Fls. dark purple outside, greenish-purple inside.

purpurascens: form of *H. viridis.*

viridis. To 2 ft.: lvs. divided into 7–11 oblong lfts.: fls. yellowish-green, 1 in. long, drooping, subtended by lvs. Eu.; nat. in E. N. Amer.

HELONIAS. *Liliaceæ.* One per. spring-blooming herb with tuberous roots, native in bogs from N. J. to N. C. **H. bullata.** Swamp-Pink. To 2 ft.: lvs. basal, to 15 in. long and 2 in. wide: fls. pink or purplish, ¼ in. long, in dense racemes to 3 in. long terminating the hollow scape.—Suitable for bog-gardens and also a good pot-plant for late winter and spring. Easily propagated by division.

HELWINGIA. *Cornaceæ.* Asian shrubs, one of which is sometimes grown as a curiosity and ornamental: lvs. alternate, toothed: fls. diœcious, small, borne in clusters on upper surface of lvs.: fr. a berry-like drupe. Propagated by cuttings of green wood under glass.

japonica. To 5 ft.: lvs. ovate, to 3 in. long: fls. greenish-white: fr. black, ¼ in. across. China, Japan; hardy in north-central parts.

HELXINE. *Urticaceæ.* One creeping moss-like little herb from Corsica and Sardinia, used as a ground- and pot-cover in greenhouses and in rock-gardens in mild climates, making dense mats. **H. Soleirolii.** Lvs. nearly orbicular, ¼ in. or less across: fls. unisexual, minute, solitary in the axils.—It thrives in partial shade. Propagated by cuttings of the rooting sts.

HEMEROCALLIS. Day-Lily. *Liliaceæ.* Per. herbs with cord-like or more or less tuberous roots, linear or sword-shaped basal lvs. and showy yellow, fulvous or orange fls. in clusters at the ends of leafless scapes, the perianth-segms. partially united below to form a tube of varying length; stamens and style prominent.

An important group of hardy spring- and summer-blooming herbs with lily-like flowers, of simple cultural requirements in any good garden soil. Propagated by division, and sometimes by seeds if available. Some of the species do not produce seeds in ordinary garden conditions. The foliage, forming mats, is useful as ground-cover. There are many good named horticultural varieties. The day-lilies fall into two groups as determined by the mode of flower-bearing: the forking kinds in which the flowers are borne in a more or less open or branched cluster terminating the scape, the involucrate kinds in which the flowers are close together and practically sessile in a head-like cluster subtended by broad short bracts resembling an involucre. To the latter group belong *H. Dumortierii* and *H. Middendorffii,* all the other species being of the dichotomous or forking group. Certain garden kinds are probably hybrids between the two groups.

aurantiaca. Golden Summer D. To 3 ft.: lvs. to 3 ft. long and 1 in. or more across: fls. clear burnt-orange or salmon-orange, not fragrant, late spring and summer. Japan. Var. major is larger and apparently the common form: fls. erect on stiff scapes, 6 in. across when expanded.

citrina. Long Yellow D. To 4 ft. and more: lvs. to 3 ft. long and 1 in. or more across: fls. light lemon-yellow, to 6 in. long, very fragrant, not open broadly in full daylight, on stiff scapes, summer. China.—*H. serotina* is often called by this name.

disticha *H. fulva.*

Dumortierii (*H. rutilans. H. Sieboldii*). Narrow Dwarf D. To 1 ft. or so: lvs. to 1½ ft. long and ½ in. across: fls. pale orange, to 2¾ in. long, the tube very short, outer segms. lanceolate-acute, fragrant, 2–4 of them together in a close head or cluster, spring. Japan.

flava. Tall Yellow D. To 3 ft.: lvs. to 2 ft. long and ¾ in. across: fls. yellow, to 4 in. long, fragrant, on weak more or less lopping scapes, spring. Siberia to Japan; Eu.—Common early yellow day-lily.

fulva (*H. disticha*). Tawny or Fulvous D. To 6 ft.: lvs. to 2 ft. long and 1⅓ in. across: fls. fulvous or rusty orange-red, to 5 in. long, not fragrant, to 3½ in. across when fully expanded, usually with darker lines and stripes, summer. Eu., Asia; nat. in E. U. S.—The commonest day-lily of midsummer. Var. **Kwanso** has double fls.: plant usually stouter and blooms somewhat later.

Kwanso: *H. fulva* var.

luteola. Hybrid between *H. serotina* and *H. aurantiaca* var. *major:* fls. golden-yellow.

Middendorffii. Broad Dwarf D. To 1 ft. or so: lvs. to 1½ ft. long and 1 in. across: fls. pale orange, in a close cluster or head, to 2¾ in. long, the segms. broad and mostly obtuse and recurving at full bloom and thereby differing from *H. Dumortierii,* spring. Siberia.

minor. Dwarf Yellow D. To 18 in.: lvs. to 20 in. long and ¼ in. across: fls. mostly 2 or 3, yellow, 4 in. long, fragrant, spring. E. Siberia to Japan.—Plants grown under this name are likely to be *H. Middendorffii* or hybrids from it.

rutilans: *H. Dumortierii.*

serotina (*H. Thunbergii*). Late Yellow D. To 3 ft.: lvs. to 2 ft. long and ¾ in. across: scapes stiff and erect, more or less 3-angled; fls. lemon-yellow, 3 in. long, slightly fragrant, summer. Japan. —Sometimes grown erroneously as *H. citrina*; the prevailing yellow summer day-lily.

Sieboldii: *H. Dumortierii.*

Thunbergii: *H. serotina.*

HEMIANDRA. *Labiatæ.* Shrubs from W. Australia, with opposite narrow lvs. and white or pink 2-lipped fls. solitary in the axils; one species intro. in Calif.

pungens. To 2 ft., stiff: lvs. linear or linear-lanceolate, pungent-pointed: fls. with dark spots.

HEMICYCLIA. *Euphorbiaceæ.* Trees and shrubs with alternate entire leathery lvs., small diœcious fls. solitary or clustered, and fr. a 1-seeded drupe; native E. Indies to Australia, one intro. in warm regions.

australasica. Tree to 40 ft.: lvs. ovate, to 3 in. long, obtuse: fr. ovoid, ½ in. long, red and succulent. Australia.

HEMIGRAPHIS. *Acanthaceæ.* Asian herbs or shrubs with opposite lvs. and tubular 5-lobed fls. subtended by large bracts and borne mostly in terminal heads; one species grown in S. Fla. as a basket or cover plant, but must be protected or kept in the greenhouse in winter. Propagated by cuttings.

colorata. Prostrate rooting per.: lvs. ovate-cordate, to 3 in. long, purplish, toothed, bullate: fls. white, ¾ in. long. Java.

HEMIONITIS. *Polypodiaceæ.* Small trop. ferns with palmately or pinnately lobed lvs., fertile stiff and long-stalked, sterile short-stalked; sori naked, borne along the veins. Sometimes grown in fern-cases, making attractive little subjects. Propagated by buds and spores. See *Ferns.*

palmata. Strawberry-Fern. Lvs. palmate, to 6 in. long and wide, with 5 triangular divisions, pubescent. W. Indies, Mex., S. Amer.

HEMIPTELEA. *Ulmaceæ.* One small much branched deciduous spiny tree native in N. E. Asia. **H. Davidii** (*Zelkova Davidii*). Lvs. alternate, elliptic, to 2 in. long, coarsely toothed, very short-stalked: fls. in clusters on young branchlets: fr. a small winged nutlet.—Hardy N. and sometimes planted for hedges. Propagated by seeds, layers, grafting on elm.

HEMLOCK: *Tsuga.* **Ground-**: *Taxus canadensis.* **Poison-**: *Conium maculatum.* **Water-**: *Cicuta.*

HEMP: *Cannabis sativa.* **Bowstring-**: *Sansevieria.* **Indian**: *Apocynum cannabinum.* **Manila**: *Musa textilis.* **Sisal**: *Agave sisalana.* **-Tree**: *Vitex Agnus-castus.*

HEMPWEED, CLIMBING: *Mikania scandens.*

HEN-AND-CHICKENS: *Sempervivum tectorum.*

HENBANE: *Hyoscyamus.*

HENEQUEN: *Agave fourcroydes.*

HENNA: *Lawsonia inermis.*

HEPATICA. Liverleaf. *Ranunculaceæ.* Little per. hardy herbs with long-stalked, basal, 3-lobed, evergreen old lvs. and white or purple fls. solitary on the end of a scape, the sepals petal-like, the apparent calyx being an involucre of 3 small lvs.; native in north temp. zone, blooming in early spring. Hepaticas prosper in rich well-drained soil. They are woods plants, useful for colonizing. Propagated by seeds and division of roots.

acutiloba. To 9 in., differing from *H. americana* chiefly in the lobes of the lvs. and involucre being acute. Me. to Ga., and Mo.

americana (*H. triloba* and *Anemone Hepatica* as to the American plant). To 6 in., with petioles and scapes shaggy-hairy: lvs. with 3 rounded or obtuse lobes: fls. ½ to 1 in. across, lavender-blue but passing into white and rose-colored forms. N. S. to Man. and Fla.

angulosa (*Anemone angulosa*). To 6 in., hairy: lvs. 3–5-lobed, the lobes often toothed: fls. about 1¼ in. across. Hungary.

nobilis (*H. triloba* and *Anemone Hepatica* as to the European plant). Much like *H. americana* but petioles and scapes less hairy and fls. 1 in. or more across, blue, rose, whitish, cult. also in double forms. Continental Eu.

triloba: *H. americana* and *H. nobilis.*

HERACLEUM. Cow-Parsnip. *Umbelliferæ.* Coarse per. herbs with large ternately compound lvs., white or pinkish fls. in compound umbels, and flattened frs.; planted in wild-gardens for bold effects and sometimes as specimen plants. They thrive on rich moist soil. Propagated by seeds and division.

giganteum: *H. villosum.*

japonicum: listed name.

lanatum. To 8 ft.: lfts. broad-ovate, lobed and toothed, tomentose beneath: umbels to 1 ft. across. N. Amer.

Mantegazzianum. To 9 ft.: lvs. to 3 ft. long, deeply cut: fls. white, the umbels to 4 ft. across. Caucasus.

villosum (*H. giganteum*). To 12 ft.: lfts. deeply cut and toothed, woolly-tomentose beneath: fls. white. Caucasus.

HERALDS-TRUMPET: *Beaumontia grandiflora.*

HERB: plant naturally dying to the ground; without persistent living stem above ground; lacking definite woody firm structure. It may be annual, biennial or perennial. **-Christopher**: *Actæa.* **-Paris**: *Paris quadrifolia.* **-Patience**: *Rumex Patientia.* **-Robert**: *Geranium Robertianum.*

HERBARIUM: a permanent collection of pressed dried specimens, together with properly preserved fruits and other parts, representing the kinds of plants, for record and critical study.

HERCULES-CLUB: *Aralia spinosa, Zanthoxylum Clava-Herculis.*

HEREROA. *Aizoaceæ.* Separated on technical characters from Mesembryanthemum (which see for cult.): plant stemless or nearly so: lvs. entire, rather elongated and soft, with large dark dots, opposite in four rows: fls. yellow. **H. dolabriformis** (*M. dolabriforme*) has st. at length to 6 or 8 in., per.: lvs. hatchet-shaped (dolabriform), glaucous, to 1½ in. long and nearly or quite half as broad at apex: fls. in 3's or 5's, the petals ½ in. long. S. Afr.

HERMESIAS: *Brownea.*

HERNIARIA. Herniary. Rupture-Wort. Burst-Wort. *Caryophyllaceæ.* Ann. or per. trailing mat-forming little herbs, with roots of short duration: lvs. small and sessile: fls. small, green and crowded in axillary clusters; native in sandy places, usually near the sea, in Eu., W. Asia, N. Afr. and the Canaries and 1 in S. Afr. Grown for carpet-bedding, rock-gardens and for covering graves.

cinerea. Light gray hairy ann., sts. ascending: lvs. oblong-linear: fls. sessile, in 7–10-fld. clusters. Medit. region, Canary Isls.

glabra. Per. 4–6 in., sts. with swollen joints, spreading along the ground several inches: lvs. oblong, usually bronzy-red in winter: fls. sessile, in axillary 7–8-fld. clusters on the lateral branches, making a leafy spike. Eu., Asia.

hirsuta. Hairy per. to 6 in., sts. prostrate: lvs. elliptic-oblong: fls. sessile, in 7–10-fld. clusters. Eu.

HERNIARY: *Herniaria.*

HERONSBILL: *Erodium.*

HERPETICA: *Cassia alata.*

HESPERALOE. *Liliaceæ.* Stemless herbs similar to Yucca but with greenish or reddish fls. opening by day; native Tex. to Mex.

Engelmannii: *H. parviflora* var.

parviflora (*H. yuccæfolia*). To 4 ft.: lvs. to 4 ft. long and 1 in. wide, the margins thread-bearing: fls. rose, 1¼ in. long, nodding. Tex. Var. Engelmannii (*H. Engelmannii*) has more bell-shaped fls. about 1 in. long.

yuccæfolia: *H. parviflora.*

HESPERETHUSA. *Rutaceæ.* One spiny bush or small tree, **H. crenulata,** NAIBEL, native India to Indo-China, grown somewhat in the citrus country for ornament and curiosity, allied to Feronia: evergreen: lvs. odd-pinnate, with small crenulate lfts. and very broadly winged rachis and petiole: fls. small, white, fragrant: fr. ½ in. or less diam., globose, with very bitter pulp. A good pot plant; grows on Citrus stocks.

HESPERIS. ROCKET. *Cruciferæ.* Bien. and per. erect branching herbs of Eu. and Asia: lvs. narrow, entire or toothed, mostly undivided: fls. white to rose, mauve-purple, often showy, in long terminal mostly paniculate racemes, sometimes fragrant: fr. an elongated pod or silique.

matronalis. DAMES-R. or DAMES-VIOLET. Rather coarse per. or sometimes bien. to 3 ft., hirsute to glabrous, much branched: lvs. lanceolate to lance-ovate, to 4 in. long, toothed: fls. large, ½ in. and more across, fragrant, lilac or light purple, varying to white (var. nivea) and to double forms, late spring, early summer. Eu.; nat. in N. Amer.—Propagated by seed sown a season in advance of blooming.

nivalis. Per., 1 ft., green or minutely pubescent: lvs. lance-oblong, entire, to 2 in. long and ¾ in. broad: fls. pale lead-color, in a lax raceme. Near snow-line, mts. of Persia.—Plants grown under this name may be white forms of *H. matronalis.*

HESPEROSCORDUM HYACINTHINUM: *Brodiæa lactea.*

HESPEROYUCCA. *Liliaceæ.* One S. Californian plant with very short woody caudex and basal rosette of narrow lvs. **H. Whipplei** (*Yucca Whipplei*). Lvs. to 1¾ ft. long and ¾ in. across, rigid, finely toothed and terminating in sharp spine: fls. creamy-white, to 2 in. long, fragrant, nodding, in panicles on scapes to 12 ft. high, the perianth-segms. distinct. Hardy only in warm climates. Cult. as for *Agave.*

HETEROCENTRON. *Melastomaceæ.* Herbs or subshrubs native in Mex. and Cent. Amer., having entire lvs., white, rose or purple fls. in panicles, and capsular fr.; grown out-of-doors in warm regions or under glass for the numerous small pleasing fls. Propagated by cuttings.

elegans: *Schizocentron elegans.*

mexicanum: the plant cult. under this name is *H. roseum.*

roseum (*Heeria rosea*). To 2 ft., the branches 4-angled: lvs. oblong, to 2 in. long: fls. rose or white in var. alba, ½ in. long. Mex.

HETEROMELES. *Rosaceæ.* One evergreen shrub native in Calif. and Lower Calif. and much planted there for ornament and employed in holiday decorations. **H. arbutifolia** (*Photinia arbutifolia*). TOYON. CHRISTMAS-BERRY. To 15 ft.: lvs. oblong, to 4 in. long, sharp-toothed, thick, dark green and shining above: fls. white, ¼ in. across, in panicles to 3 in. high: fr. bright red or yellow, ¼ in. long, persistent through winter.—Not hardy N. Propagated by seeds, cuttings, and by layers.

HETEROSPATHE. *Palmaceæ.* Several species of monœcious unarmed feather-palms, native in Philippines and S. Sea Isls., one of which is sometimes planted in S. Fla. Infl. among the lvs., much branched; fls. in 3's, 2 outer ones staminate or in 2's and both staminate on upper part of branches; stamens 6: fr. globular, size of a pea, stigmatic point near or toward the apex; seed 1. For cult. see *Palm.*

elata. Graceful ringed palm to 30 ft. with deep green arching lvs. on long petiole and many drooping strongly nerved pinnæ 2–3 ft. long and 1½ in. or less broad with thickened margins and narrowed to a long point: fr. about ¼ in. across, slightly rugose, becoming white.

HETEROSPERMUM. *Compositæ.* Ann. herbs from Mex. to S. Amer., with opposite lvs. and small heads of yellow fls. with few rays; pappus none or of awns. Grown in flower-garden.

pinnatum. To 1 ft.: lvs. 1–2-pinnate into linear segms.: heads ¼ in. long. W. Tex., Ariz., Mex.

HEUCHERA. ALUM-ROOT. *Saxifragaceæ.* Herbaceous perennials with a tuft of rounded or broad 5–9-lobed toothed lvs. cordate at base, from which spring many slender scapes, overtopping foliage, with small cup-shaped, urn-shaped or saucer-shaped, greenish, white, red or purplish fls. in narrow panicles or racemes; native in N. Amer., largely in the western part.

One (*H. sanguinea*) is common in the perennial border and a few others are sometimes grown in rockeries and wild-gardens. They thrive in the average garden soil, preferably in an open situation. Propagated by division of the clumps in spring or in autumn, or by seed. These plants are native mostly on cliffs, hills and mountains.

alba: *H. sanguinea* var.

americana. To 3 ft.: fls. greenish-white, petals about length of calyx-lobes, stamens much exserted: foliage mottled when young, becoming plain green. Ont. to La. and Minn.

bracteata. Densely tufted, to 6 in.: petals very narrow, slightly longer than calyx-lobes, the infl. spike-like, stamens slightly exserted. Colo., S. Wyo.

brizoides: see *H. lithophila.*

chlorantha. Tufted, to 3 ft.: fls. greenish, infl. spike-like; the petals very small or wanting, stamens included. B. C. to Ore. and Ida.

convallaria: hort. name for a form with long-stalked panicles of fls. somewhat like lily-of-the-valley; also a pink-fld. form.

cylindrica. To 2 ft.: infl. spike-like, fls. yellowish-green, the petals minute or sometimes lacking. Ore., Ida., Mont.

gracillima: *H. sanguinea* var.

hispida. To 4 ft., sts. white-hairy: fls. in narrow panicles, the petals as long as or slightly shorter than sepals. Mts., Va., N. C.

hybrida: *H. sanguinea* var.

lithophila. To 2½ ft. in cult., the infl. a narrow diffuse long panicle of small pinkish fls. about ⅛ in. long, the narrow petals twice as long as sepals. Mts., Calif.—Has been grown as *H. brizoides*, a reputed hybrid.

micrantha. To 2 ft.: fls. whitish, in loose panicles, petals about length of calyx. Calif. to B. C.

pubescens. To 3 ft.: fls. purplish, in open panicles, petals slightly longer than calyx-lobes. Rich woods in mts., Pa. to N. C.

Rosmondi: hort. form with coral-pink fls., to 1½ ft.

rubescens. To 15 in.: fls. in open panicles, with sepals pinkish, green-tipped, petals about twice as long as sepals. Mts., Utah to Ore. and Calif.

sanguinea. CORAL-BELLS. To 2 ft.: infl. open, fls. bright red (in cult. sometimes whitish, pink or crimson), to ½ in. long, bell-shaped, petals shorter than calyx. New Mex., Ariz. and Mex. but hardy N. There are many hort. vars. as: **alba**, fls. white; **gracillima** and **gracillima rosea**, slender form; **hybrida**, robust; **maxima** and **splendens**, fls. dark crimson; Virginal.

villosa. To 3 ft.: panicles open, fls. nearly white, petals twice as long as calyx. Va. to Ga. and Tenn.

HEVEA. *Euphorbiaceæ.* Brazilian trees with milky juice which is the most important single source of rubber, lvs. of 3 lfts., small monœcious fls. without petals, in panicles, and fr. a large caps.; sometimes grown for ornament.

It does best in hot damp climates. Propagated by seeds, and sometimes by cuttings as an ornamental subject or when grown under glass for interest.

brasiliensis. PARA RUBBER OR CAOUTCHOUC TREE. To 60 ft.: lfts. elliptic, sometimes as much as 2 ft. long: fls. white: seeds about 1 in. long. Amazon.

HEXASTYLIS: *Asarum.*

HIBBERTIA. *Dilleniaceæ.* Mostly Australian shrubs with erect, procumbent or climbing sts.: lvs. small and often heath-like: fls. yellow or white, solitary and terminal. Grown out-of-doors in S. Calif.

cuneiformis: *Candollea cuneiformis.*

dentata. Sts. trailing or twining: lvs. oblong, to 2½ in. long, slightly toothed, petioled: fls. dark yellow, to 2 in. across, with numerous stamens.

perfoliata. Sts. procumbent or ascending: lvs. ovate, to 2 in. long, slightly toothed, perfoliate: fls. pale yellow, with numerous stamens.

volubilis. Sts. trailing or twining to 30 ft.: lvs. obovate to lanceolate, to 3 in. long, clasping at base, silky-pubescent beneath: fls. yellow, with numerous stamens.

HIBISCUS. ROSE-MALLOW. *Malvaceæ.* Herbs, shrubs or small trees with alternate palmately lobed lvs., mostly very large and showy fls. from white to yellow and scarlet, and dry capsular 5-valved fr.; popular ornamental subjects, a few also grown for the edible parts. Species of hibiscus are among the most showy fls. of the tropics; they are specially abundant and prized in Hawaii.

The annual flower-garden sorts may be grown from seed sown where the plants are to stand. The perennials are propagated by seed or division; many of these are native in swamps and should have plenty of moisture. The shrubby kinds may be grown from seed sown in pots and transplanted; also by cuttings and grafting. See also *Okra* and *Roselle.*

Abelmoschus (*Abelmoschus moschatus*). MUSK-MALLOW. Ann. or bien. to 6 ft.: lvs. variously lobed: fls. yellow with crimson center, 4 in. across: fr. to 3 in. long, the seeds with musky odor sometimes used in perfumery. India.

africanus: *H. Trionum.*

Arnottianus. Shrub or small tree: lvs. ovate, entire: fls. white, sometimes with pinkish veins, 4 in. or more across, handsome; calyx-teeth short; bracts of involucel ⅛ in. or less long. Hawaii.

calisureus: hort. name, probably *H. Trionum.*

Calleri: *H. Rosa-sinensis* var.

calycinus (*H. chrysanthus*). Small shrub: lvs. round, angled: fls. lemon-yellow with dark center, to 3 in. across. S. Afr.; grown in Calif. and similar climates.

cannabinus. Ann. or per. with prickly st.: upper lvs. with deep narrow lobes: fls. yellow, with crimson center. Tropics of Old World.—Yields fiber.

chrysanthus: *H. calycinus.*

coccineus (*H. speciosus*). Per. to 10 ft., glaucous: lvs. with deep slender lobes: fls. rose-red or crimson, to 6 in. across. Swamps, Ga. and Fla.

Cooperi: *H. Rosa-sinensis* var.

Denisoni. Lvs. ovate, leathery, entire: fls. white. Much like *H. Arnottianus* but calyx deeply cleft and involucel bracts much longer. Origin doubtful.

diversifolius. To 8 ft., shrubby and prickly: lower lvs. deeply 3–5-lobed, upper toothed: fls. yellow with dark center. Afr., Pacific Isls., Australia.

elatus (*Paritium elatum*). Supposed to differ from *H. tiliaceus* in greater stature, larger fls. that change from yellow to red, involucre and calyces deciduous from ripe fr., and hairy seeds, but some of the plants so called not separable from that species.

esculentus (*Abelmoschus esculentus*). OKRA. GUMBO. Ann. to 6 ft.: lvs. variously lobed or divided: fls. yellow with reddish center, to 3 in. long: fr. to 1 ft. long, ribbed, becoming woody, when immature eaten as a vegetable. Tropics of Old World.—See *Okra.*

gossypinus. Tall shrub: lvs. ovate, finely toothed: fls. yellow, small, with an involucre of thread-like lfts. shorter than calyx-lobes. S. Afr.; adapted to Calif. and similar climates.

grandiflorus. GREAT R. Velvety per. to 6 ft. or more: lvs. commonly broader than long and 3-lobed: fls. pale pink with reddish in bottom, petals to 6 in. long. Marshes, Ga., Fla., Miss.—Allied to *H. Moscheutos*; perhaps sometimes transplanted.

Hamabo. Shrub to 10 ft. or more: lvs. round, slightly toothed, white-tomentose beneath: fls. yellow, darker at base, 3 in. across. Japan; thrives in southernmost regions.

heterophyllus. Tall shrub: lvs. simple or divided into long narrow lobes: fls. white with crimson or purple center, to 4 in. long. Australia; adaptable to southern parts of the country.

Huegelii. Tall shrub, mostly tomentose: lvs. deeply 3–5-lobed: fls. violet-purple, petals to 3 in. long. Australia. Var. **glabrescens** is nearly glabrous.

incanus. Per. to 6 ft.: lvs. ovate-lanceolate, toothed, white-tomentose beneath: fls. white or pink with crimson center, to 4 in. long. Swamps, Md. to Fla. and La.

Manihot (*Abelmoschus Manihot*). Ann. or per. to 9 ft.: lvs. divided into long narrow lobes: fls. yellow or whitish with dark brown center, to 9 in. across. Probably E. Asia.—Showy in bloom; widely spread as a more or less weedy plant.

militaris. SOLDIER R. Per. to 6 ft.: lvs. halberd-shaped: fls. white or pink with purple center, to 5 in. across. Pa. to Fla. and La.

Moscheutos (*H. palustris*). COMMON R. Per. to 8 ft.: lvs. ovate, longer than broad, not lobed or sometimes with small lobes or angles on shoulders, toothed, white-tomentose underneath: fls. pink or rose, sometimes whitish, to 8 in. across. Swamps, Mass. to Fla. and Mo.—Here belong the large-fld. garden mallows, some of them accounted hybrids with related species.

mutabilis. COTTON-ROSE. CONFEDERATE-ROSE. Shrub or small tree: lvs. broadly ovate, lobed to half or less their depth, tomentose beneath: fls. white or pink, becoming red, to 4 in. across. China; planted in southernmost states and in the tropics.

oculiroseus. CRIMSON-EYE R. Closely resembling *H. Moscheutos* but the white fls. with a dark rose or crimson center. Salt marshes, N. Y. and N. J.

palustris: *H. Moscheutos.*

Rosa-sinensis. ROSE-OF-CHINA. CHINESE H. Shrub to 30 ft.: lvs. ovate, not lobed, toothed or nearly entire: fls. of many colors, rose-red to white, sometimes double, to 6 in. across. Asia; widely grown in all warm countries and also under glass. Var. Calleri has buff-yellow fls. crimson at base. Var. Cooperi (*H. Cooperi*) has narrow lvs. variegated with white and small scarlet fls. Var. Van Houttei has deep crimson fls. Other forms in the trade are **aurantiacus, grandiflorus** and **miniatus.**

Sabdariffa. ROSELLE. JAMAICA SORREL. Ann. or bien. to 7 ft.: st.-lvs. lobed or divided: fls. yellow, having thick red acid calices and involucels from which sauces and jellies are made in warm countries; fiber is derived from the sts. Tropics of Old World.—See *Roselle.*

schizopetalus. Shrub: lvs. ovate, not lobed, toothed: fls. long-peduncled and hanging, red or orange-red, to 3 in. across, the petals much cut and recurved, the staminal column long-exserted. E. trop. Afr.; grown in the southernmost parts of the country.

sinensis: *H. Rosa-sinensis.*

speciosus: *H. coccineus.*

syriacus (*Althæa frutex*). SHRUB-ALTHEA. ROSE-OF-SHARON. Shrub to 12 ft., much planted: lvs. 3-lobed or toothed: fls. rose or purple to white and bluish, often double, to 3 in. across. E. Asia; hardy N. There are many hort. forms, such as **albus plenus, amplissimus** with double purple-pink fls., and **pæoniflorus.**

tiliaceus (*Pariti* or *Paritium tiliaceum*). MAHOE. Shrub or tree: lvs. nearly orbicular, resembling those of the linden: fls. yellow, to 3 in. long; involucel and calyx persistent on fr. Probably Old World tropics, now widely spread.

Trionum (*H. africanus*). FLOWER-OF-AN-HOUR. Ann. to 2 ft.: lvs. deeply divided into coarsely toothed lobes: fls. sulfur-yellow or white with dark center to 3 in. across. Afr.: nat. in N. Amer.

HICKORY-NUT. The hard husk-inclosed fruit of various species of Carya (which see), characteristic of North America, and some of the species much prized. They are gathered in the wild and one of them is much planted in the South: see *Pecan.* All the hickories are readily raised from seeds (or nuts), stratified and planted in spring, or sown directly in the ground in autumn if they can be protected from rodents. Because of the tap-root, seedlings transplant with considerable loss if allowed to stand in the original nursery more than a year or so. Special strains or named varieties of hickories may be propagated by severing some of the side roots but not loosening their hold in the ground, then tieing the upper end to a stake with the severed part about level with the soil: a shoot should arise from the top. Seedlings also may be side-grafted to the desired kind. On trees well established in permanent place, the common cleft-graft is successful; the grafting is usually performed at the crown, just below the surface of the ground. The cions should be dormant and provided with a terminal bud; the work is then covered with fine earth so that the top bud protrudes, the parts having first been waxed or bandaged.

Aside from the pecan, the most prized of the hickory-nuts are the shagbark, *Carya ovata*, and the shellbark, *C. laciniosa.* Other species also produce edible nuts.

HICKSBEACHIA. *Proteaceæ.* One Australian tree, **H. pinnatifolia.** Lvs. of 18–23 stiff toothed lfts. to 9 in. long and 2 in. wide: fls. silky outside, ½ in. long, in spike-like racemes to 11 in. long: fr. globular, to 1½ in. across, orange-colored.

HICORIA: *Carya.*

HIDALGOA. *Compositæ.* Cent. American climbing shrubs with ternately cut lvs. and rather large heads of ray- and disk-fls., resembling single dahlias; one species grown out-of-doors in S. Calif.

Wercklei (*Childsia Wercklei*). CLIMBING-DAHLIA. Lvs. opposite, to 2½ in. long, climbing by the coiled petioles: heads orange-scarlet, to 2½ in. across. Costa Rica.

HIERACIUM. HAWKWEED. *Compositæ.* Many per. herbs, often stoloniferous, of the north temp. zone, with alternate or basal lvs. and panicled or occasionally solitary heads of yellow, orange or red ray- and disk-fls.; pappus of stiff usually brownish bristles.

A few hawkweeds are sometimes grown in the garden, especially in rockeries. They prosper in poor soil. Care must be exercised to keep them from spreading too much. Propagated easily from seed, also by division of the stolons. See also *Tolpis.*

amplexicaule. To 2 ft., glandular-sticky: lvs. ovate to lanceolate, toothed, the st.-lvs. clasping: heads 2–many, yellow, 1 in. or more across. S. Eu.

aurantiacum. ORANGE H. DEVILS-PAINTBRUSH. To 20 in., covered with long spreading hairs: lvs. mostly in basal tuft, oblong, nearly entire: heads clustered, 1 in. across, deep orange to flame color. Eu.; a bad weed in E. N. Amer.

bombycinum. To 1½ ft.: lvs. obovate, densely silvery-pubescent: heads ½ in. across, yellow. Spain.

Gronovii. To 3 ft., hairy: lvs. obovate or oval, toothed or entire: heads clustered, ½ in. across, yellow. Mass. to Fla. and Tex.

gymnocephalum. To 2 ft., white-pubescent: lvs. oval or oblong, slightly toothed: heads clustered, ¾ in. across, yellow. S. Eu.

lanatum. To 20 in., densely gray-tomentose: lvs. oval or ovate, nearly entire: heads clustered, 1 in. across, pale yellow. S. Eu.

marmoreum. To 1 ft., hairy: lvs. ovate-oblong, toothed: heads clustered, ¾ in. across, yellow. S. E. Eu.

paniculatum. To 3 ft., nearly glabrous: lvs. lanceolate, toothed: heads panicled, ½ in. across, yellow. N. S. to Ga. and Ala.

Pilosella. MOUSE-EAR H. Slender, to 1 ft., densely hairy: lvs. in a basal tuft, oblong, entire: heads solitary, 1 in. across, pale yellow, sometimes striped or tinged with red or purple. Eu.; nat. in E. N. Amer.

rubrum. To 1½ ft., densely woolly, resembling *H. aurantiacum.* E. Cent. Eu.

stoloniferum: a confused name.

tridentatum. To 3 ft., hairy: lvs. oblong to lanceolate, with few coarse teeth: heads clustered, to ¾ in. across, yellow. Eu.

umbellatum. NARROW-LEAVED H. To 3 ft.: lvs. lanceolate to linear, toothed: heads clustered, to 1½ in. across, golden-yellow. Eu., Asia.

venosum: To 3 ft., nearly glabrous: lvs. obovate to oval, toothed, often purple-veined: heads numerous, ½ in. across, yellow. Me. to Ga. and Neb.

villosum. SHAGGY H. To 2 ft., soft silky-pubescent: lvs. oblanceolate to ovate, nearly entire: heads to 2 in. across, bright golden-yellow, often solitary at end of sts. Eu.

HILLS-OF-SNOW: *Hydrangea arborescens* var. *grandiflora.*

HIMALAYA-BERRY. A kind of blackberry introduced into North America in recent years and grown somewhat for fruit. It is one of the many kinds of European brambles with very long scrambling more or less perennial canes, *Rubus procerus;* it is not Himalayan. The plant is rampant and viciously thorny. It is best handled on a trellis or arbor. In parts of California it is a useful fruit plant and may also be grown acceptably elsewhere when properly trained, but in general its pomological promise is not great. The plant has established itself in some places outside cultivation. Propagation and culture as for *Blackberry.*

HIPPEASTRUM. *Amaryllidaceæ.* Bulbous herbs native in the tropics of the western hemisphere, having narrow basal lvs. and red or whitish lily-like fls. borne in an umbel at top of hollow scape, the perianth-segms. united into a short tube.

Hippeastrums are grown as house-plants and out-of-doors but the bulbs must be lifted in winter. The plants bloom in spring or summer or in late winter in the greenhouse. The best soil is one composed of fibrous loam, leaf-mold and sand. They may be propagated by seeds which produce blooming plants in about two years. In gardens these plants are commonly known as Amaryllis; the common garden kinds are hybrids or variants.

equestre: *H. puniceum.*

hybridum: a name for hort. forms.

Johnsoni. An old hybrid between *H. Reginæ* and *H. vittatum* probably not now in cult., or represented by more recent crosses and variants.

puniceum (*H.* and *Amaryllis equestre*). Lvs. to 2 in. wide, after fls.: fls. red or salmon-red, lighter toward base, to 5 in. long, the tube about 1 in. long. Trop. Amer.

Reginæ (*Amaryllis Reginæ*). Lvs. to 2 in. wide, after fls.: fls. bright red with whitish star in throat, to 5 in. long, the tube to ½ in. long. Trop. Amer.

reticulatum (*Amaryllis reticulata*). Lvs. to 2 in. wide, with fls.: fls. rose-pink cross-barred with darker rose, to 4 in. long, the tube 1 in. long. Brazil. Var. **striatifolium** has lvs. with a prominent white rib.

solandriflorum. Lvs. to 2 in. wide, with fls.: fls. greenish-white, to 10 in. long, the tube 4–5 in. long. S. Amer.

vittatum (*Amaryllis vittata*). Lvs. with or after fls.: fls. striped red and white, to 6 in. long, the tube about 1 in. long. Peruvian Andes.—The usual garden forms or colors are much like this species.

HIPPOCASTANACEÆ. HORSE-CHESTNUT FAMILY. Two widely distributed genera of trees and shrubs bearing opposite digitately compound lvs., irregular polygamous fls. having 5 sepals, 4–5 petals, 5–8 stamens, superior 3-celled ovary, and leathery capsular fr. Only Æsculus is cult.

HIPPOCREPIS. *Leguminosæ.* Herbs or small shrubs with pinnate lvs. and yellow papilionaceous fls. in nodding racemes or spikes; native in Medit. region and grown sometimes in rock-gardens and borders.

multisiliquosa. Ann. to 1 ft.: lfts. in 2–7 pairs: fls. small: pods curved, breaking into 3–7 joints.

HIPPOPHAË. SEA-BUCKTHORN. *Elæagnaceæ.* Spiny shrubs or small trees covered with silvery scales, having alternate willow-like lvs., inconspicuous yellow diœcious fls. appearing before the lvs., and drupe-like frs.

Any soil is satisfactory. To insure fruit care must be taken to have a few staminate plants. Propagated by seeds sown in fall or stratified, cuttings of ripened wood in spring, root-cuttings, layers and suckers.

hybrida: a listed name.

rhamnoides. Very hardy, to 30 ft.: fr. bright orange-yellow, ¼ in. long, staying on through the winter. Eu., Asia. Var. **angustifolia** has narrow lvs. and pendulous branches. Var. **procera** grows to 50 ft.

salicifolia. To 50 ft., the branches drooping: lvs. stellate-tomentose below, dull green above: fr. yellow. Himalayas; to be planted S.

HIPPOSELINUM LEVISTICUM: *Levisticum officinale.*

HIRSUTE: with rather rough or coarse hairs.

HISPID: provided with stiff or bristly hairs.

HOARHOUND: *Marrubium.* **Black:** *Ballota nigra.* **Water:** *Lycopus.*

HOARY: covered with a close white or whitish pubescence or down.

HOBBLE-BUSH: *Viburnum alnifolium.*

HOFFMANNIA. *Rubiaceæ.* Shrubs or rarely herbs native from Mex. to S. Amer. with opposite or whorled usually colored lvs., small tubular 4-lobed fls. in axillary cymes, and fr. a small berry; a few of them are grown as foliage plants in the greenhouse. Propagated by cuttings.

discolor. To 6 in., hairy: lvs. obovate, to 6 in. long, satiny above, purple beneath: fls. red, the cymes long-stalked. Mex.

Ghiesbreghtii (*Campylobotrys Ghiesbreghtii*). To 4 ft., nearly glabrous: lvs. oblong-lanceolate, to 1 ft. long, dark velvety-green above, purple-red beneath: fls. yellow with red spot, the cymes short-stalked. Mex. Var. **variegata** has mottled lvs.

regalis. Subshrub: lvs. round-ovate, dark green above, purple-red beneath: fls. yellow, the cymes nearly sessile. Mex.

HOHERIA. *Malvaceæ.* New Zeal. trees with alternate toothed lvs., white small or medium fls. clustered or solitary in the axils, the pedicels jointed near middle, and 5 indehiscent winged carpels falling away from a central axis; grown in S. Calif.

angustifolia (*H. populnea* var. *angustifolia*). To 25 ft.: lvs. linear-oblong, to 2 in. long, spiny-toothed: fls. ⅓ in. across.

populnea. To 30 ft.: lvs. ovate, to 5 in. long, doubly toothed: fls. to 1 in. across.

sexstylosa (*H. populnea* var. *lanceolata*). To 25 ft.: lvs. lanceolate, to 5 in. long, sharp-toothed: fls. ¾ in. across.

HOLBOELLIA: see *Lardizabalaceæ.*

HOLCUS (*Sorghum*). *Gramineæ.* Tall coarse quick-growing broad-lvd. ann. and per. grasses native in warm parts of the Old World, the spikelets borne in large terminal panicles which in some species mature into heavy grain-bearing heads or tassels; grown for grain and forage, and for the sirup extracted from the stalks of *H. Sorghum* var. *saccharatus.* The species are not clearly defined and there are many forms. See *Grasses.*

caffrorum: *H. Sorghum* var.

Durra: *H. Sorghum* var.

halepensis (*Andropogon halepensis*). JOHNSON-GRASS. MEANS-GRASS. ALEPPO-GRASS. Per. to 6 ft., very leafy, with strong creeping rootstocks: lvs. to 2 ft. long and 1 in. wide: panicles loose, to 2 ft. long, the branches spreading. Medit. region but widely nat.—Grown for forage and pasture, mostly in the S.; becomes an invading weed.

lanatus: *Notholcus lanatus.*

saccharatus: *H. Sorghum* var.

Sorghum (*Andropogon Sorghum*). SORGHUM. Ann. to 12 ft. or more, often with juicy pith yielding sirup: lvs. to 2 ft. long and 2 in. wide: panicles variable, the spikelets large and broad and persistent at maturity. Probably Afr.; long cult. and the source of many races, some of which yield important grain as well as forage; one is broom-corn and one the sweet or sirup sorghum. Var. **caffrorum** (*H. caffrorum*). Kafir. Pith dry: panicles dense, oblong or cylindric, grains large. S. Afr. Var. **caudatus.** Feterita. To 14 ft.: panicles very dense, oblong, grains large, white, yellow or red. Cent. Afr. Var. **Drummondii.** Chicken-Corn. To 6 ft.: panicles to 16 in. long, the branches ascending, grains small, orange. Guinea. Var. **Durra** (*H. Durra*). Durra. Pith dry: panicles ovate, recurved, grains large. Nile region. Var. **Roxburghii.** Shallu. Panicles oblong, becoming loose, grains small. Afr., India. Var. **saccharatus** (*H. saccharatus*). Sorgho, Sweet or Sugar S. Pith juicy and sweet, employed in the making of sirup. Var. **technicus.** Broom-Corn. Panicles to 2 ft. or more long, spikelets usually awned.

sudanensis. Sudan-Grass. Ann. to 10 ft.: lvs. to 2 ft. long and ½ in. wide: panicles to 1 ft. long and 6 in. across, the branches ascending. Afr.

virgatus. Tunis-Grass. Ann.: panicles to 2 ft. or more long, very narrow and slender, spikelets awned. Afr.

HOLLY: *Ilex.* African-: *Solanum giganteum.* Mountain-: *Nemopanthus.* Sea-: *Eryngium maritimum.*

HOLLYHOCK. Two species of Althæa, *A. rosea* and *A. ficifolia,* the latter differing in its deeply lobed and somewhat fig-like leaves and probably not specifically distinct. Hollyhocks are stately hardy plants, 5–9 feet tall, well known everywhere, summer-blooming, bearing large wide-open flowers along the main axis in white, rose, red, yellowish, single and double.

The culture is very simple. The seed is usually sown in July, and the plants set where wanted the following spring or they may stand where sown. They will bloom the same year in which they are transplanted—the year following the seed-sowing. New plants should be set every two years, as they are essentially biennial. For the rust of hollyhocks, remove affected leaves promptly; do not allow diseased leaves to remain over winter, in particular remove all pustuled leaves of the low clump just before winter and again in spring; frequent thorough dusting on both surfaces of the leaf with sulfur or green-sulfur should then keep the disease in check. Clean up the garden thoroughly.

HOLMSKIOLDIA. *Verbenaceæ.* Shrubs with opposite simple lvs., tubular fls. with conspicuous colored calices borne in racemes or cymes, and drupaceous frs.; planted out-of-doors in warm climates and sometimes under glass, particularly for its large ornamental calyx.

sanguinea. Chinese-Hat Plant. To 30 ft., evergreen: lvs. ovate, to 4 in. long: fls. with red corolla 1 in. long and spreading brick-red or orange calyx to 1 in. across. Himalayan region.—Now a characteristic plant in parts of trop. Amer.

HOLODISCUS (*Sericotheca. Schizonotus*). *Rosaceæ.* W. American deciduous shrubs with alternate toothed or lobed lvs. and small whitish fls. in terminal panicles; planted for ornament.

They thrive in sunny positions in well-drained soil. Propagated by seeds, by layers, and sometimes by greenwood cuttings under glass.

discolor (*Spiræa discolor*). Rock-Spirea. To 20 ft.: lvs. ovate, to 4 in. long, white-tomentose beneath: fls. creamy-white, in panicles to 9 in. long on drooping branches. B. C. to Calif. and Mont. Var. **ariæfolius** (*Spiræa ariæfolia*) has lvs. gray-pubescent beneath.

microphyllus. To 3 ft.: lvs. elliptic, to ½ in. long, white-silky beneath: fls. in panicles to 3 in. long. Colo., Utah, Wyo.

HOLOPTELEA. *Ulmaceæ.* One large deciduous tree in India, separated from the elms by the entire lvs. and technical characters of fl. and fr. **H. integrifolia** has pubescent shoots and elliptic or obovate-oblong lvs. to 6 in. long and 5 or 7 pairs of nerves: fr. 1 in. long, elliptic or nearly orbicular, notched at end.—Adapted only to warm climates.

HOLY-GHOST-FLOWER: *Peristeria elata.*

HOMALANTHUS. *Euphorbiaceæ.* Trop. Asian and Australian trees or shrubs with alternate entire lvs., monœcious apetalous fls. in terminal racemes, and capsular frs.; sometimes grown in S. U. S. for ornament or curiosity.

populifolius (*Carumbium populifolium*). Small tree: lvs. triangular-ovate, to 6 in. long, long-stalked: racemes to 4 in. long. Ceylon to Pacific Isls.

HOMALOBUS: *Astragalus flexuosus.*

HOMALOCEPHALA. *Cactaceæ.* Segregate from Echinocactus distinguished by the different fr., which is somewhat fleshy and bursts irregularly, the plant body subglobose or depressed. One species. See *Cacti.* **H. texensis** (*Echinocactus texensis*). Usually much depressed or flattened endwise, to 12 in. broad and half as high, ribs 13–27 and very prominent, radial spines 6 or 7, central solitary and longer: fls. 2 in. or more long, bell-shaped, scarlet and orange below, pink to nearly white above. Tex., New Mex., Mex.

HOMALOCLADIUM. Ribbon-Bush. Centipede-Plant. *Polygonaceæ.* One shrub with flat articulated striate sts. that are usually leafless in the flowering stage, bearing small greenish fls. in little sessile clusters at alternate joints; true lvs. appearing mostly in the vegetative stage, ½–2½ in. long, lanceolate, often lobed at base. **H. platycladum** (*Muehlenbeckia platyclados*), from the Solomon Isls., frequently grown as a pot plant and in the open far S. for interest and curiosity: 2–4 ft. but in tropics making terete canes to 12 ft.: fr. small, red, berry-like, 5-sulcate at top.—Easily grown, sometimes standing light frost; propagated by cuttings.

HOMALOMENA. *Araceæ.* Trop. herbs with woody sts., lanceolate or oblong lvs with sheathing petioles, and unisexual fls. borne on spadices slightly shorter than the erect spathes; occasionally grown under glass for the variegated foliage. Cult. as for *Dieffenbachia.*

Wallisii (*Curmeria Wallisii*). Lvs. to 8 in. long and 3 in. wide, deep green above irregularly spotted with yellow and margined with white, glaucescent beneath, the petioles 2 in. long and channelled: spathes pale red minutely spotted with white. Trop. Amer.

HONESTY: *Lunaria.*

HONEY-BELL: *Mahernia verticillata.*

HONEY-BUSH: *Melianthus.*

HONEYSUCKLE: *Lonicera*. **Bush-**: *Diervilla*. **Cape-**: *Tecomaria capensis*. **French-**: *Hedysarum coronarium*. **Himalaya-**: *Leycesteria formosa*. **Jamaica-**: *Passiflora laurifolia*. **White Swamp**: *Rhododendron viscosum*.

HONEYWORT: *Cerinthe*.

HOOKERA: *Brodiæa*.

HOP: *Humulus*. **-Bush**: *Dodonæa cuneata*. **-Tree**: *Ptelea*.

HORDEUM. *Gramineæ*. Ann. and per. grasses in temp. regions of both hemispheres, with flat lvs. and spikelets in terminal cylindric dense spikes, awned; one species valuable for grain and forage. See *Grasses*.

jubatum. Squirrel-tail-Grass. Bien. or per. to 2½ ft.: lvs. to 5 in. long and ⅙ in. wide: spikes to 4 in. long, nodding, the slender awns to 3 in. long. N. Amer., Eu., Asia.—Sometimes grown for the abundant ornamental drooping spikes.

vulgare. Barley. Ann. to 3 ft.: lvs. to 1 ft. long and ¾ in. wide: panicles to 4 in. long, mostly erect, the stout awns to 6 in. long. Cultigen, of Old World origin. Var. **trifurcatum** is beardless.

HOREHOUND: *Marrubium*.

HORMIGO: *Triplaris americana*.

HORMINUM. *Labiatæ*. One per. herb adapted to the rock-garden, native from the Pyrenees to the Tyrol. **H. pyrenaicum**. To 1 ft.: lvs. mostly basal, ovate and toothed: fls. bluish-purple, ¾ in. long, somewhat 2-lipped, in whorls in long leafless spikes, in summer.

HORNBEAM: *Carpinus*. **Hop-**: *Ostrya*.

HORNWORT: *Ceratophyllum demersum*.

HORSE-BRIER: *Smilax rotundifolia*.

HORSE-CHESTNUT: *Æsculus*.

HORSE-RADISH. The comestible part of *Armoracia rusticana*, a deep-rooted perennial native in southeastern Europe and also run wild in this country, is the fleshy root, which is grated and employed as a relish or appetizer with meats and other foods. The plant blooms freely but does not mature seeds; it is therefore propagated by root-cuttings, which are planted in spring and the roots harvested in late autumn of the same year or for home use left in the ground until spring. By growing horse-radish as an annual crop and thoroughly cleaning the land of roots at harvesting time, the plant does not become established as a persistent dock-like weed and a more shapely tender easily managed product is obtained. Grown as a regular tilled crop on good land, the yield may be 3–5 tons more or less to the acre, of commercial roots fit for grating in machine. The usual practice of keeping a few old stools about the house for home use produces tough shapeless stringy roots.

Side roots saved from the trimmings, of the size of a lead-pencil to ¾ inch diameter, are cut to 5–8 inches long; these cuttings are tied in bundles and stored in cellar till spring, when they are set in a slanting position where the plants are to grow, in rows far enough apart (say 2½–3 feet or farther if set between rows of early-season crops as cabbage) to allow of good tillage and 10–18 inches in the row; the top of the cutting should be 3–5 inches below the surface of the ground.

HORSE-RADISH-TREE: *Moringa oleifera*.

HORSETAIL: *Equisetum*. **-Tree**: *Casuarina equisetifolia*.

HORSE-WEED: *Collinsonia*.

HORTICULTURE is a broad inclusive term covering the making and care of home gardens, market-gardens, orchards, nurseries, greenhouses, as well as the plant-raising phase of parks, estates and botanic gardens. It comprises whatever has to do with the growing of ornamentals, of vegetables, of fruits, and of plants prized for their general interest. It may constitute the way of earning a living and developing a business, at the same moment that in the fuller sense its subjects are embedded in the emotional assets of life.

It follows that horticulture cannot be measured or defined by its organized and commercial aspects alone or its importance be represented in statistics. The amateur and personal practice of it determine the extent of the trade development; and this fact will be increasingly apparent as home-making rises to higher satisfactions.

The main departments of horticulture, as defined by the plant subjects, are pomology or fruit-growing, floriculture or flower-growing, olericulture or vegetable-growing, landscape practice.

To grow the vast range of plants successfully and to defend them against insect and disease requires experience and definite knowledge. The plant resources of the earth are largely within the purview of the horticulturist, involving conceptions of plant geography, climate, adaptations. These resources afford endless opportunities in plant-breeding. It follows that the exact identification of species and varieties is an indispensable part of this field of knowledge. Horticultural subjects have been put into pedagogical form and are now effective means of elementary and higher education. Personal skill in cultivation and in technique is essential to success and real satisfactions; yet horticulture and gardening are much more than the growing of plants. See *Garden*.

HOSACKIA. *Leguminosæ*. American herbs or rarely subshrubs with pinnate lvs. and yellow or reddish papilionaceous fls. in axillary umbels; by some authors retained in Lotus and differing in technical characters.

gracilis (*Lotus formosissimus*). Sts. weak, herbaceous, to 1 ft. long: lfts. 3–7, obovate or oblanceolate: fls. to ¾ in. long, rose, upper petal yellow. Wash. to Calif.

HOSTA (*Funkia. Niobe*). Plantain-Lily. *Liliaceæ*. Per. herbs with thick durable roots, large clumps of broad or at least not greatly elongated basal lvs. and blue, lilac or white fls. in racemes or spikes terminating the scape or peduncle, the perianth-segms. partially united.

Plantain-lilies are hardy and of easy cultivation, doing well in moist shady places, making neat attractive foliage clumps until cut down by cold weather. Propagated by division of the stools, and only seldom by seeds for some of the kinds do not produce capsules.

H. cærulea and *H. plantaginea* make shallow clumpy rootstocks with large scars, and the other kinds have more fibrous but thick roots from the crown or from short rootstocks. The long white wax-like flowers of *H. plantaginea* are very fragrant, appearing in late summer and autumn; the others have short lavender-purple ("blue") or lilac flowers, sometimes almost white, drooping or soon becoming so, and little if at all odorous. *H. cærulea* differs from all others in the flower being suddenly enlarged or widened in its upper half; the other lilac or blue kinds have a gradually widened flower-tube.

albo-marginata: *H. japonica* var.

cærulea (*F. ovata*). BLUE P. To 3 ft.: lvs. to 9 in. long and 5 in. wide, cordate at base, deep green: fls. lavender-purple (blue), striped with lighter color, to 2 in. long, in summer, the perianth-tube narrowly furrowed-cylindrical for about half its length and then suddenly bulging or shouldered into an urn-shaped bloom: seeds freely. Japan, China, Siberia.

decorata. BLUNT P. To 2 ft.: lvs. oval, to 6 in. long, obtuse or only very short- and abruptly pointed, about 5-nerved either side midrib, white-margined, petioles winged: scape exceeding foliage, winged: fls. rather dark lilac, to 2 in. or more long, drooping, in summer: seeds freely. Origin undetermined.

Fortunei. TALL-CLUSTER P. To 2 ft. and more, the scapes much taller than foliage: lvs. to 5 in. long and 3½ in. broad, heart-shaped at base, glaucous or blue-green as if glaucous, with 10–12 nerves either side midrib, short-petioled: fls. pale lilac, 1½ in. long, in late spring and early summer. Probably Japan. Var. gigantea is a form with larger longer-petioled lvs., rather larger fls. that stand less high above the foliage.

japonica (*H. lancifolia. H. lanceolata*). NARROW-LEAVED P. To 2 ft., slender, the scapes exceeding the foliage: lvs. narrow, to 4 in. long and 2 in. wide, tapering to both ends, green, with 3 or 4 nerves either side midrib, the petioles slender and scarcely winged: fls. lilac or pale lavender, to 2 in. long, in summer and autumn; seldom if at all fruitful in cult. Japan. Var. albo-marginata has lvs. edged with white. Var. fortis is a common form in cult. differing in greater size and vigor, larger and leaf-like bracts on scape, nerves 6 or 7, petioles winged, blooms in summer. Var. tardiflora has prominently acuminate-pointed lvs., short margined petioles, autumnal fls. in a condensed often branched cluster; probably not in cult. in N. Amer., the plant so named being *H. japonica* itself.

lanceolata: *H. japonica.*

lancifolia: *H. japonica.*

ovata: *H. cærulea.*

plantaginea (*F. grandiflora. F. subcordata*). FRAGRANT P. To 2½ ft., the scapes exceeding the foliage: lvs. to 10 in. long and 6 in. wide, cordate at base, green, nerves either side midrib 7–9: fls. tubular, ascending, white, fragrant, to 5 in. long, late summer and autumn. Japan, China.

robusta: a name of inexact application, sometimes meaning *H. undulata.*

Sieboldiana (*F. glauca*). SHORT-CLUSTER P. Scapes mostly shorter than foliage: lvs. 10–15 in. long and 6–10 in. broad, cordate, long-petioled, usually very glaucous, many-nerved either side midrib: fls. many, slender, faint lilac, conspicuously drooping, spring and early summer, in a close raceme. Japan.

subcordata: *H. plantaginea.*

undulata. WAVY-LEAVED P. To 2½ ft., stout, the scapes much exceeding foliage and leafy: lvs. ovate, 6 in. long and 3 in. broad, narrowed toward base, sharp-pointed, curved, margins more or less undulate, striped and splashed lengthwise with cream-color or white: fls. about 2 in. long, pale lavender. Origin undetermined.—The supposed green-lvd. form is probably *H. Fortunei.*

HOTBED is a frame or box that has artificial heat and a transparent covering and in which plants are grown. It differs from a coldframe in having artificial bottom heat. This bottom heat is supplied by fermenting organic matter, hot water or steam in pipes underneath the bed, and hot air conducted in horizontal flues. Formerly fermenting horse manure was the heating agency, but with the lessened supply of it and the development of mechanical devices the mechanical agencies are now mostly employed. Information on such devices may be obtained from dealers in gardening equipment and from recent bulletins.

The hotbed is covered with sash of which the normal or standard size is 3 feet wide and 6 feet long. These sashes are laid crosswise the box or frame. The standard size of frame is 6 feet wide and 12 feet long. A "frame," therefore, accommodates four sashes. However, the frame may be of any length desired. This frame is ordinarily made of boards, and the back of it is 3 or 4 inches higher than the front, so that the sashes slope to the sun. It is customary to have a space of 6 to 10 inches between the ground and the sash on the lower or front side. The area or location in which the frames are set should be protected from cold and prevailing winds by a rising slope, a high board fence, a building, hedge, or other obstruction. If the frame yard is near the main buildings, it is much more accessible in rainy or snowy times, and the plants are likely to have better care. Water should also be at hand.

When to start a hotbed depends on the kinds of plants to be grown, the time one wishes to gain, and something, also, on the character of the heat. The hardier the plant the earlier it can be started. In the latitude of New York, from the first to the middle of March is the usual time for starting a hotbed. In this bed are sown seeds of early flowers and such vegetables as cabbage, cauliflower, tomato. In the raising of plants in the hotbed, it is essential that they do not become "drawn" or "leggy." To prevent this, they must be given plenty of room, thorough ventilation on all pleasant days, and not too great heat. It is well to transplant them once or twice before they are finally set in the field, particularly if they are started, in New York, as early as the first or middle of March. When transplanted, they can be set in another hotbed or in a coldframe; but it is important that the succeeding frames in which they are set should not be very much colder than the one in which they grew, else they may become stunted. It is well, however, to transplant them into a gradually cooler and freer atmosphere to harden them off, that they may go into the open ground without danger.

On pleasant days, raise the sash at the upper end 1 or 2 inches, or if the sun shines brightly and the wind does not blow, give even more air; and eventually strip off the sashes entirely. It is important that the plants are not kept too close and grown too soft. It is usually advisable to sow cabbage, lettuce and hardy plants in different frames from tomatoes and other tender things, in order that the proper requirements may be given to each. At night the hotbeds (at least early in the season) need more protection than the glass sash. It was formerly the custom to use thick rye-straw mats to cover them, but it is now common practice to use straw matting or other fabric purchased of carpet dealers. This is rolled out on the sashes at night in one or two thicknesses; and if the weather is sharp, board shutters, the size of the sash, may be laid on top.

One must not expect to gain as much time in the crop as one gains in the starting of the seeds: that is, if seeds are started two months ahead of the normal season, one will not gain two months in the ripening of the crop. Ordinarily, one cannot expect to gain much more than one-half the time, if the plants are transplanted to the field from the hotbed.

Some plants may be grown to maturity in the hotbed, as lettuce and radishes. After hotbeds have been emptied of their plants, the sashes may be stored away, and the frames employed for the growing of a crop of melons or cucumbers.

HOTEIA: *Astilbe.*

HOTTENTOTS - BREAD: *Testudinaria elephantipes.*

HOULLETIA. *Orchidaceæ.* Epiphytes native in trop. Amer. with 1-lvd. pseudobulbs and fls. in racemes, the sepals and petals similar, the lip clawed; for cult. see *Orchids.*

odoratissima. Lvs. to 16 in. long and 3 in. wide: fls. 2½ in across, in 6–9-fld. racemes to 16 in. high; sepals and petals chocolate-brown; lip white, Aug.–Sept. Colombia.

HOUNDS-TONGUE: *Cynoglossum.*

HOUSELEEK: *Sempervivum*

HOUSE PLANTS are such as are capable of being readily and satisfactorily grown in a residence, for home adornment and decoration. The care of house plants is window-gardening, although porch- and window-boxes outside the building may not strictly be a part of it inasmuch as the purpose is exterior rather than domestic embellishment.

The growing of house plants becomes practically a question of proper window space. The essentials to be taken into consideration, before the attempt is made, is whether the place has sufficient sunlight, whether temperature can be depended on and controlled, whether the air will be too dry, and the room free from coal and illuminating gas and dust. The air of a living-room is likely to be that of a desert, as to moisture; whereas the plants one commonly desires to grow in it are those requiring a more or less humid climate. Gas leaks soon cause foliage to shed.

The house garden may occupy an entire window or set of windows, or it may consist simply of a jardinière, or a few choice pot-plants on a stand. Expensive arrangements are by no means necessary, nor is a large collection. The plants and flowers themselves are the main consideration, and a small collection well cared for is better than a large one that is not kept in good condition. The window-box in the room will be seen near at hand, however, so may be more or less ornamental in character. The sides may be covered with ornamental tile held in place by molding, or a light lattice-work of wood. But a neatly made and strong box of stout pine of a length corresponding to the width of the window, about 10 inches wide and 8 deep, answers quite as well as a costlier receptacle. A zinc tray of a size to fit into the wooden box may be ordered of the tinsmith. It tends to keep the soil from drying out so rapidly. This is provided with a false wooden bottom, with cracks for drainage, 2 inches above the real bottom of the tray. The plants will then have a vacant space below them into which drainage water may pass. Such a box may be thoroughly watered as the plants require, without danger of the water running on the floor. Of course, a faucet should be provided at some suitable point on a level with the bottom of the tray, to permit of its being drained every day or so if the water tends to accumulate. It would not do to allow the water to remain long; specially should it never rise to the false bottom, as then the soil might become too wet.

Some persons attach the plant box to the window, or support it on brackets below the window-sill; but a preferable arrangement is to support it on a low and light stand of suitable height provided with rollers. It may then be drawn back from the window, turned around from time to time to give the plants light on all sides, or turned with the attractive side inward as may be desired.

The plants are often set directly in the soil; but if they are kept in pots they may be rearranged to suit the pleasure. Larger plants to stand on shelves or brackets may be in porous earthenware pots; but the smaller ones which are to fill the window-box may be placed in heavy paper pots. The sides of these are flexible, and the plants in them, therefore, may be crowded close together with great economy in space. When pots are spaced, damp sphagnum or other moss among them will hold them in place, keep the soil from drying out too rapidly, and at the same time give off moisture.

The window for winter plants should have a southern, southeastern or eastern exposure. Plants need all the light they can get in the northern winter, especially those expected to bloom. The window should be tight-fitting. Shutters and a curtain are an advantage in cold weather.

The plants should have a certain regularity in conditions. It is trying on them, and often fatal to success, to be snug and warm one night and in a temperature only a few degrees above freezing the next. Some plants live in spite of it, but they cannot be expected to prosper to their best. Those persons whose rooms are heated with steam, hot water or hot air will have to guard against keeping rooms too warm fully as much as too cool. Rooms in brick dwellings that have been warm all day, if shut up and made snug in the evening, often keep warm over night without heat except in the coldest weather. Rooms in frame dwellings, and exposed on all sides, soon cool down. If the living-rooms are too dry for plants, the bow-window may be set off from the room by glass doors; one then has a miniature conservatory. A pan of water on the stove or on the register and damp moss among the pots may provide the necessary humidity.

From time to time the foliage will need cleansing to free it from dust. A bath-tub provided with a ready outlet for the water is an excellent place for this purpose. The plants may be turned on their sides and supported on a small box above the bottom of the tub. Then they may be freely syringed without danger of making the soil too wet. It is usually advisable not to wet the flowers, however, especially the white waxen kinds, like hyacinths. The foliage of Rex begonias should be cleansed with a piece of dry or only slightly moist cotton or soft cloth; but if the leaves can be quickly dried off by placing them in the open air on mild days, or moderately near the stove, the foliage may be syringed.
